Artificial Petroleum In view of the necessity of developing artificial petroleum industry as a means of covering the shortage of the resources of natural petroleum in this country, the Government formulated a plan to establish a company with a capital of ¥100,000,000 to take charge of the task.

At present, the annual consumption of petroleum in this country amounts to approximately 3,000,000 metric tons, not including the demand of the Imperial Navy. As the domestic production still remains in the neighbourhood of 300,000 metric tons, the nation has to look for 90 per cent of its demand in foreign petroleum, mainly supplied by British and American oil interests. The policy for the compulsory storage of a fixed amount of oil by foreign oil concerns in the country is merely a negative meaure like the policy for economizing petroleum.

Compelled by the present extraordinary international situation to take positive measures, the Government has resolved to establish the artificial petroleum industry by three methods comprising technical assistance, financial assistance through government investments, and encouragement for products.

The Fuel Research Institute of the Ministry of Commerce and Industry, which is located at Kawaguchi City in Saitama Prefecture, has succeeded in its experiments aiming to transfer from the laboratory to the plant the manufacturing of artificial petroleum by the three processes of low temperature, dry distillation, direct liquefaction and synthesization of oils. This success has led to the decision to establish a model State-managed plant in the Hokkaido at a cost of some ¥20,000,000 as an enterprise spreading over a period of three years beginning with the 1937–38 fiscal year.

Unlike the private enterprises which have already been placed on industrial basis, the enterprise of the Ministry of Commerce and Industry, which is undertaken through the creation of a new department in the Fuel Research Institute, will be featured by an attempt to lower the production cost through rationally employing the aforementioned three processes. The minimum amount of annual production required for placing the enterprise on industrial basis is estimated at 20,000 tons. When this State enterprise proves successful, additional plants on the same scale are expected to be established in other suitable places.

It is to be noted that in undertaking to embark upon the enterprise, the Government also aims at the training of technicians to be charged with the task of guiding the private enterprises. In other words, the new department of the Fuel Research Institute will play the role of a pilot of new enterprises.

The organization of a ¥100,000,000 investment company as a semi-official concern was decided upon in view of the necessity of the Government extending financial aid to the industrialists for embarking upon the enterprises of national importance. According to the tentative plan, the new company will be called the Imperial Fuel Company and will aim at the annual production of 2,000,000 tons of artificial petroleum, including 1,000,000 tons of volatile oil and 1,000,000 tons of heavy oil.

This aim is to be attained through the execution of a seven-year programme. For this purpose, the Government has decided to authorize the new company to issue debentures to a total amount three times that of its capital (or five times in case the capital fails to reach ¥100,000,000 due to a curtailment of the budget estimates). In order to encourage private investments, it was also decided to gurantee a dividend of 3.5 per cent during the first three years and of 5 per cent later on for the private shares of the company, with the government shares receiving no dividend in case the profits of the company do not amount to 5 per cent.

With a view to the sound development of the artificial petroleum industry, the Government has decided to enforce a control through the adoption of the licensing system for the industry. Not only the enterprises to be launched in the future but the already commenced enterprises also are required to obtain the license so that they may enjoy the privilege of securing the investments of the semi-official investment company referred to above. It is estimated that all the enterprises will involve a huge sum of ¥700,000,000 upon the completion of the six-year programme, comprising ¥400,000,000 in the investments of the semi-official concern, ¥200,000,000 in the investments of enterprisers and ¥100,000,000 in the expenses for 10,000,000 tons of coal liquefaction to produce 2,000,000 tons of artificial petroleum.

The production costs of artificial petroleum products are estimated to average ¥0.8 per gallon under the existing circumstances while the present quotation of gasolene is ¥0.51. Through the imposition of a gasolene tax as well as the raising of the tariffs, the Govern-

ment expects to advance the prices of petroleum by about ¥0.10 per gallon. This, however, would still leave a margin of around ¥0.20 between the production cost and market price and accordingly, the Government plans to adopt a compensation system.

Producers and Operatives

Companies engaged in mining industry were as follows:

Year	No. of Companies	Capital	Reserve	Net Profit	Dividend	Net Loss

CHAPTER XVIII

THE TEXTILE INDUSTRY

Introduction

The use of foreign-style machinery in Japan began in the Meiji Era, when cotton spinning equipment was imported from Europe and the United States. After that time the spinning industry gradually developed along modern lines, a development that was extended to weaving as well. The total capital invested in the Japanese textile industry amounts to ¥1,355,370,847, giving employment to 1,066,794 workers in 25,562 factories which corresponds to 42.5 per cent of the total industrial operatives in Japan. The products of spinning and weaving of all kinds account for 30.9 per cent of Japan's industrial production. The total production of textiles in Japan for 1935 was ¥3,352,564,198, gaining ¥185,000,000 over 1934. Of this, the production of cotton yarns headed the list with ¥877,043,443 against ¥895,884,636 in 1934, followed by cotton fabrics ¥641,-148,071 against ¥607,032,344 in 1934; raw silk ¥484,586,816 against ¥407,686,233 of 1934; silk fabrics ¥237,512,527 against ¥222,300,695 in 1934; wool, wool-cotton and other mixtures ¥200,799,657 against ¥183,071,439 in 1934; and knitgoods ¥74,-448,405 against ¥76,981,374 in 1934. The year 1935 marked the pinnacle of Japan's fibre industry.

The fact that it has developed to this point is in large measure due to the adaptability of the Japanese people to this special type of industry, an abundant supply of labour, favourable climatic conditions, brisk domestic consumption of cotton yarn, the propinquity to large foreign markets, the constant efforts of manufacturers, and the protective policy of the Government. The Government and private firms have co-operated in furthering technical improvement by the rationalization of production by large mills and by production control and improvement in the quality of products through the organization into industrial guilds of the smaller mills. There were, in 1935, 180 such guilds throughout the country. This development and co-operation enable Japanese mills to supply the world's markets with goods of excellent quality at reasonable prices.

According to the new factory law of 1926, the employment of minors and women during night hours was prohibited after July 1, 1929. As a result, workers are now divided into two shifts, each of 8½ hours, which means a 15 per cent reduction in the operating hours as compared with the old system. In order to make good this loss the cotton spinning factories have been trying to increase efficiency in other ways. Two methods have been adopted. One is to improve the technical factors of operation, and the other is to improve the workers by giving them better training, and the result has been larger individual output and the replacing of lower by higher quality goods.

Statistics The number of operatives, mills, etc. for almost all kinds of textile industry in 1935 show an increase over those of 1934, indicating that the industry as a whole was very prosperous in that year. The following table shows these figures :

NUMBERS OF OPERATIVES, MILLS, ETC. IN TEXTILE INDUSTRY IN 1935 AS COMPARED WITH THOSE IN 1934

Kind of Industry	No. of Mills		No. of Mills using Motors		No. of Officials		No. of Technician

Cotton Spinning

The Year 1936 The cotton industry in this country during the latter half of the first term of 1936 and the early part of the second term was in a considerably depressed condition, not in relation to quotations but in the matter of profit. In order to cope with the situation the spinners put restrictions on the increase of spindles and at the same time strictly enforced curtailment of their operation.

This method of adjusting production began to show results in the middle of the second term of the year. It was employed in anticipation of a decrease in exports of cotton goods but the result was just the contrary, for exports mounted. This brought about a scarcity of cotton yarn which was felt especially keenly towards the end of the year when quotations recorded an abnormal rise.

The higher quotations of cotton goods continued into 1937, but though they have by now declined to a considerable extent the firm tone still continues and present conditions are such that optimism may be entertained over future prospects.

The conditions of the producing companies during 1936 were excellent both in the first and second terms. There are indications that many of those companies are considering an increase in their dividend to shareholders along with calls on outstanding shares and increases in capitalization. It is still impossible to predict that such measures will be realized during the course of 1937 but there is a possibility of their realization in the first term of 1938.

Prices of Raw Cotton The American raw cotton market, which was featureless during the first term of 1936, showed a firm tone with the advent of the second term. For a time between August and September the tone weakened, but the scarcity of goods felt after October brought about a rising tendency in spot quotations, and this, coupled with the general business boom, caused a definite improvement in the market which continued into 1937.

American raw cotton quotations in Japan began to mount in November due to the feeling of a scarcity of cotton yarn, thus occurring independently of the conditions in the American market.

Prices of Cotton Yarn Needless to say, the prices of cotton yarn vary according to the quotations of raw cotton. Like the raw cotton market, the market of cotton yarn was in a normal tone throughout the first term of 1936, when quotations fluctuated around ¥193 with a margin of ¥35. With the advent of the second term, however, prices commenced to show a firm tone, and it was seldom that quotations broke below ¥200. In the middle of October, quotations rose to ¥225–¥226 and in November the ¥240 mark was reached until finally the ¥260 level was passed toward the end of the year. This occurred in the case of current month contracts.

A salient feature in the quotations of long futures during the second term of 1936 was that prices were lower than for the near months on account of the shortage of cotton yarn which became all the more conspicuous toward the end of the year.

Demand and Supply of Cotton Yarn Throughout 1936, a curtailment of operation was continued at the high rate of 26.2 per cent. Although this was in clear contradiction to the shortage of goods, it could not be avoided because of the various contracts and agreements reached between the producing companies, brokers and other circles concerned. The increase in production of cotton yarn ranged from 250,000 to 370,000 bales annually in increasing amounts during the three years beginning with 1932, but the increasing tendency suddenly slackened during 1935, when a gain of only 90,000 bales over the figures for

the preceding year and of 47,000 bales over the figures for 1933 were recorded.

On the other hand, the exports of cotton yarn increased by 165,000 bales in 1935 and by 87,000 bales in 1936. When compared with the increases in 1932 and 1934, they were not very considerable, but the increasing rate was still higher than that of production.

While exports have increased, the domestic consumption of cotton yarn has gradually decreased in recent years, probably because of competition from the rapidly increasing rayon and staple fibre industries, and change in taste of the Japanese people.

Exports of Cotton Cloth Exports of cotton cloth during 1936 amounted to 2,709,000,000 square yards, showing a decrease of 16,000,000 square yards from the figures for the preceding year. Although the decrease in quantity was very slight, the substance of the exports during 1936 gives an unsatisfactory impression because the exports to the old markets, British India, the Dutch Indies, Egypt, Australia, the Philippines, Iraq, Argentine and Colombia declined in all cases. The decrease was barely made up for by the increase in the exports to Manchoukuo and the Kwantung Leased Territory.

The decrease in exports to the old markets is attributable to the various restrictions imposed on Japanese goods by these countries .

Prospects in 1937 The cotton situation is now stabilized on the strength of the adjustment of production through the restriction of expansion of productive facilities and the curtailment of operation. Under the present system, increased spindles cannot be operated at full capacity within three years of their installation. As a result, an increase in spindles is practically checked. In this connection, it is to be noted that a satisfactory adjustment of production has been impossible in the past because of the absence of restriction on the increase in spindles. Under these circumstances, the cotton situation is expected to continue stable.

As regards exports, it is expected that the level of 1936 will be maintained in 1937, while domestic consumption is expected to considerably increase. In case the demand should fail to increase as anticipated, further steps for adjusting production are likely to be taken, and the condition of the cotton industry will in all probability continue satisfactory.

Cotton Textiles

It may be safely said that to-day the Japanese cotton spinning industry is practically occupied in the manufacture of cotton textiles, and, therefore, the rise or fall of the industry depends on the growth or decline in the export of these textiles.

There are 71 members in the Japan Cotton Spinners' Association. This organization also reports on the yarn output of outsiders, which among them have but a few mills. These are all spinners, but some of them also weave. Less than a third of the cotton yarn consumed in this country is taken by the spinning mills in their cloth production, the balance goes to hundred of little weaving plants, scattered all over the country. Some of them are one-loom sheds, worked by a family as a household industry. The following table shows the output of cotton textiles by the member companies of the Japan Cotton Spinners' Association.

COTTON CLOTH PRODUCTION DATA IN MEMBER MILLS

Terms	Working Looms	Output Yards (000s)	Yds. per Day per Loom	Yarn Used Pounds (000s)	Waste Pounds (000s)	Operatives Men	Operatives Women

The Past, Present and Future of the Cotton Piece-goods Trade

The cotton piece-goods trade of Japan has recently made great development. In 1935 exports of the cotton textiles reached 2,725,000,000 square yards, which, as compared with 1,412,000,000 square yards in 1931, that is to say, in the short space of 4 years exports had practically doubled. Great Britain once made a world record of 7,000,000,000 square yards, yet, in 1935 she exported only 1,949,000,000 square yards. Japan has now come to the point, however, when she is beginning to complain of the want of export markets for cotton goods.

Japanese exports in general have increased, the total value for 1936 reached ¥2,641,488,000, an increase of ¥181,175,000 (7.3%) as compared with 1935, but the value of cotton goods exported in that year shrank by the large sum

previous year. This sharp decline in exports was caused not by any circumstances in this country, but by the lack of free markets abroad.

The markets to which Japanese cotton piece-goods are exported number 130 of which about 80 are restricting their importation through discriminatory tariffs or quotas. The remaining 50 are left free, but they are very small markets and the opportunity to push Japanese goods is limited. These circumstances, then, are a cause of a profound anxiety to those who have the future of the cotton piece-goods trade of Japan in their hands.

In the past the cotton-goods industry has been faced with many difficulties, and each time pessimistic views have been entertained as to its future; but in each case the problem has been solved and the industry has come to its present stage of prosperity through steadiness and persistence. In view of past experiences some hold that the industry will again overcome its difficulties and look upon the situation in a comparatively easy frame of mind. However, the tense international situation in recent years is such as to have made Great Britain abandon her traditional policy of free trade, and one should not, therefore, be unduly optimistic.

The history of the Japanese cotton industry begins somewhere about 1850, and by 1895, the time of the Sino-Japanese War self-sufficiency in cotton-goods was attained. Prior to that the country was an importer of cotton-goods.

The kinds of goods manufactured were simple and were mostly the coarser sorts of cotton piece-goods. But during the Great War the Japanese cotton goods industry made great progress through Britain being so occupied in war production that Japan stepped into the world as a powerful cotton-goods exporting country.

Just prior to the Great War, namely in 1913, Great Britain's exports amounted to 7,075,000,000 yards of cotton piece-goods and 527,000 bales of cotton yarn, while Japan exported 300,000,000 yards of cotton piece-goods and 468,000 bales of cotton yarn, but with the coming of the War the exports of British cotton-goods began suddenly to decline, while Japan's exports increased just as suddenly. During the closing years of the War the exports of Japanese cotton piece-goods amounted to 800,000,000 yards. But prosperity did not last long. The great economic crisis of 1920 gave a severe blow to the industry, and for a time there was a great deal of pessimism as to its future.

At that time from 70 to 80 per cent of the exports of Japanese cotton goods went to China. But the Great War also acted as a stimulant to the Chinese cotton-goods industry, and since the Japanese goods depended too much upon the Chinese market, where the quality of the goods was of such a character as to be readily replaceable by China-made goods, it was quite natural that the rise of the Chinese cotton goods industry should cause Japanese exports fall. Moreover, the boycotting of Japanese goods and the return of British goods into the market with the cessation of the War made the Japanese cotton-goods trade extremely difficult.

Unfortunately conditions in China went from bad to worse. The periodic obstinate exclusions of Japanese goods, the raising of the tariff, and the development of the Chinese cotton-goods industry made great inroads into the Japanese export trade and compelled Japan to develop markets in British India and other countries to make up for the loss in China.

When night work was abolished through international agreement, the industry had to make tremendous efforts to prevent the lowering of production and the raising of production costs. During the depression of 1930 and 1931 the industry was forced into a most difficult position because of the higher yen exchange through the raising of the gold embargo. Fortunately, however, the industry was able to overcome these difficulties, through the rationalization of management and increased efforts to secure further overseas markets.

The expansion of the Japanese cotton-goods trade after 1932 has been partly due to the low yen exchange, but efforts to reduce the cost of production on the one hand and obtain new markets on the other have borne fruit.

The table given below shows the percentage of exports of cotton textiles classified according to their destinations, and shows in what way the country's cotton-goods trade moved.

PERCENTAGE OF EXPORTS OF COTTON TEXTILES ACCORDING TO DESTINATIONS

	1928	1931	1933	1935
Total exports (In 1,000 sq. yards)	1,418,435	1,412,071	2,088,383	2,715,980
China	26.16	15.46	5.42	2.06
Manchoukuo	15.13	4.17	8.52	8.18
Hong-Kong	4.89	4.48	1.37	1.82
Siam	0.45	0.41	1.90	2.62
Philippines	2.18	2.38	1.67	3.20
Dutch East Indies	12.22	15.05	20.23	13.62
Straits Settlements	1.08	2.93	4.61	1.62
Australia	0.73	1.51	2.74	3.19
British India	25.17	28.61	21.60	20.55
Africa	7.57	15.94	20.26	17.51
South America	1.17	1.17	2.75	7.29
Others	3.25	7.89	8.93	18.31

Freedom of trade has now practically disappeared and not only has it become difficult for Japan to find new markets, but the maintenance of her present position in the old markets has become difficult. Even with a low cost of production a further expansion of the cotton-goods trade can hardly be expected unless some fresh outlet is found for the goods produced. There is a limit to the size of the world's markets, and these are gradually being narrowed by new economic blocs, restrictions of imports, reciprocal trade agreements and the like. As many as eighty countries are restricting imports of Japan's cotton-goods by discriminatory tariffs or quotas, and Great Britain and her colonies are the ones which are most openly and effectively bringing pressure upon her goods.

Besides Great Britain, not a few other countries are restricting imports of Japanese cotton-goods by reciprocal or barter agreements, which do not always work in farvour of Japan.

In 1935, Japan's total imports (including those of Saghalien) amounted to ¥2,472,000,000 while exports reached ¥2,499,000,000 leaving an excess of exports valued at ¥27,000,000. Twenty-five countries sold to Japan more than they bought, the excess of imports from them amounted to ¥740,000,000, 80 per cent of which was divided between the four countries of the United States of America, Canada, Australia and Germany. To the rest of the countries Japan sold more than she bought.

The effect of trade restrictions is acute and gives a direct and immediate blow to Japanese exports and imports, but in addition, one thing that cannot be over-looked for the future is the development of the cotton-goods industry in other countries less advanced, together with the rise of artificial-fibre industries the world-over.

The consumption of cotton in the world at present is 27,000,000 bales which, as compared with the pre-war figures of 20,000,000 bales shows an increase of more than 30 per cent in about twenty years. During these years the amount of trade in cotton-goods has decreased inversely, through the productive capacity of many countries approaching self-sufficiency. This tendency will probably increase, and before long we shall probably find China and India competing for the few then existing markets.

The world production of artificial fibres expressed in terms of piece-goods, reaches the large amount of about 6,000,000,000 square yards (of which Japan's share is about 1,400,000,000 square yards). The fact that it has made such an advance within the short space of fifteen years is in itself marvellous, but the consequences are of paramount importance. Of course the world demand for textiles increases every year in accordance with the increase in population and the rise in the standard of living. During the twenty years ending with 1930 the production of textiles increased at the average rate of 100,000,000 lbs a year. On the other hand the average increase in the production of artificial fibres in the last five years was 120,000,000 lbs per year, while that in 1936 reached the stupendous amount of 250,000,000 lbs.

The cotton-goods trade is thus hard pressed by the development of the cotton-goods industry in the less advanced countries and the rise of the artificial fibre industries at home and abroad. It appears then that salvation will probably have to be sought in qualitative

exports rather than quantitative, the production of the cheaper lines being left to the new and unskilled entrants to the trade.

Silk Textile Industry

Silk Weaving Districts As early as the days of the Emperor Suinin, about 1,960 years ago, weaving was already carried on, on a fairly large scale, under encouragement of the Imperial Court. During the Yedo Age the weaving industry made marked development as one of the most important domestic industries. The Ryomo district, which is one of the chief weaving districts for silk textiles for domestic use, has been known as a very prosperous weaving centre for centuries. This district is in Gumma and Tochigi prefectures and includes great weaving centres such as Ashikaga, Kiryu, Isézaki, Sano and Tatebayashi. The district may be likened to Paterson, New Jersey, U.S.A.

Another important weaving district is Fukui, followed by Kyoto, Ishikawa, Niigata and Tokyo in the order named. Among silk weaves of Japanese manufacture habutaé, taffeta, popline, chiffon, pongee, fuji silk, crêpe, etc, are well-known abroad. In addition to these, however, there are many varieties, which are used by the Japanese at home, but these weaves are generally of narrow width, omeshi, ro, sha, meisen, nishijin, etc.

The Industry in 1935 Continued prosperity featured the silk weaving industry in Japan in 1935, low price of silk and low wages accounting for this. Exports again increased. Though British-India and some countries in Europe tried to bar imports of Japanese silk weaves, the depreciation in currency enabled Japan to counteract such moves successfully, for her exports experienced an unprecedented boom.

In 1935 the number of silk weaving factories in Japan proper was 72,311 with 334,845 looms and 290,912 operatives.

Production of Silk Weaves Owing to the increase in consumption both at home and abroad production showed great gains. Most weavers, except those in Kyoto, turned to weaves intended for export, so that those engaged in weaving textiles intended for domestic consumption were also kept busy and prosperous. Total production in 1935 was valued at ¥632,933,188, a gain of ¥32,062,526 over the previous year. Of the total, crépes amounted to ¥82,973,754 and showed an increase of ¥9,252,513 over 1934; habutaé totalled ¥21,888,845 and decreased by ¥5,285,862; and fuji silk ¥27,804,750 with a loss of ¥3,350,301. Weaves which are mainly consumed at home, omeshi, nishijin, meisen, etc. showed increases in production. The industry as a whole profited through the low price of silk. Production of silk textiles since 1926 follows:

PRODUCTION OF SILK TEXTILES[1]

(Compiled by the Ministry of Commerce and Industry)

Year	Broad Weaves					
	Crêpes and Kabe-ori		Habutaé		Pongee

Rayon

Rise of Rayon Industry

In 1926, the total production of rayon yarn in Japan amounted to only 5,000,000 lbs. while in 1932 it increased to more than 64,000,000 lbs. The output was 223,024,400 lbs. in 1935 and 276,505,100 lbs. in 1936, thus making Japan one of the chief producing countries in the world. Only a few of the existing rayon manufacturing companies, such as Teikoku and Asahi, were established before 1926. Since then, quite a number of new companies have been added, including Nihon, Tokyo, Showa and Kurashiki.

The Industry in 1936 The rayon industry in this country during 1936 was in a depressed condition during the first half of the year due to the aggravated relations of demand and supply and the reactionary decline in the prices of commodities in general. When the second half of the year set in, however, the demand-supply relations improved and general commodity prices began to rise rapidly, which enabled the quotations of rayon to recover from the depression.

The improvement in the relations of demand and supply is attributable to various factors, including the strengthened curtailment of operation, the establishment of a definite policy for restricting the addition of new spindles and the participation of outsider manufacturers in the Rayon Association's work enabled a strengthened control of production. Another important factor was the increased demand for rayon yarn and rayon taxtiles, especially in the Oriental markets, though a slight decline marked the demand in the Dutch Indies, Egypt and Australia, where severe restrictions were put on the importation of Japanese goods.

With the advent of the year 1937, rayon quotations showed some signs of a reactionary decline, the key note of the rayon industry, however, remained firm. This, coupled with the anticipated continuance of a rising demand, gives a feeling of optimism to the industry.

Changes in Quotations From January till March, 1936, rayon quotations on the Fukui market were at the low level of ¥52. As the relations of demand and supply improved with the advent of the second half of the year, however, the quotations began to show a firm tone. Toward the end of the year, when the prices of cotton yarn and raw silk soared and the general commodity prices also showed a rapidly rising tendency, speculative buying was conducted in anticipation of higher quotations with the result that even futures were sent up to the high level of ¥76. Details are shown in the following table :

RAYON QUOTATIONS ON FUKUI MARKET

	Current Month		Futures	
	Highest	Lowest	Highest	Lowest
January, 1936	¥56.60	¥52.40	¥55.20	¥52.60
February ,,	54.60	52.60	54.80	53.00
March ,,	57.20	52.10	58.10	51.70
April ,,	61.50	58.70	61.40	58.70
May ,,	64.70	57.80	63.10	56.50
June ,,	60.90	57.20	58.50	55.90

	Current Month		Futures	
	Highest	Lowest	Highest	Lowest
July „	62.60	59.80	60.60	58.10
August „	66.10	63.00	62.70	59.60
September „	63.60	61.40	60.40	58.60
October „	63.30	59.20	61.90	57.40
November „	67.90	63.20	64.70	61.70
December „	67.40	65.60	76.00	63.50
1936 Average	67.90	52.10	76.00	51.00
1935 Average	86.70	53.70	80.00	55.10
January, 1937	93.70	81.00	91.00	80.40
February „	87,10	78.20	86.50	77.40

Note: The figures for Febuary, 1937, do not cover the latter 12 days of the months.

As is clear from the above table, the average quotations during 1936 were still considerably low when compared with those during the preceding year. Since the beginning of 1937, however, the upward trend of rayon quotations has been further accelerated. In this connection, it must be noted that the afternoon sessions of all the rayon exchanges in the country on January 11 were forced to be suspended because of an abnormal rise in prices on account of the strengthened import exchange control. On January 13, current month quotations rose above the ¥93 mark, setting an all-time high since November, 1934.

The abnormal rise was brought about by a fear that the strengthened exchange control might check even the importation of rayon pulp. It is therefore natural that rayon quotations should have suffered a reactionary fall when it became clear that the Ministry of Finance did not mean to restrict the importation of rayon pulp in view of the poor conditions of the rayon industry of the country. In February, prices fell to the ¥80 level and the declining tendency continued until the ¥70 level was finally reached. As compared with 1936, however, the level was still rather high.

Increased Production The production of rayon in this country has been increasing remarkably during recent years. During 1936, the member companies of the Rayon Association and the outsiders turned out a total of 2,765,000 cases which represented an increase of 535,000 cases or about 2.4 per cent over the figures for the preceding year. The increasing rate in 1936, however, was rather low when compared with the preceding years, as is shown in the following table:

RAYON PRODUCTION (In cases)

	Amount of Production	Increase Over Preceding Year	Percentage of Increase
1929	269,970	104,970	63.7
1930	359,590	89,620	33.1
1931	476,141	116,551	32.4
1932	689,273	213,132	44.7
1933	974,285	285,012	41.3
1934	1,589,951	610,666	62.6
1935	2,230,214	645,263	40.7
1936	2,765,051	535,337	24.0

The slackened increasing tendency of rayon production is attributable to the fact that besides strengthening the curtailment of operation, the Rayon Association imposed restrictions upon the addition of new spindles and the control of production was further strengthened by the participation of the outsider manufacturers in the work of the Association. The curtailment of operation, which was 20 per cent for the first three months of the year, was expanded to 30 per cent for the following three months and further increased to 35 per cent as from July. The restriction of the addition of new spindles was enforced on May 1.

In this respect, mention must be made of the fact that although the increasing rate of production thus slackened during 1936, it was still remarkable when compared with that of other countries. To cite an instance, rayon production in this country during 1936 amounted to 2,765,000 cases, equivalent to some 276,000,000 pounds against 275,000,000 pounds for the United States.

Increased Consumption The consumption of Japanese rayon recorded a marked increase both at home and abroad during 1936 on the strength of the improved quality which served to enhance the popularity of the yarn and the goods, made from it. The demand for rayon for mixed use with other

fibres also advanced and the scope for its utilization was enlarged through the emergence of higher-grade material. With reference to exports, it is to be noted that in spite of the various restrictions put on Japanese goods by various foreign countries, Japanese rayon continued to make a notable advance chiefly owing to its improved quality and low price. As another factor contributing towards the advance of Japanese rayon may be mentioned the world-wide improvement in business conditions and the increased purchasing power thus brought about.

The exports of rayon yarn during 1936 amounted to more than 443,000 cases and those of rayon textile reached upwards of 871,000 cases in term of yarn. The former increased by 139,000 cases and the latter by 170,000 cases over the figures for the preceding year. The domestic consumption of rayon amounted to more than 1,451,000 cases during the same year, gaining by 216,000 cases over the figures for 1935.

The remarkable advance of the Japanese exports of rayon during 1936 was achieved perhaps, at the expense of a slight decline in the exports of cotton cloth. The total value of the rayon exports during the year reached the neighbourhood of ¥200,000,000 including ¥149,000,000 in textiles, ¥29,000,000 in yarn and ¥20,000,000 in miscellaneous goods. The important position held by rayon in the export trade of this nation is well illustrated by the fact that it is second only to cotton cloth and raw silk.

Details of the relations of the demand and supply of rayon during 1936 are tabulated below, the figures being given in unit of cases :

	Production of Yarn	Imports of Yarn	Exports of Yarn	Exports of Textiles	Domestic Consumption
January	202,564	4	42,769	49,623	20,175
February	200,146	2	43,894	63,323	92,926
March	216,066	5	47,494	73,335	95,241
April	228,043	22	50,769	81,564	95,732
May	231,447	10	37,434	83,766	110,256
June	231,471	11	26,728	73,493	131,260
July	226,563	42	28,531	69,445	128,628
August	230,006	32	29,649	70,041	130,348
September	237,196	64	25,523	70,641	141,096
October	245,893	291	29,972	75,411	140,539
November	253,107	8	28,379	67,152	157,583
December	263,107	7	52,229	93,405	117,488
Total	2,765,552	238	443,371	871,203	1,451,277
1935	2,230,214	433	304,279	700,837	1,235,023

Exports of Rayon Yarn. As already stated, the exports of rayon yarn during 1936 amounted to more than 443,000 cases, which represented a gain by 139,000 cases over the figures for the preceding year. During the first three months of the year, the exports ranged between 40,000 and 50,000 cases, but in April the amount rose to 50,769 cases (see the table of the relations of demand and supply). This sudden rise was brought about by the situation surrounding the Italo-Ethiopian controversy and the exportation of a part of the rayon which had been warehoused by the rayon companies as a means of regulating the prices.

After April, exports began to decrease because of the season. The aggravated situation surrounding the China question and the temporary halt of trade in North China combined to pull down exports to the 20,000-case level in June. The conditions, however, suddenly changed in December when as many as 52,229 cases were exported. This sudden change was caused by the world-wide business recovery, the subsequently increased purchasing power and the decrease in stocks in India and Manchuria which are both principal markets for Japanese rayon, as well as the resultant speculative buying in anticipation of higher quotations.

The increase in the exports of rayon yarn was particularly notable in the case of Manchoukuo, including the Kwantung Leased Territory, and British India. These two markets between them take more than 60 per cent of the total exports. During 1936, British India imported upwards of 141,000 cases of rayon yarn from this country, an increase of 39,000 cases over the figures for the preceding year, while Manchoukuo imported 131,000 cases or 59,000 cases more than 1935. In other words, the Japanese exports of rayon yarn in-

creased by nearly 100,000 cases during the year for these two markets alone, and accounted for about 70 per cent of the total increase.

The exports of rayon yarn to the Dutch Indies and the South Sea region also continued to increase. As other principal markets for Japanese rayon yarn must be mentioned Australia, Egypt and Central America. The increase in the exports to Australia during 1936, however, was very slight on account of the restrictions put by the Commonwealth on Japanese goods, but the increase in the exports to Egypt and Central America was considerable. What should be noted here is that the exports to South America shrank a little because of a decline in the exports to Argentine. The exports to Europe and North America, however, continued to increase.

Exports of Rayon Textile Material Rayon textiles also advanced remarkably despite the trade barriers built up in various lands. The exports of rayon materials during 1936 amounted to 527,942,000 square yards valued at ¥149,170,000. Compared with the preceding year, an increase of 103,820,000 square yards or 26.8 per cent was recorded in volume while the value gained by ¥21,000,000 or 16.4 per cent.

The advance of Japanese rayon material in the Oriental markets was particularly phenomenal during 1936, which shows that this market is steadily increasing in importance for this kind of Japanese manufacture. The exports to Manchoukuo including the Kwantung Leased Territory during the year increased by 30,000,000 square yards over the exports in 1935, those to British India increased by 17,000,000 square yards and those to China by 15,000,000 square yards. A total increase of 24,000,000 square yards was recorded in the exports to the South Seas and other parts of Asia.

While the exports to both Central and South America as well as Europe continued to expand, those to Australia and Egypt showed a decline because these lands adopted extreme measures to check the imports from Japan. The exports to the Dutch Indies were also in a depressed condition. Detailed figures in this connection are given below :

	1936 (In square yards)	Increase Compared with 1935
Asia	318,937,000	89,676,000
Europe	21,401,000	9,514,000
North America	5,289,000	3,834,000
Central America	23,328,000	7,763,000
South America	28,626,000	7,739,000
Africa	56,667,000	(dec.)13,211,000
Oceania	73,694,000	(dec.) 1,536,000

The above table indicates that the future expansion of Japanese exports of rayon textiles is to be made chiefly in the Oriental markets inasmuch as the exports to Africa and Oceania are already on a downward trend. Further details of the exports of rayon yarn and rayon textiles according to destinations are tabulated below :

EXPORTS OF RAYON YARN AND RAYON TEXTILES ACCORDING TO DESTINATIONS

	Rayon Yarn		Rayon Textiles	
	1936 (In cases)	Increase Compared with 1935	1936 (In square yards)	Increase Compared with 1935
China & Hong-Kong	36,011	(dec.) 2,219	28,676,900	15,639,000
Manchoukuo & Kwantung Leased Territory	131,597	59,719	58,814,200	30,470,900
British India	141,124	39,793	92,081,200	17,410,400

Australia	16,468	920	73,693,800	(dec.) 1,534,900

Prospects of Rayon Industry So far, the conditions of the rayon industry in this country have shown a marked improvement on the strength of the strong control of production enforced by the various companies and the increased

demand both at home and abroad. Though, as already pointed out, the abnormal rise in the quotations from toward the end of 1936 till the early part of 1937 was followed by a reactionary decline, the general conditions of the rayon circles are still satisfactory. When the adjustment of the reaction is completed, a further improvements is expected.

Production will no doubt continue to increase. In January, 1937, production amounted to 259,000 cases, but as expansion activities are being displayed by some companies, it is expected that the monthly production will be increased to about 270,000 cases in the latter half of the year. On the basis of this expectation, it is estimated that the total production during 1937 will reach some 3,180,000 cases, which would represent an increase of 42,000 cases over the figures for the preceding year.

There is no need for pessimism over the future relations of demand and supply if the satisfactory conditions of the demand both at home and abroad as recorded since autumn of 1936 are maintained. In other words, if the conditions of the consumption in December, 1936, when a total of 263,000 cases of rayon were either consumed at home or exported to overseas markets, are maintained, the total consumption in 1937 will reach some 3,150,000 cases against the estimated production of 3,180,000 cases and present indications support such a supposition.

As regards the trade barriers built up in overseas markets against Japanese goods, it is impossible to find any factors which would cause such barriers to be further raised. What should be noted here is that the expansion of the exports of rayon will be retarded if the quotations of rayon yarn should rise suddenly, but it will not be amiss to expect a further expansion of exports provided the rayon yarn quotations are stabilized around ¥80.

Taking a general view of the situation, it is also expected that inflation will serve to stimulate the demand for rayon. Mention also must be made of the fact that the scope of the utilization of rayon has been expanded of late. A remarkable increase is being made in the number of miscellaneous goods manufactured through the utilization of rayon, the demand in this field, which amounts to about 20,000 cases monthly at present, is on an upward tendency.

The Output Observation of the development of the rayon industry in Japan discloses that, while in 1928 the output was only 4.5 per cent of the world output, in 1931, it represented over 10 per cent and in 1934 it had risen to 17 per cent, with the result that, in point of production of rayon, Japan ranks second to the United States and has an output 50 per cent greater than Great Britain and Germany, and 30 more than Italy.

This rapid development is traceable primarily to the cheapness of fibrous material in this country, but partly to the improvement in the quality of the product, the progress of technical skill and the extension of the use of rayon during the last few years and, moreover, to the extensive markets that Japanese products enjoy in China, India, the Dutch East Indies, the Straits Settlements and the Philippines.

Production The tables below show the development of the production of rayon yarn and its exports and exports of rayon fabrics during the years 1925-36.

RAYON YARN

(In pounds)

Year	Production	Imports	Exports	Real Supply
1925	3,200,000	824,285	—*	4,024,285
1926	5,000,000	3,288,149	—*	8,288,149
1927	10,500,000	791,650	37,524	11,254,126
1928	19,652,000	256,763	68,155	16,840,608
1929	25,716,000	624,980	153,877	26,187,103
1930	35,959,000	842,467	3,204,363	33,597,104
1931	46,764,120	1,154,634	2,555,521	45,363,233
1932	70,389,606	376,184	7,294,735	63,471,049
1933	90,428,900	509,147	8,859,500	82,078,447

Woollen Industry

Introduction

The establishment of a Government woollen textile mill at Senju, Tokyo, in 1876, was the origin of this industry in Japan. Many private companies were organized after the Sino-Japanese and Russo-Japanese Wars, but owing to the pressure of foreign competition only a few companies were able to survive. By the World War the industry was given a further good opportunity for trial at development, an opportunity that was not neglected, and which turned out more successful than previous attempts, as a very big demand for woollen goods was created.

The production of woollen goods in Japan is carried out by two classes of manufacturers. The first are the large scale producers, all joint-stock companies, who carry through the whole process of spinning the yarns, weaving them on power looms and dyeing them. The other class is that of the small producers who buy yarns from others and weave by hand looms. There are about 39 companies which belong to the former class, while there are numerous weavers who belong to the latter class and who produce considerable quantities of serge, muslin, etc.

Woollen textiles are manufactured from wools mostly imported from Australia. Japan does not produce any wool herself. Formerly, in addition to greasy wools, tops were imported in large quantities, but, as the facilities

for preparing tops from greasy wools have been greatly improved, the importation of tops has recently been drastically reduced.

Present Condition

1936 Woollen Industry The conditions of the woollen industry in Japan began to improve in the middle of the second half of 1936 owing to the world-wide shortage of wool and the advent of a general business boom in various countries.

During the spring of 1936, the woollen industry was in a depressed condition because the market prices of woollen goods were not sufficiently high to meet the rise in the price of wool. When the second half of the year set in the market conditions showed signs of a slight improvement, and towards the end of the year the prices of woollen goods started rising quickly under the impetus of the world-wide increase in commodity prices.

The abnormal rise in the prices of woollen goods left its effect upon the conditions of the industry during the early part of 1937, in that although the production decreased by about 10 per cent on account of restricted imports of wool, business conditions of the various companies showed a remarkable improvement. Conditions during the latter half of the year, however, are not expected to be so satisfactory because the high-priced wool is to be then consumed.

Generally speaking, the woollen industry of Japan has just commenced to develop, so Japanese woollen goods have to compete with the products of the leading woollen manufacturing nations in the world's markets. The present indications are that the restriction of imports of wool was enforced just at the time that there appeared signs of a great possibility of Japanese woollen goods coming out victorious in their competition with foreign goods in the world's markets. Under present conditions, the development of the industry is likely to be retarded although the producing companies are assured of a normal profit.

Wool Quotations During the early part of the 1935–36 wool year, wool quotations were at a low level. Merino Nos. 64–70 was quoted on the Melbourne market at from 26 to 27 pence in September, 1935, but had reached the level of 33 pence by March, 1936, quotations in the 1936–37 wool year also started from a comparatively low level, rising to 31 pence at the end of August, 1936, but the latter part of September witnessed a fall to 29 pence.

On account of the shortage of wool and also under the influence of the higher prices of commodities throughout the world, wool prices rose to 35 or 36 pence towards the end of 1936 and further soared to the 40 pence level in January, 1937.

The shortage of wool was felt particularly keenly in Japan. As a result of the Australian question which arose in May, 1936, Japan adopted a policy of boycotting Australian wool and purchasing South African and South American wool instead. As practically no dealings in raw wool were conducted in Japan proper, there were no domestic quotations for raw wool, but the shortage of wool was reflected in the prices of woollen goods.

Prices of Yarn and Materials The prices of woollen yarn and woollen textiles gradually advanced after May, 1936, and began to rise abnormally towards the end of the year. On the whole, the prices of yarn and textiles advanced along with the rise in the price of raw wool but it is to be noted that the prices did not fall during the period between the end of August and the latter part of September in spite of the decline in the price of raw wool. This is attributable to the fact that Japan was particularly badly in need of it.

The following is a table showing the average prices of woollen yarn and woollen materials during the past six years or so :

	Serge Yarn	Worsted	Muslin
1931	—	¥1.46	¥0.31
1932	¥1.97	1.42	0.32
1933	2.45	1.78	0.36
1934	2.31	2.07	0.39
1935	2.25	1.82	0.37
1936			
January	2.43	1.99	0.39
February	2.43	2.05	0.40
March	2.44	2.09	0.39
April	2.40	2.10	0.38
May	2.53	2.12	0.38
June	2.59	2.34	0.40
July	2.62	2.43	0.41
August	2.57	2.42	0.42
September	2.58	2.42	0.41
October	2.70	2.49	0.43
November	2.68	2.50	0.41
December	3.06	2.80	0.46
1937			
January,	3.52	3.34	0.51
	3.34	3.20	0.49

Exports and Imports of Woollen Goods The woollen industry of Japan

is now in the process of development but, unlike the rayon and staple fibre industries which are just rising, it has a long history to its credit. To be more accurate, it is comparable to the cotton industry from the historical point of view. Its development has been very slow until very recently because it was not so conformable to conditions in this country as was the cotton industry.

The fact that the woollen industry is still in the process of development is clearly reflected in the exports and imports of woollen yarn and woollen materials, exports have been rapidly increasing while imports have been decreasing. In 1932, there was an excess of imports over exports, amounting to ¥9,429,000 but the following year witnessed an excess of exports over imports. The favourable balance was increased to as much as ¥49,720,000 in 1936. The rapid progress achieved by the woollen industry during the past few years is well illustrated in the following table :

DEMAND AND SUPPLY OF WOOLLEN YARN

(In 1,000 pounds)

	Production by Associated Co's.	Imports	Total	Exports	Balance
1931	77,586	9,550	87,136	698	86,438
1932	89,660	3,219	92,879	1,249	91,630
1933	101,361	1,638	102,999	3,168	99,831
1934	103,246	913	104,159	5,920	98,239
1935	113,098	1,085	114,183	5,319	108,864
1936	121,957	905	122,862	7,140	115,722

Note: The balance represents domestic consumption.

According to the above figures, the production of woollen yarn by the member companies of the Woollen Industrial Association, which amounted to 77,586,000 pounds in 1931, swelled to 121,957,000 pounds in 1936, achieving an increase by about 70 per cent in only five years. While imports in 1936 shrank to merely 955,000 pounds, exports in the same year mounted to 7,140,000 pounds.

Further details of the exports and imports of woollen yarn and woollen textiles are tabulated below (all figures being given in units of 1,000) :

EXPORTS

	1932	1933	1934	1935	1936

Balance between Exports & Imports (yen)	9,429	7,706	35,581	33,405	49,720

Prospects As already stated, the woollen industry of this country has advanced remarkably during recent years, reaching a point where its products are able to compete with foreign goods in the word's markets. Just at this juncture when an epoch-making expansion of the productive equipment of the industry is considered inevitable, the nation is being compelled to adopt such measures as will retard the further development of the industry on account

of the necessity of importing raw wool. The imports of wool for the 1936-37 wool year are limited to about 300,000 bales of Australian wool and 500,000 bales of wool from other sources. Under these circumstances, production is expected to remain at the same level as in the preceding year.

As a result of the control of production, there is no possibility of increasing exports and the market prices of woollen yarn and woollen textiles are expected to continue firm. In view, however, of the fact that further development would be possible if it were not for the restriction on the importation of raw wool, it must be said that the condition of the woollen industry is generally satisfactory.

Business Conditions of Companies The business conditions of the woollen companies during 1936 were very satisfactory, because the raw wool consumed during the year was purchased at low prices in 1935 while the quotations of wool in 1936 were much higher. The higher quotations were partly attributable to the Australian question, which caused the purchase of Australian wool to be suspended for a time, and as practically no dealings in raw wool were conducted in Japan proper during the time of the dispute, the rise in the quotations for raw wool took the form of advanced prices of woollen goods, and enabled the producing companies to gain a good profit.

As these excellent business conditions were abnormal, there naturally existed misgivings about the prospects. Consequently, all the companies refrained from increasing the percentage of dividend for their shareholders as explained by the following figures:

Companies	Dividend for 2nd Half of 1936	Dividend for 2nd Half of 1935
Itami Seiju	15%	15%
Nippon Keori	12	12
Nippon Keito	8	8
Toyo Keito	6	6
Toyo Keori	8	—
Chuo Keito	8	8
Kyodo Keito	12	10
Showa Keito	12	12
Shinko Keori	10	12
Manmo Keori		
Preferential	8	8
Ordinary	5	5

Generally speaking, production this year will not be less than that in the previous year. It is to be noted, however, that the productive facilities at the end of 1936 were more than 20 per cent greater than those at the end of 1935 and that as the increased spindles are also covered by the allotments of raw wool, the share of the old facilities will be reduced accordingly. To put it in another way, those companies which have not increased their spindles will have to reduce their production on account of their reduced share in the allotments of raw wool.

This question concerns the latter half of the year rather than the first half because there is some low-priced wool brought over from the previous year. When the Japanese-Australian agreement was concluded which enabled the resumption of the purchase of wool from the Commonwealth, the Australian wool had already advanced in price. The higher prices are bound to affect the whole of the second half of this year.

With the purchase of raw wool being restricted, it is inevitable that a shortage of wool will come about. This in turn will cause a firm tone in the prices of woollen goods, and will assure the companies of a normal profit. As restrictive measures are in force, however, a further considerable development of the woollen industry cannot be expected and the business conditions of those companies which have to reduce production on account of the shortage of raw wool will be effected accordingly.

Japan's imports of wool in the past 7 years are shown below:

JAPAN'S IMPORTS OF RAW WOOL[1]

	Quantity in 1,000 lbs.	Value in ¥1,000
1930	115,999	73,919
1931	191,374	86,518
1932	206,858	88,321
1933	242,620	165,818
1934	184,379	187,667
1935	247,275	193,090
1936	219,951	204,343

Note: (1) Including tops and goat and camel hair.

IMPORTS OF RAW WOOL BY COUNTRIES

(According to the Woollen Industrial Assn. Statistics)

(In 1,000 lbs.)

	1932	1933	1934	1935	1936
Australia	198,426.5	227,430.6	155,375.9	230,269.6	154,691.3
New Zealand	2,992.1	1,835.0	10,187.7	7,276.1	23,737.4

CHAPTER XIX

MACHINERY AND ENGINEERING

Machinery

Introduction

The manufacture of machinery in Japan started after the Restoration. The progress at first was very slow, and it was only after the Russo-Japanese War of 1904–1905 that the public began to take any real interest in investment in this kind of industry. Improvement was gradually being made before the Great War, but with the outbreak of war the situation completely changed. Prior to the War Japan had to import large quantities of machinery, but during the War imports were stopped, and a great stimulus was thereby given to home production. During the war years Japan became able to supply not only most of her own needs, but also some of those of foreign countries. Factories for manufacturing arms and various kinds of machinery, as well as shipbuilding-yards, were established in many parts of the country, and these profited both financially and in the experience they acquired in skilled mechanical work of various kinds. The great boom in shipbuilding stimulated the establishment of many new works for turning out engines and other equipment for steamers, while the difficulty of obtaining imported machines for spinning, weaving, papermaking, etc., caused a rapid establishment of new works for their manufacture. This cutting off of imports also served to encourage the manufacture of motors, electrical machinery, automobiles and aeroplanes. With the great post-war slump, naval disarmament, general depression the world over, embargo on gold, high tariffs, and all the other ills from which industry suffered the machinery production industry was heavily hit. The outbreak of trouble in Manchuria in September, 1931, and the military operations which followed, created a new demand for arms, while the reimposition of the gold embargo, and subsequent decline of the value of the yen served to revive the industry.

Machinery Manufacturing Industry in 1936

The machinery manufacturing industry in this country has been very active since it was decided to perfect national defence. The advance achieved by the industry during 1936 was quite remarkable, all the companies concerned recording an improvement in their business conditions without exception, and conditions in 1937 are expected to be satisfactory under the influence of the enormous spending envisaged from the budget.

With expansion in armaments being a phenomenon common to every nation in the world, Japan could not leave her defences in the state they were. Expansion was necessary and this assured the machinery industry of five or six busy years. Particularly are the leading companies affected because they are required to expand their productive equipments, and many companies are expected to increase their capitalization.

The position is not without its difficulties. There is the worry of the higher prices of materials, and a strong fear of higher wages. The Government is trying to ease the position by endeavouring to control the prices of steel and iron, but in any case it will be the consumer who pays for the increased prices of materials and labour will be passed on to them by manufacturers.

Increase in Deliveries Ever since the quasi-emergency began, the production of machinery has shown an increase every successive business term. The big seven machinery manufacturing companies, the Mitsubishi Heavy Industry, the Hidachi Seisakusho, the Kokusan Kogyo, the Shibaura Seisakusho, the Niigata Iron Works, the Ishikawajima Works and the Daido Denki Seiko manufactured various sorts of machinery to a total value of ¥288,700,000 during 1936 against ¥249,000,000 for the preceding year. Their total annual production during the past five years was :

1932	¥ 75,310,000
1933	98,140,000
1934	163,907,000
1935	247,819,000
1936	288,707,000

Note: A part of the figures for 1936 is based on estimation.

The increase in production has been especially remarkable since 1934. When considered in terms of index numbers, the increase was from 100 in 1932 to 399 in 1936. The following table shows the production by each of the big seven:

Companies	1934	1935	1936
Ishikawajima	¥ 13,300,000	¥ 15,422,000	¥ 17,724,000
Daido Seiko	4,712,000	6,238,000	6,575,000
Hidachi Seisaku	38,637,000	56,912,000	68,952,000
Kokusan Kogyo	20,210,000	25,556,000	26,389,000
Shibaura Seisaku	20,487,000	28,348,000	35,853,000
Niigata Iron Works	10,011,000	13,342,000	15,207,000
Mitsubishi Heavy Industry	56,548,000	103,001,000	118,007,000
Total	163,907,000	248,819,000	88,707,000

Fixed Capital of Manufacturers Compared with the increase in production, the fixed capital of the various manufacturing companies has swollen only slightly. Many companies have employed their old facilities to their full capacity but very few of them added new equipment. The raising of the fixed capital of the principal companies including the aforementioned big seven, the Tokyo Gas & Electric Industrial Company, the Ikegai Iron Works and the Osaka Machinery Works during the past five years is tabulated below :

1st half of 1932	¥ 85,380,000
2nd half ,,	86,164,000
1st half of 1933	83,424,000
2nd half ,,	¥ 86,224,000
1st half of 1934	100,915,000
2nd half ,,	105,447,000
1st half of 1935	108,619,000
2nd half ,,	118,031,000
1st half of 1936	119,634,000
2nd half ,,	126,012,000

The above figures show that the fixed capital of the principal companies in the second half of 1936 had gained by ¥40,632,000 or 47 per cent over the figures for the first half of 1932. To go into details, the fixed capital of some of the companies increased while that of others decreased on account of readjustment, as shown in the following table :

	1st Half of 1932	1st Half of 1936	2nd Half of 1936
Ishikawajima Works	¥ 6,829,000	¥ 6,124,000	¥ 5,654,000
Daido Seiko	2,564,000	3,836,000	3,981,000
Hidachi seisakusho	11,232,000	28,478,000	—
Kokusan Kogyo	5,989,000	12,607,000	12,600,000
Gas & Electric Industrial	12,955,000	7,348,000	7,517,000
Ikegai Iron Works	3,196,000	2,579,000	2,633,000
Shibaura Seisakusho	13,572,000	12,167,000	12,065,000
Niigata Iron Works	3,945,000	4,124,000	4,162,000
Mitsubishi Heavy Industry	24,521,000	40,435,000	—
Osaka Machinery Works	563,000	1,926,000	2,299,000
Total	85,381,000	107,151,000	—

It is shown in the above table that the fixed capital decreased in the case of the Ishikawajima Works, the Tokyo Gas & Electric Industrial Company, the Ikegai Iron Works and the Shibaura Seisakusho, while a remarkable increase was recorded in the case of the Mitsubishi Heavy Industry, the Hidachi Seisakusho, and the Kokusan Kogyo Kaisha. The fixed capital of the Daido Denki Seiko and the Niigata Iron Works increased but slightly. From this fact may be judged the business policy of the various companies.

On the other hand, the floating capital has increased quite markedly. At the end of first half of 1932, the floating capital of the 10 principal companies totalled ¥123,310,000 but by the end of the first half of 1936, the amount had

risen to ¥289,370,000. Although accurate figures are still unavailable, it is estimated that the amount further increased to ¥312,040,000 in the latter half of the year. The increase in floating capital is attributed to the increase in the amount of goods manufactured, materials and deposits with banks. It must be noted that the increase in manufactures and materials does not occasion any unrest under prevailing conditions because they are readily convertible into cash.

The increased capital was obtained either through raising the capitalization or securing loans. Particularly notable was the increase in internal liabilities, as shown in the following table :

INTERNAL LIABILITIES

1st half of 1932	¥106,871,000
2nd half ,,	108,101,000
1st half of 1933	106,972,000
2nd half ,,	123,220,000
1st half of 1934	168,977,000
2nd half ,,	180,316,000
1st half of 1935	188,508,000
2nd half ,,	235,510,000
1st half of 1936	235,807,000
2nd half ,,	250,956,000

The above figures show that the internal liabilities of the principal companies have increased by ¥144,000,000 since the state of quasi-emergency first arose. Of this amount, ¥94,470,000 was increased paid-up capital and the remaining ¥49,600,000 represented reserved savings. As the increased internal liabilities were insufficient to meet the needs of the expanded activities, it was necessary to increase external liabilities. The following is a comparison of the external liabilities of the principal companies in the first half of 1932 and in the latter half of 1936 :

EXTERNAL LIABILITIES

	1st half of 1932	2nd half of 1936
Ishikawajima Works	¥7,659,000	¥9,908,000
Daido Seiko	546,000	2,342,000
Hidachi Seisakusho	7,312,000	28,768,000
Kokusan Kogyo	4,810,000	12,474,000
Tokyo Gas & Electric	30,340,000	11,712,000
Ikegai Iron Works	1,123,000	1,100,000
Shibaura Seisakusho	9,684,000	15,212,000
Niigata Iron Works	1,236,000	914,000
Mitsubishi Heavy Industry	38,584,000	90,800,000
Osaka Machinery Works	362,000	1,776,000
Total	101,836,000	175,205,000

Thus, the increase in the external liabilities was the most remarkable in the case of the Mitsubishi Heavy Industry, then followed the Hidachi Seisakusho, the Shibaura Seisakusho, the Kokusan Kogyo and the Ishikawajima Works in the order named. It is to be noted that the external liabilities shrank in the case of the Tokyo Gas & Electric Industrial Company, the Ikegai Iron Works and the Niigata Iron Works. The first named effected a readjustment of its capital while the two others did not need to secure loans because they had ample funds on hand.

Bright Prospects The new estimates for the various sections of the Government as included in the budget for the 1937–38 year, which almost doubled the amount for the 1931–32 fiscal year reached upwards of ¥900,000,000. Of this sum, about ¥600,000,000 was allotted to the defence services which thus share a total of ¥1,360,000,000 in the entire budget including the basic items. This shows strong signs of a quasi-war time economic system.

The expenditure on the defence services is expected to continue swelling in and after the 1938–39 fiscal year. It is intimated that the Army has a 6-year programme calling for a total expenditure amounting to ¥3,200,00,000. The expenses of the Navy, too, are of an increasing tendency. Needless to say, the national defence expenditure is centering around the perfection of equipment and the augmentation of materials. As machines and weapons are estimated to account for from 70 to 80 per cent of such cost, and as the principal items are ships, arms, motorcars and chemicals, it may be noted that the munitions industry is assured of busy years to come.

The Tokyo Gas and Electric Industrial Company is expanding its facilities for producing motor cars, aircraft and weapons, the Mitsubishi Heavy Industry is also concentrating upon the manufacture of aircraft and motor cars. The Hidachi Seisakusho, the Ikegai Iron Works, the Shibaura Seisakusho and the Niigata Iron Works have started manufacturing Diesel cars. The Ishikawajima Works is encouraging its subsidiary companies which produce aircraft and turbines to expand their activities while the Daido Denki Seiko is taking to the supply of parts for automobiles and aircraft.

In other words, all these companies are adjusting their activities in conformity with the national policy, and under the circumstances, it is expected that the production of machinery during the

1937–38 fiscal year will further advance, and set a new record.

As the present prosperity is due to the munitions boom, the interested companies are not allowed to increase their dividends to shareholders on the strength of increased profits while the people at large are suffering from higher prices of commodities. They may increase their capitalization for the purpose of expanding their productive equipment but any change in policy to benefit the shareholders and directors is subjected to control.

Such being the situation, it is expected that the principal companies will increase their reserves with a view to expanding their facilities and strengthening the positions, conducting researches and improving the treatment of their employees.

The rise in the prices of materials will cause the shipbuilding and machinery manufacturing companies to suffer to some extent but there are measures of relief in this connection. Furthermore, as the principal companies concerned are splitting the profits, it is possible for them to meet the situation with some degree of composure.

GROWTH OF MACHINERY INDUSTRY

(Amount in ¥1,000)

Kind	No. of mills	No. of operatives	Value of production
1914	388	80,862	110,906

Locomotives and Rolling Stock

Of all the mechanical industries, few compare with that of the manufacture of locomotives and rolling stock in largeness of amount of production and value. Nearly 90,000 locomotives, passenger cars, freight cars, electric cars, etc., are owned by the Department of Railways of the Imperial Government, most of which manufactured in the Department's works in Omiya, Oi, Hamamatsu-cho in Tokyo, Takatori in Kobé, Kokura, etc. In addition they are manufactured by a few private companies.

When the first railway was constructed, in 1872, between Tokyo and Yokohama, locomotives were imported from Great Britain, so in the beginning nearly all the locomotives were of English-make, but later they were replaced by locomotives imported from America.

The first locomotive to be manufactured in Japan was turned out by a Kobé mill, now belonging to the Department of Railways, in 1893, and the Kisha Seizo Kaisha turned out its first in 1896. Later, in 1910, the Hyogo mill of the Kawasaki Shipbuilding Co., Ltd., started manufacturing locomotives on a large scale, and about the same time the Department of Railways began to do the same. From that time locomotive manufacturing developed at a great pace and since 1912 their importation has practically ceased. During the World War, the Nippon Sharyo Kaisha, Ltd., and the Kasado mill of the Hidachi Seisakusho were established, and in 1924 the Mitsubishi Shipbuilding Co., Ltd. entered the industry. At present Japanese works are not only filling home requirements but are exporting to Korea, Formosa, Manchoukuo and China.

The manufacture of passenger cars has also advanced. The highest speed of passenger trains has been increased to 64 m.p.h. and as the Japanese gauge is a narrow one of 3'6" it has been necessary to make intensive studies to reduce rolling. As the result of the studies, new devices have been applied and good results achieved.

Electric locomotives were first imported from Germany in 1912, but in recent years most of them are manufactured at the Omiya Works of the Department of Railways.

Through the popularity of streamline cars and locomotives and the attempt to make higher grade cars, locomotive and rolling stock manufacturing is showing great activity, especially those works which have orders from Manchoukuo. Making of higher grade cars has a direct bearing upon makers of parts and trucks. On account of increased demand for Diesel and gasolene locomotives, the demand for small-sized steam locomotives has somewhat slackened. But on the other hand, the demand for cars for electric tramways, etc. has increased.

Steam Locomotives Owing to the electrification of private railways and the more extensive use of gasolene cars, private railway companies use very few steam locomotives, and the makers have now hardly any orders coming to them except from the Department of Railways. There are still a few makers manufacturing small-sized locomotives for mining and public works but these are now being driven out by small-sized gasolene or Diesel locomotive builders. Some makers have, therefore, totally given up the manufacture of steam locomotives and are concentrating on the manufacture of locomotives using Diesel engines.

Electric Locomotives On account of the increased electrification of railways, great efforts are constantly being made for the improvement of electric locomotives especially by the application of electric arc welding and the lightening of weight. In future, the centre of gravity of locomotives will be lowered and the "streamline form" will be adopted in order to increase the speed.

New improvements such as sand sprinkling devices to prevent racing, or equipment to recover lost electric power, are constantly being experimented with.

Rolling Stock Orders coming from private railway companies for rolling stock are very small, being limited to a few gasolene or ordinary passenger cars. However, makers are well satisfied with orders coming from electric tramway companies, and especially wih orders coming from Manchoukuo.

Electric Cars Electric cars are divided into those equipped with motors and those not, the latter being subdivided into passenger, freight and emergency cars. In order to keep pace with the government railways the private railways are forging ahead with electrification and replacement of their equipment, giving bright prospects to the industry.

Aerial Cable Cars As the safety of aerial cable transport has come to be recognized, the fever for its construction has become intense. For the carriage of goods, various mining and cement companies are now changing from ground railways into aerial cables, making this industry very active, the activity being further stimulatd by construction of aerial cables in Manchoukuo.

Various Appliances Controllers, brakes, brake shoes, pointers, separators, etc. are successfully manufactured and the mills are fairly active.

Aircraft

Introduction Captain Tokugawa was the first pilot to fly a heavier than air machine in Japan. This was in 1910. The manufacture of aircraft was commenced in the Army and Navy arsenals and manufacture under licence was farmed out to private companies, in this way the manufacture of aeroplanes was greatly encouraged and military and naval aircraft can now be satisfactorily manufactured at home.

History Dr. Ichita Kishi, a physician, constructed at his own expense various workshops in his own residence at Tsukiji, Tokyo, and, in 1914, with the help of several expert engineers, succeeded in constructing an aeroplane engine, the first to be maufactured in this country. A trial flight of the aeroplane using this engine was very suc-

cesful, so he manufactured his second aeroplane in 1916. In 1917, Mr. Nakajima, a retired engineer captain of the Navy, manufactured various kinds of aeroplanes with the help of Messrs. Mohei Ishikawa and Seibei Kawanishi. In 1920, the Aichi Tokei Denki Kaisha, Ltd. (Aichi Clock Electric Machinery Co., Ltd.) established an aeroplane department and in the same year turned out a seaplane. From that time this department has developed rapidly. In 1921, the Kawanishi Machine Company established an aeroplane factory in Hyogo, and started the manufacture of seaplanes in 1923. Also, in 1921, the Mitsubishi Aircraft Co., Ltd., brought nine experts in aeroplane manufacturing from Great Britain and began to manufacture both aeroplanes and engines on a large scale. The Kawasaki Shipbuilding Co., Ltd., following in the steps of the Mitsubishi Aircraft Co., Ltd., began manufacturing aeroplanes in 1922.

Present State of the Industry The aircraft manufacturing industry has shown considerable activity in recent years. Aside from military requirements, manufactures have received good orders from public bodies who have raised subscriptions to denote aeroplanes to the army and navy. Japanese manufactured civil planes have had many successes of late and orders have been coming in for these. Manufacturers of aircrafts at present are as follows :

MANUFACTURERS OF AIRCRAFTS

Year	Makers of Bodies and Motors	Makers of Balloons and Airships
1926	6	2
1927	6	2
1928	6	3
1929	6	3
1930	6	3
1931	7	2
1932	7	2
1933	8	2
1934	8	2
1935	8	3

Automobile Manufacturing

History The first automobile to be manufactured in Japan was by the Tokyo Motor Car Works, under the management of Mr. S. Yoshida, in the year 1909, but until the present progress has been very slow. In 1910, several military motor cars were manufactured for the Army in the Osaka Arsenal, and in 1911, the Tokyo Automobile Factory commenced the manufacture of "DAT" cars.

The Tokyo Gas and Electric Co., Ltd., began to manufacture military automobiles "T.G.E." in 1916, and trucks in 1917. In 1918, the Military Automobile Subsidy Act was put into force and this company was the first to get a subsidy from the Army Department under the act. In 1920 the Tokyo Ishikawajima Shipbuilding Co., Ltd., began to manufacture passenger cars. Companies other than the above which are making automobiles are Hakuyosha, Ltd., and the Oriental Automobile Co.

Present State of the Industry The motor car industry is perhaps the only one of all the heavy induistries in Japan of which the country has not anything to feel proud of to-day. While there are more than 176,000 cars, buses and trucks of all kinds in the country, almost all of them are imported, about 80 per cent of them being Chevrolets and Fords. Of the balance, a considerable number are other American and European makes. However, inasmuch as the motor car industry is as yet undeveloped a great future can be prophesied for it.

Passenger Cars The "Atsuta-go", modelled after the Nash and White, and from this year, the "Nissan" are the only passenger cars manufactured in Japan aside from the baby cars.

Buses and Trucks Bus and truck manufacturing is slightly better than passenger car making. The "Chiyoda" manufactured by the Tokyo Gas and Electric Co., and the "Sumida" made by the Jidosha Kogyo Kaisha have long histories. These companies are also jointly making the "Isuzu," designed by the Department of Commerce and Industry. These three classes of buses and trucks are supplied to the market in considerable numbers. Kyodo Kokusai Jidosha, which was established in 1933 by these two companies, is selling domestic trucks and buses of five classes. The Mitsubishi Heavy Industry Co., Ltd. is making the large-sized bus "Fuso-go" at its Kobé plant, the Kawasaki Sharyo Kaisha, Ltd. the truck and bus "Rokko".

Baby Cars and Motor Cycles Small motor cars are defined, in dimensions and power, by the "Regulations of Motor Cars" and include such small-sized cars as the "Dutsun" car, rear cars, etc. Rear cars have made a marvellous development in Japan as a means of carrying small parcels. Their production totals 15,000 a year, for they are not only in use throughout Japan but are exported to Manchoukuo, the

South Sea Islands, etc. The sales of small-sized cars like the "Datsun", are rapidly increasing.

Accessories and Parts Associations nd parts of motor cars used in Japan vere almost exclusively of American nake before replacement of the em- bargo on gold in 1931. Owing to the low exchange rate which followed thereafter their importation became very difficult and domestic makes took their place. At present, even Chevrolet and Ford parts are being replaced by demestic makes. They are also being exported.

PRODUCTION OF AUTOMABILES AND MOTOR CYCLES

(Value in yen)

Year	Imported Parts Assembled		Others		Accessories and Parts	Total	Motor Cycles

Imports of Automobiles In 1914 imports barely amounted to ¥500,000, but by 1929, they amounted to ¥30,000,000. Owing to the depression there was a drop to ¥20,000,000 in 1930, and to ¥14,000,000 in 1933. The figures then took an upward course, rising to ¥32,302,000 in 1934, ¥32,589,000 in 1935, and ¥37,036 in 1936.

IMPORTS OF AUTOMOBILES & ACCESSORIES

Bicycle Manufacturing

History A bicycle was first introduced into Japan in 1881 by an Englishman. In 1889, an American brought a bicycle with him from America. In 1904, frames and other accessories were imported from Great Britain, and the making of bicycles at a lower cost became comparatively easy and bicycles became very popular.

Before 1913, accessories other than saddles, rims, and chains were being manufactured at home. Factories capable of manufacturing these latter articles on a large scale did not exist and it was impossible for small scale producers to compete against foreign products. From 1913 on, however, the demand for bicycles increased at great speed, and as the manufacturing of each of the above parts on a large scale became possible, bicycles came to be produced at a very low cost, though until the World War, those manufactured in Japan could not compete with European-made ones. During the War, the art of manufacturing advanced so much that domestic bicycles could well compete in both quality and price with imported ones, and not only were home demands satisfied, but the Japanese

product was exported to China, Russia, India and other countries.

Bicycles in 1935 Bicycles in use in Japan proper numbered 7,303,660, which means that one in every nine persons owned a bicycle. This compares favourably with Holland where the ratio is one bicycle to every seven persons. Moreover, the quality of bicycles made in Japan is so good that no country in the world can compete with her at the price at which she can sell. Exports of bicycles and accessories amount to ¥25,000,000 a year, and bicycles made in Japan can be seen in every country except Soviet Russia. There are some 800 manufacturers.

Conditions Suitable for Bicycles Conditions in this country are well suited to the use of this vehicle. The factors which have made for the increased demand are :

(1) Individual wealth is comparatively small and the use of automobiles has not yet become universal.

(2) Roads are mostly too narrow, though greatly improved of late, to take automobiles.

(3) The making of bicycles, especially accessories like rims, is purely artisans' work, and is a type of work in which the Japanese people excel.

PRODUCTION OF BICYCLES IN JAPAN

(Value in yen)

Year	No. Produced	Value	Value of Accessories Produced
1926	41,832	1,112,621	—
1927	89,629	3,093,083	—
1928	125,588	3,323,999	—
1929	90,285	2,593,051	16,138,063
1930	136,985	2,790,331	12,206,374
1931	105,088	2,022,013	13,747,235
1932	63,988	1,315,748	20,666,605
1933	118,405	2,164,804	26,396,495
1934	152,920	2,542,376	34,462,225
1935	90,885	2,260,889	38,889,853

The principal places of production are Tokyo, Osaka, Aichi, Hyogo, and Fukuoka prefectures.

Imports and exports of cycles and ascessories since 1926 are as follows :

Year	Imports	Exports
1926	5,923,000	1,959,000
1927	3,527,000	1,879,000
1928	1,634,000	2,557,000
1929	1,280,000	3,429,000
1930	1,563,000	5,274,000
1931	1,153,000	7,119,000
1932	795,000	6,028,000
1933	619,000	12,114,000
1934	73,308	18,904,257
1935	85,545	17,436,446
1936	27,000	20,575,000

Note:—Tyres are not included.

Imports of Machinery

Imports of machinery in 1935 totalled ¥158,984,000 and in 1936 ¥153,087,000. The increase over 1934, when imports were ¥143,590,000, was due to lower exchange rate and increase of imports of some special machinery on account of the general industrial activity in the country. However, these figures were smaller than the 1929 figures of ¥186,832,556.

Imports of machinery by Japan, excluding automobiles and their accessories, from 1919 to 1928, were somewhere between ¥100,000,000 and ¥140,000,000. There was a sharp reduction in 1930, and in 1931 the bottom was reached, but since then there has been a yearly increase. (See Chapter XI.)

Automobiles, cycles and steam vessels are not included.

Exports of Machinery

In 1936 Japan witnessed the highest record in exports of machinery of her own making. The value of exports was ¥174,541,000 which was an increase of 53 per cent as compared with the preceding year. The future of Japan's machinery manufacturing depends upon the degree to which her exports expand, and especially upon the development of The market is Manchoukuo. The invasion of Japanese products into the Dutch East Indian, Indian and other foreign markets is a matter of future prospect. The exportation of Japanese made spinning and weaving machines is very promising. The Toyoda Automatic Weaving Machines are very much in demand wherever the spinning industry prospers. Diesel-engines to be fitted into fishing vessels are built in Japan and shipped to the Dutch East Indies. Japanese made machines exported during the last three years follow :

Shipbuilding

Introduction

The mercantile shipbuilding industry in Japan developed with the shipping business, while the development of warship building was mainly due to the urgent demands created by the Sino-Japanese and the Russo-Japanese Wars.

Owing to the construction of new vessels to be placed on subsidized lines, easy money and low interest rates, the shipbuilding industry which had been depressed since the close of the World War, revived and boomed temporarily in 1928. Tonnage output, which in 1919 amounted to as much as 674,000 tons, dropped to 53,000 tons in 1926. This was increased to 112,583 tons in 1928 and to 167,365 tons in 1929. However, as the improvement was brought about artificiallyl and not by general improvements in economic conditions, the industry soon became dull again, and was further depressed by the enforcement of the conditions of the London Disarmament Agreement. Naval orders to private shipbuilding companies were reduced by 30%, which, together with the decreased orders from private transportation companies reduced the 1931 output to 84,004 tons and in 1932 to 58,763 tons.

Owing, however, to the subsidies granted by the Department of Communications since 1932 for the improvement of steamers, the shipbuilding industry has been fairly active. The subsidies were granted with an aim of constructing 200,000 tons of new steamers, and closed at the end of March, 1935. In addition to this, due to the low exchange rate, enquiries for steamers are forthcoming from Brazil, Siam, Italy, France, Sweden, Soviet Russia, Manchoukuo, China, etc. (See Chapter XXVI, Sea Transportation.)

Shipbuilding in 1936

The condition of the shipbuilding industry in Japan during 1936 was characterized by great activity throughout the year. The total tonnage of ships launched by the end of October reached 216,000 tons and it is estimated that with those launched from the beginning of November until the close of the year included, the total tonnage must have risen above the 280,000-ton level, thus doubling similar figures for the preceding year and quadrupling those for 1932.

Indications are that the shipbuilding circles in this country will witness still busier days this year. During the early part of November, 1936, there were already orders outstanding for ships totalling 600,000 tons, all of which had to be filled by the end of 1938. It is expected that the vessels already launched or to be launched by the end of 1937 will total more than 300,000 tons.

The recent rise in the prices of ma-

terials has been hindering the conclusion of new shipbuilding contracts but as soon as prices have become stable many new orders are expected to be placed. The optimism over shipbuilding prospects is backed by the scheduled construction of warships to replace superannuated ones, new building, and the construction of superior merchantmen.

The Navy's orders for new vessels are bound to increase from this year because the first non-treaty year arising from the expiration of the Washington and London naval treaties is intended to be marked with the commencement of a five-year shipbuilding programme. As the naval years are insufficient to execute this, a considerable portion of it is expected to be carried out at the hands of civilian shipbuilders. It follows that the shipbuilding companies, which already have too many orders to fill, will have to expand their facilities in order to meet the demand.

Under these circumstances, the business conditions of the shipbuilding companies are expected to continue improving although the raising of wages and increases in taxes may be inevitable. However, it is difficult for the shareholders of the shipbuilding companies to expect dividends of a higher percentage in view of the specific nature of the shipbuilding industry. Instead, payments on outstanding portions of shares and capital increases are possible. Special interest attaches to the expansion of the medium-size and small-scale shipbuilding companies.

The great activity of the shipbuilding companies in this country during 1936 were the most remarkable of the kind since the close of the European War. As already stated, the total tonnage of ships launched by the end of October reached 216,000 tons and the 280,000-ton mark is believed to have been exceeded by the end of the year. A comparison with similar figures for the preceding four years is tabulated below :

SHIPS LAUNCHED

	No. of Ships	Total Tonnage
1932	61	71,791
1933	67	79,820
1934	177	154,860
1935	195	145,901
1936 (Until October)	175	216,499

Some circles even estimate that the total tonnage of ships launched during the year may reach the neighbourhood of 300,000 tons which would more than double similar figures for the preceding year and quadruple those for 1932. Needless to say, the activities of the shipbuilding circles are based on the improvement in the shipbuilding business. In this respect, it may be noted that there has arisen the necessity of replacing those ships which were constructed hurriedly during the European War. Further, the need for superior ships from the standpoint of profits is also accelerating shipbuilding programmes.

The bright prospects of the shipping business and the anticipation of higher prices of ships combine to increase the number of ships planned for construction. To make the shipbuilders busier, the imports of petroleum have been increasing rapidly and have caused successive orders to be placed for tankers. The development of the whaling enterprises is also increasing the orders for new whalers and catcher boats.

Statistics shows that a total of 830,000 tons under construction and ordered at the close of 1936. In addition, there were naval orders placed with civilian shipbuilders.

Prospects The present conditions are such that it is anticipated that the shipbuilding boom will continue until 1939. Barring unforeseen developments, no sudden unfavourable changes are expected even after 1939. As a matter of fact, some of the orders in hands are intended to be filled by 1939 because earlier filling is considered difficult. In spite of this fact, further orders are expected to be forthcoming.

According to a survey, the ships under construction as on November 1 totalled 218,000 tons. In addition, there were a total of 377,000 tons involved in ships the keels of which were in process of being laid. These two items make a total of nearly 600,000 tons. Supposing that it takes one year to complete the construction of ships totalling 300,000 tons, two years will be required for the filling of the orders now being worked on. In other words, the shipbuilding companies will be kept busy until the end of 1938 by those orders alone.

Also to be considered in this connection is the fact that there will be more orders for ships forthcoming from the Navy as presaged by the enormous naval estimates, which represent an increase of over ¥100,000,000 when compared with similar figures for the preceding year. As it is considered urgent to construct capital ships for replace-

ment purposes in view of the advent of the non-treaty era, civilian shipbuilders are expected to be required to make good the shortage of facilities of the naval yards.

CHAPTER XX

UTILITIES

Electricity

Historical Survey

The electric light and power industry in this country dates from November, 1887, when the Tokyo Electric Light Company undertook to light 75 incandescent lamps, using a home-made generator installed at the first commercial plant at Nihonbashi, Tokyo.

Hydro-electric power production was started in 1891 in Kyoto in connection with the Lake Biwa canal works. Two motors of 80 kw. each were installed.

The electric railway industry began with the establishment of the Kyoto Electric Railway Co., Ltd., in 1895, followed by the Nagoya Electric Railway Co., Ltd., in 1898. With respect to long distance transmission of electric power, Koriyama Kenshi Boseki Kaisha, Ltd. (Koriyama Silk Spinning Co., Ltd.) succeeded, in 1889, in transmitting 10,000 volts 15 miles. In 1907, Tokyo Electric Light Co., Ltd., completed the hydro-electric power station of 15,000 kw. in Komabashi, Yamanashi prefecture, and succeeded in transmitting 55,000 volts for a distance of 50 miles. This marked a new era for the hydro-electric industry.

The Hydro-Electric Industry

For over 15 years after the electric power industry was first started, coal produced electric power was supreme, and the development of the hydro-electric industry was very slow. In 1903, of the total electric power of 44,000 kw., 31,000 kw. were produced by coal, the remaining 13,000 kw. were generated by water. However, after the Russo-Japanese War, the hydro-electric industry developed very quickly.

About that time, in view of the success in transmission of power for long distances, the Temporary Investigation Bureau of Hydro-Electric Power was established under the direct supervision of the Minister of Communications, and investigations as to the available water power were made throughout the country. As the result of these investigations and encouragement from the Bureau, hydro-electric power production quickly developed and by 1912 had increased to 233,000 kw. exceeding the thermally produced power by 4,500 kw. Development during and after the World War was rapid, especially after the great earthquake in the Kanto Distric in 1923. In 1933 the hydro-electric power developed totalled 3,168,705 kw., while the thermal power amounted to 1,827,131 kw. The rapid increase in production finally resulted in an oversupply of power, a factor which later became the weakness of the industry. However, a combination of factors has aided the industry to regain prosperity. At the end of 1935 the number of concerns engaged in the electric business was 818, and the number of private electric plants in factories, etc. was 8,398. The total capacity of these 9,216 plants aggregated 6,050,000 kw., the hydro-electric 3,410,000 kw. and the thermal-electric 2,640,000 kw. Plants under construction were to have a further combined capacity of 2,090,000 kw.

ELECTRIC POWER GENERATED FOR INDUSTRIAL PURPOSES
(in kw.)

Year	Hydro-electric	Thermal	Total
1907	38,622	76,288	114,910
1912	233,339	228,864	462,203

1932	12,557,696,988	5.6
1933	16,961,724,058	35.1
1934	18,793,610,146	10.8
1935	21,548,700,173	14.7

Trend of Demand

For Lighting In 1935 the number of electric-lighted households increased by 233,259 as compared with the previous year, the number of lamps being 61 to every 100 persons. Of the total number of electric lamps which reached 42,477,828 in 1935, those in the 127 cities comprised 55 per cent, the average number of lamps in an urban household being 5.2.

The growth of the demand for power for lighting purposes in the country as a whole and in the prefectures, in 1935, is as shown in the followng two tables :

GROWTH OF DEMAND FOR POWER FOR LIGHTING

Year	No. of Consumers	No. of Lamps	Candle-power	Electric Power
1926	10,165,739	30,159,042	547,918,369	683,584

For Power Purposes The increase of demand for electric power is even more marked than that for light. At the end of 1935, the power contracted for reached 3,129,071 kw.

Electric power for purposes other than lighting or motive power contracted for amounted to 183,945 kw. The increase in demand for electric power for industrial purposes deserves special notice and the following table showing the amount consumed in the chief consuming industries in 1934 and 1935.

AMOUNT OF ELECTRIC POWER CONSUMED BY VARIOUS KINDS OF INDUSTRIES, ETC.

at the end of 1934 and 1935

(In 1,000 kw.)

	1934	1935
Textile	552	574
Metal	501	676
Machinery	203	229
Ceramics	211	242
Chemical	773	825

Agricultural and aquatic	81	84
Miscellaneous	74	70
Other than industry	641	645
Total	3,818	4,178

Electric Power Suppliers

The following tables show the number of suppliers of electric power with the power supplied in 1935.

POWER SUPPLY COMPANIES

Year		Generating Water	Steam	Purchasing	Total
1931	Opened	305	45	385	733
	Unopened	5	7	28	40
	Total	310	52	411	733
1932	Opened	366	59	391	816
	Unopened	8	5	21	34
	Total	374	64	412	850
1933	Opened	345	56	417	818
	Unopened	7	3	15	25
	Total	352	59	433	843
1934	Opened	331	60	413	804
	Unopened	11	3	12	26
	Total	342	63	425	830
1935	Opened	319	59	410	788
	Unopened	12	3	15	30
	Total	331	62	425	818

The rate of profit earned by all companies is as shown in the follwing table:

PROFITS OF ELECTRIC INDUSTRY

1924–1934

Year	Paid-up Capital	Profit	Rate of Profit against Paid-up Capital
1926	2,453,588,000	279,331,000	11.0
1927	2,677,153,000	279,541,000	10.5
1928	2,868,717,000	282,880,000	10.0
1929	3,019,222,000	301,900,000	10.0
1930	3,180,810,000	255,800,000	8.0
1931	3,234,181,000	227,061.830	7.0
1932	3,326,834,000	195,887,000	5.9
1933	3,494,202,000	183,100,000	5.2
1934	3,956,686,518	205,005,470	5.2
1935	4,124,389,526	225,730,583	5.5

Electric Industry in 1936

There was a rapid increase in the demand for electricity during 1936, the demand for electric power being greater than that for electric light, the increased demand for power being engendered by the increase in industrial activity.

The receipts of the electric companies have included large amounts from electric light charges in the past, but at present the greater part of the receipts consists of electric power charges, attributable to the increased demand for power and electricity for general heating purposes, electrolizing, and the electric furnace industries. The increasing tendency of this kind of demand has been going on for five years but it becomes more conspicuous every year.

A large number of new thermal and hydraulic power stations were constructed during 1936, but in spite of the expansion no signs of over-production have appeared.

During the tenure of the Hirota Cabinet, there existed misgivings over the prospects of the stocks of the electric industry under State management. These misgivings, however, have been removed, at least for the time being, as a result of the postponement of the electric control plan by the Hayashi Cabinet. It must be noted that the Hayashi Cabinet postponed the plan in view of the dissatisfaction and opposition voiced by the industrialists.

In its stead it has been decided to enforce a licensing system for the fixing of electricity charges. As this system aims at the supply of electricity of good quality, both in abundance and at low rates, it must be anticipated that the possibility of the electric companies receiving increased profits has lessened.

Demand on Upward Trend A further increase was recorded during 1936 in the demand for both electric light and electric power. The demand advanced even after the outbreak of the February 26 Incident which caused chaos to prevail in financial circles for a time. The total number of electric lamps installed by the electrical bureau of the Tokyo Municipal Office, the Tokyo Electric Light Company and the electrical bureau of the Osaka Municipal Office during the year reached the prodigious total of 17,580,000, showing an increase of 920,000 lamps or 5.5 per cent as compared with the end of the preceding year. The increase was bigger than that for 1935 by 1.5 per cent. The following is a table showing the increasing demand for electric light during recent years :

DEMAND FOR ELECTRIC LIGHT

(In units of 1,000 lamps)

	Tokyo Electric Light Company	Tokyo Municipal Electrical Bureau	Osaka Municipal Electrical Bureau
1931	10,246	1,046	2,882
1932	10,607	1,078	2,984
1933	11,002	1,119	3,084
1934	11,374	1,161	3,434
1935	11,869	1,214	3,581
1936	12,567	1,263	3,749

The rate of increase in the demand for electric power has been even higher than that for electric light, the total demand in 1936 was for 1,360,000 kilowatts, an increase over the preceding year of 98,000 kilowatts or 7.6 per cent. Details of the increasing demand for electric power during recent years are shown below :

DEMAND FOR ELECTRIC POWER

(In units of 1,000 kilowatts)

	Tokyo Electric Light Company	Tokyo Municipal Electrical Bureau	Osaka Municipal Electrical Bureau
1931	742	39	147
1932	816	41	157
1933	887	42	166
1934	931	43	187
1935	1,016	44	204
1936	1,095	47	220

The business receipts of the electrical organizations have also increased, especially in the case of electric power charges. The greater part of the receipts has been derived from supply of electric light in the past but the electric power charges have gradually replaced the electric light charges as the principal item in the receipts of the electrical organizations. This tendency has of late become all the more conspicuous.

The receipts derived from the supply of electric light are seasonal. The receipts from the supply of light during 1936 were for the latter half of the year, smaller than those for the first half, but the receipts from electric power charges were free from any such influence. Details of the receipts from electricity charges during the four years beginning with 1933 are shown in the following table :

RECEIPTS FROM ELECTRICITY CHARGES

(In 1,000 yen)

	Tokyo Electric Light Co.		Toho Electric Power Co.	
	Light Charges	Power Charges	Light Charges	Power Charges
1st half, 1933	31,962	25,096	11,806	12,569
2nd half, 1933	29,475	25,434	10,715	12,009
1st half, 1934	31,869	28,379	11,509	13,732
2nd half, 1934	31,049	29,226	10,999	13,954
1st half, 1935	33,457	33,400	11,787	15,084
2nd half, 1935	32,098	34,135	11,273	15,420
1st half, 1936	35,161	37,596	12,264	16,658
2nd half, 1936	33,404	38,633	11,473	16,487

Expansion of Facilities Not a few heat-engine and hydraulic power stations were newly established during 1936. The Sasado plant of the Daido Electric Power Company, the Kasagi plant of the same company, the Kanetsuri plant of the Nihon Electric Power Company, the Nagura plant of the Toho Electric Power Company and the new hydraulic power plant of the Oigawa Electric Power Company were all completed during the year. The Tsurumi plant of the Tokyo Electric Company, the Nagoya plant of the Toho Electric Power Company and the facilities of the Kwansai Kyodo Electric Power Company were expanded. Along with the expansions in industry following the advent of the quasi-emergency situation, new expansion programmes had to be worked out to meet the increasing demand for electricity, thus presenting the most active conditions in the electric industry for several years.

Increase in Dividend Despite the fact that the electric industrialists were kept busy considering measures to cope with the plan of the Hirota Cabinet to place the electric industry under State management, the Tokyo Electric Company increased its dividend shareholders

to 8 per cent while the Daido, Uji and Godo electric power companies increased their dividends by one per cent each. The dividends of the Kwanto, Japan Sea, Chuo, Kinugawa and Fuji electric companies were also increased. Besides increasing their dividends, the Uji and Nihon electric power companies raised their capitalizations.

Merger of Leading Companies The Dai-Nippon Electric Power Company absorbed the Tobu Electric Power Company while the Toho Electric Power Company has decided to absorb the Godo Electric Power Company. Mergers of several local companies also took place. It is to be noted in this connection that the merging of the electric power companies in recent times is principally aimed at the expansion and strengthening of their organization as a means of providing against possible disturbances in the future and as such is considerably different from former times when such mergers were effected usually by way of readjustment necessitated by business depression.

Assets and Liabilities The assets and liabilities of the various electric power cmpanies increased on account of the expansion programme which became necessary because all the idle facilities had been put into use to meet the needs of the new situation.

The Toho called in a part of its unpaid share capital to pay off some of its indebtedness, a noticeable fact in the following statistics, where internal liabilities have increased in proportion to the decrease in external liabilities, evidencing a soundness of business policy.

Details of the assets and liabilities of the Tokyo Electric Light Company and the Toho Electric Power Company during the past four years are tabulated as follows :

1. ASSETS

(In 1,000 yen)

	Tokyo Electric Light Co.		Toho Electric Power Co.	
	Fixed Assets	Floating Assets	Fixed Assets	Floating Assets
1st half, 1933	779,598	139,013	160,273	130,775

Decline in Stock Value Electric shares began to lose popularity when the plan of the Hirota Cabinet for "an electric industry owned by private organizations and managed by the State" was about to be presented to the 70th session of the Imperial Diet because the realization of the plan would have limited dividends to shareholders. Even the shares of those copmanies not covered by the plan came to be disliked by investors on account of the anticipated enforcement of a licensing system for the fixing of electricity charges, and electric shares, which were at a high level immediately before the formation of the Hirota Cabinet, suddenly commenced to fall.

The highest and lowest quotations for shares of the various electric companies during 1936 are tabulated as follws :

Description	Highest	Lowest
Tokyo Electric Light	¥65,90	¥50.30
Daido Electric Power	55.50	39.90
Toho Electric Power	65.01	52.80
Nihon Electric Power	61.70	46.90
Ujigawa Electricity	56.30	42.30
Kyushu Hydraulic Power	59.80	50.50
Dai-Nippon Electric Power	67.50	51.60
Kinugawa Hydro-electricity	54.40	42.00
Toshin Electricity	79.70	65.10
Hokkai Hydraulic Power	44.50	38.50
Kwanto Hydraulic Power	77.50	55.90
Chubo Electric Power	63.00	55.50
Chuo Electricity	62.50	56.00
Godo Electricity	54.00	46.40
Hiroshima Electricity	63.20	52.20
Kyoto Electric Light	65.80	51.50
Chugoku Godo	76.00	57.20
Kumamoto Electricity	77.80	59.50
Taiwan Electric Power	54.80	50.50

The highest quotations of electric shares were recorded in February and the lowest in November when it was definitely decided that the plan to place the electric industry under State management would be submitted to the Diet session.

Prospect It is anticipated that the increasing demand for electricity will continue in 1937. As the enormous budget of the 1937–38 fiscal year becomes effective on April 1, industrial facilities will be expanded and productive capacity increased, advances being expected in the machinery manufacturing, chemical and pharmaceutical industries especially.

On the other hand, the price of coal will rise, but profits are expected to increase to a greater extent than that of the rise in the fuel price. The "extraordinary situation" boom will be particularly remarkable in the electric heating, electrolizing and electric furnace industries. It follows that the conditions of the electric light and electric power companies will improve.

Licensing System The proposed licensing system for the fixing of electricity charges will become effective after December, 1937. Under this system, the Ministry of Communications is to conduct a careful examination before authorizing the electricity charges fixed by the various companies. Although it is unlikely that the Ministry of Communications will force a reduction of the charges by a wide margin, it has already been made known that the Ministry expects the supply of electricity of good quality at once, in abundance and at low rates.

As the standard for computing electricity charges will be decided on the basis of the yields of public bonds and in consideration of fair profits derived from enterprises, electricity charges will inevitably be reduced gradually. Indications are that appliance rents will be reduced by as much as 50 per cent. This means that the receipts of the various companies concerned will be greatly affected.

As regards the limitation of dividends to shareholders, direct interference by the Government is now considered unlikely as the tenure of office of the Hirota Cabinet has come to a close and the threatened control has not received the same support from his successors. Nevertheless, barring special circumstances, dividends are not expected to be more than 8 per cent under prevailing conditions.

Gas Industry

Introduction

When compared with the electric industry, the gas industry has been very slow in its development. The introduction of gas took place in 1885, when it was used in Yokohama for street lighting purposes. Later in the same year Tokyo adopted it for the same purpose. The capital invested in 1885 was ¥54,000, and a slow but steady increase took place until 1925, when the invested capital stood at ¥276,373,000. After that year the industry made great strides as the following figures show :

End of	Material Consumed	Supply		Consumption			
	Coal	Output	Amount Supplied to Consumers	No. of Consumers	No. of Lights and Burners	Motors	
						Number	Horse-power
	Metric ton	Thousand cubic metres	Thousand cubic metres				
1926	904,087	444,890 * 42,580	423,932	795,226	2,043,829	429	6,638
1927	1,036,552	496,810 * 68,096	486,911	953,688	2,234,722	358	6,524
1928	1,191,007	576,140 * 88,884	578,493	1,212,024	2,623,257	308	6,162
1929	1,343,137	639,972 * 88,566	653,837	1,462,221	3,057,487	265	6,023
1930	1,305,297	668,329 * 103,088	700,249	1,622,982	3,438,194	224	4,712
1931	1,329,869	691,222 * 89,742	740,081	1,716,662	3,704,090	193	3,307
1932	1,283,216	734,188	712,717	1,785,205	3,921,620	186	3,237
1933	1,402,000	770,447	709,967	1,866,369	4,145,549	—	—
1934	—	1,046,639	741,787	1,906,409	4,242,215	—	—
1935	—	1,219,746	771,534	1,995,000	4,453,919	—	—

Note: * Aqueous Gas.

Gas Industry in 1936

A further improvement in the conditions of the gas industry was achieved during 1936, partly because the demand for gas continued to increase and partly because the profits derived from coke and other by-products swelled rapidly, and in spite of a rise in the price of coal.

The expansion work in the gas industry, started following the emergence of the extraordinary situation, has been practically completed. As the need for the installation of iron pipes and machinery has decreased, the effect of the higher prices of these will not be felt to any great extent by the gas industry.

Gas charge will continue to be lowered in many cases. The gas charges in Tokyo, Kyoto and Kobe have already been lowered as a result of the adoption of the licensing system for the fixing of electricity charges. Except in Yokohama, the charges in the six principal cities of the country are now not considered high. The licensing system for electricity charges, which is scheduled to be enforced after December, 1937, is expected to be followed by a reduction in the gas charges of the local gas companies.

During 1936, the Kyoto Gas Company, one of the six leading organizations of the kind, reduced its dividend to shareholders by 2 per cent. It is expected that some of the local gas companies will have to reduce their dividends in 1937.

Continued Active Demand The demand for gas, being on an upward trend since the start of the extraordinary situation, recorded a further increase during 1936. The increase was particularly remarkable in the case of the Tokyo Gas Company, reflecting the increased activities in the munitions industry and the permeating of the "extraordinary situation" boom to the lower classes. The consumption of the gas produced by the Tokyo and Toho Gas Companies during the past six years is tabulated as follows:

GAS CONSUMPTION

(In units of 1,000 themal units)

	Tokyo Gas Co.	Toho Gas Co.
1932	143,115	14,524
1933	149,842	14,382
1934	154,880	13,691
1935	158,298	14,028
1936	164,002	15,018

Illustrative of the relations between the extraordinary situation and the demand for gas is the fact that the rate of increase in the demand for gas has been higher than that of the increase in the number of gas-meters installed. The gas-meters installed by the Tokyo and Toho Gas Companies during the past four years are shown below:

Gas-Meters Installed

	By Tokyo Gas Co.	By Toho Gas Co.
At end of 1933	826,200	75,609
At end of 1934	826,539	76,310
At end of 1935	864,511	77,468
At end of 1st half of 1936	880,779	80,436
At end of 2nd half of 1936	907,664	83,752

Note: The figures for the Toho Gas Company during the 2nd half of 1936 do not cover any increase after September.

Decreased Expenditure The industrial expenditure of the six leading gas companies in the country, when considered as a whole, is now on a downward trend. When considered separately, the expenditures of the four companies other than the Tokyo and Seibu Gas Companies show a slight but insignificant, increase in 1936, as compared with the prceding year and 1934.

On account of their specific nature, the gas companies are not in a position to increase their dividends to shareholders, consequently surplus funds are being placed to reserve. The shrinkage in the amount of industrial expenditure may be attributed partly to the fact that part of the expenses required for expansion work were included in business expenditure acconts. A comparison of the industrial expenditure of the six leading gas companies during the past three years is tabulated below :

INDUSTRIAL EXPENDITURE

(In 1,000 yen)

Companies	1934	1935	1936
Tokyo	134,524	135,018	135,898
Osaka Gas	46,383	49,197	51,078
Toho	9,359	9,302	10,040
Kyoto	12,968	13,524	*13,670
Kobe Gas	14,889	15,237	15,921
Seibu Gas	4,933	5,030	*4,926

* Do not cover the period after July.

Profits from By-Products The profits derived by the various gas companies from their by-products have increased rapidly since the commencement of the extraordinary situation. The by-products include coke, coal-tar, ammonium sulphate, crosote and cresol, the first named being the principal item. The rise of the metallurgic and refining industries accounts for the increased demand for cokes. A comparison of the receipts from gas with profits derived from by-products of the Tokyo Gas Company and the Toho Gas Company is shown in the following table :

	Tokyo Gas Co.		Toho Gas Co.	
	Gas Charges (1,000 yen)	Profits Derived from By-Products (1,000 yen)	Gas Charges (1,000 yen)	Profits Derived from By-Products (1,000 yen)
1933	32,476	5,941	2,994	1,156
1934	33,513	7,475	3,084	1,427
1935	34,280	8,633	3,116	1,760
1936	35,536	9,346	3.228	1,765

Prospects The foundation of the gas industry has become consolidated, for while the demand for gas has been steadily increasing, industrial expenditure has been on a downward trend. Furthermore, the profits derived from by-products have been increasing rapidly. In spite of the rise in the price of coal and the higher prices of iron pipes and machinery, the gas companies have been operating satisfactorily. Sound conditions are also expected to be witnessed in 1937.

Of late, gas charges have begun to be reduced. From January, 1937, the gas charges of the Tokyo Gas Company for the new city and adjoining districts were reduced from ¥2.18 to ¥2.08 per 10 thermal units. It has also been announced that a further reduction by ¥0.09 will be carried out in April, 1938. The Kyoto Gas Company has decided to raise the heating quality of the gas it supplies from 3,800 to 4,000 calories and to reduce its rent for appliances. On this account, its dividend has been reduced by 2 per cent. The Kobé Gas Company has also effected a reduction of its gas charges.

As all the leading gas companies have reduced their charges, there will be no more question in this direction during the current year (1937). It may be repeated that the lowering of gas charges has come as a result of the adoption of the licensing system for the fixing of electricity charges. In view of the fact that this licensing system will be enforced after December, 1937, throughout the country, local gas companies are

expected to be affected as the gas charges imposed by many of them are still considered too high.

BUSINESS RESULTS OF GAS COMPANIES

(In ¥1,000)

March	Paid-up Capital	Fixed Capital	Profit	Percentage of Profit against Fixed Capital	Dividend Rate
1930	350,232	459,686	48,874	9.2%	9.6%
1931	382,930	555,614	50,896	9.0	8.7
1932	395,632	571,564	51,452	8.7	8.3
1933	400,908	580,053	50,317	9.1	8.0

1935	440,210	585,998	60,295	13.6	7.6
1936	458,196	591,637	70,302	11.9	7.8

Warehousing

History

Since warehousing depends on the storing of large quantities of goods, transportation facilities are the factors which influence its success, an expansion of one calls for an expansion of the other and, in Japan, it was the development of transport facilities in the days of Meiji which gave rise to the modern warehousing business.

Warehouses of kinds have always existed. Emperors in olden times kept rice and cereals in warehouses for military purposes. Later, cereals were kept to provide for relief of the people in case of poor crops, but in either case, the warehouses were used for military or political, not commercial, purposes. When the Tokugawas came to rule the country as Shoguns about three hundred years ago, both Yedo (present Tokyo) and Osaka became great cities where trade and commerce flourished. Transportation by sea developed, and many feudal lords came to reside in these cities, bringing with them, or having sent to them, the agricultural products of their country districts. The produce was stored at the lords' residences, which became, in a sense, public warehouses. The produce was sold by public tender and to the successful bidder a memorandum was given against receipt of payment in cash. This memorandum was equivalent to the warehouse receipt of the present day, and the holder of the memorandum was authorized to keep his cereals in the warehouses for the time stipulated on it. Loans were often raised with memoranda as collaterals.

After the Restoration, owing to development of commerce and activity in the movement of goods, many warehouse businsses were started, the first company, to operate on a modern basis being the Soko Kaisha in Fukagawa, Tokyo, established in 1881 with a capital of ¥65,000. Dissolution took place 3 years later. In Osaka, the Konoiké family organized the Osaka Soko Kaisha with a capital of ¥200,000 in 1882. In 1883, the Sanbashi Kaisha in Kobé, and in 1884, the Otsu Soko Kaisha in Otsu in Shiga prefecture, were established. In 1886, the Tokyo Soko Kaisha, Ltd., was founded by the Iwasaki family. After that year there was no great change until after the Sino-Japanese War, when with increased foreign trade and improved transportation ficilities by land and sea, the number of warehouse companies rapidly increased. In 1906, there were 536 people engaged in the warehouse business, either on private account or on an incorporated basis.

Present State of the Business

At the end of 1936 the number of warehouse managements which belonged to the Japan Warehouse Association was 127, the value of commodities stored, being, on the average throughout the year, ¥614,381,000. However, there are many warehouse managements, incorporated or otherwise, which do not belong to the Association. According to an investigation made by the Department of Commerce and Industry, the number of warehouse managements in the country totalled 345 in 1935.

Value of Commodities The values of commodities stored in the 107 warehouses, above mentioned were as follows :

STOCKS IN WAREHOUSES IN JAPAN PROPER

(According to the Japan Warehouse Association)

Year	Average			End of June			End of December		
	Warehouses	1,000 Parcels	Value ¥1,000	Warehouses	1,000 Parcels	Value ¥1,000	Warehouses	1,000 Parcels	Value ¥1,000

CHAPTER XXI

FOODSTUFFS

Wheat Flour

Historical Survey

Before the Russo-Japanese War It was not until after the Russo-Japanese War (1904–5) that the wheat flour industry made any progress in Japan. Prior to the war there was a fairly large consumption, but manufacturing was only in the infant stage, most of the production being with the help of water-wheels. The daily output by this method was only 10 to 50 or 60 bags; the quality was poor and not uniform and, being packed in straw bags, the product was not at all satisfactory. It was only in the year 1895 that wheat flour was first produced on a modern basis by machinery. In that year, the Nippon Seifun Kaisha, Ltd., began to operate mills with a capacity of 200 koku per day, and gradually, mills with capacities of 50 to 100 koku a day were established, but progress was very slow. However, the demand for flour increased and as production could not keep pace with it imports naturally increased. In 1895, imports were 280,000 bags, valued at ¥400,000, ten years later imports had increased to 4,990,000 bags, valued at ¥9,950,000. Imported and water-mill produced domestic flour together satisfied practically the whole of home consumption, while domestic flour made by machinery formed but a very small part of the supply. The imported flour coming chiefly from the United States of America, was of a far superior quality to the home product.

Yield of Wheat Before 1901, the land used for wheat planting averaged between 440,000 and 480,000 cho, and in 1905, it was 450,000 cho. The yield of wheat gradually increased up to 1901, when it was 4,370,000 koku, but during the next few years there was a gradual decrease until in 1905 the yield was 3,600,000 koku.

As regards imported wheat, the amount imported usually depended upon the domestic wheat crops, but showed in general a gradual increase. In 1895 imports were only 1,600 koku with a value of ¥7,500. In 1902 they had increased to 38,000 koku, valued at ¥240,000. The year 1903 proved to be a lean year for domestic wheat, and imports suddenly increased to 560,000 koku, of a value of ¥4,760,000. After that, owing to the prosperity which visited Japan after the war with Russia, wheat continued to be imported in large quantities. In 1904 it was 170,000 koku, valued at ¥1,530,000, and in 1905, 450,000 koku, valued at ¥4,000,000.

After the Russo-Japanese War Many flour mills were established on a modern basis during the time of the great boom which followed the Russo-Japanese War, and production capacity was greatly expanded, but a contraction was brought about by the closing down of many of the newly established mills when the reaction later set in. In 1914, when the World War started the capacity of production by machinery was 9,060 barrels and this, by 1922, had increased to over 20,000 barrels. During those seven years the industry experienced unprecedented prosperity, and with this development on modern lines, domestic producers who make flour in the old-fashioned way have lost nearly all their customers and, further, imported flour has been practically shut out of the country.

The Industry at Present

Production and Imports of Wheat After 1918 the demand for wheat flour, keeping pace with the advance in the standard of living, greatly increased. The extended westernization of the country in recent years largely accounts for this and has brought about a consequent heavy demand for wheat. Home production has not increased to meet the demand, the result being, as the following tables show, heavy annual importations of wheat. An attempt, therefore, has been made by the Government to increase domestic production through tariff and increase of wheat acreage, in which they were highly successful. The production increased very much in 1933 in proportion to the increased acreage, which was further accelerated in 1935, when an all-time record high was established. The pro-

duction in 1936 decreased by 7.2 per cent as compared with the preceding year.

PRODUCTION OF DOMESTIC WHEAT AND ITS ACREAGE

Year	Production koku	Acreage cho
1927	6,059,000	473,000
1928	6,389,000	489,000
1929	6,323,000	494,000
1930	6,124,000	491,000
1931	6,405,000	501,000
1932	6,497,000	508,000
1933	8,013,000	616,000
1934	9,450,700	648,000
1935	9,660,386	663,700
1936	8,961,762	688,900

QUANTITIES OF WHEAT IMPORTED

Countries from Which Imported

(Quantities in piculs)

Year	China	Kwantung Peninsula	U.S.A.	Canada	Australia	Other Countries	Total
1925	8,406	8,478	2,839,673	1,513,904	3,354,246	2,298	7,727,044
1926	—	—	3,257,855	4,177,409	4,269,521	11,563	11,716,549
1927	261,959	62,958	2,608,611	2,879,710	1,953,867	6,973	7,774,088

1929	224,974	440,452	2,439,587	6,649,680	2,402,582	74,282	12,231,557
1930	204	34	3,398,999	2,957,510	1,706,306	22	8,063,078
1931	23	0	884,210	2,597,625	8,554,294	3,379	12,039,531
1932	—	0	195,634	1,983,110	10,264,635	54	12,443,434
1933	—	0	49,367	1,874,606	6,593,331	3,165	8,520,470
1934	17,820	0	2,220,803	1,325,549	4,455,025	135,864	8,155,061
1935	3,000	0	45,994	881,786	5,558,084	928,436	7,417,300
1936	320,470	0	61,818	164,000	2,812,000	376,360	3,734,700

Owing to great increase of domestic production of wheat, the import of wheat from countries other than Australia decreased to a considerable extent.

The Export of Wheat Flour The export of wheat flour in 1917 was as large as 4,410,000 bags, and 2,560,000 bags in 1918, but this was only a temporary war-time phenomenon. After the latter year exports fell away sharply and it was not until 1925 that exporting on a steady basis really began.

EXPORTS OF WHEAT FLOUR

Countries to Which Exported

(Quantities in piculs)

Year	Manchoukou	China	Kwantung Province	Dutch Indies	Others and Total
1927	—	938,934	200,234	30,156	1,251,687
1928	—	1,763,898	536,245	24,538	2,372,329
1929	—	1,786,880	1,086,880	16,571	3,063,378
1930	—	1,337,437	378,057	21,595	1,998,758
1931	—	1,684,775	490,162	14,068	2,252,011
1932	858,103	1,049,163	2,572,327	5,998	3,694,883
1933	1,427,036	482,700	803,963	14,068	5,304,249
1934	1,402,032	17,133	2,899,819	8,988	4,427,819
1935	2,035,048	29,123	2,366,348	10,323	4,819,629
1936	736,400	80,900	1,065,800	19,500	2,165,300

Exports in 1932 showed the highest figure up to that time, exceeding the figure of 1931 by 1,443,000 piculs. The Tsurumi Mill of the Nisshin Seifun Kaisha, Ltd., the largest mill in the Orient, was destroyed by fire in 1931. In 1933, aided by the fall in yen exchange and the Tsurumi Mill again coming into operation, the year showed even better results than 1932. In 1934, however, the figure showed a slight decline owing to the sales by the Aus-

tralian exporters at Dairen, which checked the export of Japanese flour to Manchoukuo and Kwantung Peninsula.

In 1936 the exports to Manchoukuo greatly decreased owing to the policy of Manchoukuo Government to promote the production of wheat in her own territory and protection of the flour industry, and accordingly the production of wheat flour in Japan was forced to decrease by 20 per cent.

FLOUR PRODUCTION, CONSUMPTION, ETC

(In bags)

Year	Production	Import	Export	Home Consumption and in Stock
1923	30,098,000	921,100	470,000	30,500,000

1933	41,395,892	40,246	14,321,472	26,114,666
1934	46,084,000	45,400	11,966,000	34,175,000
1935	49,700,000	93,000	13,026,000	36,767,000
1936	38,993,000	101,000	5,852,000	33,242,000

Wheat Encouragement Policy

The great development of flour milling industry and the shortage of domestic supply of wheat increased the import of foreign wheat to a tremendous extent. For a long time it was studied to check the import of wheat. It was proposed later that to attain the purpose, the best way would be to increase domestic production through increase in wheat acreage, with the goal of making Japan self-sufficient as to the supply of wheat. With this in view, when tariffs were revised in general in 1932, that on wheat was raised from ¥1.50 to ¥2.50 and that on flour from ¥2.90 to 4.30 per 100 kin each. Moreover, it was estimated by the Ministry of Agriculture and Forestry that Japan's annual requirement of wheat was about 9,000,000 koku, 5,000,000 koku of which was used as flour while balance of 4,000,000 koku for brewing and other purposes. The Government, therefore, determined to increase wheat production to this figure. They encouraged rice farmers in 1932 to turn over their land to wheat production, figuring on a five year drive, and the Government's goal was reached in three years instead of five. Wheat crop amounted in 1934 to 9,450,000 koku against 8,006,000 koku of 1933, and showed an increase of 41.5 per cent over the average of preceding five years. The acreage was 648,400 cho against 615,888 of 1933. Its increase over the average of preceding years was 24.4 per cent.

The fact that tariff was raised and Japan has become self-sufficient in wheat gives a new advantage to Japan. In the past, Japan had to buy most of wheat in foreign markets. Prices always were subject to fluctuations according to conditions in foreign markets, and it was not always convenient to hedge purchase made in this country. In fact, for many years the business of flour milling was handled as if it were a speculation and the near-failure of the Nihon Flour Company, Ltd. (in the days before the Mitsui Bussan Kaisha, Ltd. assumed control of it) was entirely due to gambling in wheat. Now this danger of speculation has been entirely wiped away from the business. Domestic wheat, most of time, is well within the tariff walls, and is not very much affected by foreign influences now.

Sugar

History and Development

The art of making sugar was introduced from China about two hundred years ago, but no great progress is recorded in sugar manufacture until

after the Restoration, and even then it remained as a farmers' sideline until the end of the Sino-Japanese War of 1894–5, when Formosa, well-known for its sugar production, was ceded to Japan by China. This marked a new era in the sugar industry. In 1896, a sugar refining company was organized in Osaka and from that time the industry began to develop.

The Government undertook to levy a duty on raw sugar in 1899, and, by successive steps, this duty has reached the present rate. In 1911, a tariff of a similar nature was imposed, for the first time, on refined sugar.

In view of the fact that Formosa is ideal both in temperature and rainfall for cane growing the Government decided to encourage the establishment of sugar mills in the Island. With this in view it established the Temporary Sugar Bureau as a branch of the Government of Formosa. The Bureau subsidized sugar companies in establishing sugar mills and purchasing required machinery.. It imported cane seedlings and distributed them to cane growers. It gave, too, subsidies for the purchase of fertilizes, and in various other ways succeeded in dispensing as subsidies, up to 1924, a sum amounting to more than thirteen million yen. As the result of these subsidies, the industry has developed to the present stage. In 1902, the production of raw sugar in Formosa was only about 600,000 piculs, but by 1931 this had increased to over 13,000,000 piculs.

In 1901, the Taiwan Sugar Co., Ltd., was organized. Raw sugar mills with all new machines were established and war was declared against the old-fashioned machines which were only able to produce raw brown sugar. Development was destined to be slow, for the plantations and mills were subject to attacks from the native savages, but this difficulty was gradually overcome and during the prosperity that visited Japan after the Russo-Japanese War, many new companies were organized and the industry developed rapidly.

Present State of the Industry

The sugar industry in Shikoku, Kyushu, and the Loochoo Islands is making no headway, but that in Formosa, is rapidly progressing, and at present it is the Formosan sugar that controls the sugar market in Japan. Refining is making good progress in Japan proper.

PRODUCTION OF SUGAR

(Unit 1,000 piculs)

Year	Formosa	Japan Proper	Hokkaido	Korea	South Sea Islands	Total
1924-1925	7,992	1,201	167	6	148	9,516

1936-1937*	16,292	1,696	750	—	1,000	19,738

* Estimate

Before 1926, the total production of sugar was only about 10,000,000 piculs. But after that year production rapidly increased, and in 1934–35, it had reached over 19,536 piculs, about twice as much as six or seven years ago. The increase came chiefly from Formosa, and is due to the advance in agricultural method, viz., the planting of superior canes, prolongation of the time of planting, improvements in ploughing, etc. As the result of this increase in yield, imports of sugar have been considerably reduced.

CONSUMPTION OF SUGAR
IN JAPAN PROPER

(Unit 1,000 piculs)

Year	Total Consumption	Per Capita Consumption in kin
1927	12,093	20,07
1928	13,035	21,27
1929	13,596	21,86
1930	12,949	20,57
1931	13,461	20,59
1932	14,310	20,73
1933	13,936	18,69
1934	12,147	23,18
1935	15,656	22,23
1936	16,618	23.99

Japan's consumption of sugar showed an increase during the 1934 calendar year, reaching a figure which broke all records except that of 15,333,253 piculs set in 1932.

In the past Japan has been generally a self-supplying country, having either only a very small excess of import or export. Even 1934–1935 production, which is considered very large in Japan and is estimated to amount to 1,333,000 tons, will be only 4½ per cent of the world total production, which is estimated at 25,165,000 tons. Her per capita consumption only slightly exceeds the international average of 22 kin per year, that in 1935 being 23.18 kin.

Tables for exports and imports of sugar are given below. In spite of all political troubles China has always been the best market for the Japanese production. The figures for 1932 declined abruptly, but this was due to the Manchurian Incident, and the loss of Manchuria which was itself a good market. If figures for Manchoukuo, Kwantung Peninsula and China are added together, it will be found that there has been no really great change as might otherwise seem indicated.

Imports from Java Since some of Japanese sugar companies are refiners rather than planters they buy crude sugar wherever they can get it at the lowest price. Often the Javanese sugar is more reasonable in prince and hence usually the import of sugar from there. This was the situation in general until 1931. Domestic producers could not compete and had a hard time making profits, for the Japanese sugar kept entering the country at lower prices. The situation changed somewhat with the reimposition of gold embargo, which caused the decline of yen. The establishment of a new imports tariff served to change the situation further. Since then the Japanese sugar was protected to a certain extent against the import, the producers were plannings to curtail production. Prices soared remarkably. Plans to reduce production costs were taking effect. Per picul cost of the leading companies dropped from ¥7 in 1931 to ¥5 in 1932, while domestic sugar quotations rose from ¥7 in October, 1931 to ¥14 in September, 1932, elevating earnings per picul from zero to between ¥8 and ¥9 a picul, and in this manner the sugar industry experienced its boom in 1933.

The boom, however, did not seem to last long. The international oversupply of sugar, the constant threat that the Netherlands may abandon the gold standard, public criticism against the sugar companies due to recent consumption tax evasion case and the resultant public cry for the abolition of the tariff protecting sugar were all unfavourable factors for the sugar industry. These causes acted to keep raw sugar prices from going up. Since the boom in 1933, the price has been steadily downward. It should be noted, however, that the conditions are not very bad; only forebodings for the future are keeping down prices of sugar.

Brewing

Beer

Historical Beer was brewed in Japan about 80 years ago by a certain scholar, Mr. Ko Kawamoto, who, as he learned how to brew it when he visited Admiral Perry's fleet, on the latter's visit to Japan, tried to brew on his own private account. In 1870, beer was brewed for the first time on a modern industrial basis by an American, Mr. Gobland, at Amanuma, Yokohama. Four years later, Marquis K. Kuroda saw that the soil of Hokkaido was particularly suitable for barley, so he established a brewery in Sapporo, and soon others were built in Meguro, Tokyo, in Suita, Osaka, in Hodogaya, Yokohama, and other places, and the industry has so developed that at present Japan has six beer brewery companies and fourteen breweries with a total capacity of about 1,500,000 koku.

At the end of Feburary	Production of Beer (In Koku)
1927	795,335
1928	904,377
1929	895,945
1930	846,014
1931	797,544
1932	797,283
1933	959,762
1934	980,175
1935	1,047,213
1936 (estimate)	1,210,892

Japan as Beer Consuming Country In spite of the increase in consumption, Japan still occupies an insignificant position as beer producer and consumer in the world. Her production of about 1,000,000 koku in 1933 stands at the fourteenth in the list of beer producing countries with the U.S.A.'s 27,000,000 koku as the first. Also her per capita consumption of 2.77 litres was the tweny-eighth in the list of beer consumers with Belgium's 176.46 litres at the head. This is easy to explain. Most of her people take saké, the production of which is about 4.5 times as large as beer. Saké is the standard drink, only a very small quantity of which is enough for average man. In other countries, beer is a staple, an article of food. But in Japan it is something of luxury, reserved for the people of middle and upper classes. A bottle of beer, which contains about one-fifth of a gallon of beer, sells about at 50 or 60 sen, which is too high for average Japanese farmers or wage-earners. If the Japanese of these classes take as much beer as the Belgians do they would spend greater portion of their income on beer.

Exports and Imports Exports of beer in recent years follow :

EXPORTS OF BEER

(Quantity in koku and value in ¥1,000)

Destination	1933		1934		1935		1936

In spite of the fact that beer which was exported has been exempt from brewing tax since 1912, the export has not been very encouraging. During the Great War, export temporarily increased, due to England and Germany having neglected their Oriental markets, but with the return of peace their attention was again directed toward the East and Japan's export there fell off with it. Since then the export fluctuated between 23,000 and 53,000 koku. The decline of yen has given the export business an importance it never had before, and in 1932 the export totalled 68,812 koku, the largest since 1918. In 1933 the export amounted to 132,373 koku, valued at ¥7,684,000. Relegation in the U.S.A. gave a great spur, the export to that country including Hawaii amounting to ¥537,000. But the export to America proved but temporary; it sharply fell off in 1934. As a whole the 1934 export showed a slight decline as compared with 1933, which was due to the smaller British India and the Dutch East Indian markets. In the latter the Government took steps to end imports from Japan, which reduced the export to that country drastically. On the other hand, exports to Manchoukuo and Kwantung Peninsula increased, so far the latter proving the best market for Japanese beer abroad. Demand in Manchoukuo is steadily gaining, but owing to the establishment of the Manchurian Beer Company, Ltd. export to that country is bound to decrease in future.

Production Capacity Production capacity of breweries was 1,090,000 koku in 1922, which steadily expanded. The increase of capacity was especially marked after the Great Earthquake of 1923, and consumption of beer could not keep pace with it. It increased to 1,700,000 koku in 1931, while actual production was barely 740,000 koku, and it was further increased up to 1,830,000 koku. When the industry was in chaotic conditions during the time of depression, which was made worse by the competition among brewers, this over-expanded capacity proved a great weakness of the industry. The production was curtailed then to the extent of 55 per cent.

Production of Raw Materials The principal raw commodity for brewing beer is barley. This, until recently, was mostly imported, but at present it is being grown in various parts of the country through the brewers making contract with village and town agricultural associations. In this manner about 300,000 koku, which is about the

quantity required by the brewers, is being produced annually, and as most of the breweries have their own equipment for converting the barley into malt the necessity of importing either of these materials is obviated. However, the quantity of barley now raised yearly may prove insufficient if the demand for beer increase to any great extent and supplies will then have to be obtained from abroad.

Another important raw material is hops. Though several attempts have been made at different times to grow them in this country the yield has always been very small, and reliance has to be placed on foreign supplies.

The Beer Industry in 1936 By the understanding of four beer companies the amount of beer to be brewed in 1936 was fixed at 1,210,892 koku, an increase of 153,230 koku as compared with the previous year. Exports of beer decreased 2,604 koku largely due to the rivalry of other countries. Under the permission of the Philippine Government, a beer brewery is to be established in Manila in 1937 by a joint capitalization of the Dai Nippon Beer Company, Mitsui Bussan and Osaka Trade Company.

In accordance with the general change of tax rates in 1937 the same on beer was also raised to ¥35 from ¥25 per koku and the present price of beer per bottle which is ¥0.33 will be raised accordingly.

Japanese Saké

History Japanese saké, brewed from rice, has been the principal alcoholic liquor of the Japanese from olden times. It is brewed everywhere in the country, but the most famous places are the "Nada Gogo," five villages in Hyogo prefecture, the climatic conditions of which are peculiarly suited for its production. In recent years, Hiroshima and Fukuoka prefectures have also begun to brew saké of superior grade. The best rice for saké brewing is raised in Kumamoto, Hyogo and Okayama prefectures.

As saké has been the chief drink of the people for many centuries it has been heavily taxed all along. In 1879, a tax of ¥2 per koku was levied and since then the rate has been gradually increased until it now amounts to ¥40 per koku and brings in an annual revenue to the Government of ¥200,000,000.

No study of brewing saké on a scientific basis was started until as late as 1895. In 1904, a Brewery Experimental Station was established by the Government, at Oji, Tokyo, various experiments were made, and many good experts trained. The art of brewing has now advanced a great deal and the quality of saké brewed has become practically uniform. The quantity now brewed annually is about 5,000,000 koku, nearly all of which is consumed at home, only a negligibly small quantity being exported to China and several other countries.

Present Condition Production of saké in recent years is as follows :

PRODUCTION OF SAKÉ BY KINDS

(In 1,000 koku)

Year (Oct.-Sept.)	Refined Saké	Unrefined Saké	White Saké	Sweet Saké	Distilled Saké	Total
1925-26	5,147	11	11	101	523	5,795
1926-27	4,804	10	10	94	519	5,439
1927-28	4,520	9	10	100	517	5,158
1928-29	4,668	8	10	103	534	5,326
1929-30	4,238	7	8	83	466	4,810
1930-31	3,851	6	6	70	455	4,121
1931-32	3,284	5	6	87	445	3,829
1932-33	3,807	5	6	100	509	4,429
1933-34	4,012	6	6	92	528	4,646
1934-35	3,772	5	6	87	499	4,371

The peculiarity of brewing saké is that large quantities of raw materials cannot be fermented at once. According to the growth of saccharomyces saké, steamed rice, yeast, and water are gradually added and fermentation is brought about slowly. If this method is adopted, with only a very small quantity of saccharomyces saké a large amount of raw materials may be formented and saké of good flavour may be brewed. If, on the other hand, a large quantity of raw

materials is fermented at one time by using a great deal of saccharomyces saké, the resultant saké will not taste good.

Consumption of Saké Nothing is more directly affected by prosperity or depression than the consumption of saké, and it can be quite well understood that consumption, owing to the economic depression, has considerably decreased during the last few years. The farming districts are now feeling the depression very severely, and as saké is consumed more in rural than in urban districts, the saké brewers have suffered in proportion.

Saké Brewery in Manchoukuo Plans were under consideration to establish saké brewery in Manchoukuo, which materialized in 1934. The brewers of "Kiku-Masamuné" of Nada, near Kobé, established a company there, which has a capacity of 1,500 koku a year of saké newly branded "Manshu-Kiku-Masamuné" while the brewers of "Hakkaku" also established one with the same capacity, the saké newly brewed by this company being branded "Kinkaku". Both began brewing on November 15.

Soft Drinks

As Japan is geologically blessed with mineral springs, the people were not slow to study their medicinal effects, and hot springs were used as baths from olden times. As to the utilization of mineral spring water for drinking purposes, mineral water from Rokko Mountain in Hyogo prefecture was the first of its kind that was put on the market. This was as late as 1833, and the drink was named "Mitsuya Hiranosui". Three years later, some Englishmen taught the making of artificially aerated water and with the importation of Cood's bottles and syphon-bottles the manufacture of sweetened aerated water originated. These drinks soon became very popular and the industry made rapid development. After the Russo-Japanese War, "Champion" cider was put on the market to be soon followed by lemonade, citron, and different kinds of syrup, etc.

At present the total production of soft drinks amounts to 710,000 koku a year, of which sweetened drinks accounts for 93%, the rest being ordinary unflavoured aerated water or soda-water. Producers of soft drinks may be roughly divided into two classes. The first of these is composed of those who manufacture the drinks along with beer. These have good equipment and produce on a large scale. The second class is made up of those many who produce on a small scale and sell their products locally.

PRODUCTION OF SOFT DRINKS

(In yen)

	Cider	Ramune	Syrup	Others	Total
1930	7,912,541	2,296,451	1,108,003	6,059,871	17,376,866
1931	8,509,936	1,803,975	970,528	2,668,945	13,953,384
1932	6,976,626	1,676,215	1,073,595	3,721,403	13,447,839
1933	14,132,015	1,424,789	1,182,207	2,950,569	19,689,580
1934	7,801,890	1,600,975	1,848,819	5,495,852	16,747,536
1935	10,365,531	2,611,915	1,615,720	4,023,263	17,616,429

CONSUMPTION OF SOFT DRINKS

(In litre)

(Import included)

	Lemonade, etc.	Cider	Soda water, etc.	Others and Total
1932	22,954,172	73,047,750	7,119,783	161,213,950
1933	24,152,273	53,684,554	7,384,382	129,667,486
1934	22,728,171	53,705,621	7,334,329	142,636,001
1935	18,298,972	56,474,509	8,013,707	139,163,526

Soft drinks which are now selling in Japan can be classified from the standpoint of water and gas used into the following :

(1) Those manufactured of natural spring water and natural carbonic acid.

(2) Those manufactured of natural spring water and artificial carbonic acid.

(3) Those manufactured of filtered or well-water and artificial carbonic acid gas.

Canning

Introduction

The canning industry in Japan was started as early as 1870, but the real impetus to its development was given by the Sino-Japanese and the Russo-Japanese Wars as they created a great demand for canned provisions for the Army and Navy. The Treaty of Portsmouth also served to further encourage this industry by giving Japan fishing rights in Kamchatka and the Maritime Province of Siberia, and together with the development of can manufacturing and floating canneries, the above have been the cause of the great progress in the canning industry as a whole.

Present Conditions of the Industry

At present, the packing industry in Japan is in a fairly developed state in all of its branches. Canned meats have reached a stage where the quantity of production cannot be increased. The demand for meat in Japan has expanded so far that supply cannot keep pace with demand, a shortage of cattle is being felt and a plentiful supply for canning is not forthcoming. On the other hand, canned vegetable, such as canned bamboo shoots, are finding good markets in the U.S.A. and China. Of all the fruits procurable in cans pineapples are the most popular with the Japanese. They are produced in Formosa, and of the 450,000 cases or more that are packed in that island about 400,000 cases are consumed in Japan proper while a greater part of the balance is sold in Formosa, and only a few thousand cases are exported to foreign countries. As to canned fish and shellfish, the production of canned crab and salmon dominates all others. In no other places are canned crabs produced in such large quantities as in Japan, and most of this production is exported to the U.S.A., annual exports being valued at about ¥10,000,000. Red and silver salmon are finding a good market in Great Britain. In view of the fact that catches of salmon on the coast of the U.S.A. and Canada are decreasing the exportation of canned salmon is expected to increase, as also is the exportation of crab-meat, for the demand for it in the U.S.A. is increasing steadily.

PRODUCTION OF CANNED PROVISIONS

(Quantity in kg. and value in yen)

Kinds	1934 Quantity	1934 Value	1935 Quantity	1935 Value
Canned meats	1,861,096	1,986,604	2,577,441	2,364,517
Canned fishes	39,936,500	22,561,174	41,303,645	19,291,820
,, fruit	6,572,153	2,819,074	8,385,953	3,821,032
,, vegetable	8,440,297	3,668,622	9,608,730	3,709,580
Other canned food	46,916,366	12,373,211	38,963,658	16,942,399
Total	103,726,412	43,408,685	100,839,427	46,129,348

The exports of canned provisions from Japan for 1936 amounted to ¥71,077,000 showing an increase of ¥13,948,000 over 1935. The low exchange rate was a potent factor to have caused the heavy gain in exports. Of the exports, ¥15,458,000 was for the United States; ¥32,384,000 for the United Kingdom.

Exports of canned and bottled provisions were again heavy in 1936. This was partly due to active shipments of canned tomato-sardines to the South Sea countries, South America and British India. Until 1931 annual exports of these were only about 30,000 boxes, but in 1932 they gained to 160,000 boxes and to 300,000 boxes the following year. Exports totalled 520,000 boxes in 1934 and reached a pinnacle of 700,000 boxes for 1935.

Japanese goods have now completely ousted American goods in these countries. This has given rise to severe competition among Japanese makers and exporters. Surplus production and the inferior quality are troubling the trade.

Alive to the fact that the canned tomato-sardine industry is doomed to ruin if the situation is allowed to go on unremedied, the Ministry of Agriculture and Forestry has applied the Export Marine Product Control Law to these articles and had the Japan Export Sardine Marine Product Guild manage export testing.

CHAPTER XXII

MISCELLANEOUS INDUSTRIES

Paper, Cement, Ceramics, etc.

Paper

Historical and General

Paper-making in Japan remained a handicraft for over twelve centuries after a Korean priest, Doncho, introduced the technique in 610 A.D. (Some writers maintain that paper existed in this country prior to that date.) During this long period of time, various grades of paper were produced from fibres of certain shrubs such as "kozo[1]," "mitsumata[2]," "gampi[3]," etc.

Foreign-style paper was made for the first time in the 7th year of Meiji, 1874, in a small mill, the Yukosha, Tokyo, through the assistance of an English engineer. Several more mills were established the following year, but the development of the industry was naturally slow on account of the small demand. In the beginning, the raw materials used for foreign-style paper were chiefly rags, but in 1889, wood pulp was used for the first time in a mill which belonged to the Oji Paper Mills, Ltd. At first, the smallness of quantity required and competition from abroad made the industry struggle severely, but as with all other industries, the wars with China in 1894–95 and with Russia in 1904–5 gave it a great chance of development. In 1910, the Tomakomai Mill of the Oji Paper Mills, Ltd., which had been under construction since 1906 began operation. With the establishment of the Tomakomai Mill Japan became selfsupplying with respect to newsprint. Again, the Oji Paper Mills, Ltd., took the initiative in establishing a pulp mill, in 1912, in Odomari, Saghalien Island, but was quickly followed by the Fuji Paper Mills, Ltd., and the Karafuto Industrial Co., Ltd. The industry was just getting well settled when the Great War broke out and prosperity was forced upon it. Importations of foreign-style paper was practically stopped. Demand at home advanced, exports increased and the industry expanded at a great speed. The production of foreign-style paper in 1881 was only 3,968,000 lbs., it increased to 327,614,000 lbs. in 1914, 519,141,000 lbs. in 1919, 317,383,000 lbs. in 1924, and 1,418,187,000 lbs. in 1929.

In 1932 the Oji Paper Mills, Fuji Paper Mills and Karafuto Industrial Company were merged into one firm under the name of the Oji Seishi Kabushiki Kaisha (Oji Paper Manufacturing Company, Ltd.). It has a subscribed capital of ¥300,000,000, and is virtually monopolistic having control over 80% of the total paper production in the country and producing about 85% of the total foreign-style paper. The real strength of the Oji Paper Manufacturing Co., Ltd. lies in its almost complete monopoly of pulp production. In 1935 it turned out 500,000 tons, which was equivalent to 95.2 per cent of domestic production.

Production

Eleven large companies form the Nihon Seishi Rengokai (The Paper-Makers' Association of Japan). They are the Oji Paper Manufacturing Company, Ltd., Mitsubishi Paper Mills, Ltd., Hokuetsu Paper Mills, Ltd., Nihon Paper Industry Co., Ltd., Inui Paper Mills, Ltd., Nihon Paper Mills, Ltd., Nishino Paper Manufacturing Plant, Showa Co., Asahi Co., Taisho Industrial Co. and Tomoegawa Paper Manufacturing Co. These companies together produce 98% of the foreign-style paper in Japan. The chief functions of this organization at present are to make agreements for the limitation of production, for the joint control of stocked paper and for the maintenance of selling prices. Four of the member companies produce pulp in addition to paper, and the largest company, Oji, produces newsprint, the production of which is so large that they practically supply all domestic requirements, only a very small quantity being imported.

Production as well as sales broke previous records of 1,418,187,000 pounds and 1,379,231,000 pounds respectively in

1 Paper mulberry. 2 Golden flowered Edgeworthia (Edgeworthia chrysantha). 3 An indigenous plant (Wikstroemia sikokiana).

1929. The chief cause for rise in volume of output and sales was a lifting of pressure from import paper because of a decline in the yen's exchange rate.

In 1930, the consumption of paper was reduced to an alarming degree and as a measure to dispose of surplus products, the Nihon Seishi Rengokai agreed to reduce production. During 1931, the curtailment was 35% from January to August, 45% from September to November, and 55% in December. The production of cardboard was also curtailed by 45%. In this manner, production in 1931 was reduced by 37,000,000 lbs. or 2.7% as compared with the previous year. The figures in the following tables show production since 1926.

PRODUCTION OF PAPER SINCE 1925

(Factory Statistics by the Ministry of Commerce and Industry)

(Quantity in 1,000 kg. and value in ¥1,000)

Year	Printing Paper		Copying Paper		Drawing Paper		Wrapping Paper	
	Quantity	Value	Quantity	Value	Quantity	Value	Quantity	Value

Cellophane

The monthly output of the Japanese cellophane industry, which has grown considerably within recent years, is approximately 6,000 reams produced by 11 manufacturing concerns, such as Nippon Cellophane, Tokyo Cellophane, Ta-

kasaki Cellophane, Fuji Glyphane and others. Ever since 1932 importing of the French product into Japan has been checked. Thus, the country's cellophane industry, having become selfsufficient, is today exporting this domestic product and the line is one of the most promising in the land. Cellophane exportation has been conducted since January, 1934. Orders keep coming from British India, the Straits Settlements, Hongkong and other points abroad. India is considered as an exceptionally worth-while market for the product. Having become encouraged, many cellophane producers are expanding their products. The 1933 production reached 574,029 kg. valued at ¥2,000,000. This industry in Japan may outdistance the corresponding French industry, and places its products on the markets of various European countries. Cellophane was first imported into the country about 1923, but in the following year Japanese found how to manufacture it. The Tokyo Cellophane Company stated the operation and then several other companies followed suit. Both imports and exports are hardly worth mentioning in quantity and value. Its production since 1929 rapidly expanded as the following table shows :

PRODUCTION OF CELLOPHANE

Year	Production Qty in kg.	Value in yen
1929	16,875	86,400
1930	—	85,400
1931	64,575	176,170
1932	147,000	473,634
1933	574,029	2,008,057
1934	726,842	3,414,839
1935	2,382,433	3,940,716

Consumption of Paper

Foreign-Style Paper Looking at the figures of paper consumption, we find that until 1929 it kept increasing, but in the following year it decreased somewhat owing to the world-wide economic depression. It increased again in 1931, but we can safely presume that the stock was considerable, because imports increased considerably while exports decreased to an alarming degree. The following table indicates the trend of paper consumption in Japan proper during the past twelve years.

CONSUMPTION OF FOREIGN-STYLE PAPER

(Statistics of the Nihon Seishi Rengokai)

(Quantity in 1,000 lbs.)

Year	Production	Imports	Exports	Consumption	Consumption per Capita
1927	1,191,074	112,555	92,484	1,211,245	18.9
1928	1,343,479	102,863	134,035	1,312,307	20.2
1929	1,451,526	81,084	140,289	1,392,321	21.1
1930	1,401,711	100,160	168,808	1,333,063	19.9
1931	1,374,899	147,549	141,821	1,380,627	20.4
1932	1,311,315	99,453	87,356	1,323,412	19.0

1936	1,825,848	193,664	225,080	1,794,432	25.6

Pulp Industry

Since Japan started to manufacture wood pulp in 1889, its development has kept pace with the development in the paper industry, and expansion during the time of the World War was prodigious. The industry has been in a state of depression since 1921, but in spite of that capacity of production has expanded. In the years 1930, 1931 and the early part of 1932, it was further depressed on account of the shrinkage in demand, lower prices, and competition from Canada and Scandinavia.

Production and Imports The peculiarity of paper pulp production in Japan is that there is no independent mill which produces pulp of this description, that which is produced being turned out by paper-makers, who not only produce for their own consumption, but also for the purpose of selling to other paper-makers. Most of Japanese paper-makers who do not own pulp mills, therefore, must either rely on the Japanese pulp producers for supplies of pulp, or must buy imported pulp. Tables given below show the amount of production and import of pulp, as well as

he amount of lumber used for pulp production. There is hardly any export of pulp from Japan.

PRODUCTION OF PULP

(Forest Bureau, Ministry of Agriculture and Forestry)

(In tons)

Year	Sulphite Pulp	Ground Pulp	Karaft Pulp	Others and Total	Lumber Consumed (in koku)
1928	310,020	237,203	20,306	567,529	7,905,884

Demand and Supply There is scarcely any export of pulp from Japan, and domestic production plus the quantity imported can be taken as quantity required. The following table shows the relation between demand and supply.

DEMAND AND SUPPLY OF PULPS DURING THE LAST 7 YEARS

(Forest Bureau, Ministry of Agriculture and Forestry)

(Unit in ton)

Year	Quantity Produced	Quantity Imported	Total Consumption	Quantity Required for Paper Making
1928	567,529	73,144	640,673	631,853
1929	618,602	80,410	699,012	684,612
1930	625,537	79,107	704,644	685,324
1931	566,709	100,636	667,221	641,781
1932	551,120	101,168	652,288	615,328
1933	637,400	159,974	997,343	745,143
1934	710,000	225,260	935,250	850,060
1935	724,042	269,923	993,234	755,889

1936 Paper Industry

The conditions of the foreign-style paper manufacturing industry in Japan during 1936 were featurless. The only point that deserves mentioning here is that the lack of equilibrium arising from the comparatively low level of prices of manufactures in spite of the higher quotations of materials were further aggravated.

The relations between demand and supply in the foreign-style paper continued to be satisfactory. The production by the member companies of the Japan Paper Manufacturers' Association during 1936 amounted to 1,825,000,000 pounds which represented an increase of 106,000,000 pounds over similar figures for the preceding year. The domestic con-

sumption during the year amounted to 1,884,000,000 pounds, gaining by 156,000,000 pounds when compared with the consumption in the preceding year. The percentage of the increase in the production was 6.2 per cent and that of the increase in the consumption was 9.2 per cent.

The exports of Japanese-made foreign-style paper gained their lost strength to a great extent in 1936. The amount of the exports reached 225,000,000 pounds which came very close to the figures for 1930 which recorded an all-time high. As the domestic consumption is expected to continue its increasing tendency, the various paper mills are expected to expand their facilities. The production of printing paper will then increase.

The question that arises here concerns with a smooth supply of pulp for the manufacture of paper and the movements of quotations in the future. At present a shortage of pulp is being felt throughout the world and it is said that the Northern European countries have no stocks. In view of this fact, the upward trend of quotations of pulp, and of the foreign-style paper as well, will, in all probability, continue to be accelerated in the future. It follows that the small-scaled paper manufacturing companies which are not equipped with facilities for the manufacture of pulp will have less profits in the future.

Quotations The conditions of the market of foreign-style paper in this country have been quite alive of late. The weak tone which presented itself in October, 1933, continued until November, 1936, and was then replaced by an active tone. The Japan Paper Manufacturers' Association has already raised the official quotations of printing paper by ¥0.027 since the close of November, 1936. The latest prices were ¥0.185 per one pound of the "Chitose" printing paper, ¥0.17 per one pound of the imitation paper "B" and ¥4.50 per one ream (36½ pounds) of the "Yuri" rough paper, octavo. These prices were ¥0.02, ¥0.015 and ¥1.05, respectively, higher than the low quotations recorded in 1936.

The higher quotations of papers were due to the rise in the price of pulp which in turn was caused by the world-wide shortage of supply. The price of sulphurous acid unbleached pulp rose from around ¥0.08 per one pound until the autumn of 1936 to ¥0.14 of late, gaining by 60 per cent.

QUOTATIONS OF FOREIGN-STYLE PAPERS

		Printing Paper "Chitose" (per one lb.)	Imitation Paper "B" (per one lb.)	Rough Paper (octavo, per one ream of 16½ lbs.)
1929	average	¥0.155	¥0.138	¥3.47
1930	,,	0.143	0.121	3.00
1931	,,	0.130	0.116	2.65
1932	,,	0.135	0.130	2.75
1933	,,	0.171	0.168	3.49
1934	,,	0.168	0.165	3.45
1935	,,	0.167	0.161	3.45
1936	high	0.175	0.160	3.80
	low	0.165	0.155	3.45
	average	0.166	0.156	3.49
1937	January	0.180	0.165	4.30
	February	0.185	0.170	4.50

Demand and Supply The demand-supply relations in foreign-style paper during 1936 continued in a satisfactory state. The production continued to increase but the demand increased more rapidly. It is to be noted that the foreign trade of foreign-style paper also improved. During the year, the total production by the 12 paper manufacturing companies which are members of the Japan Paper Manufacturers' Association reached the enormous figures of ¥1,825,000,000 pounds, gaining by 106,000,000 or 6.2 pec cent over the output in 1935.

The increase in the production by the members of the Japan Paper Manufacturers' Association may be attributed to the participation of the Gakuyo Paper Manufacturing Company in the J. P. M.'s Association and the establishment of new paper manufacturing facilities. The alleviation of the curtailment of production of printing paper is also accountable for the increased production to some extent .

The consumption of foreign-style paper in Japan Proper during 1936 amounted to 1,884,000,000 pounds which represented an increase of 156,000,000 pounds or 9.2 per cent over similar figures for the preceding year. The percentage of increase did not reach the level of 10.2 per cent as recorded in 1934 but otherwise it was the highest since 1929.

The following is a table showing the relations of demand and supply in regard to foreign style paper from 1929 to 1936 :

	Number of Manufacturing Machines being Operated at End of Year	Production (In 1,000 pounds)	Sales (In 1,000 pounds)	Demand (In 1,000 pounds)
1929	136	1,418,187	1,379,231	1,337,484
1930	145	1,367,534	1,347,188	1,271,102
1931	138	1,330,584	1,329,585	1,327,011
1932	138	1,311,315	1,414,768	1,378,784
1933	148	1,444,105	1,468,580	1,457,072
1934	155	1,591,475	1,605,885	1,605,350
1935	160	1,719,637	1,680,670	1,727,551
1936	173	1,825,848	1,872,640	1,884,244

Exports and Imports The exports of oreign style paper during the year nder review amounted to 225,000,000 ounds valued at ¥27,500,000 odd. When ompared with similar figures for the receding year, the volume of the exorts increased by 25,100,000 pounds or 3 per cent and the value swelled by 4,460,000 or 19 per cent. The highest ecord of this kind of exports in the ast was established in 1930, amounting to 226,900,000 odd pounds in volume nd ¥27,560,000 in value.

In the past, the exports of foreign-tyle paper from this nation were almost all destined for China. On account of the Chinese boycott of Japanese goods following the outbreak of he Manchurian Incident, the exports f foreign-style paper also suffered a reat blow. It may be observed in this connection that the exports were reduced by half during 1932. The reimposition of the gold embargo, however, enabled the exports to advance to he South Sea region and India on the trength of the low exchange rates of he yen, thereby regaining what they ost in the Chinese market.

In the meantime, Manchoukuo emerged as a State independent from China nd North China also came to be included as a destination of Japanese exports. The Chinese consumers of foreign-style paper, who turned to the products of the Northern European countries mainly out of their anti-Japanese sentiment, are now found to be gradually returning to the use of Japanese products for various reasons.

Along with the advance of the exports, the imports of foreign-style paper also appeared in large quantities. During 1936, the imports amounted to 193,000,000 odd pounds valued at ¥16,000,000. When compared with the imports in 1935, these figures represented an increase of 26,100,000 odd pounds or 15 per cent in volume and upwards of ¥300,000 or 9 per cent in value.

Thus, the excess of exports over imports of foreign-style paper during the year under review amounted to more than 31,400,000 pounds valued at upwards of ¥11,500,000. The volume of the export excess showed a slight decrease from similar figures for the preceding year but the value increased.

Prospects of Paper Manufacturing Business It is anticipated that the satisfactory conditions of the foreign-style paper circles in this country will continue in the future. In this connection, it is to be noted that the demand for foreign-style paper is seldom affected by the changes in the general business conditions because of its cultural nature. A review of the demand during the past 10 years shows that there has been an annual increase except in 1930 when a decrease was recorded. The average annual increase amounted to 6.2 per cent.

Fertilizers

In 1931 the association formed by manufacturers of chemical fertilizers, maintained a high rate of curtailment of production in order to minimize the loss which resulted from the general alarming situation in industries, especially in agriculture, but the dumping of sulphate of ammonia by British and German manufacturers swept the fertilizer market and the prices of bean cake, fish guano, sulphate of ammonia, superphosphate of lime, mixed fertilizers, cyanamide, etc., slumped to destructive levels. The domestic manufacturers

did everything possible in their powers to stop importations. They proposed the raising of the rate of import duty, the passing of a law, the establishment of a system of special permits for import and export, and so on, but practically in vain. The price of sulphate of ammonia declined to as low as ¥60 per ton. The situation was very serious, and at last, in November, a special permit system was put into effect through a Departmental ordinance. A ministerial change took place during December and the Seiyukai Party came into power. The Government at once re-imposed the embargo on gold, exports and the stock market immediately became active, and industries, including the fertilizer industry, followed suit.

The problem of food in Japan is a serious one. The Japanese population is increasing yearly by about a million, but the amount of food produced in the country is not enough to feed them. Besides, the arable land in the country is so small and limited that hardly any space is left to effect any further increase, and the only method left, beyond extending abroad, is to increase the yield of crops through intensive farming. For this fertilizers are necessary and the demand has steadily been increasing. The consumption of fertilizers during 1934 was valued at ¥528,-761,000, of which ¥299,920,000 were self-supplied fertilizers, while ¥228,841,000's worth were bought in the market.

General Condition of the Industry

Of all the chemical fertilizers, superphosphate of lime and sulphate of ammonia are the two representative ones, and because of the largeness of their demand and supply the market trend of these two is practically the market trend of the rest.

Superphosphate of Lime The principal raw material for the manufacture of superphosphate of lime is phosphate rock. During 1930 some 570,000 tons were imported, while some 63,385 tons were produced at home, and during 1933 and 1934 imports were 703,686 and 682,546 tons respectively. This rock is imported from U. S. A., Egypt, and the South Sea Islands.

Superphosphate production has been gaining steadily and in 1934 its production was 1,126,149 m.t. valued at ¥34,-771,000. Production during the past few years is reported by the Ministry of Commerce and Industry as follows :

PRODUCTION OF SUPER-PHOSPHATES

(In metric tons)

1929	947,204
1930	957,159
1931	862,401
1932	1,041,497
1933	1,116,573
1934	1,126,149
1935	1,331,616
1936 (estimate)	1,442,000

Demand and supply of superphosphate for the last 10 years follow :

	Production	Exports and Re-exports	Consumption in Japan Proper
	(1,000 tons)		
1926	786	33	751
1927	935	39	894
1928	926	41	884
1929	947	38	908
1930	957	35	922
1931	862	32	808
1932	1,041	81	960
1933	1,116	106	1,009
1934	1,126	121	1,004
1935	1,331	180	1,150

Sulphate of Ammonia The demand for sulphate of ammonia has steadily increased for years. Consumption in 1930 was 488,000 tons, in 1931 it showed a remarkable increase to 618,000 tons. Imports in 1930 were 302,905 tons (value ¥29,612,000), in 1931 they decreased to 224,148 tons and in 1932 a decrease to 119,000 tons was witnessed, value being ¥15,861,000 and ¥7,035,000 respectively. The decrease in imports was made good by the increase in domestic production, which in 1931 was 393,237 tons, while in 1932 it increased to 459,663 tons, to 471,398 tons in 1933 and to 494,-350 tons in 1934. Japan, in this manner, has become self-supporting in sulphate of ammonia, and has become very uneasy regarding overproduction in the future.

In Europe and America, the International Nitrogen Conference failed to relieve various countries from the pressure of overproduction, and these countries, in 1931, tried to dump their stocks in the Orient, especially in Japan, thereby causing the price of sulphate to sharply decline.

Demand and supply of ammonium sulphate in Japan for the last 10 years follow :

	Production	Imports	Reimports	Exports	Re-exports	Consumption in Japan proper
			(In metric ton)			
1926	147,000	296,026	—	4,202	39,278	399,545
1927	176,475	250,014	—	774	40,471	385,243
1928	232,425	284,475	—	2,431	57,921	456,548
1929	234,609	380,658	—	1,858	93,488	519,921
1930	265,826	302,905	18,065	14,924	83,872	488,000

1935	611,751	238,598	71,551	5,992	103,294	812,614

Cyanamide While cyanamide was a fertilizer difficult to make farmers use it, they now recognize the merit of this nitrogenous fertilizer, and owing perhaps to its reasonableness in price, its consumption increased with a great stride. In 1931 its consumption was 168,448 tons, in 1932 177,632 tons, in 1933 216,525 tons, and in 1934 169,071. Production increased rapidly too. While, in 1924, it barely amounted to about 121,000 tons, it increased up to 223,409 tons in 1933, almost two times as large, although it has declined in the following years, as shown in the following table :

PRODUCTION OF CYANAMIDE

(Unit in metric ton and in ¥1,000)

Year	Quantity	Value
1926	140,663	11,960
1927	120,413	10,883
1928	159,938	15,051
1929	161,157	15,066
1930	222,383	16,959
1931	168,042	8,743
1932	180,583	10,660
1933	223,409	15,159
1934	197,252	14,323
1935	260,632	20,633

Vegetable Fertilizers Vegetable fertilizers are many in kind. Bean cake, rape-seed cake, cotton-seed cake, rice bran, etc., come into this class of fertilizers, bean cake being the most important. Supplies and consumption for 1934 were :

SUPPLY AND DEMAND OF VEGETABLE FERTILIZERS, 1935

(In Japan Proper)

(In ton)

	Production at Home	Imports	Reimports	Exports and Re-exports	Consumption
Bean cake	226,876	431,978	87,051	40,032	714,373
Rape-seed cake	106,091	35,777	—	,,	114,804
Cotton-seed cake	48,379	72,204	—	,,	123,390

The domestic production of bean cake is very small when compared with the quantity imported, the greater part of which comes from Manchoukuo. In 1912 the consumption of bean cake, rape-seed cake, and cotton-seed cake was 34,640 tons, which, by 1921, increased to over a million tons, but since then no increase can be noted as the development of the synthetic nitrogen industry has cut deeply into the development of vegetable fertilizer industry.

Fish and Animal Fertilizers In Japan fish is indispensable as food, but at the same time they are caught for oil extraction and the refuse is converted into manure. The consumption of fish and animal fertilizers is as shown in the tables attached at the end of this article. (See Chapter XV.)

In addition to chemical, vegetable and animal fertilizers, a great quantity of self-supplied fertilizers are supplied and consumed, the figures for which are given also in statistics attached at the end of this subject.

1936 Fertilizer Industry

The production of ammonium sulphate during 1936 in Japan was again insufficient to meet the demand because the latter increased rapidly. Although

the demand for ammonium sulphate has increased almost every year during the past, the increase was particularly remarkable in 1936, when the demand reached 1,600,000 tons and showed an increase of 400,000 tons or 33 per cent over similar figures for the preceding year.

Various factors are responsible for the unusual increase in the demand for ammonium sulphate during 1936 but three facts may be enumerated as the principals ones. First, the market price of ammonium sulphate was lowered during the year; second, the economic conditions of the agricultural community improved; and third, ammonium sulphate invaded the territory of soya bean cakes.

Such a tendency as was witnessed by the year 1936 is expected to continue in 1937. Particularly, the economic recovery of the agricultural community is likely to be accelerated. The higher price of soya beans and the shortage of the supply of soya bean cakes will combine to stimulate further the consumption of ammonium sulphate.

Under these circumstances, it is estimated that the demand for ammonium sulphate during 1937 will rise above the 1,800,000-ton level. As the production during the year is estimated at 1,600,000 tons, there will be a shortage amounting to more than 200,000 tons. In this connection, mention must be made of the fact that the quotations of ammonium sulphate will not necessarily be influenced by the demand-supply relations because there is in force a control which will check any abnormal rise in the price. Although the sales prices which form the principal item under control are in principle left to be decided by the civilian circles concerned, the spirit of the Fertilizer Control Law strictly prohibits profiteering.

It is not anticipated that the ammonium sulphate circles will suffer from market disturbances in the future as they did in the past.

Fertilizer Quotations During 1936, the prices of chemical fertilizers were comparatively low while those of vegetable fertilizers were comparatively high. Representatives of these two items are ammonium sulphate and soya bean cakes. The former slumped to ¥3.15 for a time, setting a new low since 1933. The slump, which attracted all the greater attention because of the high quotations recorded in the beginning of the year was attributable to the influence of the enforcement of the Fertilizer Control Law.

On the other hand, the prices of soya bean cakes soared in an abnormal manner, aparently on account of the higher prices of soya beans and the shortage of supply. The rising tendency of the prices of nitrogenous and superphosphorous fertilizers, however, appeared to be held in check. Generally speaking, the market conditions concerning these fertilizers during 1936 were better than in 1935. As these also are under governmental control, they are not likely to suffer much because they have been yielding only slight profits from the beginning.

The following is a table showing the changes in the quotations of the various fertilizers during 1936 and a comparison with the preceding three yaers:

	Nitrogenous Fertilizer (22.5 kwan)		Ammonium Sulphate (10 kwan)		Superphosphorous Fertilizer (One bag)		Soy Bean Cakes (One cake)	
	High	Low	High	Low	High	Low	High	Low
			(In yen)

1936	2.16	1.70	4.80	3.15	1.33	1.17	2.72	1.86
1935	2.16	1.67	4.70	3.52	1.30	1.11	2.18	1.66
1934	1.85	1.62	3.98	3.42	1.17	1.10	1.88	1.33
1933	1.83	1.45	3.90	2.33	1.15	0.90	1.92	1.46

Demand and Supply The demand for ammonium sulphate continued to increase in 1936, reaching 1,600,000 tons and gaining by 400,000 tons or 33 per cent over similar figures for the preceding year. Both the amount and the increasing rate were record-breaking. The result was that a large quantity of ammonium sulphate had to be imported to supply the shortage.

The production of nitrogenous and superphosphorous fertilizers during 1936 showed a decrease when compared with similar figures for the preceding year. With the nitrogen and superphosphate, which were used in the manufacture of compound fertilizers, taken into account, however, the output of these two items of fertilizers during the year under review is believed to have exceeded the production in 1935 although accurate figures are unavailable.

Business Conditions Excepting one or two companies, the business conditions of all the fertilizer manufacturing organizations showed a depression during 1936. Nevertheless, the various companies managed to get along somehow or other and in some cases, greater dividends than before were distributed. This fact is attributable to the increased receipts in profits from other soures by the investing companies. Details are tabulated below :

	Artificial Fertilizer Company		Electro-chemical Company		Show Fertilizer Company

Future Demand and Supply It is believed inevitable that the production of ammonium sulphate during 1937 will be again insufficient to meet the demand because the increasing tendency of production cannot keep pace with that of demand. As in 1936, three factors, namely, the lowering of the market price of ammonium sulphate, the economic recovery of the agricultural community and the invasion of the field of soya bean cakes by ammonium sulphate, are expected to feature the conditions of the ammonium sulphate circles during 1937. The economic recovery of the agricultural community is expected to be particularly notable.

In spite of the bumper crop, the price of rice remains at a high level. Wheat, rape-seeds and soya beans are also dear. In view of this fact, there can be no doubt but that the purchasing power of the agricultural community in regard to fertilizers will be greater in 1937 than in 1936. The higher price of soya bean cakes will accelerate the increasing tendency of the demand for ammonium suphate. It is estimated that the demand for ammonium sulphate during 1937 will rise above the 1,800,000-ton level.

The production of ammonium sulphate from January to November 1936 reach-

ed 1,300,000 tons and by the end of the year, it is estimated to have increased to 1,400,000 or 1,500,000 tons. Further increase in the production is likely to be recorded during 1937. In this respect, however, it may be noted that the expansion plans of the various companies have been almost completed. The present productive capacity totals about 130,000 tons monthly, which means an annual production of 1,560,000 tons. In addition, the productive capacity of the newly established Niigata Sulphuric Acid Company reaching 18,000 tons annually and that of the Yasaku Industrial Company reaching 30,000 tons annually must be taken into account. However, as the operation of the facilities of the two companies are expected to be delayed, it is estimated that the total production in 1937 will not exceed 1,600,000 tons.

If the total production amounts to what is estimated, there will be a shortage amounting to 200,000 tons, which must be met by imported ammonium sulphate.

Statistics

The value of production and consumption of various kinds of fertilizers are to be found in the following tables :

THE VALUE OF FERTILIZERS PRODUCED IN JAPAN PROPER 1925-1934

(Unit ¥1,000)

Cement

History

In 1871, cement works were established by the Government in Fukagawa, Tokyo. This was the origin of the cement industry in Japan. For ten years the works gradually expanded so that by 1891, the total capital invested in the industry was ¥1,000,000, the works numbered ten and the capacity was about 300,000 barrels a year.

In 1898, there were sixteen works with an aggregate capacity of 1,000,000 bbls, and imports were entirely excluded. In 1912, there were nineteen companies and twenty three mills. The total capital invested amounted to ¥18,000,000 while the capacity increased to 4,000,000 bbls.

During the World War, the industry enjoyed unprecedented prosperity and expanded rapidly. New companies were formed and new mills added. At the end to 1926, companies numbered twenty-one with thirty four mills, the total authorized capital was ¥118,000,000 of which ¥85,000,000 was paid up, and the total production capacity increased to 17,500,000 bbls.

During the last twenty years, demand for cement increased every year with five exceptions, there was a 2% decrease in 1912 and a 10% in 1915 and 1919. The average rate of increase was about 11%. But in 1930, domestic consumption suddenly decreased by 12%, the first time that any such sharp decrease had ever been experienced. The decrease was due to the general depression and the economic retrenchment policy of the Government following the removal of the gold embargo in January, 1930. In 1931, there was a further decrease, but in 1932, with general activity in industry being felt, there was some recovery over the previous two years.

The Industry in Recent Years

For some years in the past, the interest of cement industry in Japan centred on the question of the adjustment of over-extended capacity of production. The result is a large curtailment of production.

In 1925 capacity was about 50 per cent larger than the output, which became almost 100 per cent in 1934. In recent years the greatest consumption of cement, including domestic consumption and export, was 480,000 tons of May, 1934, while the production capacity at the end of November of the same year was 1,020,000 tons a month. For almost a year 57 per cent of the Cement Association's (Cement Rengokai) capacity has been curtailed.

The cause of this abnormal condition of the industry is found in the fact that in fixing production curtailment ratio of the member companies of the Rengokai, it has been based on the capacities of production of the members. This led the member companies to expand capacities to get larger shares of business. The situation culminated in the latter part of 1934 in forcing the Department of Commerce and Industry to apply the Major Industries Control Law to the cement industry.

Statistics Statistics for the capacity of production, actual production, output of cement classified by uses and export of the same classified by destinations follow :

PRODUCTION OF CEMENT

(Compiled by the Ministry of Commerce and Industry)

1936 Cement Industry

1936 was a year of disturbances to the cement industry in Japan. The fervent efforts of the Onoda Cement Company and the Cement Manufacturers' Association to undersell each other were at their height and the market price of cement was at an unprecedentedly low level. The decrease in the demand for cement due to the February 26 affair and unfavourable weather conditions further accelerated the competition between the two groups and a production curtailment at an unprecedentedly high percentage was necessitated. Under these circumstances, it was only natural that the profit situation should be aggravated for the cement companies. Excepting the Asano Cement Company, however, all the firms managed to avoid a reduction of dividend by utilizing their profits carried over from preceding terms.

The compromise reached between the Onoda Cement Company and the Cement Manufacturers' Association brought about a stabilization of the cement situation in 1937. The quotations of cement also rose, reaching the neighbourhood of the highest level on record. To add to the stabilization of the situation, a licensing system was enforced, which renders it impossible for the industrialists concerned in Japan Proper to plan increased production or new facilities for the time being. Although outside the sphere of the licensing system, Chosen has also decided to enforce a control over the production of cement.

The demand for cement began to increase on the strength of the enormous budget for the 1937-38 fiscal year. As a result, the rate of production curtailment is expected to be slackened. Accordingly, the business conditions of the various cement companies are expected to be improved. It must be pointed out, however, that besides the acquirement of the right to decide the market price of cement by the Ministry of Commerce and Industry, the enforcement of the licensing system restricts the expansion of the facilities for producing cement in the future so that a remarkable expansion of the productive equipment of the cement industry in the country cannot be expected in the near future although the cement situation has been stabilized.

Conditions in 1936 The competition between the Onoda Cement Company and the Cement Manufacturers' Association was started in Kyushu and South Chosen, both territories of the Onoda. The influence of the rival extended to as far as the Tohoku and Hokuriku districts from the Kwansai. To make the situation worse, the demand for cement decreased to a great extent on account of the situation brought about by the February 26 affair and the continued unfavourable weather conditions

which prevailed during the first half of the year.

Attempting to prevent the decrease in profits, the Onoda Cement Company and the Cement Manufacturers' Association became more desperate in their efforts in increase of sales, thus bringing their competition to its height. In May, the quotations of cement already fell to an unprecedentedly low level, being ¥0.70 per one bag in South Chosen, about ¥0.80 in the Kwansai district and ¥0.90 in the Tohoku district. The low quotations represented a decrease of from ¥0.10 to ¥0.20 when compared with the highest sales price fixed on December 1, 1934.

The shipment of cement from the Chosen factory of the Onoda Cement Company to Japan Proper dealt a great blow to the Cement Manufacturers' Association. The stocks in Japan Proper were thus greatly increased, exceeding the 500,000 metric tons' mark when both the Onoda and the Association are taken into consideration. This necessitated a production curtailment at a greater rate. In January the production curtailment was at the rate of 55 per cent but the rate was increased to 57 per cent in March, to 58.5 per cent in April, to 59.5 in June and to the unprecedented figure of 63 per cent in December.

With the fall of the quotations of cement, the decrease in sales and the higher rate of production curtailment, the business conditions of the various cement companies, including both members of the Cement Manufacturers' Association and outsiders, were greatly aggravated because the production cost was raised. The business reports of the various companies for the first half of the year were able to conceal the unfavourable situation to some extent through the utilization of the reserves carried over from the preceding terms but those for the latter half of the year clearly showed the aggravated conditions.

To go into some details, the total profits of the 14 member companies of the Cement Manufacturers' Association during the first half of the year amounted to ¥10,590,000 against ¥9,964,000 for the latter half of the year. These figures represented a decrease of from 3 to 4 per cent when compared with the profits for the latter half of 1935. Although only the Asano Cement Company reduced the divident for shareholders by 2 per cent, it is still clear that the profit situation was highly aggravated for all the companies concerned.

With the advent of 1937, however, there appeared signs of the cement situation being stabilized as a result of the compromise reached between the Onoda Cement Company and the Association. To further the stabilization of the situation, a licensing system was adopted for the cement industry and the Ministry of Commerce and Industry acquired the right to determine the market price of cement.

Control of Quotations The compromise between the Onoda Cement Company and the Cement Manufacturers' Association was reached in July, 1936, whereby it was agreed to enforce a control over quotations through revising the highest sales price. The prices in the Hokkaido and the Tohoku district which had been at a high level were reduced in wide margins while those in Kyushu and the Kwansai district were lowered slightly. This revision served to restrain an abnormal rise in the price of cement following the conclusion of the compromise between the two groups but at the same time raised the market price which had been lower than the revised prices.

Licensing System The long expected licensing system was enforced on November 21, 1936. Although the system is applied to Japan Proper alone without affecting Chosen, it has made a great contribution toward the stabilization of the cement situation. As a result of the enforcement of the system, the establishment of new facilities and expansion of old ones became impossible after November 20, 1936, without the permission of the Ministry of Commerce and Industry.

As many as 12 or 13 companies were involved in the plans worked out in anticipation of the enforcement of the licensing system but only 5 of them were permitted. In view of the restrictions put on the new facilities and expansion, it may be stated that the cement industry in this country will be free from the usual menace by new establishments.

Demand-Supply Relations The enforcement of the licensing system also eliminated the fear of an aggravation of the relations of demand and supply. The supply is assured of an increase by the operation, either already started or scheduled to be started, of the new and increased facilities. The increase, however, cannot be very great because of the restrictions now in force. It is estimated that the rate of increase in 1937 will be about 6 or 7 per cent.

On the other hand, the demand for cement, which decreased greatly during 1936, is expected to record an in-

crease in 1937 in view of the expanding works of the various producing companies, undertaken under the impetus of the enormous budget for the 1937–38 fiscal year. It is estimated that the rate of increase will be about 12 or 13 per cent.

The following is a table showing details of the demand-supply relations on the basis of a survey of the Cement Manufacturers' Association :

	Production Capacity			Shipments to

(Note: The figures for 1934 do not include the production and shipments by the Onoda, Electric Chemical and Oita during December because the three companies withdrew from the Cement Manufacturers' Association in that month.)

Ceramics

Introduction

Pottery making has an old history in Japan. As far back as can be traced in history some potters appear to have had their secret proprietary methods of production. In the Meiji Era, especially after the Russo-Japanese War, along with the advance in industry in general, pottery making was industrialized, a procedure which was thought difficult of accomplishment, and to-day annual production amounts to from ¥60,000,000 to ¥80,000,000 in value, while exports amount to over ¥30,000,000. It is now one of the principal industries in Japan.

The chief places of production are Nagoya and Seto, both in Aichi prefecture, and the eastern part of Gifu prefecture. The quantity produced in these places amounts to about 70% of the country's total production. Seto is such

a famous place for pottery that the Japanese commonly call chinaware "Seto-mono." Besides the products named above "Kutani" ware of Ishikawa prefecture, "Shimizu" ware of Kyoto prefecture, and "Arita" ware of Saga prefecture, are all famous though produced in small quantities only. Nagoya district is one of the largest pottery producing places in the world.

History

Pottery was being made, crudely admittedly, at the time of the Emperor Jimmu, the first Emperor of Japan, who lived about 650 B.C. At the time of the Emperor Suinin, that is, 66 A.D., a Korean prince was nationalized, and one of his retainers, who knew the potter's art, was able to give instruction on foreign manufacturing methods. Later, at the time of the Emperor Kammu, i.e., 781 A.D., pottery was imported from China, and the art made further progress.

In 1221 A.D., a man named Kagemasa Kato studied the art of pottery making in China. When he returned, he settled in Seto village, Aichi prefecture, and made chinaware of superior quality, the origin of the present "Seto" ware.

After that, many master artisans arose and tea-things, rice bowls, pitchers, incense burners, etc., now of great rarity and value were produced.

Present Condition of the Industry

In 1935 total production of chinaware amounted to ¥99,368,010, while there were as many as 6,624 factories and 61,135 employees. The value of total production including tiles and drainage pipes reached ¥128,451,869.

The following table shows how this industry has developed recently.

FACTORIES AND PRODUCTION OF CERAMICS

(Compiled by the Ministry of Commerce and Industry)

Year	Factories	Operatives	Tablewares	Furnitures	Building Materials	Insulators	Toys	Others	Total
					(In yen)

Exports of Chinaware

Though exports of chinaware amounting to ¥1,300,000 were made as early as 1886, the export business did not develop to any great extent until the Russo-Japanese War. In 1904, the Nippon Toki Kaisha, Ltd., was organized, to be quickly followed by the Toyo Toki Kaisha, Ltd., and the Nagoya Seito-sho. Each of these companies established large mills with up-to-date equipment and be-

gan to produce chinaware on a big scale. Painstaking studies were made to improve the products and build up an export business, and these, together with other special factors, account for the remarkably large increase in exports. The special factors are :

(1) Japan is able to produce specially thin chinaware that other countries cannot.

(2) Japanese artisans are especially clever at their work.

(3) The cost of production is reasonable.

Just at the time when the industry was organized on a modern basis, the World War broke out. Pottery works in belligerent countries in Europe were closed down and exports from Japan increased by leaps and bounds. A temporary set-back was experienced when the War ceased, but a recovery was soon made and there was a steady growth until 1929, then there was a falling off until 1932, when some slight gain was made over the previous year.

EXPORTS OF CHINAWARE TO DIFFERENT COUNTRIES

(In ¥1,000)

Others	303	2,049	1,942	1,962	4,040	5,440	6,270
Total	5,913	27,171	19,307	22,937	35,634	41,879	42,734

Domestic Consumption

There are no statistics to rely upon for the exact amount of domestic consumption, but if we subtract exports from the total production we have an approximate value. Figures shown in the second column of the first table "Factories and Production of ceramics" give some idea of the amount. Though tile making is growing fast on account of the increase in building of Western style houses, the market had been depressed because of lack of control over production and sales until 1934 when it began to regain property.

The peculiarity about chinaware intended for domestic use is that it must be made by small factories on the family basis. The reason is that the taste of the Japanese for chinaware is very varied, differing according to each individual as to the form, colour, design, etc., and making it impossible to produce on large scale mass production principles.

Glass and Glass Manufactures

Origin and Development

As far as historical record shows, the art of glass manufacturing was developed in the Nara period, that is about 700 A.D. Later, technics of manufacturing were imported both from the South Sea Islands and China, and put into

practice in Osaka, Kyoto and Tokyo, where the industry developed. After the Meiji Restoration, the Government established a model factory to encourage the development of the industry and various attempts were afterwards made to make glass and glassware both by the Government and by individual concerns, but it was not until after the Russo-Japanese War of 1904–1905, that the industry made any great progress.

Present Condition

Due to the strenuous efforts of manufacturers and advantages from a low exchange rate since the gold embargo was replaced, the glass industry in Japan is doing remarkably well. Imports have declined in the past 3 years, their worth being ¥7,442,000 in 1934, ¥6,322,000 in 1935 and ¥3,845,000 in 1936.

On the other hand, the exportation of Japanese glass products, stimulated by exchange relations, has been exceptionally active since the last gold embargo was clamped. Exports in 1933 came to ¥15,326,611, in 1934 to ¥19,454,333, in 1935 to ¥23,337,000, and in 1936 to ¥25,627,000. Glass products from this country are shipped to almost all parts of the world.

A strong point for Japanese glass exports is that Japanese manufacturers and traders are able to reduce their export prices by 30 per cent, since the present prices are 30 per cent higher than usual. Exporters are wisely leaving room for competition with foreign products, even though tariff rates are raised by foreign countries. Still, the present prices of Japanese products are low and for this reason, they are in heavy demand abroad.

Glass Tableware Glass tableware was early manufactured in Kagoshima and the old province of Satsuma in Kyushu Island. After the Meiji Restoration it was manufactured by the Shinagawa Shoshi Seizosho (Shinagawa Glass Co.) which was under Government control. At present it is manufactured by the Fukushima Glass Co. organized in 1896, Koidé Shoshi Seizosho (Koidé Glass Co.) established in 1898, Marasa Glass Co., organized in 1918, and the Kawai Shoshi Shokki Seizosho (Kawai Table Glassware Co.) organized in 1920, etc. Production by these and other manufacturers is given below

Other Glass Articles Glass articles for scientific and medical purposes were manufactured as early as 1850. There are many manufacturers of these articles in Tokyo district.

The manufacturing of eye-glasses was first practised as early as 1600. In 1873, a certain Mr. Matsugoro Asakura from Tokyo, went to Austria and learned the art of manufacturing eye-glasses on modern principles. His son and several others are now manufacturing them.

Red glass was manufactured by the Kagoshima clan prior to the Meiji Restoration, and later by the Shinagawa Shoshi Seizosho, which was under Government control. Also a certain Mr. Tokijiro Iwashiro succeeded in manufacturing lenses for the use of searchlights, and light-houses. The right of manufacturing these lenses was later transferred to the Nippon Kogaku Kogyo Kaisha, Ltd., (The Nippon Optical Science Industrial Co., Ltd.). Mr. Iwashiro's son later succeeded in manufacturing cut glass.

Glasses for optical work were mostly imported from Germany before the World War, but when the supply was cut off by the war, it was determined that "lenses for optical science must be produced at home at any cost." The Nippon Kogaku Kogyo Kaisha, Ltd., to which all the results of studies made by the naval arsenal were transferred in 1914, and the Osaka Industrial Research Institute, which started research work in 1921, continued investigations. The Osaka Institute succeeded in 1925 in discovering a formula for manufacturing lenses, superior to German makes at reasonable cost. The Nippon Kogaku Kogyo Kaisha, Ltd., also succeeded in finding a way to make these lenses, and it is probable that the importation of lenses of these classes from Germany will, in a not distant future, become unnecessary.

Glasses for the chemical industry, that is, hard glasses, are manufactured in several mills in Japan. High grade hard glass which is not in any degree inferior to the best imported is now manufactured by several firms for thermometers, gauges and the chemical industry.

Sheet Glass

Though many efforts were previously made to manufacture sheet glass, it was not until 1904 that a Mr. Magoichi Shimoda, after two years of experimental manufacture, was successful in producing a product that could be put on the market.

In 1907, the Asahi Glass Co., Ltd., was organized in Amagasaki, Hyogo prefecture, by the family of the late Baron Yanosuké Iwasaki. An export and five skilled workmen were brought over from Belgium and commenced to manufacture it from 1909. The company struggled for 7 years against difficulties

in technique and pressure of foreign competition, and in the end succeeded in producing about 120,000 cases a year. In 1914, a patent, which enabled the company to produce sheet glass by a mechanical process was bought from the American Window Glass Co., Ltd., and a factory was established at Makiyama in Tobata, Fukuoka prefecture. On account of the cutting off of imports from Europe during the World War, the company not only increased production, but exported their products to places far afield as South Africa and London. In 1916, the company established a factory in Tsurumi, Yokohama, and in 1917 another in Yawata, Fukuoka prefecture. In 1923 and 1924, the factories in Makiyama and Tsurumi were extended, and at present the company is able to produce as much as 330,000,000 sq. feet.

At present the Asahi Glass Co. Ltd., the Nippon Sheet Glass Co. Ltd., the Nippon Thick Glass Co. Ltd., and the Tokunaga Sheet Glass Co. Ltd. are manufacturing sheet glasses.

PRODUCTION OF GLASS AND GLASSWARE

(one case contains 100 sq. ft. of glass)

Lacquer-ware

Historical and General

Industry Inherent The Japanese are a people skilled in handiwork. Prior to the introduction of modern productive industries from the West in the early years of Meiji, the Japanese were separated from Occidental civilization and culture and the various handicraft industries that had come down from ancient times were in a flourishing condition and in a state of development peculiar to the country. The industries especially referred to are the silk, porcelain, earthen-ware, lacquer-ware, cloisonné-ware, gold lacquer-ware and the metal engraving.

The lacquer-ware industry existed in ancient times. As was the case with the ceramic industry, it progressed with the introduction of Buddhism and of advanced methods from China, but did not make so notable a development as in the case of the textile, ceramic or other industries. With the rise to favour of the tea ceremony in the Ashikaga Age, Kyoto monopolized the production of lacquer-ware, although wares of nearly the same kind, such as "Wajimanuri" and "Shunkeinuri" were produced in fairly large quantities in different places and were largely used for table-ware. After the Restoration of Meiji there was a considerable decline in the demand for such wares as "Noshironuri," "Wakanuri" and "Tsugarunuri" which had been popular in the Tokugawa Period, while the output of "Wajimanuri," "Kurodenuri," and "Imazunuri" which had principally been used as table-ware greatly increased as they were being exported in increasingly large quantities.

Urushi Obtainable Only in the Orient Japan is the only country in the world enjoying world-wide renown in the technical art of lacquer-ware manufacture. The various industrial arts of Japan such as the porcelanic and weaving owe their origin to China or Western countries, but as regards lacquer, Japan acknowledges no teacher; from remote antiquity, especially in the technique of relief lacquer the art has developed without aid from any foreign methods of manufacture or materials. For more than two thousand years the craftsmen of Japan, having striven to improve, finally attained a degree of wonderful skill. The production of lacquer-ware is confined to Oriental countries where only lacquer juice, known as urushi, is obtainable—Japan, China, Korea and India,—although there is an evident tendency in Western countries in recent years to manufacture lacquer-ware of industrial art value. The application of mother of pearl, known as nacre work, became common during the Nara Age. A large number of ancient examples of lacquer-ware that have served as models for succeeding generations are still kept in the Shosoin, the Imperial Treasure House in Nara. These represent products of the Tempyo period, when even large wooden buildings were lacquered. Among such buildings left standing are the Chuson Temple in Iwaté prefecture and the Byodoin Temple in Kyoto prefecture. Embossed lacquerware was invented during the Kamakura Age, when tasteful designs of chrysanthemums and other flowers were in vogue.

From Toyotomi Downward A golden mother of pearl inkstone case in

embossed lacquer with a chrysanthemum design is now treasured in the Hachiman Shrine at Kamakura. The pomp and glory of the third Ashikaga Shogun stimulated the art and resulted in the perfecting of embossed lacquer work and the extension of its application to articles of daily necessity. Hideyoshi Toyotomi accomplished his gigantic task of pacifying the country. Grandeur was a unique feature of his administrative policy and social and other life in those days. The grand Momoyama style, named after his palace, was reflected on the industrial arts. Koetsu relief lacquer was supreme and Kodaiji relief lacquer was also produced, representative lacquer products of those days. When the third Tokugawa Shogun, Iyémitsu, came into power, he erected the great Nikko mausoleum and Zojoji Temple at Shiba, Tokyo for his grandfather and father respectively, and lacquer was amply applied to these buildings. During the reign of the fifth Shogun, Tsunayoshi, an exquisite technique attained its zenith, defying all the imitative powers of succeeding generations. It was applied to scabbards of swords, miniature medicine-cases (known as inro) and various articles used by the Daimyo. Notable lacquerers such as Koami Choju, Koma Ikyu, Ogata Korin and others flourihed during this period. Since that time the production of lacquer has spread to various localities throughout the country, and unique local colour has been freely introduced into the design. Competition ensued as in all industrial articles, and some of the products of those days were exported abroad. Japanese industrial arts were almost wholly neglected during several years following the Meiji Restoration. Lacquered articles of artistic value were sold at ridiculously low prices and these were purchased by foreigners who had eyes for their value and who took them to their own countries. This provided an opportunity to introduce the Japanese lacquer art to foreign countries, but at the same time Japan lost many articles of both æthetic and monetary value.

Its Fine Quality A French steamer was wrecked off Izu while outward bound from Japan laden with Japanese lacquer-ware that was to be exhibited at the Vienna International Exposition in 1873. The cargo was salvaged 18 months after the accident and the lacquer goods were found to be undamaged. On slight polishing they regained their former lustre and thus displayed the intrinsic value of this national art product. When the news of this salvaging and condition of the goods became known abroad the export trade took a sudden spurt forward, but there were traders who exported goods of poor quality, and did great damage to the credit and value of Japanese products in the eyes of foreign customers. Apart from defects in manufacture, some of the bad reputation which exported Japanese lacquer-ware has gained, is ascribed to the fact that some manufacturers are producing inferior articles on account of having been forced by exporters to lower prices, but of late years efforts have been made by the authorities concerned to remedy these evils.

How the Ware is Made

Lacquer Juice Lacquer juice forms the main material of the craftsmen. It is obtained from the lacquer (urushi) tree grown in Oriental countries and is a milky juice with a greyish-white colour. In air it undergoes an oxidizing process, becomes brown and finally solidifies. When solidified, it is not soluble in ordinary solvents and has an unusual resistance to acids. Its beautiful appearance and smooth feel defy paint and varnish. Lacquer juice is regarded as a botanical excretion and in normal conditions is stored in a fixed position in the tree. The tree is tapped by making a horizontal, slanting or V-shaped incision of 10 centimetres right to the sap, and from this the greyish-white juice oozes. Attempts have been made to obtain the juice by means of pressing the bark and leaves of the tree, or by using alcohol, but without success. The greyish-white product is called raw lacquer and is used for the initial application to the goods to be lacquered. As material for the finishing applications and colour lacquering the water is extracted from the juice, and various refining processes follow according to the result required. The chief ingredients of raw lacquer are Urshiol, 77.63%, gummy substance, 2.62%, carbonic substance 1.94% and water 17.81%.

Manufacturing Process Lacquer-ware manufacturing is divided into three stages, namely, the initial application, lacquering and relief lacquering. The process is further divided into different categories according to technical experience and skill. Wood, bamboo, paper, metal and porcelain are used as basic materials for initial lacquer applications. Wood is mostly used throughout the country, but wood has the drawback of swelling and contract-

ing according to weather condition. Bamboo and paper are used for particular lacquer-ware making, while metal and porcelain are less commonly used. The initial application is made on the surface of the ware by means of a spatula or brush, the article is thus made water-proof and the absorption of lacquer applied to finish or fill in tiny holes or other defects is prevented. The fininshing process is of course for the purpose of making the ware solid and smooth.

Lacquer is the best material for the initial application, though shibu-varnishing or glue-varnishing is also practised, especially for low grade wares. The juice of the astringent persimmon is the chief substance of shibu, and with this is mixed powdered charcoal or other materials. Glue is also used as a raw material, but it is not much good for solidity. Glue-varnished wares are made mostly for export, and the bad reputation that modern Japanese lacquer-ware has in foreign markets is chiefly ascribed to these glue-varnished articles. Formalin is used to solidify these wares. As regards the finishing application, a proper amount of pigment is added to refined lacquer to make it coloured or transparent, and this is finely applied to wares that have been through the initial application. These are then kept in a wooden closet to avoid dust and allowed to dry. This is called fresh lacquering. When wares are dry, they are polished by charcoal.

Relief lacquering was evolved to give beautiful designs to wares after the finishing application had been gone through. Pictures or designs are painted on the articles by lacquer and before the lacquer is dry, gold, silver and other metallic dust or pigment is applied. Then polishing for the finishing touches takes place. This is called ordinary relief lacquering, but there are other methods of production and prices differ according to the extent of finish. Of the two principal methods of manufacturing high-class goods, polished relief lacquering is one. When the ordinary relief lacquering process is completed, lacquer is once more applied to all the surface and the whole is then polished by charcoal, and the design is presented on the surface. The other is embossed relief lacquering, and this requires much time and skill. Designs are made in high relief and the ordinary relief lacquer is applied. Shells, corals, jewels and stones are often inlaid in lacquer-ware and to these are applied transparent or block lacquer, the product being known as aventurine-ground lacquer-ware. Gold dust is also applied in relief and this is known as flush painting. Another unique lacquering is the application of coloured lacquer coatings for as many as a hundred times, and when dry an exquisite design is carved on the ware. This process somewhat differs from relief lacquering but it forms one of those elaborate methods in the manufacture of the lacquer-ware which remains one of the outstanding products of the Japanese craftsman.

Production

In 1935 there were 11,170 factories with 36,217 operatives. The value of production amounted to ¥38,399,906, a gain of ¥2,088,147 as compared with the previous year.

CHAPTER XXIII

MISCELLANEOUS INDUSTRIES (Continued)

Caustic Soda, Soda Ash, Bleaching Powder, Dyestuff, etc.

Introductory

The Japanese chemical industries involving the manufacturing of caustic soda, soda ash (sodium carbonate or washing soda) and bleaching powder owed their development to the World War, which stimulated them to sudden growth. More than 10 companies were founded during that period, but only a few of them survived the great economic slump which followed the termination of the War. For a long time afterwards the industries were in a depressed condition, and it has been no easy matter for the existing companies to have arrived at their present stage of development, many attempted but fell on the way, often, with others, to be merged with stronger concerns. Those which are doing business at present are all backed by large business houses or financing organizations. Protection of the Government, which is alive to the momentous value of these industries, must not be ignored. Without Government protection and encouragement, the prosperity to which they have now attained would never have been realized. There are about nine leading industries which the Government and the various authorities concerned are making efforts to consolidate, and this is one of them. The others are the nitrogen fixation industry, the dyestuffs industry, the iron and steel manufacturing industry, the aluminium industry, the oil industry, the automobile industry, the photo-chemical industry, and the minute chemical industry.

Soda Ash Industry

The soda ash industry holds an important position in Japanese industrial circles. It is an industry inseparable from that of glass and other chemical industries that require considerable amounts of alkali. Soda ash occurs in its natural state in some parts of the world, but in this country it has to be prepared from salt, and as salt is a Government monopoly the price is high, so when the Asahi Glass Company, in order to attain self-sufficiency, started the production of soda ash after the World War it did so on an uneconomic basis, but the Government came along and by granting liberal subsidies to this and other concerns saved the industry and put it on a paying basis. Brunner, Mond and Company (British) and H. Ahrens and Company (German), who used to be the largest importers, were hit hard by this development in home production. The history of the growth of the soda ash industry in Japan is the history of strife between the Asahi Glass Company, backed by the Mitsubishi interests and protected by the Government, and these foreign concerns. The total production of soda ash in 1933 was 272,135 tons while about 20,372 metric tons were imported. In 1934 Japan succeeded in exporting about 17,496 metric tons and has become more than self-sufficient in this article.

Caustic Soda

As a by-product of the production of caustic soda the poisonous gas chlorine freed. This gas is made into commercial bleaching powder, and in the past the commercial production of caustic soda was only possible if a good price was obtained for bleaching powder. The industry, therefore, was greatly dependent on this latter commodity for quantity production. As soda ash is now being produced cheaply, caustic soda is being manufactured from it so domestic production is increasing. The replacement of the gold embargo and the raisng of the tariff virtually sealed the activity of the British importing concern, whose pressure was a great hindrance to the development of the Japanese soda industry, and selfsufficiency in the production of both soda ash and caustic soda has been thereby attained. Brunner, Mond and Company has largely restricted its activities and home production has greatly increased. The Asahi Glass Company and Nippon Soda Kaisha, known as N. S. K., have recently expanded their equipment for producting soda ash to an annual productive capacity of 150,000 tons, which is about 30,000 tons more than the year-

ly domestic demand. The production of caustic soda in 1935 totalled 210,030 tons which showed that the increased productive equipment of N. S. K. and the Electrolytic Soda Industry Company was completed.

Bleaching Powder

The demand for bleaching powder has become active since an improvement was registered by the paper manufacturing companies, who consume 70 per cent of the total production. The business solely depends on the rise and fall of the foreign-style paper manufacturing industry.

The Industries in 1936

The demand for soda continued to be active during 1936. The demand for caustic soda during the year amounted to 252,000 metric tons against 215,000 metric tons in 1935 and 163,000 metric tons in 1934 while that for soda ash increased from 206,000 metric tons in 1935 and 186,000 metric tons in 1934 to 234,000 metric tons. The continued active demand is attributable to the activities in the rayon, glass, dyestuff and other chemical industries. Particularly, the increase in the demand for caustic soda reflects the advance of the rayon industry.

On account of the active demand, there was a slight shortage of supply although production increased. Nevertheless, the quotations of soda declined. At the beginning of the year, the quotations were from ¥15 to ¥16 per 100 kilograms but a fall to the ¥13 level was soon recorded. In July and August, the price further slumped to the low level of ¥10.50 which set an all-time low, on account of competition.

During December prices began to pick up, and with the advent of 1937, they started mounting rapidly until recently they reached ¥16.30. While the recovery in December, 1936, was brought about by a sales control, the rapid rise in January and February was brought about by the recovery of the rayon industry and the higher prices of commodities in general.

As the upward trend is still continuing, it is even considered possible that the soda prices will soar to the high level of ¥20. This consideration is based on the anticipation that the chemical industries centering around the rayon industry will achieve a further advance. It may be noted, however, that even if the prices of soda remain at the present level, the business conditions of the soda companies will still be satisfactory.

Record Production The production of soda during 1936 again set a new high on the strength of the active demand in the rayon, glass, dyestuff and other chemical industries. Details of the demand are tabulated as follows:

Rayon Industry	50%
Dyestuff Industry	20
Soap Industry	10
Oil Industry	5
Others	15

The 1936 production totalled 480,000 metric tons including 265,000 metric tons of caustic soda and 215,000 metric tons of soda ash, against 410,000 metric tons in 1935 and 265,000 metric tons in 1934. Although comparatively small, the supply of caustic soda during the year amounted to 252,000 metric tons against 234,000 metric tons of soda ash. It is clear that the production was slightly insufficient to cover the supply.

It is estimated that the production of caustic soda during 1937 will be about 350,000 metric tons while that of soda ash will amount to some 250,000 metric tons. This estimation means an increase of 40 per cent in the production of caustic soda, which reflects the usual upward trend of the demand.

Quotations In spite of the fact that production was insufficient to cover the supply, the quotations of soda declined gradually during 1936, even touching the unprecedentedly low level of ¥10.-50 for a time because of competition. Towards the end of the year, prices picked up although the recovery was not complete until after January, 1937, when a rapid rise started. The prices of caustic soda reached ¥16.50 per 100 kilograms while the prices of soda ash rose to ¥7.50, apparently due chiefly to the enforcement of a sales control and the increased demand in the rayon industry.

Details of the changes in prices are as below.

PRICE PER 100 KILOGRAMS

	Caustic Soda		Soda Ash	
	High	Low	High	Low
1934	¥22,00	¥17.80	¥11.50	¥9,00
1935	17.80	15.80	9.50	7.50
1936	15.80	10.50	7.50	7.50
1937 Feb	16.00		7.50	

Conditions of Soda Companies The business conditions of the soda companies in the country were in a state of depression during 1936. The depression was worse in the latter half

of the year than in the first half, with one or two exceptions. A recovery, however, started toward the end of the year and a further improvement was seen from the beginning of 1937 when the quotations of soda began to rise rapidly. While whether the expectation entertained by some circle that the quotations of caustic soda will reach the ¥20 mark will be realized or not still remains to be seen. it may be pointed out that even if the quotations remain at the present level of ¥16, the business conditions of the soda companies will still give satisfaction. Further, mention must be made of the fact that the prices of such by-products as bleaching powder, hydrochloric acid and other chemicals have also advanced remarkably—a factor which will serve to increase the profits of the soda companies.

The following is a table showing the changes in the business conditions of the soda companies during the past few years :

	Japan Soda Co.		Tokuyama Soda Co.	
	Percentage of Profit	Percentage of Dividend	Percentage of Profit	Percentage of Dividend
1st half of 1934	43.0	12.0	40.6	20.0
2nd half „	35.0	12.0	34.4	20.0
1st half of 1935	27.0	12.0	26.7	15.0
2nd half „	34.5	12.0	22.3	13.0
1st half of 1936	26.8	12.0	15.0	13.0
2nd half „	24.1	12.0	7.7	10.0

	Hokkaido Sodo Co.		Asahi Electric Chemical	
	Percentage of Profit	Percentage of Divident	Percentage of Profid	Percentage of Dividend
1st half of 1934	12.3	10.0	27.1	10.0
2nd half „	12.5	10.0	27.8	10.0
1st half of 1935	10,8	8.0	24.5	10.0
2nd half „	7.4	6.0	24.8	10.0
1st half of 1936	1.9	3.0	25.4	10.0
2nd half „	9.0	6.0	25.4	10.0

Statistics Below are given data bearing upon the industry of these three articles :

PRODUCTION AND IMPORTS OF SODA ASH

	Production (In metric tons)	Imports		Production (In metric tons)	Imports
1927	23,130	100,434	1932	134,807	46,434
1928	30,928	78,649	1933	272,135	46,447
1929	43,583	76,116	1934	202,291	37,139
1930	57,233	65,206	1935	198,307	38,263
1931	93,244	54,336	1936	129,108	45,858

PRODUCTION, IMPORTS AND EXPORTS OF CAUSTIC SODA

	Production	Exports (In metric tons)	Imports	Supply
1927	24,094	54	40,946	64,986
1928	28,700	33	58,583	87,260
1929	57,382	22	42,388	99,550

1931	45,005	3,544	41,461	1936	78,321	8,505	69,816

Soap Making

Development and Production

The industry was started early in the Meiji Era, but no great progress was made until after the Russo-Japanese War of 1904–1905, when machinery was introduced from abroad. During the World War, the industry enjoyed great prosperity, but the reaction was also very severe when it came in 1920. However, during those difficult times, the foundation of the industry became more consolidated and the quality of soap improved a great deal.

Production of soap in Japan is as per the accompanying table. Tokyo and Osaka are the two principal places of production, the former producing about 50% of the total production in the country, while Osaka produces about 30%. Exports of soap, 90% of which is toilet soap, are made mostly from Osaka, to China and Kwantung Province. Imports amount to barely ¥100,000 in value a year.

PRODUCTION OF SOAP BY MILLS

(In ¥1,000)

Year	Toilet	Industrial	Medical	Laundy	Powdered	Others	Total
1926	21,825	2,114	—	—	—	—	33,906

Vegetable and Animal Oils and Fats

Introduction

For lighting purposes vegetable oils have been used in Japan for centuries. In earlier days perilla oil was used but this was later replaced by rapeseed oil. The production of these oils on an industrial basis only developed after the Russo-Japanese War of 1904–1905.

Production of hardened oil in Japan during 1935 amounted to 82,086 metric tons in contrast to 63,252 tons in 1934. The increase was the result of the high market price. It is used mostly for soap making, candles and dietary purposes. Even during the time that Japan was on gold, hardened oil was exported, so after the gold embargo was imposed exports increased. The 1935 exports amounted to ¥8,920,000.

The principal vegetable oils produced are soya bean and rapeseed. Linseed oil, perilla oil, hempseed oil, wood oil, sesame oil, cotton-seed oil, castor oil, groundnut oil, copra oil, camellia oil, etc., are also produced in considerable quantities. The production of soya bean oil in 1913 was valued at ¥1,333,000, but by 1935, this had increased to ¥15,329,198, rapeseed oil was valued at ¥20,019,129 in 1935.

Of the principal vegetable oils produced in Japan, only wood and camallia oils and vegetable wax are pressed from domestically grown seeds, all the others are pressed from materials from abroad. Soya bean oil, rapeseed oil, and vege-

table wax are exported, their total value in 1935 being ¥33,051,000. The importation of vegetable oils is very small.

Statistics Statistics for the vegetable and animal oil industry follows :

PRODUCTION OF VEGETABLE OILS

Year	Rapeseed Oil	Sesameseed Oil	Groundnut Oil	Cottonseed Oil	Copra Oil	Soya bean Oil

Rubber

The rubber industry in Japan began with the establishment in 1886 of the Mitatsuchi Rubber Company, a limited-partnership concern, in Tokyo. The industry developed steadily through the Sino-Japanese and the Russo-Japanese Wars of 1894–1895, and 1904–1905. In 1909 there were 20 mills, 900 workers and production reached ¥4,000,000 in value. During the World War the industry further developed. The earthquake of 1923 destroyed about 80% of the rubber manufacturing capacity of Tokyo and Yokohama districts, and many people were gravely doubtful as to whether the rubber factories in those districts would ever revive, but reconstruction quickly took place and the factories rebuilt. In 1935 the total production in the country by mills employing more than 5 persons was as large as ¥119,052,000 in value, but the figure

would be much larger if goods produced by people working in their own homes were included. The number of mills employing more than 5 persons in 1934 was 765, and the number of workers 38,087. Hyogo, Tokyo and Osaka prefectures are the chief producing centres.

An unusual improvement was made in the business conditions of the rubber companies in this country during 1936. As a matter of fact, the rubber companies began to recover from their depression during the latter half of 1933 but it was not until 1936 that they could realize a noable improvement in their business conditions. All the companies operated quite satisfactorily during the year and all the leading companies increased their dividends to shareholders, except the Tropical Industrial Company. Further, unlike in former times, surpluses remained after their settlement of accounts despite the increased dividends. Details are shown in the following tables :

	Second Half of 1934		First Half of 1935		Second Half of 1935
	Percentage of Profit	Percentage of Dividend	Percentage of Profit	Percentage of Dividend	Percentage of Profit
Tropical Industrial Company	4.9	3.0	3.2	3.0	3.4

Sumatra Development Company	7.0	17.5	8.0	26.0	10.0
Nissan Rubber Company	10.0	23.6	15.0	37.0	20.0

Note: The figures for the second half of 1936 for the Nissan Rubber Company are based on estimation.

Market Prices The prices of rubber are expected to remain at high level in view of their firm tone although the rising tendency has been checked by the successive reductions in restriction quotas of production, but the increase in production will enable the rubber companies to show satisfactory results and probably increase their dividends to shareholders.

The chief articles produced are tyres, rubber shoes, toys, tubes, electric battery cases, etc. The following table gives statistics for mills employing more than five persons only.

1935	8,262	4,422	23,113	116,431	2,620	119,052

Imports and Exports

The importation of rubber manufactures is decreasing each year. Tyres for automobiles, hose, belting for machinery, old rubber, etc., are the principal imports, but hose and belting of domestc manufacture are rapidly replacing the imported articles. On the other hand, the exportation of rubber manufactures is developing rapidly, especially in the case of rubber shoes.

Cultivation of Gum Trees

Plantation work by the Japanese was started as early as 1906 in the Malay States, and was later extended to Sumatra, North Borneo and other places. Soon afterwards a great interest was taken in the industry, Japanese investments quickly grew, and the work that was originally started as a private enterprise is now mostly carried on by joint stock companies.

Demand and Supply

According to the international agreement on the limitation of rubber production, the rubber production allotted to this country during 1937 is fixed at 1,298,000, tons or an average of 108,000 tons monthly. These figures represent a curtailment by 25 per cent for the first quarter of the year, 20 per cent for the second quarter and 15 per cent for the third quarter. The curtailment rate for the last quarter of the year still remains to be fixed. With this amount of production, it is estimated that the exports of rubber during the year will amount to 1,053,000 tons or to around 1,100,000 tons if wild rubber is taken into account.

IMPORTS OF RAW RUBBER AND EXPORTS OF PRINCIPAL RUBBER MANUFACTURES

(Unit in yen)

Year	Imports of Raw Rubber	Exports of Principal Rubber Manufactures			
		Boots and shoes	Tires for Rikisha, Bicycles and Other Vehicles	Toys	Others
1932	15,988,000	4,889,000	4,377,000	5,506,000	—

1936	72,957,000	1,832,000	9,939,000	4,641,000	7,424,000

Celluloid

General

The Japanese celluloid industry made considerable development during the World War. Owing to a heavy demand coming from European countries, where factories were closed by the War, Japanese celluloid products once dominated the world's markets. but with the termination of the War, foreign products quickly regained their position in the markets captured by Japan during the War, and for some years the industry was in a state of depression. Gradually penetration was effected by traders and exporters, and overseas markets were largely restored, especially after the replacement of the gold embargo in December, 1931. The domestic market has been prosperous for many years, without being affected very much by changes in economic conditions.

Japanese celluloid products are mainly exported to America, England, South America and Australia. They are now exported to Europe and Africa, in competition with German products, their most formidable rivals. As long as the exchange rate is low and tariff walls are not raised, the export trade is destined to be prosperous.

Celluloid manufacturing is one of the most promising industries in Japan, with total production amounting to ¥34,042,000 and exports reaching ¥18,998,000 in 1935, but it is faced with one great difficulty, that of obtaining its chief material cheaply. Camphor is the material, but as this is restricted by monopoly law its price is kept fairly high.

The Dai Nippon Celluloid Kaisha is the largest manufacturer. 75 per cent of the total production in Japan comes from this company, while the remaining 25 per cent is divided among about ten shall manufacturing concerns. The company, which has a virtual monopoly of celluloid manufacturing in this country, concentrates its energies on exporting. Nearly 80 per cent of Japan's total exports of celluloid are the produce of this company.

The company, at a cost of ¥2,000,000, has started manufacturing films at Ashigara at the foot of Mount Hakoné. Cellophane is manufactured at the Kanzaki factory of the Company, and is now procurable at very low prices.

Statistics Production of raw celluloid, celluloid manufactures, and exports of the same follow :

PRODUCTION OF CELLULOID AND MANUFACTURES THEREOF

Year	Raw Celluloid		Manufactures of Celluloid				
	Quantity metric tons	Value	Toys	Combs	Others	Total	Grand Total
			(In ¥1,000)				
1926	3,650	9,848	1,971		3,988	5,960	15,808
1927	3,414	9,372	1,539		3,125	4,665	14,037
1928	3,969	10,992	1,724		3,825	5,550	16,542
1929	5,806	12,278	2,025	535	4,668	7,229	19,508
1930	4,146	8,029	1,757	364	2,193	4,315	12,345
1931	4,847	7,800	861	393	1,347	2,602	10,403

1933	1,320	2,363	3,178	3,110	2,346	8,635	11,813
1934	1,804	3,303	3,708	4,260	3,223	11,191	14,494
1935	2,033	3,469	6,054	4,414	3,065	13,433	16,902
1936	—	3,717	6,338	3,857	4,229	14,424	18,141

Note: Incongruity in the figures of celluloid manufactures in the production and exports tables is due to the fact that a large amount of celluloid manufacture is produced by mills where less than 5 persons are employed.

Matches

The Industry in the Past

A factory for making matches was first established in Japan, in Tokyo, in April, 1875, by a certain Mr. Makoto Shimizu, who had just returned from studying the subject in a French technical school and a match factory managed by the French Government. In the same year a factory was established in Osaka, and in 1877 another was established in Kobé. In 1878, three years after the first factory was established, matches to the value of ¥24,000 were exported, and in succession factories were established in Shizuoka, Aichi, Osaka and Hyogo prefectures. By 1889, not only had the importation of matches ceased, but large quantities, in face of strong foreign competition, were being exported to China. In 1887, Hyōgo-ken Match Seizogyo Kumiai (Association of Manufacturers of Matches in Hyogo prefecture) was formed and in 1900 the Dogyo Kumiai (Association of Traders in Matches) was organized. The industry experienced great prosperity during the Russo-Japanese War, exports were made not only to China but also to the South Sea Islands, Straits Settlements and India. But from about that time the match industry began to develop in China and by 1908 it had developed to the extent that the market in China was considerably curtailed for the Japanese product, then when India raised her tariff on matches, and the Dutch East Indies imposed a consumption tax on them, exports of matches to countries in the Orient were considerably reduced. Exports for some time became almost negligibly small but in 1933, they suddenly increased to ¥3,248,000 from about ¥938,000 in 1932.

Present State of the Industry

There are 89 factories with the total monthly productive capacity of 63,000 tons, but the actual demand is about 40,000 toons or 50,000 tons.

The development of the match industry during the World War was such as to make the industry a menace to the International Match Company. This company, therefore, commenced nagotiations with and was successful in amalgamating the Nippon Match Manufacturing Co., Ltd., which was one of the Mitsui interests, and the Nippon Match Co. came under foreign management for three years, that is, until 1927, when the largest match manufacturer in Japan, the Toyo Match Co., Ltd., seeing the advantages which would accrue from co-operation with the International Match Company agreed to amalgamation. The Daido Match Co., Ltd. (The Great Consolidated Match Co., Ltd.) was organized with capital equally subscribed by Japan and Sweden, and the management was placed in Japanese hands, avoiding in this way competition in foreign markets.

Exports Exports increased along with the development of the industry and as far back as 1913 Japan's match exports totalled some ¥12,000,000 after meeting the domestic demand. During the World War annual exports were between ¥30,000,000 and ¥40,000,000, forming one of the big ten export items of Japan.

Due to the rising importance of Soviet matches in international trade, Japan's shipments to the United States have fallen almost to the vanishing point. At one time Japanese matches were most active in this trade, outstripping Soviet and Swedish matches in American sales. In the spring of 1935, however, a match sales agreement was concluded in New York, covering the American market. Each group agreed to take an annual quota of 33,000 tons.

In spite of the agreement, the situation has developed adversely for the Japanese and the trade is facing ruin. In anticipation of the conclusion of the agreement, the Soviet Union shipped vast quantities of its matches to America and since then has been underselling all competitors.

Japanese efforts to combat this tendency have been fruitless. The Goto

Match Importing Company which the Japanese exporters established in New York to handle that end of the business has not been able to check the Soviet advance, for it has been trying to get large profits on each unit, rather than meeting the Soviet price. Shipments have fallen away to nothing and the exporters here are likely to repudiate the agreement and ship directly in the future unless something is done.

When the Japanese match industry was influenced by Swedish interests the export field was limited to China and part of the South Seas. America, Australia, the Near East, Africa and Europe was monopolized by Swedish interests. After Kreuger's downfall Japanese match exporters took back their old markets. With the replacement of the gold embargo Japanese products have found their way in heavy volume to their old markets. The low exchange rate and cheap labour in Japan have stimulated exports.

Exports in 1934 and 1935 follow :

EXPORTS OF MATCHES

(Value in yen)

Destinations	1935	1936
Hong-Kong	1,565,000	—
Straits Settlements	501,000	—
U. S. A.	300,000	—
Other	842,000	—
Total	3,209,000	2,174,000

Number of Factories The number of match factories in Japan was 146 with 8,463 operatives at the end of 1934, an increase of 3 and 313 respectively.

Production of matches and allied articles in recent years has been as follows :

PRODUCTION OF MATCHES, ETC.

Year	Quantity Produced Gross	Value (In yen)	Match-boxes	Matchwood
1926	24,087,312	15,667,221	1,111,140	1,566,661
1927	3,301,575	14,540,033	1,217,350	2,202,373
1928	19,471,637	12,445,793	741,202	1,383,046
1929	21,607,683	9,825,495	1,358,616	1,220,148
1930	16,722,653	7,464,081	645,765	600,047
1931	13,535,353	6,686,245	457,067	701,334
1932	18,234,683	7,306,721	764,905	613,939
1933	20,711,239	9,202,221	1,169,029	710,525
1934	20,597,615	10,033,567	550,947	616,915
1935	27,369,618	12,659,929	607,979	742,767

Dyestuffs

Through Governmental protection extending over many years, the Japanese dyestuff industry is now well established. Self-sufficiency will be only a matter of time, for within recent years this industry has, along with the other industries of the country been making exceptional progress. Japan supplies 99 per cent of all sulphuric dyes demanded domestically. Concerning ratios of high-grade dye supplies, Japan can supply 86 per cent of miscellaneous dyes, 49 per cent of acid dyes, 35 per cent of mordant dyes and 26 per cent of cat dyes for internal use. Coal-tar dyes were already exported in 1934 to the volume of 7,023 metric tons, worth ¥4,259,000. Napthol and Indanthrane dyes, of which consumption is approximately 150,000 kin worth about ¥3,000,000, are not manufactured here, but are imported from Germany. Research in producing these dyes is under way by the Mitsui Mining and Japan Dyestuff Manufacturing Companies. Notwithstanding all this domestic activity, Japan still imports a large quantity of dyes. Vat colour imports were especially notable because Mitsui Mining produced mostly artificial indigo. Imports of dyestuff in 1936 were ¥11,404,000 in value, and showed an increase of ¥2,066,00 over 1935, details of which follow :

IMPORTS OF DYESTUFF

Colours	1934	1935 (In ¥1,000)	1936
Basic	979	828	796
Direct	2,403	2,252	3,013
Acid	1,669	1,939	1,776
Mordant and intermediate	1,353	1,723	2,006
Vat	2,147	1,865	2,458
Others	594	729	2,355
Total	9,147	9,338	11,404

The domestic production of dyes during 1935 compared with the preceding four years and exports of Japan-made dyes since 1931, follow :

PRODUCTION OF SYNTHETIC DYESTUFFS

Year	Basic		Direct		Acid		Mordant	
	Quantity 1,000kg.	Value ¥1,000	Quantity 1,000kg.	Value ¥1,000	Quantity 1,000kg.	Value ¥1,000	Quantity 1,000kg.	Value ¥1,000

EXPORTS OF DOMESTIC DYESTUFFS

	Quantity (Metric tons)	Value (¥1,000)
1931	2,011	509
1932	4,521	1,522
1933	6,125	2,895
1934	6,423	4,259
1935	8,882	7,304

Aluminium

The first aluminium manufacturing plant in Japan was erected at Omachi, Nagano prefecture, in December, 1933. The Japan Electric Industry Company, formerly known as the Japan Iodine Company, runs it. This concern also built the first alumina factory at Koyasu, Yokohama, in the spring of the same year. At the Koyasu factory Korean alum is used for making 20 metric tons of alumina a day. Alumina is sent to the Omachi factory, where 10 tons of aluminium is manufactured. The production cost of alumina is ¥1,000 per metric ton. This factory has a yearly productive capacity of 3,600 tons, but Japan's annual demand is from 10,000 to 12,000 tons, which used to be entirely imported from abroad. The capitalization of this company is ¥12,000,000. Plans for another alumina manufacturing plant are well advanced. Anticipating completion of the Jitsugetsutan Power station in June by the Taiwan Electric Power Company, an aluminium manufacturing company capitalized at ¥10,000,000 will be founded in Formosa in 1937. Under joint management of the Mitsui, Mitsubishi, Sumitomo and Furukawa interests. The factory will be erected in Takao province, Formosa. Bauxite will be imported from Borneo, Korea, the Malay Peninsula and Brazil. In the first year the firm plans to have an output of 2,000 tons of aluminium,but this will be boosted to 20,000 tons in the future. When the annual production reaches the 20,444 ton level, Japan will be self-sufficient as regards this metal.

Imports of aluminium into Japan during the past five years have been as follows :

	Amount in kilogrammes	Value in yen
1932	8,285,050	7,794,000
1933	7,238,760	10,233,107
1934	10,175,820	12,581,368
1935	13,401,480	18,362,317
1936	10,241,000	13,229,000

Pyrethrum

Hokkaido is noted for producing the pyrethrum flower, the raw material for anti-insect powder largely used for making mosquito incense and anti-bed bug powder. Pyrethrum was formerly exported through Kobé merchants, but owing to inconvenience the Hokkaido Government encouraged direct shipments from Hokkaido, the first direct shipment being made in September, 1933. The Hokkaido Government also caused pyrethrum manufacturers to organize the Manufactured Pyrethrum Industrial Guild, as the first step to the export of manufactured pyrethrum abroad, which had hitherto been exported in the shape of dried flowers. As an international commodity, manufactured pyrethrum is steadily gaining ground, and under the encouragement of their government, the Hokkaido pyrethrum raisers are manufacturing it for direct export to the United States, Saigon, Bangkok, Rangoon, Manila, Singapore, Sourabaya, Batavia, Calcutta and Bombay, and to such European markets as London, Hamburg and Paris. Wakayama prefecture is also noted for raising pyrethrum flowers. Production and exports of pyrethrum during the last few years follow :

PRODUCTION AND EXPORTS OF PYRETHRUM

Year	Production		Exports	
	Quantity	Value	Quantity	Value
	1,000kg.	¥1,000	1,000kg.	¥1,000
1931	5,147	2,627	2,630	1,681
1932	5,107	3,730	5,680	4,752
1933	6,061	7,809	5,088	6,349

1935	12,746	7,322	7,665	6,400
1936	—	—	—	3,207

CHAPTER XXIV

COMMUNICATIONS

General

The communications of the country are supervised by the Minister of Communications and a special account is established for the management of this business, beginning with the fiscal year 1934–1935. General condition of the business in Japan proper in 1935–1936 may be obtained from the following :

Post, telegraph and telephone officials and operatives (Sept. 30. 1936)	240,937
Post, telegraph and telephone offices (Sept. 30, 1936)	13,587
Ordinary mail routes (Dec. 31, 1935) in. km.	86,088
Ordinary mails accepted (1935–36)	4,735,348,007
Ordinary mails delivered (1935–36)	4,901,685,581
Parcel post routes (March 31, 1935) in km.	85,385
Parcel accepted (1935–36)	68,291,938
Parcels delivered (1935–36)	64,854,931
Telegraph routes (Dec. 3,1 1935) in km.	50,886
Telegraph lines (Dec. 31, 1935) in km.	377,025
Telegraphs despatched (1935–36)	63,755,257
Telegraphs received (1935–36)	66,874,566
Telephone subscribers (Sept. 30, 1936)	908,488
Telephone routes (Dec. 31, 1935) in km.	72,240
Telephone lines (Dec. 31, 1935) in km.	6,737,327
Telephones (March 31,1935)	935,139
Telephone messages (1934–35)	3,783,991,018
Income from postage and fees (1935–36)	¥288,489,480
Business expenditure (1935–36)	¥189,781,664

The Postal Service

Historical Survey

The present state postal service system was established in 1871, between Tokyo and Osaka. In August of that year, post offices were opened in Niigata, Hakodaté, Kobé, Nagasaki, and Yokohama. In December a new postal route was established between Tokyo and Nagasaki, connecting the two cities in 7 days and 17 hours. In May, 1872, the postal service between Yokohama and Tokyo was greatly improved by the establishment of five deliveries a day, and by July the service was extended to all the cities and towns of importance throughout the country, except a part of Hokkaido.

Foreign Mail Opens In March, 1872, a foreign mail service was opened at the same time as the establishment of official postal regulations. In those days, foreign mail matter in Japan was handled with the aid of the British, American, and French post offices in Yokohama, Kobé and Nagasaki. Soon after the conclusion of the America-Japan Mail Service Treaty in 1873, the American post offices were withdrawn from this country, and Japan was thus placed on an equal footing with the U.S.A. as regards the mail service between the two countries. In 1877, an arrangement was made with twenty-five countries participating in the International Mail Service Treaty. Thereupon, the British and the French post offices were also withdrawn from this country.

The post offices were at first classified into five grades, and in March 1886, they were classified into three as at present. In view of the development of telephone and telegraph business, the authorities introduced a revision in the system of the Communications Department in 1903, and divided post offices into post, telegraph, and telephone offices each of them being classified into 1st, 2nd and 3rd, or 1st and 2nd in the case of telephone offices. With the rapid increase in the amount of mail matter and telephone and telegraphic messages, the regulations of the Communications Department as to the number and kind of offices, were extended from time to time, and at present there are offices in warships, steamers, trains, etc., in addition to the network throughout the country.

The air mail service was commenced

in 1929 with the establishment of the Japan Air Transport Company in April of the same year.

The Growth The rapid growth of the postal service in the early years is illustrated by the following statistics :

Year	No. of P. O.
1871	180
1872	1,160
1873	1,501
1874	3,245
1882	5,527

Following the introduction of a revision in the postal service regulations in 1883, some of the offices were eliminated, the number being reduced to 4,088 by the end of 1889. But the steady development of postal business necessitated an increasing number of offices as the following figures for Japan proper show :

On March 31 of	No. of P. O.
1927	8,916
1928	9,114
1929	9,393
1930	9,690
1931	9,954
1932	10,208
1933	10,322
1934	10,611
1935	10,891
1936	11,253

Post offices are classified into three grades, namely 1st, 2nd and 3rd, the 1st being, side by side with 2nd and 3rd offices, in such important places as Tokyo, Osaka, and other leading cities. The 2nd and 3rd are in smaller cities, towns and villages throughout the country. Those of the 1st and 2nd grade are government offices, under direct government management. In post offices of the 3rd class, business is conducted on the contract system.

Its Business

In addition to ordinary matters relating to post and telegrams, the post offices in Japan receive taxes on behalf of the various tax authorities and pay pensions, annuities, etc. on behalf of the Treasury. Since 1906, New Year's greeting cards have been handled separately from ordinary mail matter with a view to relieving congestion. Such mail matter is accepted by all post offices from December 15 to 29 for delivery on New Year's day.

Ordinary mail matter is delivered 5 or 6 times daily in Tokyo, Osaka, and Kyoto, and 4 or 5 times in other large cities, where there are 1st class offices. In smaller cities, the 2nd class offices deliver 3 or 4 times a day. In towns and villages where they have 3rd class offices, mail matter is delivered twice a day only. The number of collections is the same as that of delivery in most cases.

The parcel post service was started in 1892, the first arrangement as regards foreign connections being made with Hongkong in 1879. The scope of international service was gradually extended, and covers almost all treaty countries at present.

Statistical Tables The following tables indicate the volume of business, handled by the post offices, and the increase in the amount of their work ;

NUMBER OF POST OFFICES (September 30, 1936)

	Japan Proper	Taiwan	Karafuto	Chosen	Kawantung Leased Territory	South Sea Islands
1st Clas	97	13	—	—	—	—

Postal Money Order can hardly be included into the business of communications. It is, however, one of the important lines of business handled by the post office for the convenience of the large mass of people. The number and amount of postal money orders handled during 1935-36 are given below :

POSTAL MONEY ORDERS IN 1935-36
DOMESTIC

Territory	Issued		Paid	
	No.	Amount (In yen)	No.	Amount (In yen)
Japan Proper	36,926,278	751,734,983	39,348,351	817,399,466

Telegraph Service

Telegraph service in Japan was started in August, 1869, but this was for Governmental messages exclusively. Public telegraph service was started in September of the same year between Tokyo and Yokohama. Telegrams in European languages were despatched for the first time in April, 1870. In August of the same year Osaka and Kobé began to exchange telegraph messages. In June, 1871 the laying of the submarine cable between Nagasaki and Shanghai was completed. In February, 1873, aerial lines connected Tokyo and Nagasaki and telegraph service for districts along the lines was opened. In January, 1879, Japan entered the international telegraph association. With revisions of rules and laws in subsequent years the business was started on a fair and steady road of progress. Wireless telegraph service was installed in 1908, and telegraphic picture transmission was undertaken from August, 1930.

Statistics on the telegraph services follow :

Wireless Telegraph Service

The study of wireless telegraphy was begun in Japan in 1896, or one year after the invention of wireless telegraphy by Marquis Marconi. In 1903, an experiment was made between Nagasaki and Taiwan by the Communications Department with satisfactory results.

The First Station In November, 1906, Japan sent her delegation to Berlin to represent her at the First World Conference on Wireless Telegraphy. In May, 1908, the first land wireless telegraph station was established in Choshi, (Chiba prefecture), whilst the first marine wireless telegraph equipment was set up on the Toyo Kisen liner "Tenyo Maru" in the same year. In July, 1908 wireless telegraph stations were established at Ohsezaki in Nagasaki prefecture, Shionomisaki in Wakayama prefecture and Tsunojima in Yamaguchi prefecture. In December, 1908, a wireless telegraph station was established at Otchishi in Hokkaido. At the same time sets were installed on some of our ocean liners. Japan was thus placed on a more or less secure foundation in the sphere of wireless telegraphy.

The circulation of regulations for private wireless telegraph offices in October, 1915, greatly facilitated the healthy growth of the business, and the service was extended to wider areas. It was utilized for steamship communication, and contact was also made with steamers and between ships and land stations, and also between aeroplanes and steamers or stations on land. With the enforcement of a law for the establishment of wireless sets on steamers, the number of stations rapidly increased.

International Communication The extension of wireless communication with other countries started in Japan in 1915, when messages were exchanged between Otchishi station and Petropavlovsk in

Kamchatka. In 1916, the Funabashi station succeeded in exchanging messages with Hawaii. In 1920, the Iwaki station was established for handling messages between Japan and America. In 1925, the Government issued a law establishing the Japan Wireless Telegraph Company with a capital of ¥20,000,000, with a view to becoming absolutely independent of foreign telegraph companies, with whose co-operation Japan had been exchanging wireless messages with all other countries, except America, Russia, and China.

The Government transferred to the Company its Iwaki radio plant and the ground at Yosami and Yokkaichi which it was holding with the intention of erecting radio stations for the services with countries in Europe.

The Company has, according to the Law, to equip and manage the facilities and then rent them to the Ministry of Communications in consideration of a subsidy. Although many improvements were introduced at considerable outlay over all former installations of Iwaki radio plant by the Company, the advent of short-wave methods compelled it to close the stations upon the completion of its new stations at Oyama and Fukuoka.

The Company's circuits now offer from Nagoya direct communication service with England, France, Germany, Italy, Switzerland, Poland, Holland, Mexico and Brazil; and from Tokyo the circuits reach out to North and South America, Hawaii, the Philippines, French Indo-China, Siam, Dutch Indies, British India, and Syria. The Company has an extensive plan of development which will in future place Japan in direct touch with all the important countries of the world.

The Company now places the following stations in daily twenty-four hour service :

(a) Transmitting station at Oyama, near Tokyo.

Receiving station at Fukuoka, near Tokyo.

(b) Transmitting station at Yosami, near Nagoya.

Receiving station at Yokkaichi, near Nagoya.

Stations (a) are used for direct communication with San Francisco, Buenos Aires, Honolulu, Manila, Saigon, Bangkok, Bandoeng (Java), Bombay and Beirut (Syria); and, stations (b) for direct communication with London, Paris, Berlin, Rome, Geneva and Warsaw.

Messages originating in or destined to places beyond those mentioned above are retransmitted at those particular points.

Number of telegrams dealt with at wireless telegraph offices in the past five years was as follows :

		Domestic	Foreign
1930–31	Despatched	376,593	56,687
	Received	302,153	25,039

Wireless Telephone Service

The first experiment with wireless telephony in Japan was made in 1911 by the Communications Department with very satisfactory results. It was in 1923, however, that the service was opened for public use between Kobé city and steamers in the harbour. In 1926, this service was extended to Moji. The result being satisfactory, the Government decided further to extend the service and in December, 1932, the International Telephone Company, with a capital of ¥10,000,000, was established through the solicitation of the Communications Ministry to build up stations for the use of the Government and private bodies. This was done to facilitate wireless telephone service between Japan and the world, Japan's colonies and ships at sea. The transmitting station of the company is established at Nazaki, Ibaraki prefecture, and the receiving station at Komuro, Saitama prefecture, and these stations are connected each other and with the Tokyo Central Telephone Office by cables. Wireless telephones are now available between Tokyo, Nagoya, Kanazawa, Kobé, Osaka, Kyoto, Yokohama, Toyohashi, Nara, Himéji, Shimonoséki, Fukui, Fukuoka, Yawata, Wakamatsu, Nishinomiya, Amagasaki and Suma. The service has been opened between Formosa and Tokyo, on June 20, 1934.

In 1934-35 international wireless telephone service was successively opened between Japan and Manchoukuo, U. S. A., Canada, Mexico, Cuba, Philippines, Dutch East Indies, Sumatra, England, and Germany. The service with other 28 European countries was opened in July, 1935, with China in February, 1936, with Cape Town and Brazil in April, 1936, with Saigon in May, 1936, and with Argentine, Uruguay, Paraguay, French-Indo-China, Siam, and Union of South Africa in 1937.

Rates for the first 3 minutes range from ¥40 to ¥110 for European countries and from ¥54 to ¥95 for the U.S.A., the highest being ¥164 for Paraguay in South America.

Telephotograph Service This service is only available between Tokyo, Osaka and Formosa.

Radio

Radio broadcasting in Japan is under the control of a single organization, the Broadcasting Corporation of Japan, which in turn is supervised by the Ministry of Communications. Programmes are subjected to strict censorship and nothing that might harm the interests of the country and its people is allowed to go on the air. Advertising of all sorts is prohibited. Political speeches cannot be included in the daily programmes. Even election campaign speeches and Diet proceedings cannot be broadcasted. (See Chapter XXXVII.)

The First Programme The first radio programme in Japan went on the air on March 22, 1925, five years after the world's first regular commercial broadcasting by the station KDKA, East Pittsburgh, Pennsylvania. The station, using the call letters JOAK, was in Tokyo, and it had a power of only 500 watts. This station, established temporarily at Shibaura, on the water front of Tokyo Harbour, was replaced in July by a 1 kw. station at Atagoyama, a hill in the southern part of Tokyo. In the difficult times following the great earthquake and fire of September, 1923, which laid waste a greater part of Tokyo, the radio played an important part in comforting and encouraging the citizens who were working hard to rebuild their city and their homes.

Shortly afterwards, small stations were established in Osaka and Nagoya, which form with Tokyo the three largest population centres. The engineers in charge of these stations were sceptical about their success. There was no assurance that the Japanese public would respond by buying radio sets and listening in, or would like the programmes once they were heard. These fears, however, were groundless. For a time there were not enough receiving sets in the stores to meet the demand. Instead of a novelty, the radio became a daily necessity. Elated at their success, the promoters worked out a plan to centralize all the broadcasting in the country, which was heartily approved by the Ministry of Communications. Before the end of a year, the stations in Tokyo, Osaka and Nagoya were merged, and the Broadcasting Corporation of Japan was formed to assure nationwide cooperation in meeting the demand for more efficient stations and better programmes.

The expansion of Japanese broadcasting in the past twelve years has been as follows :

March	22nd,	1925	The first experimental station JOAK commenced broadcasting at Shibaura, Tokyo.
June	1st,	1925	Station JOBK (Osaka) commenced activities.
June	15th,	1925	Station JOCK (Nagoya) „ „
July	12th,	1925	The experimental station JOAK was replaced by a 1 k.w. station at Atagoyama, Tokyo, now used as a studio.
July	15th,	1926	10 k. w. broadcasting was inaugurated at the Nagoyastation.
August	6th,	1926	The formation of the Nippon Hoso Kyokai (B. C. J.) as a corporate juridical person, with authorization to operate wireless stations in Japan proper, under the supervision of the Ministry of Communications.
Aug.	20th,	1926	The three stations JOAK, JOBK, & JOCK were amalgamated into C.B.J.
May		1928	10 k. w. broadcasting was inaugurated at the Tokyo and Osaka stations.
June	5th,	1928	10 k. w. broadcasting was inaugurated at the Sapporo station.
June	16th,	1928	10 k. w. broadcasting was inaugurated at the Sendai station.
June	16th,	1928	10 k. w. broadcasting was inaugurated at the Kumamoto station.
July	3rd,	1928	10 k. w. broadcasting was inaugurated at the Hiroshima station.
April	15th,	1930	Station JOJK (Kanazawa) commenced activities.
Dec.	6th,	1930	Station JOLK (Fukuoka) „ „
Feb.	1st,	1931	Station JOKK (Okayama) „ „
March	8th,	1931	Station JONK (Nagano) „ „
March	21st,	1931	Station JOPK (Shizuoka) „ „
April	6th,	1931	Station JOAK (Tokyo) Wave No. II „
Nov.	11th,	1931	Station JOQK (Niigata) „ „
Dec.	2nd,	1931	Station JOSK (Kokura) „ „
Feb.	6th,	1932	Station JOVK (Hakodate) „ „
Feb.	26th,	1932	Station JOUK (Akita) „ „
March	7th,	1932	Station JOTK (Matsuye) „ „
March	22nd,	1932	Station JORK (Kochi) „ „
April	1st,	1932	Monthly subscription fee was reduced from one Yen to seventy-five Sen.
June	24th,	1932	Station JOOK (Kyoto) commenced activities.
June	23rd,	1932	Station JOBG (Mayebashi) „ „
June	26th,	1932	Station JOBK (Osaka) Wave No. II „
			Station JOCK (Nagoya) Wave No. II „
July	13th,	1932	Station JOFG (Fukui) „ „
July	19th,	1932	Station JODG (Hamamatsu) „ „
July	23rd,	1932	Station JOXK (Tokushima) „ „
Sept.	4th,	1932	Station JOCG (Asahikawa) „ „
Sept	20th,	1932	Station JOAG (Nagasaki) „ „
May	16th,	1934	The reoganization :— The new statute came into force with the sanction of the Ministry of Communications, which has brought Japanese broad-

casting on to one unified working system.

April	1st,	1935	Monthly subscription fee was reduced from seventy-five Sen to fifty Sen.
Oct.	20th,	1935	Station JOHG (Kagoshima) commenced activities.
Dec.	13th,	1935	Station JOIG (Toyama) „ „
Sept.	25th,	1936	Extraordinary General Meeting.
		1936	The installation of Prince Fumimaro Konoe as Patron.
Nov.	21st,	1936	The new Osaka Broadcasting House was opened to service.
Nov.	22nd,	1936	Station JOOG (Obihiro) opened to operation.
Nov.	30th,	1936	Station JOJG (Yamagata) „ „ „
Dec.	14th,	1936	Station JOLG (Tottori) „ „ „

International Programme Exchange Starting with the vivid scenes of New Year's Eve from U.S.A., the year of 1936 was the busiest year the Corporation ever experienced in the line of international broadcasting.

In the early spring, speeches on the London Naval Disarmament Conference by Japanese representatives and the relay of Funeral Service of the late King George V. from England impressed the hearts of whole nation. Besides the large number of programme exchanges with other countries, as one of the chief events previously planned, the Corporation succeeded in relaying eye-witness accounts of almost all events from the actual scene of the Olympic stadium and swimming pool on the occasion of the XIth Olympiad which was held in Berlin.

In order to describe the running commentary of the Olympic Games, the Corporation sent a corps of JOAK staff members to Berlin for the benefit of the domestic listeners.

The entire nation most enthusiastically listened to these broadcasts from Berlin, because of the two-fold events; one of which was Olympic Committee's deliberation in Berlin on the fortunate city for 1940 Olympiad, and the other was the outcome of the Berlin Olympiad itself, awaiting the success of the large number of Japanese competitors participating in the Games. The result of reception was so successful that the whole nation not only enjoyed these broadcasts but marvelled at the technical perfection in the modern art of radio transmission for long distance in which much credit is due to the skill and effort of the operators on both sides.

The international programme exchange yearly adding its importance as one of the most effective mediums to create a better understanding of each nation, the Corporation is increasing its effort in various phases of this field to co-operate with as many broadcasting organisations of the world as circumstances permit.

In the year 1936, Japan participated in thirty-three international broadcasts.

Overseas Broadcast The Broadcasting Corporation of Japan inaugurated daily one hour short-wave broadcast, that is 2:00 to 3:00 p.m., Tokyo Time, under the name of "Overseas Broadcast" on June 1st, 1935 with the object of furnishing the residents in the foreign countries with accurate information about Japan and of introducing the culture of Japan.

The programmes of this broadcast consist of news in Japanese and English, music, entertainment, talk and eyewitness accounts of various sport events and other subjects, specially selected to present a true and interesting glimpse of the real Japan to all listeners abroad.

Though this broadcast was mainly directed to the West Coast of North America and Hawaii, the programmes of this broadcast met with an enthusiastic response and reports of good reception and much encouraging response complimenting the contents of the programmes were received, not only from the areas to which they were specifically addressed but also from other parts of the world.

Moreover, the Corporation was carrying out during the past year experimental transmissions, one for the East Coast of North America and South America and the other for Europe, each twice a week. These transmissions also met with considerable response and a large number of reception reports from those who had listened to these broadcasts in various countries to which these transmissions were specifically directed.

Encouraged by the good results of these experimental transmissions, the Corporation has decided to inaugurate three more daily transmissions, and the first programme of these transmissions went on the air on January 1st, 1937.

Transmitters of 20 kilowatt are used temporarily for these broadcasts, but they will be replaced in the near future by 50 kilowatt transmitter which is now under construction.

From the beginning of April 1937, the broadcast to Europe, on Monday, Wednesday and Friday, will be in Eng-

lish and German and on Tuesday, Thursday and Saturday, French and English will be employed. On Sunday the broadcast will be only in English.

In the other three directions broadcasts will be in Japanese and English.

Programme Hours The working hours of each broadcasting station in Japan differ a little according to their local conditions as well as the seasons of the year. According to the statistics of the year 1935, the average broadcasting hours per day per station were nine hours and fifty-eight minutes.

The first programme of the day is sent out at 6.00 a.m. (from April to October) and at 6.30 a.m. (from November to March), and the closing announcements of the day's programme goes on the air at 9.50 p.m.

The following table gives programme statistics for the year 1936 (from Jan. 1 to Dec. 31) classified into nine groups.

PROGRAMME STATISTICS
(From Jan. 1 to Dec. 31, 1936)

Programme Classes	Number of broadcasts	Hours (in total)	Duration (per broadcast)	Percent. (Programme hours)
		m.	m.	%
News	79,968	468,432	5.8	25.0

750	10.0	JFAK	TAIHOKU (TAIWAN)	11.22.1928

Remarks: The frequencies of almost all stations in Japan have been altered since July 1st, 1936.

New Broadcasting Houses Development of our broadcasting is reflected in the establishment of two large broadcasting houses, one in Osaka and the other in Tokyo at a total cost of six million yen. The Broadcasting House in Osaka was opened to service in November 1936. This six storied building (exclusive of the central tower which is three storied) covers an area of 1927 sq. meters, and comprises 13 studios in all.

While in Tokyo, a site of 3950 sq. meters has been chosen near the Hibiya park for a six storied building which will house 16 studios and rooms for various department offices. The construction for the foundation has been already completed, and the steel structures are now being raised and it is expected that we shall see the central broadcasting house in full swing in the summer of 1938. In September, 1935, a research committee for the design of studios to be housed in these broadcasting houses was formed. This committee comprises electrical, acoustical and architectural specialists, and preliminary practical tests are being carried out at present at the JOAK building at Atagoyama.

Research Laboratory The technical research laboratory of the Corporation was established at Setagaya district in western part of the city of Tokyo in April 1930. The work of the laboratory is directed mainly to the fundamental and general researches as well as to the various possibilities of broadcast transmission and reception apparatus, wave propagation phenomena, visual broadcasting, patents and other problems related to the art of broadcasting.

Owing to the rapid development of the radio art, the laboratory was found to be too narrow to continue these researches, and the premises and building were enlarged in 1936.

Television For some years past research work of television has been going on separately at the Waseda University, Hamamatsu Higher Technical College, Tokyo Electric Co., Electrotechnical Laboratory of the Department of Communications and the Research Laboratory of the Corporation. They had their own special system and the comparison of merits between them is a question very difficult to solve. A somewhat different line of investigation is now being undertaken, namely, whether it is possible to combine advantages of these systems and realise the experimental broadcasting of the television.

The Television Society of Japan, which was formed in 1934, and which comprises the investigators of television throughout the country is earnestly recommending to start the experimental broadcasting, and the Corporation is now considering the matter to comply with the recommendation. The desirability of its early realization is justified, though the policy of the Corporation towards the question is yet to be disclosed. The special building for the purpose of the television research is under construction at present on the premises of the Research Laboratory.

Wireless Exchange System Although the growing trend of listeners of broadcast has been of a steady and healthy nature, the listeners are mainly concentrated in the city districts and the percentage of listeners to population in the country districts remains far below that of the former. This difference is chiefly attributed to the financial difficulties of the country districts. To conquer this drawback the Corporation is planning to start the wireless exchange system, with special units suitable for the nature of its service.

Technical experiments to find out the most efficient method for this system are being carried out at present in different regions throughout the country. A representative is chosen in a village and a broadcast receiving set is installed there, the operations and care of the set being entrusted to the representative and the audio output distributed by specially constructed lines to the subscribers in the village. The results in various districts so far are proving to be successful, and as soon as the plan is authorized by the government it is expected to be actually put in service at an early date. It is expected that by applying this system the majority of the population in country districts who are individually not able to pay the cost of a receiving set, the expense for maintenance and the charge for power supply for the receiving set, will now be able to enjoy the benefit of the broadcasting.

This system appeals also to those who find wireless reception difficult or who wish to avoid the trouble of looking after a wireless set.

Listeners When the Tokyo broadcasting station was opened on the 22nd of March 1925, the total number of listeners for the whole country was something like 5,400. On the 20th of August 1926, when the Broadcasting Corporation of Japan was formed, the number of listeners had reached a figure of over 338,2000.

The listening fee of two yen a month had been calculated to be charged at the time when the broadcasting services were started, was reduced to one Yen due to the unexpected increase in the number of listeners. This rate was uniform all over the country.

In September 1928, the number of listeners reached the 500,000 mark. In February 1932, three years and four months after, the number ran into 1,000,000, and in April of the same year, the subscription fee was reduced to seventy-five sen. The so-called "Golden Age" in our broadcasting begins at this period and in June 1933, the number passed the 1,500,000 mark, and keep ing up the momentum, it leapt into 2,000,000 in April 1935. In commemoration of this growth, the subscription fee was reduced to the modest sum of 50 sen a month, which is being kept up to this day.

To sum up, it took about seven years for the number of registrations to reach the first 1,000,000; the next 1,000,000 was reached in three years only; while the subscription fee has been reduced to half the original sum during these 10 years,—a rate without parallel elsewhere in the world.

Thereafter, there was a tendency for the number of registrations to go on rapidly increasing, and at the end of December 1936, the number reached the figure of 2,776,189, the rate of distribution representing 39.9 per 1000 population or 20.5 per 100 families.

THE YEARLY INCREASE OF LISTENERS

Year	Number of new registrations	Number of discontinuances	Number of net increases	Average increase per month
1925	200,191	5,619	194,572	17,688
1926	218,830	64,431	154,399	12,867
1927	129,867	101,541	28,326	2,361
1928	283,043	120,297	162,746	13,562
1929	243,559	161,860	81,699	6,808
1930	283,714	170,921	112,793	9,399
1931	396,078	181,791	214,287	17,857
1932	546,859	175,416	371,321	30,943
1933	504,657	196,976	307,693	25,641
1934	501,695	232,003	269,562	22,464

Remarks: The number of families is taken from the report of the National Census, Oct. 1, 1935.

MONTHLY INCREASES DURING THE YEAR 1936

Month	Number of new registrations	Number of discontinuances	Number of net increases	Number of net increase in the corresponding month of previous year
Jan.	59,545	17,316	42,350	31,470
Feb.	54,296	15,978	38,199	25,724
Mar.	59,753	22,971	37,083	24,504
Apr.	69,274	16,504	52,302	52,684
May	58,799	21,419	37,471	48,831
June	62,374	21,450	41,043	37,636
July	59,825	19,522	40,459	38,772
Aug.	69,695	19,051	50,402	35,216
Sept.	59,677	21,177	38,565	26,257
Oct.	52,970	24,411	28,516	26,154
Nov.	51,984	19,517	32,501	27,557
Dec.	52,744	19,923	32,819	32,276
Total	710,936	239,244	471,710	407,081

This number of registrations, when divided between cities and towns, the number in the former occupying 69% of the whole total, while in the case of the number of families, just the reverse is noted i.e. large percentage of 65.4 is claimed by towns, hence it is that the rate of diffusion, with the former comes out to be 40.8 per 100 families and with the latter 9.7%, constituting a marked difference between the rates of the two. The accompanying list gives the comparison of the rates of diffusion of licence holders in cities and those in towns during the past six years.

Year	Total Number of licence holders	%	Cities Number of licence holders	%	Towns & Villages Number of licence holders	%
1936	2,776,189	100	1,915,857	69.0	860,332	31.0
1935	2,304,479	100	1,628,059	70.6	676,420	29.4
1934	1,897,398	100	1,364,573	71.9	532,825	28.1
1933	1,627,836	100	1,166,777	71.7	461,056	28.3
1932	1,320,143	100	965,740	73.2	354,403	26.8
1931	948,822	100	542,340	57.2	406,482	42.8

The new registrations in the course of 1936 passed the 710,000 mark, creating a new record since the inauguration of broadcasting activities, which far exceeded the figure for 1935 over 628,000.

When this number of new registrations of over 710,000 is divided between cities and towns, the former occupies 59.8% of the total. Recently there is a marked tendency of the rate being on the increase with towns, and the reverse is the case with cities.

When the number of new registrations and that of discontinuances, during 1936 are classified respectively according to the professions, and set against the corresponding percentages for the previous year, as is done in the following list, we find that the increase in the percentage was recorded in agriculture, manufacturing industry, marine products industry.

Professions	New registration		Discontinuances		Population with profession
	1936	1935	1936	1935	1930
Agriculture	12.2	9.0	9.9	8.9	47.7
Marine products industry	0.4	0.3	0.3	0.3	1.9
Mining industry	0.5	0.4	0.4	0.3	0.9
Manufacturing industry	8.5	8.3	7.7	7.6	19.3
Commerce	37.6	39.7	37.4	38.0	15.1
Transportation industry	2.3	2.3	2.3	2.8	3.7
Civil, military services & persons of liberal professions	30.0	29.9	30.9	29.6	6.9
Households works	0.2	0.3	0.2	0.5	1.9
Other industries	0.1	0.1	0.1	0.2	2.6
No industry	8.2	9.7	10.8	11.8	not included
Total	100.0	100.0	100.0	100.0	100.0

This classification of the population by professions is the result of the National Census in Japan proper, 1930.

Finance Since the beginning of its establishment, the Broadcasting Corporation of Japan has pursued its policy of lightening the financial burdens upon the listeners by reducing the subscription fee down to its minimum.

To commemorate the tenth anniversary of the opening of broadcasting in this country and to popularise radio throughout Japan, the Corporation carried out the reduction of the subscription fee from seventy-five sen to fifty sen on April 1st, 1935. This resulted in a great increase in the number of subscribers, viz. the increase for the year ended March 31st 1936, was 443,015. But the net revenue from this fee and others decreased from 15,874,151 yen for the fiscal year of 1934 to 13,447,631 yen for the fiscal year of 1935.

On the other hand, the expenditure, including the depreciation of building and plant, amounted to 13,088,702 yen for the fiscal year of 1935, showing an increase of 856,071 yen against the last year's.

As it is clear in the following financial statement of the Broadcasting Corporation of Japan, greater part of its revenue is spent on the maintenance and development of the service, as well as on the various kinds of new enterprises.

Among the various items of expenditure, there is the contribution to the Home Office, the sum of 1,262,465 yen for fiscal year of 1935, which was distributed among the prefectures as contribution to sanitary measures.
Besides this, the Corporation paid to the Government the sum of 395,446 yen as licence fee which was calculated upon the number of listeners registered at the end of the preceding financial year.

FINANCIAL STATEMENTS OF THE BROADCASTING CORPORATION OF JAPAN

Revenue Account for the year ending March 31st, 1936

EXPENDITURE

Programmes	¥ 2,541,718.49	Service	¥ 366,948.88

CHAPTER XXV

LAND AND AIR TRANSPORTATION

State Railways

Historical Background

Japan's railway projects date from 1869, when the Government formed a plan to lay a trunk line linking Tokyo with Kyoto and Kobe, together with some branches to Yokohama and Tsuruga, a port on the Japan sea. As the first step, half a million yen was sanctioned for the work between Tokyo (Shimbashi) and Yokohama, but the State Treasury was in no position to find this amount, while private capital declined to venture into this novel field of investment. It was at this time that an Englishman, Horatio Nelson Lay, by name, came forward with a proposal to furnish the required funds. The terms offered by him were accepted and a Japanese loan for one million sterling was placed on the London market. With the arrival of a British engineering corps and materials, the first sod was dug on the 28.962 kilometre Shimbashi-Yokohama section in March, 1870, and on the 32.18 kilometre Kobé-Osaka section in November, 1870. The gauge adopted for these lines was one of 1.067 metres, which has later become the standard gauge of the Japanese railways.

Tokyo - Yokohama and Other Lines The work between Shimbashi and Yokohama was completed in September, 1872, while the Kobé-Osaka line was opened to traffic in 1874 and its further extension to Kyoto in 1877. These sections have practically formed the nucleus of what now constitutes the Tokaido Line, one of the main arteries of railway traffic in Japan. In 1880, the Kyoto-Otsu section was completed and in 1884 a further extension with a length of 41.834 kilometres between Tsuruga and Nagahama, a town along Lake Biwa, was completed and opened to traffic in pursuance of the railway idea of linking up the Pacific and the Japan Sea. Meanwhile, a survey was made on the Otaru-Horonai section in Hokkaido, where colonization work was being strenuously encouraged. Construction of this section was soon undertaken and the 88.495 kilometre length was opened to business in 1882, thus bringing the total length of railway under Government ownership toward the close of 1884 to 185.035 kilometres.

Private Lines About this time the Government was in financial difficulties and the building of State railways practically came to a standstill except for a few extensions. It was at this time that, not being in a position to undertake the work itself, the Government began to encourage private enterprise, the encouragement mostly being in the shape of subsidies. Under these circumstances, many private railways were built in rapid succession, the most notable among them being the Nippon Railway, the Sanyo Railway, the Kyushu Railway and the Hokkaido Colliery Railway. The total length of line thus built by private capital in the ten years between 1881 and 1891 aggregated 1,874.485 kilometres, a length more than double that of the State which did not exceed 886.559 kilometres by the end of 1891.

The Trunk Line Prior to this, the Government decided to lay a trunk line through the Nakasendo, the old mountainous highway of Central Japan, but in view of engineering difficulties along this line it was subsequently abandoned in favour of the level region of the Tokaido. Work on the new route was finished in July, 1889, whereby a through service was opened for a distance of 611.42 kilometres between Tokyo and Kobé. Then a branch to Yokosuka was opened and a 160.9 kilometres section between Takasaki and Naoétsu was completed with the exception of 9.654 kilometres over the Usui Pass. This difficult section, for which the Abt rack rail system was adopted, was not opened for service until 1893.

The Railway Construction Law In view of the industrial progress being made in the country there was an urgent demand for the speedy construction of more railways. The entire length of Japanese railways at that time amounted to only 2,574.4 kilometres and the bulk of contemplated lines was in remote districts with no prospect of immediate profit, and on that account did not appeal to private enterprise. These circumstances showed both the

Government and the public the advisability of state acquisition of private lines and opinion was further strengthened by the financial failure of some of the private concerns. In view of this, in 1892, the Railway Construction Law was passed and the Government set to work constructing important lines. The law embodied a comprehensive programme of railway building and contained the guiding principles on which the railway system of Japan was founded. At the same time the matter of consolidating the different lines into one complete system was being studied by a committee of enquiry appointed by the Government. The acquisition of private railways was accomplished in October, 1907, the subsidiary businesses being taken over at the same time. Immediately after nationalization the State Railways were organized under a Railway Bureau, which was directly responsible to the Cabinet. But in May, 1920, a separate Department of State was created to deal with railway affairs and the Minister of Railways was appointed to control it.

Railway Network

The law of 1892 authorized the Government to build certain specified lines within a certan limit of time, and also to buy up such private railways as were judged necessary for the completion of a unified system. Pursuant to this programme the State Railways proceeded with the work of construction and in 1906 and 1907 purchased 17 private lines to a total length of 4,547.034 kilometres, thereby bringing under national control all the railway lines in Japan proper, with the exception of feeding lines of local importance. In 1922 after a careful survey of the State lines the Railway Construction Law was modified and some new lines were added to the original programme. At the same time it was decided that, pursuant to the new law, such local lines as formed a connecting link between the State lines, either already projected or considered necessary for completing a unified national railway system be purchased.

Organization and Staff

Prior to the nationalization of the private lines, the State lines were operated on a departmental system based on the principle of centralization. The system worked well because the management of the State lines was a relatively small business, but when the Government assumed the management of all lines it was found unequal to the extra work, and in December, 1908, the Imperial Government Railways were removed from the control of the Minister of Communications and assigned to a newly created administrative body, the Railway Board. The administration was then decentralized and remains so today. The existing system of organization of the State Railways was established in May,1920, when the said Railway Board was made, by virtue of Imperial Ordinance No. 143, an independent department of the Central Government. According to the regulations, the Department of Railway not only controls the whole of the State lines, but supervises the provincial railways and tramways in Japan proper. It maintains one central and six regional offices. The Central Office is directly governed by the Minister of Railways and manages all matters relating to the State Railways as well as maintaining supervision over provincial railways and tramways. It is composed of eight departments according to the kinds of business dealt with. There are the Minister's Secretariat ; Bureau of Local Railway Administration ; Bureau of Traffic and Operation ; Bureau of Construction ; Bureau of Maintenance and Improvement ; Bureau of Mechanical Engineering ; Bureau of Electricity ; and Bureau of Finance and Purchase. The Central Office also controls Regions, District Construction, District Improvement, District Electric Offices and Tokyo Railway Hospital. On April 23, 1930, by virtue of Imperial Ordinance No. 83, a further bureau, the Board of Tourist Industry was created as a separate bureau of the Department of Railways. The bureau is controlled by the Minister of Railways and attends to the business of the tourist industry, its object being to encourage people of other lands, by advertising and in other ways, to visit Japan and see her incomparable scenic beauty, natural charm and national manners and customs, and to encourage Japanese living at home to take trips to different parts of the Empire.

As stated above, the administration of the State Railways is decentralized into six regions, Tokyo, Nagoya, Osaka, Moji, Sendai and Sapporo. Each region is a complete unit and is in charge of a director who is vested with power to conduct, at his own discretion, all affairs relative to his jurisdiction, excepting matters of general and large import for which decision of the central administration has to be obtained.

In the State Railways of Japan the members of the staff are either Government officials or employees.

On March 31, 1935 there were al-

together 209,456 servants in the employment of the State Railways as against 201,538 in the preceding year. The total salary for the year under review was ¥142,471,148 as against ¥137,932,168 in 1934. The average annual salary per person in employment was ¥680. As compared with the preceding year, the staff shows an increase of 7,918 during the year, and the annual payment of salaries increased by ¥4,538,980.

Finance By Railway Special Account Law, enforced since 1909, the budget of the State Railways was made separate of the general finances of the State. Furthermore, the law provides that all capital expenditure for railway construction and improvement should be met from the revenue accruing from all sources of traffic and that the expenditure should, in case the revenue is not sufficient to cover it, be supplemented by the proceeds of public loans issued as a charge on this special account.

Traffic

Goods and passengers carried by the State Railways in Japan proper since 1914–15 follow :

Fiscal years	Goods	Passengers	Goods Revenue	Passenger Revenue	Daily Average Revenue per km.
	Metric tons	(Unit in 1,000)	(¥1,000)	(¥1,000)	(In yen)
1914-15	35,837,241	166,092	51,750	54,671	33
1919-20	60,899,557	357,881	131,809	161,546	81
1921-22	58,312,333	454,535	167,241	214,519	99
1922-23	65,095,702	512,754	179,220	232,301	103
1923-24	65,818,955	579,288	178,109	249,563	102
1924-25	71,178,263	640,828	194,563	259,047	105
1925-26	73,090,274	683,568	198,786	262,074	103
1926-27	74,780,409	740,333	201,609	266,199	101
1927-28	78,621,788	795,722	211,749	271,523	101
1928-29	79,762,959	847,300	220,686	285,337	103
1929-30	77,224,824	862,939	217,949	279,030	99
1930-31	64,087,099	824,152	184,146	255,086	84
1931-32	60,590,746	787,222	176,124	239,972	77
1932-33	61,732,756	781,149	174,706	233,387	75
1933-34	71,970,592	841,316	198,038	254,534	—
1934-35	77,477,837	913,564	213,467	282,028	—
1935-36	71,739,000	974,047	221,804	297,775	84

At the end of 1935, the total working kilometreage of the State Railways reached 16,535.1 kilometres and shows an addition of 690.6 kilometres over the preceding year. The total train kilometreage amounted to 222,038,295 kilometres, being an increase of 18,390,684 kilometres or 9 per cent over the preceding year. The number of passengers carried during the year totalled 919,834,770 and the aggregate volume of goods transported amounted to 77,537,341 metric tons. As compared with the preceding year the former showed an increase of 73,697,940 passengers or 8.7 per cent and the latter 5,515,484 metric tons or 7.7 per cent. The receipts from these two sources amounted to ¥507,142,606, showing an increase of ¥42,422,708 or 9.1 per cent, over the preceding year.

Motor-car Service During the year under review 8 new routes with a total length of 617 kilometres were inaugurated for motor-car traffic and by the addition of the newly opened routes the total working kilometreage of the motor-car service reached 1,161 kilometres with 24 routes at the end of the year.

These extensions include those routes that were newly inaugurated in Sendai and Sapporo Regions where no motor-car service was available. The total number of passengers carried over those routes during the year came to 4,134,529, of which 3,846,011 being those isolated passengers of motor-cars only. The aggregate volume of goods handled amounted to 39,332 metric tons including 12,850 metric tons of goods carried over the motor-car routes alone. The receipts from passengers amounted to ¥918,569 and those from goods traffic to ¥62,978, the total being ¥981,547.

Ferry Service At present the State Railways run this service at 5 localities. They are Aomori-Hakodate ferry service connecting the main land with the island of Hokkaido, Shimonoseki-Moji ferry service connecting the main land with the island of Kyushu, Shimonoseki-Fusan route which connects the islands with the Asiatic mainland, Uno-Takamatsu service which links the Sanyo

ne (main land) with the Island of hikoku and Hokkaido-Karafuto route nking Japan proper with the Island f Karafuto or Saghalien. Besides, there re a few minor routes provided with maller steamboats or motorboats for nking such places of note for sight-eeing as Miyajima in the Inland Sea. At the end of the year under review here were altogether 60 boats consist-ng of 31 steamers and 29 harbour boats wned by the State Railways apart from hose chartered to private companies. The gross tonnage of these boats a-nounted to 48,957.55 tons, showing an in-rease of 270.78 tons in capacity as gainst the corresponding figures of the receding year, but the number of oats decreased by 3.

Accident and Casualty Returns The umber of accidents reported during the ear totalled 5,315, or 23.6 per 1,000,-00 train kilometres, showing an increase f 306 over the number for the preced-ng year, though there was a decrease f 0.6 per 1,000,000 train kilometres. The umber of casualties, including those aused by accidents, errors or unknown auses, numbered 3,506, during the year, r 15.6 casualties per 1,000,000 train kilo-metres. As compared with the preced-ng year this is an increase of 416 in the otal number, and 0.7 per 1,000,000 train ilometres. The number of casualties caused by suicide was 2,189, or a decrease of 71 in the number for the preceding year.

Construction

Railway construction expenses for the 1932–33 fiscal year totalled ¥47,743,368, while, the total expenses for 1931–32 were ¥37,706,907. The same for 1933–34 amounted to ¥53,130,133 and for 1934–35 ¥53,130,133.

The total expenditure disbursed during the year on account of construction a-mounted to ¥47,794,115 as against 53,-130,133 in 1934–35.

Length of Open Lines

The total length of State lines open for traffic on March 31, 1935, the end of the fiscal year of 1934, amounted to 16,-427.480 kilometres as against 15,737.077 kilometres in 1933–34, showing an in-crease of 690.403 kilometres. The total length of tracks reached 26,520.170 kilo-metres as against 25,612.643 kilometres in 1933–34, indicating increase of 907.527 kilometres. Of the total length of lines open for traffic 14,261.384 kilometres are covered by single tracks, 1,942.548 by double tracks, 29.963 by triple tracks, 173.292 by quardruple and the rest by multiple tracks. This length of lines is distributed according to regions as follows :

STATE LINES OPEN IN 1934

Kinds of Tracks	Single	Double	Triple	Quadruple and over	Total
Region	km.	km.	km.	km.	km.
Tokyo Region	1,309.725	616.265	2.910	128.588	2,057.488
Nagoya ,,	1,698.949	314.107	11.163	—	2,024.219
Osaka ,,	2,622.831	402.880	4.660	60.887	3,091.258

Works and Plants

At the end of the year under review there were altogether 22 works and 3 detached plants in operation.

On March 31, 1935 there were 14,499 workmen, on the rolls and their monthly wages aggregated ¥900,029.

The aggregate expenses involved in the repair of the rolling stock at the railway workshops amounted to ¥23,359,-719. In addition to this the repair work at the Head Office, amounted to ¥1,162,078, at the Regional Offices ¥1,-674,690 and at offices other than the workshops ¥4,691,033, the entire total on repair works amounting to ¥30,887,520. The cost of by-products either consumed by the Railways or sold to other companies is estimated at ¥2,808,387. The following were turned out of the work-shops during the year : 11 dining cars, 9 third class passenger cars, 10 gasoline cars, 31 third class electric motor-cars, 53 two-ton covered wagons with brake vans, and 9 snow-ploughs, 761 steam locomotives, 185 electric locomotives, 3,081 passenger carriages, 1,615 electric cars. In addition, 6,260 wagons were re-moddelled.

Rolling Stock

The number of locomotives in opera-tion towards the end of the fiscal year

of 1935–1936 was 3,986 with an aggregate weight of 331,375 metric tons, consisting of 3,811 steam locomotives with an aggregate weight of 11,956 metric tons and 10 special locomotives representing 20 metric tons. There was an increase of 24 electric locomotives during the year, representing a weight of 2,353 metric tons. The number of passenger carriages aggregated 10,812. The total number of covered wagons in use at the end of 1935 was 67,485 with an aggregate loading capacity of 892,422 metric tons, 220 tank cars with a loading capacity of 2,596 metric tons, 30,294 uncovered wagons with a loading capacity of 433,400 metric tons and 747 special wagons.

Electric Power

On March 31, 1935 there were altogether 4 power stations, 50 substations, 181 distributing houses and 1 switching station in operation. During the year the number of power stations increased by 1, that of the substations and the distributing houses by 14 in each. It should be noted that the power stations and substations within the compound of the workshops have been newly included in the above number as independent ones. Besides, there were altogether 11 alternators representing 98,704 k.w.a., 152 converting machines for electric traction with a capacity of 242,354 k.w., and 594 transformers representing 720,702 k.w.a. in operation at these plants.

Finance

The State Railway revenue for the 1934–35 fiscal year totalled ¥969,187,927 against ¥870,165,166 for the 1933–34 fiscal year, while expenditure totalled ¥857,585,570. Revenue and expenditure since the 1926–27 fiscal year follow :

Fiscal Year	Revenue	Expenditure
	(In yen)	
1926-27	947,386,213	825,612,827
1927-28	1,006,458,791	859,806,853
1928-29	1,014,752,892	876,675,990
1929-30	1,004,911,356	892,160,458
1930-31	813,010,038	740,039,239
1931-32	767,657,721	678,774,390
1932-33	761,894,098	691,012,532
1933-34	970,165,166	770,366,710
1934-35	969,187,927	857,585,570

The State Railway finance is independent of the general finance of the State and its accounting system consists of three accounts, i.e., Capital, Stores and Revenue Accounts. Details for the total revenue and expenditure for 1933–34 are given below classified according to the three accounts.

Capital Revenue and Expenditure The capital revenue settled for the year 1935–36 was ¥140,315,288 as against ¥124,845,934 of expenditure settled, being an increase of ¥12,627,269 for the former and of ¥6,885,152 for the latter as compared with the preceding year. The increase in the revenue was attributable chiefly to the rise in the amount transferred from the railway profit and sundry receipts, as well as surplus income on the stores account, while the growth in the expenditure was due to the increase of improvements effected sums appropriated for the redemption of liabilities.

Item	1934–35	1933–34 (In yen)	1932–33
Capital revenue	139,982,882	127,435,706	116,730,548
Surplus on stores account	332,406	252,313	328,418
Total revenue	140,315,288	127,688,019	117,058,966
Construction, improvement, and motor-car routes	118,145,718	111,449,938	99,734,424
Redemption of debts	6,700,216	6,510,844	6,331,669
Total expenditure	124,845,934	117,960,782	106,066,093

Stores Account The revenue from the sale of railway stores for the year 1935–36 was ¥154,461,933 and the expenditure on this item amounted to ¥159,225,660, or an increase of ¥21,887,722 for revenue and of ¥21,536,566 for expenditure as compared with the previous year. The increase in the revenue was accounted for partly by the larger proceeds of sales of railway stores, and partly by the increase in receipts accruing from repairs of railway stores and from the supply of electric current while the increase in the expenditure is accounted for by the rise in the stores and workshop expenses and the charge for electric current.

Item	1934-35	1933-34 (In yen)	1932-33
Railway stores and workshop receipts	154,461,933	132,574,211	113,839,431
Railway stores and workshop expenses	159,225,660	137,689,094	115,030,275

Revenue Account The total revenue settled during the year amounted to ¥674,410,706 and the total expenditure ¥573,513,976 which are respectively ¥64,507,771 and ¥52,286,298 more than in the previous year. The increase in the revenue was attributable to the increase of the traffic and the sundry receipts, as well as receipts on suspense account and advances, while increase in the expenditure was accounted for by the growth in working expenses and subsidies to local railways, as well as the increase in refunds and advances appropriated for the C.O.P. payments.

The Revenue Account settled for the past three years is as follows :

Item	1934-35	1933-34	1932-33
Revenue:	¥	¥	¥
Traffic Receipts	512,931,499	468,652,906	421,418,616
Sundry Receipts	10,624,683	9,247,931	8,241,333
Receipts on Suspense Account & Advance	150,854,524	132,002,098	101,335,751
Total	674,410,706	609,902,935	530,995,700
Expenditure:			
Working Expenses	318,543,876	284,784,383	267,958,803
Interest Charges	91,788,215	93,775,493	88,883,405
Refunds and Advances	156,101,827	135,648,919	105,843,171
Secret Service Fund	27,440	27,440	27,440
Subsidies to Local Railways	7,052,618	6,991,443	7,203,345
Total	573,513,976	521,227,678	469,916,164

Fixed assets of the State Railways for the last nine years follow :

Fiscal years	Value at the beinning of the year	Value at the end of the year
	(In ¥1,000)	
1926-27	2,453,092	2,647,453
1927-28	2,647,453	2,858,794
1928-29	2,858,794	3,062,614
1929-30	3,062,614	3,246,724
1930-31	3,246,724	3,374,392
1931-32	3,347,392	3,413,786
1932-33	3,413,786	3,503,893
1933-34	3,503,893	3,613,169
1934-35	3,613,169	3,728,485

BUSINESS INCOME AND EXPENSES

(In ¥1,000)

Fiscal years	Income	Expenses	Net profit
1926-27	484,082	353,175	130,907
1927-28	506,444	368,277	138,167
1928-29	529,256	393,380	135,875
1929-30	518,016	399,026	118,989
1930-31	458,140	382,552	75,587
1931-32	433,540	365,088	68,451
1932-33	425,954	364,874	61,079
1933-34	474,254	385,578	88,675
1934-35	518,668	314,126	204,541

Railway Business in 1935 and 1936

The conditions of the electric railway business in the country have become considerably brightened. The tendency to improvement which became evident in 1932 after the depression in electric railway business had reached the lowest point in that year, has been consistently maintained since then, and has begun to yield quite appreciable results recently, with even those local companies which had failed to give any dividend in the past having commenced to yield one now.

Various electric railway companies have long since taken to side-lines as a means of balancing against depression in railway returns. Among such side-lines are the electric light and electric power industry, department stores

and management of land. Following the re-imposition of the gold embargo, the "extraordinary situation" boom enhanced the power of consumption to such an extent that not only the side-lines but also the main business of operating electric railways has begun to yield more and more profits. The recovery from the depression has been accelerated by the decreasing tendency in the rate of interest and by the curtailment of expenses.

It is now anticipated that the conditions of the electric railway business will be further improved with the strengthening of the low-interest tendency and the progress of the "extraordinary situation" boom. There are, however, some unfavourable factors such as the increased taxes, the lowering of electric light charges and the reduction of government grants, but it is considered unlikely that the electric railway business will suffer depression on this account. This prediction is based on the fact that the increase in the receipts of the electric railways and the profits derived from the side-lines undertaken by the various companies have been greater than expected, with the tendency still continuing. Further, the progress of the Government control over the transportation system will serve to make the foundation of the electric railway companies all the firmer.

Business Conditions As already stated, the electric railway business which reached the bottom of depression in 1932 has since been improving remarkably, especially following the re-imposition of the gold embargo. While definite figures for 1936 are still unavailable, the statistics for 1935 clearly indicate this rising tendency.

During 1935, the total receipts of the State railways amounted to ¥544,530,000 which sets the highest record for all the past years. It represents an increase of ¥25,870,000 or 5 per cent over the figures for the preceding year. Along with the increase in receipts, the expenditure of the State Railways also increased. Nevertheless, the profits amounted ¥215,000,000, a sum larger by ¥10,000,000 than the profits for 1934, representing 5.45 per cent of the total capital of the State Railways. This was the best result attained since 1929.

Local railways have also improved in business conditions. Their profits in 1935 totalled ¥41,100,000 which represents 4.2 per cent of their construction cost. Although only 0.1 per cent greater than the profits in 1934, they gained as much as 1.4 per cent when compared with the figures for 1932, showing the best result since 1930.

Simultaneously with the improvement in the conditions of the local railways, electric railways have recovered from their previous business depression. The receipts of the electric railways during 1935 totalled ¥114,920,000 showing a gain of ¥1,800,000 over the receipts in the preceding year. The expenditure of the railways during 1935 totalled ¥69,180,000. showing a decrease of about ¥1,500,000 as compared with the figures for the preceding year.

The better business conditions of the electric railways are to be attributed to various factors including the increase in the volume of both passenger and freight traffic on account of the progress of the general business boom and the curtailment of expenses enabled by the prevailing low-interest tendency. All this served to bring about a total net profit of ¥45,735,000 for the electric railways in 1935, which represents an increase of ¥3,300,000 over the net profit in 1934 and amounts to 5.6 per cent of the construction cost of the railways, the highest percentage since 1931.

The changes in the business conditions of the various railways from 1918 until 1935 are shown in the following table:

	State Railways (In 1,000 yen)				Private Railways (In 1,000 yen) Ordinary Railways	
	Receipts	Expenditure	Profits	Percentage of Profits	Receipts	Expenditure
1918	243,547	114,101	99,445	0.78	21,141	12,930
1919	309,931	202,861	107,115	0.77	28,671	18,078
1920	350,669	242,161	108,537	0.70	35,352	22,223
1921	397,599	218,550	178,949	1.01	40,142	23,069
1922	429,593	229,778	199,815	1.01	45,853	26,389
1923	443,354	261,242	182,112	0.85	50,543	28,544
1924	470,927	266,232	204,694	0.88	57,674	31,956

1924	25,718	0.81	126,129	71,036	59,122	1.09
1925	27,280	0.72	129,098	75,805	53,292	0.97
1926	30,961	0.71	130,422	75,187	55,235	0.96
1927	33,591	0.64	137,063	77,949	59,114	0.94
1928	36,400	0.61	143,218	82,540	60,677	0.91
1929	41,364	0.56	140,472	80,752	59,719	0.93
1930	35,367	0.42	128,774	77,637	51,137	0.69
1931	35,273	0.38	116,645	72,558	44,089	0.58
1932	34,333	0.28	109,670	68,128	41,541	0.54
1933	28,627	0.40	110,860	67,554	43,305	0.54
1934	39,522	0.41	113,119	70,698	42,421	0.53
1935	41,105	0.42	114,919	69,184	45,735	0.56

(Note: The expenditure of the State railways as given in the above table is purely business expenditure excluding supplementary expenses, those required for the administrative control and the survey of railway lines and tracks.)

Details of the business conditions of the private railways during 1936 still remain to be ascertained but judging from the business conditions of the principal electric railways both in the Kanto and Kansai, it is clear that a further improvement was achieved during the year.

Kanto Railways The conditions of the business of the electric railway companies in the Kanto began to improve in the first half of 1934 and the improving tendency became more conspicuous during 1936. The aggregate profit of the eight principal electric railway companies in this district during that year amounted to ¥12,248,000 which equals to 10.2 per cent of the total paid-up capital of the companies. This represents an increase of ¥1,423,000 or 0.8 per cent in the profits as compared with the figures for the preceding year. In comparison with the profits for 1933, the increase is 1.2 per cent.

The average percentage of dividend offered by the electric railway companies in 1936 was 7.34 per cent, greater by 0.14 than the average percentage for the preceding year. This is attributable to the fact that the Tokyo-Yokohama Electric Railway Company increased the dividend for its shareholders by 1 per cent. Aside from the eight principal companies, the Shonan and Odawara Electric Railway Companies commenced to give a dividend to their shareholders in the same year and the Sagami Railway Company also increased its dividend.

As has been pointed out already, the improvement in the business conditions of these companies has been accomplished by the increase in receipts and the curtailment of expenses. The transportation receipts of the various companies have advanced by from 5 or 6 per cent to nearly 20 per cent, partly because the districts along the railways have been developed and part-

ly because the "extraordinary situation" boom has permeated into the lower classes. At the same time, the effect of the advancing boom upon various side-lines can not be overlooked.

Among the electric railway companies engaged in electric light and power supply as an additional line, Oji Electric Railway Company may be regarded as a representative one. The Keisei, Keio and Tamagawa Electric Railway Companies are also engaged in developing electric light and power supply as a side-line.

The Tobu Electric Railway Company has undertaken to operate autobus lines and the Tokyo-Yokohama Electric Railway Company has taken to the managment of department stores while the Meguro-Kamata Electric Railway Company has commenced the business of managing land. Apparently, these side-lines have been undertaken as means for promoting the electric railway business but in reality, they are intended as independent activities designed to enlarge the scope of the electric railway business.

As the side-lines thus undertaken have achieved a satisfactory development on the strength of the inflation boom, the business conditions of the various electric railway companies engaged in such activities have greatly improved.

Another factor affecting the electric railway business favourably is the decrease in the rate of interest on loans contracted by the various electric railway companies which have secured the greater part of their funds for construction of railways through this means.

The total receipts of the eight leading electric railway companies in the Kanto district during 1936 amounted to ¥44,277,000 which shows an increase of ¥5,400,000 over the figures for the preceding year of an increase of 14 per cent. The expenditure also increased to ¥32,000,000 which, however, is only ¥4,000,000 greater than the figures for the preceding year.

Details of the business conditions of the eight principal companies during 1936 are tabulated in comparison with the figures for the preceding six years as follows :

	Capitalization	Average Paid-up Capital	Receipts	Expenditure	Profits	Percentage of Profits	Dividend
			(In yen)				
First Half of 1936							
Tobu	50,500,000	27,750,000	4,726,000	3,483,000	1,243,000	8.9	7.0
Keisei	40,500,000	23,287,000	3,467,000	2,307,000	1,160,000	9.9	7.0
Keio	12,900,000	10,300,000	2,113,000	1,582,000	531,000	10.3	7.0
Tamagawa	12,500,000	7,950,000	1,748,000	1,336,000	412,000	10.3	7.0

Kansai Railways The business conditions of the electric railway companies in the Kansai continued to improve during 1936. Their profits continued to expand with the increase in the transportation receipts and the larger profits derived from the electric light and power enterprises. The total receipts of

the six leading companies in the district during the year amounted to ¥84,000,000, showing an increase of ¥4,600,000 over the figures for the preceding year.

The profits of the six leading companies during 1936 totalled ¥26,710,000 or 10.9 per cent which represents an increase of more than ¥2,100,000 or an increase of 1 per cent over the profits for the preceding year and 0.8 per cent over the figures for 1931, recording the highest percentage in recent years. The average dividend of 7.3 per cent is also a noteworthy fact illustrating the improvement in the business conditions which is expected to continue into 1937.

Kansai also experienced a full share of the trade boom, with Osaka as the chief centre of activity. The influence was directly felt by spinning and rayon industries, all of which were very active during the year, and foreign trade experienced a remarkable degree of prosperity. It is firmly believed that this tendency will continue for at least another few years, which means that the receipts of the various electric railway companies will continue to swell.

The following are the details of the business conditions of the six principal electric railway companies in the Kansai district during 1936, tabulated in comparison with the figures for the preceding five years.

	Capitalization	Average Paid-up Capital	Total Receipts	Total Expenditure	Profits	Percentage of Profits	Dividend
Accounts closed in March, 1936							
Hanshin Dentetsu	100,000,000	47,500,000	8,021,000	4,968,000	3,053,000	12.9	9.0

Prospects Greater improvement in the business condition of the railway companies is expected in the future as both passenger and freight traffic will continue to increase in volume owing to the operation of the enormous national budget. A prosperous future is also expected for the various sidelines although there are unfavourable factors present such as the increased taxation and reduced electricity charges as well as the likelihood of discontinuance of government grants to local railways.

Under the present system, only those local railways which commenced business by the end of 1936 are entitled to government grants which as a rule last for 10 years. In other words, according to the present system, local railways to be constructed in the future will not be given any government grants. If this system continues, not only with the construction of future railways be affected, but also some of the existing local railways will not be able to function, as they depend chiefly on government grants. Herein lies the importance of the question of government's grants. Under the present circumstances, it is unthinkable that the government grants to private local railways will be discontinued. It would be necessary for the government to continue

the grants, even if there is a reduction in the amounts.

The question that remains to be solved in the future concerns the control of the transportation system. Although the various local railways have, as already stated, achieved in recent times, a remarkable improvement in their business conditions, the improvement has been such as cannot be regarded as a complete or fundamental recovery from the depression from which they suffered before the trend of events for the better. The yields of the railways are still at a low level as compared with the prosperous times of the past. The reason may be sought in the collapse of the monopolization system in the railway business, the competition presented by the automobile business and the pressure brought to bear upon the local railways by the Ministry of Railways.

In order to liquidate the difficult situation, it is necessary that a control of the transportation system should be enforced, especially in the capital. Already, contracts have been concluded for the merger of the Shonan and Keihin Railway Companies as well as the Keihin Underground Railway Company and the Subway Company.

The question of amalgamation between Tokyo-Yokohama Electric Railway Company and the Tamagawa Electric Railway Company is under discussion, as also a merger of the Meguro-Kamata and Tokyo-Yokohama Electric Railway Companies.

It is expected that the realization of a strong control of the transportation system will stabilize the situation for the local railways.

TRAFFIC AND RECEIPTS OF JAPANESE GOVERNMENT RAILWAYS

Date	Average Mileage in Operation	No. of Passengers Carried	Revenue			Freight Loading	Freight Discharges

Private Railways

General The status of provincial railways in operation and those not yet opened at the end of 1935 follows:

	No.	Length (Kilometres)	Construction Cost (In yen)
Railways in operation	260	7,088	1,018,266,471 (estimate)
Compared with the year before	(de.) 6	(de.) 96	(in.) 4,278,482 (estimate)
Railways not opened yet	158	3,126	757,058,780 (estimate)
Compared with the year before	(de.) 21	(de.) 339	(de.) 21,135,967

Traffic During the 1934–35 year the number of passengers carried was 499,878,493, the coaching receipts amounting to ¥62,262,808. As compared with the preceding year the number of passengers carried increased by 37,515,823 or 8.1 per cent, the coaching receipts by ¥3,195,217 or 5.4 per cent. The increase both in traffic volume and coaching receipts was accounted for by the improvement of the financial situation that had been in depressed condition these

few years. The average kilometres of journey per passenger came to 8.6 kilometres and the average coaching receipts per passenger ¥0.125, which means a decrease of 0.8 kilometres for the former, but a loss of ¥0.03 for the latter as compared with the previous year. The total amount of goods moved during the year under review figured 26,327,344 metric tons and the receipts accrued therefrom amounted to ¥20,303,665. There are a gain of 1,487,694 metric tons in the volume and of ¥994,004 in the receipts. It appears that the return of business prosperity, coupled with the larger demand for munitions and the heavy crops, has brought about the boom of goods traffic during the year, resulting in the swell of the volume of goods hauled and the receipts therefrom. The average goods receipts per metric ton came to ¥0.771, which was a loss of ¥0.006. Altogether 1,812 accidents took place on all the local railways, in which 384 persons were killed and 482 injured. The number of accidents decreased by 58, the injured by 97, and the killed by 5 against the corresponding figures of the previous year.

Rolling Stock The aggregate number of locomotives in use by the local railways on March 31, 1935 was 897 with the weight of 23,135 metric tons, being a decrease of 50 locomotives. These comprise 664 tanks, 66 tenders, 164 electric and 3 gasolene locomotives.

The number of carriages belonging to the local railways at the end of the year totalled 4,343 with a capacity of 308,474 seats, being a decrease of 90 carriages and an increase of 127 seats over the preceding year.

The total of freight cars in use numbered 11,006 with the loading capacity of 109,012 metric tons, a loss of 470 wagons but an increase of 4,615 metric tons in the capacity.

Finance The total working revenue of the local railways during the year aggregated ¥91,606,427 as against their total working expenses of ¥51,857,275, leaving a profit of ¥39,749,152. As compared with the preceding year the working revenue showed a gain of ¥4,204,123, and the working expenses ¥3,082,617. The net profit for the year came to ¥32,454,168, which is composed of the profit shown above plus ¥32,674,237 of miscellaneous receipts, less ¥22,822,749 of interest paid and ¥17,146,472 of other charges. The earnings per day per kilometre ¥35.472, and the profit per day per kilometre ¥15.392, showing an increase of ¥2.021, ¥1.413 and ¥0.608 in earnings, expenses, and profit respectively against the figures for the previous year. The percentage of working expenses to working revenue stood at 56.6 per cent and that of working profit to the construction expenses at 4.1 per cent, being a gain of 0.8 per cent for the former and of 0.1 per cent for the latter.

Assets and Liabilities Both assets and liabilities of the private railways at the end of 1934–35 fiscal year totalled ¥2,115,910,749.

Employee On March 31, 1935 there were altogether 40,845 employees on the staff of the local railways, their monthly allowances amounting to ¥2,252,922, or an increase of 332 and ¥83,264 re spectively.

Tramcar Service

Growth of Tramways The tramways in Japan date back from 1880, when an application was tendered for the construction of the Tokyo Horse Tram Co.'s line which was completed and opened to traffic in 1883. As provided by the Tramway Law now in force, all the tramways in Japan are constructed as a rule on highways. The street railways, a certain number of suburban railways and others laid in provinces are placed under the control of the Law. Such public bodies as cities, towns and villages may take the management of tramways without restriction. Steam and electricity are mostly employed as motive power except a few local tramways where gasolene, horse or human power is used for the purpose.

Lines in Operation On March 31, 1935 there were 135 tramways open to business with a length of 2,615.20 kilometres and an aggregate capital of ¥1,468,193,689, being a loss of 6 in number, 37.45 kilometres in length, and a decrease of ¥603,280,350 in capital. Classified according to kinds of motive power they are made up as follows :

Kind of power	No. of Tramways	Kilometres	Capital
		k.m.	¥
Electric	89	2,079.62	1,431,452,036
Steam	8	153.38	1,861,000
Steam and gasolene combined	9	75.52	3,795,000
Gasolene	12	122.72	23,157,000
Horse power	15	150.47	7,743,000
Human power	6	33.49	185,663
Total	140	2,615.20	1,468,193,689

New Lines, Lines Under Construction During the year 6 tramways with a total length of 8.20 kilometres were newly opened to business, while 4 tramways with a total length of 5.72 kilometres were granted charters for construction. Most of them use electricity as power and aim at conducting transportation in and near towns. The tramways under construction at the end of the year numbered 70 and their aggregate length measured 785.56 kilometres while the total capital amounted to ¥23,036,000, being a decrease of 2 in number, of 26.44 kilometres in length, and of ¥2,769,842 in capital respectively as against the preceding year.

Results of Working The number of passengers carried during the 1934–35 period was 1,570,739,965, the coaching receipts resulting therefrom being ¥104,-759,835. Compared with the preceding year the number of passengers decreased by 4.3 per cent and the receipts by 2.8 per cent.

The goods carried during the period was 1,907,384 metric tons, and the goods receipts ¥1,430,598, being a loss of 0.8 per cent in receipts and of 12.7 per cent in the volume of goods carried.

The total revenue of the tramways during the year amounted to ¥113,112,507 as against their total working expenses of ¥70,689,908, leaving a balance of ¥42,-422,599 as profit. This was a gain of 2 per cent in the revenue, 4.6 per cent in the profit and a loss of 2 per cent in the working expenses. The working revenue per day per kilometre was ¥124.21, the working expenses per day per kilometre ¥46.58, being respectively an increase of 77.63 and the profit per day per kilometre ¥4.60, ¥4.74 but a loss of ¥0.14 as compared with the preceding year. The ratio of the working expenses to the working revenue stood at 62.5 per cent, or an increase of 1.6 per cent while the ratio of the profit to the construction expenditure was 5.3 per cent or 0.1 per cent more than in the preceding year.

Assets and Liabilities The total capital investment of all the tramways open to business up to the end of the year under review amounted to ¥1,658,-587,395 of which ¥1,386,682,331 was paid up and ¥807,840,784 was claimed by construction expenses for open lines. Besides, there was ¥679,718,208 in the shape of debentures, floating debts, overdraft and bills payable, etc.

Tourist Industry

Three organizations, viz., the Board of Tourist Industry, the Japan Tourist Bureau (founded in 1912), and the Kokusai Kanto Kyokai (founded in 1931), a foundation devoting itself solely to the carrying out of travel publicity abroad, and forming the hub from which radiate innumerable lines connecting it with other important organizations, such as the Society for International Cultural Relations and other cultural bodies, tourist associations in various districts, transportation concerns, hotels and all other organizations that have anything to do with the tourist industry of Japan.

The Board of Tourist Industry is divided into two departments, one for general affairs and the other for business promotion. In addition to these, it has three boards of investigation dealing with tourist resorts, hotel enterprises and treatment of tourists respectively. These boards comprise experts of the government and the public on the respective subjects. The Committee of Tourist Industry holds its general meeting at least once a year, when it decides what course to follow in carrying out any important undertaking.

The Kokusai Kanto Kyokai runs an office in New York and Los Angeles, though the actual business is carried on there in the popular name of the Japan Tourist Bureau.

The branch offices of the Japan Tourist Bureau, both in Japan and abroad, number about 130 in all. Besides, it has agents in some important cities abroad in order to make the network of its service as extensive and satisfactory as possible.

Since the establishment of the Board of Tourist Industry, tourist organizations of a non-commercial nature have been successively founded in many parts of Japan, and at present the total number is in the proximity of 400.

During the past two or three years, an annual increase of over 20 per cent has been recorded in the number of foreigners who visited Japan. According to statistics issued by the Board of Tourist Industry, the year 1935 witnessed the entry into this country of 42,-629 foreigners, not including the 2,700 passengers on ships making a world-cruise, 132,700 through passengers on ordinary boats and 500,000 members of the crews of various vessels which called at Japanese ports during the same year.

The total amount of money spent in 1935 in this country by foreigners was ¥96,019,000 of which ¥70,242,000 was spent by tourists, according to the estimate of the Ministry of Finance. During the same year, Japan exported cotton piece-goods to the amount of ¥490,000,000 raw silk to the amount of ¥380,000,000, rayon textiles to the amount of ¥120,000,000

and silk textiles to the amount of ¥77,000,000. It will be noted that the amount of money spent in this country by tourists came very near the value of the export of silk textiles.

The total number of foreigners visiting this country did not increase much in 1936 over the figures for the preceding year, but the same rate of increase as before was recorded in the number of those who travelled the country for sightseeing. Particularly noteworthy is the fact that a remarkable upward tendency was indicated in the number of tourists coming from Manchoukuo and other East Asiatic countries.

In consideration of the future of Japan's tourist industry, special mention must be made of the fact that elaborate preparations have already been commenced for holding the 12th Olympic Games in Tokyo in 1940 which will also be the 2,600th anniversary of the foundation of the Empire. Besides various national enterprises in connection with the celebration of the anniversary, international conferences in varied fields are also expected to be held in this country during that year.

It is rather difficult to form any idea as to the number of foreign visitors likely to visit Japan in 1940, but the Board of Tourist Industry and other organizations are looking for it as an epoch-making year in the history of tourist industry in Japan. The rate of increase of foreign visitors during the past 15 years, 1921–1935, has been 5 per cent per annum, and their number in 1940 will under ordinary circumstances reach 53,000, while the 12th Olympiad and some 10 international gatherings are bound to add several thousands to this number.

The governmental authorities and the civilian organizations concerned are energetically devising ways and means to promote the tourist industry in conformity with the exceedingly favourable situation. Apart from the question of perfecting sporting facilities and means of transportation, plans are under consideration for the improvement of roads, traffic, sanitation, hotels and amusement facilities. The establishment of an international sea-bathing resort has been proposed and some organizations are sponsoring the creation of better facilities for the study of Japanese culture, by means of museums, art galleries, etc.

FOREIGNERS WHO VISITED JAPAN

In 1935

Nationality	Duration of Stay: Less than 15 days	Less than 3 months	More than 3 months	Total	Purpose: Sight Seeing	Official Business

Railways in Chosen, Taiwan, Manchuria, etc.

Chosen

The first railway enterprise in Chosen dates back to 1899, when a railway linking Keijo (Seoul) with Jinsen (Chemulpo), 29.485 kilometres in length, was laid and opened to traffic by the Kei-Jin Railway Company. The outbreak of the Russo-Japanese War caused the military authorities of Japan to build the Keijo-Fusan, Keijo-Shingishu and Masan lines which were opened to traffic in 1905 and 1906 respectively. In 1906 the Imperial Government of Japan nationalized the Keijo-Fusan Line and also took over the Keijo-Shingishu and the Masan Lines from the War Office of Japan, placing all these lines under direct control of the Railway Bureau of the Korean Residency-General. Meanwhile the work of construction was steadily pushed on and in 1910 the Heijo-Chinnampo line was completed. On the spanning of the Yalu River with a swing bridge in 1911 the peninsular railway was brought into connection with the South Manchuria Railway. In 1914 the Taiden-Mokpo and Keijo-Gensan lines were completed, while in 1915 part of the Gensan-Kainei line was opened. In 1928 the Kankyo line which connects Kainei to Gensan was completed, and in 1933 the Tomon line which connects Kainei to Yuki was opened to traffic. The latter is connected with the Keito line of S.M.R.C. at Kainei, thus preparing a new eastern transportation facility between Chosen and Manchoukuo. On March 31, 1935, the State Lines in Chosen open to business totalled 3,077.4 km. as against 2,935.4 km. in 1934 showing an increase of 142 km. The number of passengers carried aggregated 25,614,815 as against 1,568,881,881 of the number of passengers carried one kilometre, while the weight of goods hauled was 7,681,776 metric tons as against 1,643,305,463 ton-kilometres. The coaching receipts amounted to ¥24,358,001 and goods receipts to ¥25,790,513, and the total ¥50,148,514. As compared with the preceding year the number of passengers shows an increase of 3,376,477, and the volume of goods hauled an increase of 426,917 metric tons, while the coaching receipts increased by ¥3,556,280 and goods receipts by ¥2,981,092 and ¥6,537,372 for the total. The average revenue per day came to ¥137,393, the average revenue per kilometre to ¥16,658, the average revenue per day per kilometre to ¥45.64, being an increase respectively of ¥17,910, ¥2,294 and ¥6,29.

The aggregate length of private railways open to traffic on March 31, 1935 amounted to 1,249.3 kilometres, the length of lines under construction 15.2 kilometres, and lines contemplated but not yet granted charters 301.2 kilometres, the total length of all these lines amounting to 1,565.7 kilometres. The number of private companies which are already operating railways in Chosen numbered 9, viz., Chosen Railway Company, Chosen Keinan Railway Company, Kongosan Electric Railway Company, Shinko Railway Company, Chosen Keito Railway Company, South Chosen Railway Company, Chosen Gas & Electric Company, South Manchurian Railway Company, and Kunsan Municipal Railway. Besides, there were two railway companies which were provided with a charter but had not begun work. Of the above mentioned companies the former six receive regular subsidies from the Government. The aggregate capital of the six subsidized companies amounts to ¥100,300,000 of which ¥45,380,000 is paid up, while the aggregated capital of the other non-subsidized companies came to ¥9,560,825. The total length of tramways operated in Korea came to 80.9 kilometres indicating a gain of 6.7 kilometres over the previous year. The power used is mostly electricity. (See Chapter XL for fuller informations.)

Taiwan

It was not until the cession of the Island of Formosa (Taiwan) from the Chinese Government to Japan that the island began to enjoy railway facilities, for, prior to that time, the only railroad existing was a small light railway between Keelung and Shinchiku built at the time of the Ching Dynasty. Soon after the cession, the Taiwan Government-General brought forward a plan, with the approval of the Diet, to build a railway connecting Takao with Keelung at the expense of ¥28,800,000. Work was started in 1889 from both termini and finished in April, 1908. This line now forms the trunk line in the island's communication system. The construction of this pioneer line was followed by other lines, that is, the Kyukyodo-Heito section completed in 1912, the Taito line in 1917 and the Giran line in 1924. The length of lines open to traffic on March 31, 1935, was 881.7 kilometres, being the same as the preceding year. The working route kilometreage of the Government lines at the end to line in 1917 and the Giran line in the train kilometreage during the year 8,968,725 kilometres, the vehicle kilometreage 160,358,297 kilometres, being an increase of 215,224 kilometres for the train kilometreage and of 9,498,619 kilometres for other vehicles. The number of passengers carried came to 18,144,327, the volume of goods hauled to 5,706,127 metric tons and the earnings accruing from these two sources to ¥21,424,698. Compared with the corresponding figures for the preceding year the number of passengers increased by 1,003,468, the volume of goods by 619,400 metric tons and the total earnings by ¥2,093,649.

Most of the private railways existing in Taiwan were originally constructed by sugar refining companies for transporting sugar and other materials, transportation business being conducted only as a side work. At the end of March 31, 1935, there were 20 companies with the total working km. of 2,341 while the balance 1,836.9 km. were for the exclusive use of the companies owing to them.

The tramways, which form an important factor in the island communication system, have made a marked development in recent years. The total length of lines in operation on March 31, 1935, was 1,232 km., the number of passengers carried aggregated 3,085,987, goods moved 715,701,554 m.t. and the total receipts ¥1,663,383.

Karafuto Railway

The first railway in Karafuto (Japanese Saghalien) was constructed by the Military Department in 1906 between Otomari, formerly known as Korsakovsa, and Toyohara, formerly Vladimolocka, 41.83 km. in length. It was a light railway with a gauge of 0.61 metre and exclusively used for military purposes. With the withdrawal of the military Government in April, 1907, the railway was transferred to the control of the Karafuto Administration and opened to public traffic in August of the same year. As traffic went on increasing the gauge was widened to 1.07 metres, some time in 1910, while construction of sections further north of Toyohara was started. Late in 1911 the work on the Toyohara-Sakaehama section being completed, the Otomari-Sakaehama section, 94.13 km. which now forms the trunk line in the island's communication, was opened to traffic. Construction work has been continued since and a branch line linking the Kawakami Mine with Konuma, and the Honto-Noda section on the west coast were completed and opened to business in 1914 and 1920 respectively. In addition, the construction of a branch line which connects Toyohara, the capital of the island, with Maoka on the west coast, was started in 1921 and opened to business in 1928.

The lines in operation at present totalled 342.9 kilometres, remaining the same as the previous year. The total number of passengers who travelled by the railways during 1935 totalled 1,400,482 and showed a decline of 4,548 or 3 per cent as compared with the previous year, though the receipts showed a gain of ¥17,921 the total receipts being ¥830,639. The total of both passenger and goods receipts amounted to ¥2,058,458 showing an increase of ¥175,791 over the receipts for the preceding year.

There are altogether three local railway companies that have run railway business in Karafuto.

South Manchuria Railway

It was on September 5, 1905, that the Japanese Government, by virtue of Article V of the Peace Treaty concluded between Japan and Russia, acquired possession of the railways in Manchuria from Changchun to Dalny, now Dairen, and Port Arthur, now Ryojun, together with its branch lines, all the rights, privileges, and property attaching thereto, including the local mines formerly owned by the Chinese Eastern Railway. On June 7, 1906, Imperial

Ordinance No. 142 was issued concerning the establishment of the South Manchuria Railway Company and on July 13 of the same year General Viscount Gentaro Kodama was appointed chairman of the promoters' committee which were composed of 80 members. On July 25, 1906, the presidency was assumed by General Viscount Masataké Terauchi, the then Minister of War, due to the death of General Kodama. The articles of association relative to the company were prepared by the committee on the basis of the Imperial Ordinance and the instructions of the Government. They were approved by the Government on August 18 and the establishment of the company was sanctioned by the Minister of Communications on November 1, 1906. The authorized capital of the company at first was ¥200,000,000, of which ¥100,000,000 represented the total of the appraised value of railways with properties and the mines at Fushun and Yentai as handed over to the company by the Military Field Railway Department. The other half of the capitalization was offered to public subscription and the shareholders were guaranteed a 6 per cent dividend per annum by the Japanee Government. By March, 1930, 800,000 shares representing 80 million yen were paid up, but with the development of various activities after the World War the capitalization was increased to 440 million, one-half of the increased capitalization being taken up by the Japanese Government. The company is authorized to issue debentures not exceeding twice the amount of paid-up capital, and not exceeding the amount of total capitalization. The company has often issued debentures on the home and foreign markets and on such occasions both the principal and interest have been guaranteed by the Government. The total capital paid up on March 31, 1935 amounted to ¥548,208,-000 and the capital unpaid to ¥251,792,-000 the total length of lines open to business was 1,129.1 kilometres. The gauge of these lines was 1.067 metres at first, excepting the Mukden-Antung Line. The company shortly after its establishment rebuilt the lines to the standard gauge of 1.434 metres. The doubling of track between Dairen and Changchun,704.3 kilometres, was completed in 1915. In the year 1934 the number of passengers carried was 13,-786,403 and showed an increase of 2,-152,528 over the previous year. Goods carried aggregated 21,671,342 m.t. The income from these came to ¥101,489,276. (See Chapter on Manchoukuo.)

Motor Transport and Its Development

Behind Japan's motor transport system there is no such history of experimentation and endeavour as characterizes the arrival of the motor car in the West. The first car seen in Japan was one imported from America by a foreign resident of Yokohama in 1897, and then for the next ten years there was no great increase in the number. In 1907 there were only 16 cars in the whole country. Then came a change. In 1912 there were 520 vehicles and a year later 1,000. In 1921, passenger cars numbered 4,683 and business cars numbered 7,439. The great earthquake and fire which destroyed Tokyo and Yokohama in 1923 brought about a great demand for motor cars because rail traffic was interrupted at various places and the help of motor cars was badly needed. In 1924, the number increased to 40,070, of which 27,959 were passenger cars and 12,097 were trucks. The rate of increase for the five years 1921–26 was for passenger cars 100.49 per cent and for trucks 1,200.6 per cent. This rapid development of motor car transport has driven rikishas, electric cars and provincial railways into the background. Motor-car passengers are increasing year after year, while passenger receipts on provincial railways are quickly decreasing. To the present, except in the vicinity of large cities, Japan has not been blessed with good roads, but the construction of first-class motor roads is being pushed ahead in all parts of the country and traffic is bound to make a phenomenal increase as the roads are completed.

Number of Cars According to the statistics taken by the Police Bureau, Home Ministry, the number of all kinds of cars in Japan proper was 175,904 at the end of 1935.

NUMBER OF MOTOR CARS IN JAPAN PROPER

At the end of	Ordinary Cars: Private	Ordinary Cars: Taxicabs	Trucks	Special Cars	Small Cars	Total
1933	7,723	59,010	38,199	5,187	25,124	135,234
1934	7,970	62,511	42,059	4,938	39,095	156,573
1935	9,213	64,795	46,918	5,065	49,913	175,904

Number of Cars in Principal Prefectures in 1934

	Ordinary Cars	Trucks	Special Cars	Small Cars	Total
Tokyo	17,608	9,918	1,104	12,733	41,363
Osaka	5,732	3,975	467	8,438	18,612
Hyogo	3,535	2,089	211	3,193	9,028
Kanagawa	3,055	2,199	129	1,889	7,272
Aichi	3,404	2,872	448	3,962	10,686
Shizuoka	2,338	1,793	134	1,371	5,636
Fukuoka	2,798	1,002	210	1,221	5,231
Kyoto	2,475	1,321	164	1,748	5,708

Figures of the National Resource Bureau taken at the end of October 1936 are as follows :

Number of Cars in the Empire

(October 31, 1936)

	Cars	Trucks	Special	Total
Japan proper	79,775	50,437	3,882	134,094
Colonies	9,233	5,645	663	15,541

Commercial Passenger Cars Although the available figures are old, the business mileage of commercial passenger motor vehicles by fixed lines at the end of 1930 totalled 122,284 kilometres. If the business mileage of motor trucks by fixed lines be added, the total amounts to more than 160,900 kilometres. There were many cases of duplication of services by competitive lines, but if the actual business mileage is estimated as being one-third of the above total, it will be found that it was more than double that of the Government-owned and private railway and tramcar services combined. The total number of companies and individuals engaged in bus business in 1935 reached 3,423. Among prefectures Fukuoka led with 204. The other prefectures which had over 100 were as follows : Kumamoto 158, Fukushima 186, Hokkaido 161, Oita 138, Hyogo 131, Hiroshima 102. These figures do not necessarily represent the prosperity or better facilities for motor transportation in the districts, but in many cases simply indicate the absence of any effective control of the business. The worst instance of the case is a road in Kumamoto where 10 buses are running.

The Ministry of Railways is going to control over such disorder or competition according to the Motor Transportation Business Law promulgated in 1934.

The prefectures which had geographical and geological handicaps had smaller numbers such as Okinawa 9, Tottori 30, Nara 25, Fukui 38, and Kochi 22. The prefectures in which the six big cities are located had comparatively small numbers indicative of a good control, i.e. Tokyo 71, Kanagawa 74, Osaka 36, Aichi 70 and Kyoto 50.

(As to the production and supply of motor cars in Japan see Chapter XIX.)

Aviation

History of Development

The Early Period During the Satsuma Rebellion in 1877, two balloons were built. In 1891, Mr. Chuhachi Ninomiya made a model of an aeroplane shaped like a bird from his own design, and, in 1894, another shaped like an insect. In 1897, Mr. Isaburo Yamada obtained a patent for a kite balloon of his own invention. Two of these kite balloons were used in the siege of Port Arthur during the Russo-Japanese War. In 1907, a balloon corps was organized in the Telegraph Corps at Nakano, and, in June, 1909, a special military balloon investigation association was established. In March, 1910, a gliding test of aeroplane No. 1 of the Hino type was made at Toyamagahara, Tokyo, and, in October that year, a flying test of an aeroplane of the Narahara type was made. On December 19 of the same year, Lieutenant Tokugawa (now Lieutenant-General) flew 3,000 metres in four minutes in a Farman aeroplane at Yoyogi, and Captain Hino flew in a Glady aeroplane. This was the first time that an aeroplane flight was carried out in Japan.

The First Civilian Flight In the spring of 1911, airship No. 2 of the Yamada type was taken out of the hangar at Osaki, Tokyo, and made a successful cross-country flight. In March and April of the same year, an American flyer carried out an exhibition flight in Osaka and Tokyo ; on April 8, Mr.

Shinzo Morita, who had studied flying in France, flew in a 45 h.p. monoplane over the Joto parade-ground in Osaka, this being the first flight by a civilian flyer in this country; and, in April that year, the aerodrome and flying ground at Tokorozawa were completed. In June, 1912, Mr. Atwater, an American flyer, conducted a series of exhibition flights by hydroplane on the sea off Nishinomiya near Osaka; and, in July that year, five officers were selected from each army division to be trained as flying officers. This marks the beginning of instruction in flying to military officers in this country. In the autumn of 1912, a number of aeroplanes and airships participated in the grand military manœuvres. In February, 1913, the Teikoku Hiko Kyokai (Imperial Aeronautical Association) was established; on May 4 that year, Mr. Koha Takeishi, a civilian flyer, started on a Naruo-Osaka-Kyoto flight, but, when landing in the Fukakusa parade-ground in Kyoto, he met with disaster and died as the first victim of civilian aviation in Japan.

Contest of Civilian Aviators In 1914, a contest by civilian aviators was held at Naruo, near Osaka, under the auspices of the Imperial Aeronautical Association, and, during the Tsingtao campaign Japanese military aeroplanes took part in actual fighting for the first time and displayed their ability in scouting, in bombing the enemy fortress and in an aerial combat with enemy planes. In 1915, a meet of civilian flyers was held in Osaka, and a military flying battalion was formed. Between January and April, 1916, American aviators visited Japan and performed trick flying at Naruo and other places; and, on April 27 that year, night flying was successfully carried out for the first time in this country. In 1917, the flying battalion was enlarged into the first and second battalions and a balloon corps. In April that year, Mr. Bird Smith, an American flyer, again visited Japan and carried out a series of high-class exhibition flights in Osaka and Tokyo. In April, 1918, Mr. Masao Goto, a private flyer, succeeded in making a non-stop flight between Tokorozawa and Osaka for the first time.

Military Flying School In April, 1919, the Military Aeronautical Department and the Military Flying School were established; and, on October 22 that year, the first mail transport flight between Tokyo and Osaka was carried out with success. In 1920, the Aeronautical Institute was established at Tsukishima, Tokyo; and in May that year, two Italian aviators paid a visit to Japan by air. In March, 1921, the regulations for the control of aviation were put in force. In the autumn of 1922, the Japan Aerial Transport Institute started a regular flying service between Sakai and Shikoku by hydroplanes. In 1923, the military air force was made an independent arm. The Osaka Asahi Shimbun started a regular air service between Tokyo and Osaka in January and the Japan Aerial Navigation Co., Ltd., opened one between Osaka and Beppu in July that year. In March, 1924, the dirigible S. S. No. 3 exploded and, in September of that year, the trial flight of the newly built airship Astra was carried out.

Air Mail Traffic In April, 1925, air mail traffic was started between Tokyo and Osaka; and, on July 25 that year, an aeroplane of the Asahi Shimbun took off from the Yoyogi parade-ground in Tokyo and, on October 27, reached Rome after a flight of 16,000 kilometres (in stages) via Moscow, Paris and London. In 1926, the Japanese Navy purchased from Italy the dirigible S-No. 3, which was one with a semi-rigid envelope, introduced into Japan for the first time. In June, 1927, the Aviation Law came into effect. In May, the Coast Defence Association successfully carried out a flight round the mainland, and, in October that year, the airship S-No. 3 exploded, while participating in the grand naval manœuvres. In April, 1928, Mr. Habuto, a civilian aviator, established a new record by flying 2,000 kilometres in 13 hours and 23 minutes; and, in July that year, aerial defence manœuvres were conducted in Osaka.

The Air Transport Co.. In 1929, the Japan Air Transport Co., Ltd., was established and inaugurated a regular air passenger service between Tokyo, Osaka and Fukuoka, later extending it to Seoul and Dairen; and two Army scouting planes of the 88 type flew between Tachiarai and Heito without stopping, making a record of aerial connection between the mainland and Taiwan. On their homeward flight, one of the planes flew for 15 hours and 15 minutes, thus establishing a new record of staying in the air in this country. In 1930, the Japan Students' Aviation League was formed and associations for the study of aviation were established one after another in different universities and colleges in Tokyo and Osaka. Mr. Yoshihara, a civilian flyer, flew from Berlin to Tokyo via Siberia in 11 days and simultane-

usly, Mr. Azuma, also a civilian flyer, eached Tokyo from Los Angeles via lew York, London, Berlin and Siberia. n March, 1931, the airship No. 8 which ad been made in Japan and belonged o the naval air force at Kasumigaura ook off and stayed in the air for a ecord length of time of 60 hours and ne minute.

The Aeronautical Institute In May, he Aeronautical Institute which ranks s the best research station in the world vas completed six years after the start- ng of its construction. In the same nonth, the aeroplane "Young Japan" belonging to Hosei University, a mem- ber of the Students' Aviation League, et off for Europe from the flying round at Haneda near Tokyo and, at he end of August, reached its desti- nation, Rome. After the outbreak of he Manchurian trouble in September hat year, our military planes partici- pated in actual warfare for the first ime since the Tsingtao campaign. In October of the same year, the aero- plane (Fokker No. 3-M) of the Japan Air Transport Company succeeded in lying between Taiwan and the main- and. In 1932, as a consequence of the Manchurian trouble, 64 "Aikoku" (Pa- riotic) planes were constructed with noney contributed by the people gen- erally, and, moreover, defence from erial attack became much discussed in our principal cities and important eco- nomic centres. On February 23, our Navy planes fought with enemy planes n the air over Shanghai. In the fight- ng, Lieutenant Kotani was killed, while Lieutenant Ikuta shot down a Boeing plane of the enemy. The trial night lights between Tokyo and Tachiarai on he nights of April 20 and May 2 that year proved a success.

Present Condition of Civil Aviation

Modest but definite progress of com- mercial aviation in Japan is indicated n the annual report of the Japan Air Transport Company, which reports mails carried by the company's planes during the year 1934 totalled 1,268,435, recording almost a 50 per cent increase over the 647,601 of the previous year. Commencing with April 1, 1935, the company has resumed night flying and also has inaugurated a special early morning service bringing Mukden within a day's reach from Tokyo by way of Seoul and Dairen. The early morning service was extended to Hsinking, the capital of Manchoukuo, on May 1. Fur- ther expansion of commercial aviation is expected to be facilitated consider- ably by the 15-year Government sub- sidy plan adopted by the Communica- tions Ministry last year with a tenta- tive budget of ¥200,000,000 for the whole period and originally a sum of ¥5,500,- 000 for the 1935–36 year but later cut to a smaller amount. During the last fiscal year the Japan Air Transport Company maintained the longest route of service totalling 2,118 kilometres be- tween Tokyo and Dairen by way of Nagoya, Osaka, Fukuoka, Urusan, Seoul, Heijo and Shingishu. Of the other avia- tion concerns Japan Aviation Research Institute maintains a 290-kilometre serv- ice between Osaka and Matsuyama in Shikoku, by way of Takamatsu; the Tokyo Air Transport Company a 150- kilometre service between Tokyo and Shimoda; the Tokyo Asahi Shimbun- sha, Ltd., a 415-kilometre service be- tween Tokyo and Niigata; and the Japan Marine Air Transport Company a newly opened service between Ma- tsué, Shimané Prefecture, and Hirosaki on the Japan Sea coast. The Tokyo- Shimoda service is operated only be- tween May and September and the Tokyo-Niigata service between May and October. In 1934 the total distance of commercial air routes in Japan was 3,751 kilometres.

Except the Japan Air Transport Com- pany, which has a paid-up capitaliza- tion of ¥4,000,000 all Japanese commer- cial aviation firms are still operated on extremely limited scale, while even Ja- pan Air Transport is assisted by an annual Government subsidy of ¥500,000.

Japan had a total of 235 civil air- planes, on October 1, 1935. The Japan Air Transport Company opened to busi- ness in April, 1929, and since its opera- tion to service the company has contrib- uted a great deal to the development of civil aviation in Japan. However, the re- sults have not proved satisfactory, es- pecially with recent years. Its profit rate was dropped considerably of late. Its business results since the opening of business follow:

	Paid-up Capital	Profit	Profit Rate	Annual Dividend Rate
	(¥1,000)			(In per cent)
1st h. 1929	2,500	355	28	5
2nd h. 1929	2,500	622	49.8	6
1st h. 1930	2,500	887	71.0	6
2nd h. 1930	3,955	1,033	52.2	6
1st h. 1931	4,000	979	49.0	6
2nd h. 1931	4,000	390	42.3	6
1st h. 1932	4,000	939	47.0	6
2nd h. 1932	4,000	924	46.0	6
1st h. 1933	4,000	844	42.2	6
2nd h. 1933	4,000	274	13.7	5
1st h. 1934	4,000	379	19.0	5
2nd h. 1934	4,000	254	12.7	5
1st h. 1935	4,000	189	9.5	5

The company will be given subsidy totalling ¥19,970,000 spreading over 11 years after its founding. For the first five years especially three years following its founding the subsidy was larger, but since then the amount has been decreasing. In the third year the subsidy totalled ¥3,580,000, but in the 10th year it will come down to ¥770,000 and in the last year it will be reduced to ¥120,000. The company opened aviation service between Tokyo and Toyama. The service to Formosa in January, 1936. The Fukuoka-Shanghai service is on the programme, but this depends on the improvement of Sino-Japanese relations.

REGULAR AIR SERVICE ROUTES IN JAPAN

Route	Distance (In kilometres)	Time Required for Flying	Carrying	Company or Body Operating Route	No. of Flights
Tokyo-Osaka	435	2 h. 30 m.	Passengers, Freight and Mail	Japan Air Transport Co., Ltd.	Twice (both ways) per day (except Sundays)
Osaka-Fukuoka	500	3 h.	,,	,,	,,

1935	68,044	4,201,771	28,606	65	9	30	55

Measures to Promote the Aviation Service

Profoundly convinced of the absolute necessity of promoting aviation service under existing conditions the Ministry of Communications intends to make it a national policy to launch a comprehensive aviation programme extending over three years beginning with the fiscal year of 1937-38. This programme covers the perfection and expansion of aviation facilities, training of aviators, encouragement and control of aircraft industry, perfection of both national and international aviation systems, etc.

Perfection and Expansion of Aviation Facilities The aviation facilities of this nation, including aerodromes, grounds for forced landing, aeronautical wireless stations, aerial lighthouses and aviation meteorological observatories, are in such condition that they are far from bearing a favourable comparison with those in various other countries. There are at present less than 10 state-managed flying grounds for civilian aeroplanes in this country, which are all too small and poorly equipped. Even the Tokyo airport, in spite of its being located at the entrance to the capital, is not large enough to enable the easy landing of a large-sized passenger plane such as the Douglas machine which traverses the American Continent.

As a means of rectifying the unsatisfactory situation, the authorities of the Ministry of Communications are endeavouring to perfect the national aviation system through the improvement of existing aviation fields and establishment of new ones in the leading cities throughout the country with the cooperation of the prefectures concerned. They are also making efforts to increase the number of grounds for forced landing and improve and expand the aerial lighthouses and other facilities in order to promote the regular air service.

Training of Aviators While the necessity of training air pilots and aircraft mechanics in order to promote the aviation service is generally recognized, the institutes for such training in this country are still very poorly organized and have few adequate training grounds. To make matters worse, the aeroplanes used by these institutes for exercise purposes are generally of a very inferior quality.

The communications authorities are working for an increase in the number of superior aviators by controlling these training institutes and urging an improvement of their equipments.

Encouragement and Control of the Aircraft Industry From the standpoint of science and technique, the Japanese people are not inferior to any other in producing aircraft of superior order but owing to the smallness of demand for civilian aeroplanes, few efforts have been made to manufacture flying machines of new types. Though some new types have been produced in the country they are chiefly imitations of foreign-made ones. The expensiveness of the production of an original type is held responsible for the slowness in the progress of aircraft industry in the nation. The government authorities are considering measures to encourage the manufacture of experimental aircraft, besides undertaking to direct the aircraft-making activities through its aeronautical research institutes. They aim at enabling the manufacture of aircraft at less cost than at present, so as to increase the demand for aeroplanes. The authorities also deem it essential to control as well as give encouragement to the manufacturers of aeroplanes and makers of aeroplane parts. The leading newspaper publishers in the country are encouraged by means of special grants to buy home-made aeroplanes instead of imported machines for use in their business. As an additional means of encouraging aircraft industry, the authorities also feel the necessity of granting subventions for the promotion of the export trade of home-made aircraft.

International Aviation Besides perfecting the national aviation system by

improving the existing facilities and creating new ones, it is being strongly urged that the air routes linking this land with other countries should be perfected and expanded. It is emphasized that this country should gain the mastery of a regular air line connecting Manchoukuo, China and Europe, another connecting India, the South Sea Islands and Australia, a third connecting Soviet Russia and a fourth connecting the United States of America. Though the difficulty of competing with the already extended influence in the East of America and Europe is conceded, yet such a mastery is deemed essential to the growth of this nation.

Promotion of the Aircraft Industry With a view to furthering the development of the aircraft industry of the country, the government authorities are devising adequate ways and means to encourage the use of aircraft for searching out schools of fish to help fishing industry, to take aerial picutures and conduct aerial surveys, in addition to promoting the regular air transport business. Measures are also under consideration for encouraging the establishment of light aeroplane clubs, glider clubs and similar civilian aviation organizations, as well as for increasing facilities for training in aviation.

Flying Grounds

Public and private flying grounds in Japan are as follows :

Public Grounds The Tokyo Airport. The Tokyo flying ground is situated at Suzuki-Shinden, Haneda-machi, Tokyo, prefecture (Long. 139° 40′ E. and Lat. 35°30′ N.). It is a flying ground on land and covers an area of 528,926 square metres. Its runway extends for 600 metres from east to west and as much from north to south. It slopes at a gradient of 1/500 and is divided into 330,000 square metres of exposed land, 198,000 square metres of grass land and 33,000 square metres of concrete paved zone. The usual direction of wind there is from south to north. In the grounds, there are a signal pole, a weighing beam, a compass correction stand, and a factory.

The Osaka Airport. The Osaka flying ground is situated at Kizugawajiri, Funa-machi, Minato-ku, Osaka (Long. 135° 23′ E. and Lat. 34° 39′ N.). It is a flying ground both on land and water in category and covers an area of approximately 350,000 square metres. Its runway extends for 720 metres from east to west and 400 metres from north to south. The ground inclines in a minor degree from north to south and is overgrown with clover. The gliding range for hydroplanes is the sea outside Osaka harbour. The direction of wind there is generally from east to west. Chief provisions in the ground are a signal-pole, two tower-cranes, and a compass correction stand.

The Fukuoka Flying Ground. The Fukuoka flying ground is situated at Najima, Tadara-mura, Kasuya-gun, Fukuoka prefecture (Long. 130° 26′ E. and Lat. 33° 39′ N.). It is a flying ground for hydroplanes and its gliding range extends over the eastern part of Fukuoka Bay. The direction of wind there is generally from south to north. It is provided with a signal-pole, a crane, a weighing beam for hydroplanes, a compass correction stand, a gliding incline, an anchorage, etc.

The Urusan Flying Ground. The Urusan flying ground is situated at Urusan, Urusan-gun, Keisho-Nando (South Kyongsang-do), Chosen. It is a flying ground on land and its runway extends for 600 metres from east to west and for the same distance from north to south.

The Keijo Flying Ground. The Keijo flying ground is situated at Nyoito, Ryukomen, Koyo-gun, Keikido (Kyongki-do), Chosen. It is a flying ground on land and its runway extends for 600 metres from east to west and for the same distance from north to south.

The Dairen Flying Ground. The Dairen flying ground is situated at Choushuitzu, Kwantung Province. It is a flying ground on land and its runway forms a circle with a 600-metres diameter.

Other public flying grounds are Shingishu, Niigata, Matsué, Toyama, Miyakonojo and Nagoya.

Aeronautical Wireless Stations

The following wireless stations exist with the special object of supplying aeroplanes flying the Tokyo-Dairen and the Osaka-Shanghai routes with weather reports and also of reporting their arrival and departure :

Name	Call Signal	Site
Tokyo Wireless Station	JXS	Otemachi Nichomé, Kojimachi-ku, Tokyo.
Hakoné „ „	JXH	Segyodaira, Mishima-machi, Takata-gun, Shizuoka prefecture.
Kameyama „	JXK	Ochizaki, Kameda, Kameyama-machi, Suzuga-gun, Miyé prefecture.

Name	Call Signal	Site
Osaka Wireless Station	JXO	Dojima Nichomé, Kita-ku, Osaka.
Fukuoka „ „	JXF	Najima, Tadara-mura, Kasuya-gun, Fukuoka prefecture.
Itsuhara „ „	JXI	Itsuhara-machi, Shimokata-gun Nagano prefecture.
Tomiyé „ „	JXY	Minami Tomiyé-mura, Matsuura-gun, Nagasaki prefecture.
Kagoshima Post Office	JKB	Yamashita-cho, Kagoshima.
Naha „ „	JCX	Tenki-cho, Naha.
Urusan Wireless Station	JBM	Hokumen-Dotei, Urusan, Urusan-gun, Keisho-Nando (South Kyongsang-do), Chosen.
Keijo „ „	JBB	Hommachi 1-chomé, Keijo (Seoul), Keikido (Kyonkido) Chosen.
Dairen Telegraph Office	JDP	Kanbudori, Dairen.
Taihoku „ „	JFQ	Kyomachi, Taihoku, Formosa.

Land Marks for Aviators

In order to secure the safety of aerial navigation, the following places are marked with their names in large white "Kana" letters :

Mark	Place
Numazu	Tsuruta, O-oka-mura, Sunto-gun, Shizuoka prefecture.
Hamamatsu	Matakogawa, Tomizuka-mura, Hamana-gun, Shizuoka prefecture.
Kameyama	Nomura, Kameyama-machi, Suzuka-gun, Miyé prefecture.
Shōdoshima	Shikai-mura, Azuki-gun, Kagawa prefecture.
Imabari	Ohama, Chikami-mura, Koshichi-gun, Ehimé prefecture.
Murozumi	Aburada, Murozumi-machi, Kumaké-gun, Yamaguchi prefecture.
Nakatsu	Tsunoki, Nakatsu-machi, Shimoké-gun, Oita prefecture.
Yukuhashi	Yukibashi, Yukibashi-machi, Kyoto-gun, Fukuoka prefecture.
Urusan	Sansanri, Urusanmen, Urusan-gun, Keisho-Nando (South Kyongsang-do), Chosen.
Kwokan	Nasanri, Kwokanmen, Yeido-gun, Chusei Hokudo (North Choongchong-do), Chosen.
Taiden	Kudori, Gainamen, Taidén-gun, Chusei Nando (South Choongchong-do), Chosen.
Ten-an	Seiseiri, Ten-anmen, Ten-an-gun, Chusei Nando (South Choongchong-do), Chosen.
Shariin	Tetsuzanri, Shriinmen, Hozan-gun, Kwokai-do (Whanghai-do), Chosen.
Heijo (Pyongyang)	Jinkori, Seisenmen, Daido-gun, Heian Nando (South Pyong-an-do), Chosen.
Teishu	Jogaido, Teishumen, Teishu-gun, Heian Hokudo (North Pyong-an-do), Chosen.
Shingishu	Mirokudo, Kojomen, Gishu-gun, Heian Hokudo (North Pyong-an-do), Chosen.
Pitzuwo	Pitzuwo, Kwantung Province.

Civilian Aeroplanes

Civilian aeroplanes on October 1, 1935, for which certificates of airworthiness and registry certificates have been granted, are as follows :

Classification	Description	Number	Total Number
Free from all restrictions	Aeroplanes	33	33
	Hydroplanes	—	
Not qualified for trick flying	Aeroplanes	177	202
	Hydroplanes	25	
Total	Aeroplanes	210	235
	Hydroplanes	25	

Note: 50 planes were damaged by the typhoon of September 21, 1934.

Civilian Aviators in Japan Licensed Japanese civilian aviators on October 1, 1935, were as follows :

Classification	1st class	2nd class	3rd class	Total
Aeroplane and hydroplane pilots	267	332	97	696
Navigators	18	246	—	264
Mechanics	—	—	—	86
Dirigible balloon pilots	—	—	—	1

Aerial Lighthouses According to the first plan of the Department of Communications 19 aerial lighthouses will be established along the Tokyo-Osaka route and the same number along the Osaka-Fukuoka line. On the former four larger ones, at Hakoné (Shizuoka prefecture), Yaizu (Shizuoka), Chita (Aichi) and Ikoma (Nara) were already erected, but these have been changed and 34 lighthouses have been erected between Tokyo and Osaka. The erection of the same number of aerial lighthouses between Osaka and Fukuoka is also comtemplated. In the following list those under the heading Osaka and Fukuoka the first five have been completed :

Tokyo-Osaka Place	Prefecture
Tokyo Airport	Tokyo
Totsuka	Kanagawa

Organizations connected with Aviation

The Aviation Council This body is under the direct control of the Minister of Education and returns reports on matters submitted by him ; it also deliberates on important matters concerning the study of the basic theories of flying-machines and makes recommendations to the Cabinet Ministers concerned. It is composed of a president and 20 councillors, and, in case of particular need, councillors ad interim are appointed. The councillors are the Vice-Ministers of the Departments of War, Marine, Education, and Communications, as well as those who have deep knowledge and wide experience, while the councillors ad interim are selected from among scholars and experts.

The Imperial Aeronautical Association The Imperial Aeronautical Association was established in 1913 with the object of encouraging and protecting the development of science and art pertaining to aviation and of flying machines and their parts and accessories as well as diffusing knowledge of, and culti-

vating taste for, aerial flight among the people. A sum of ¥500,000 granted from the Privy Purse was made a foundation-fund, and, with interest accruing from it and with receipts from dues paid by its members (¥2.00 per member), the Association carries on its undertaking, the principal items of which are presenting persons who fall victims to aviation and accidents connected thereto with condolence money, awarding bounties to persons connected with aviation, and giving lectures, cinema shows, and exhibitions concerning aviation. It also publishes a monthly journal containing aviation news at home and abroad. It has an Imperial Prince as patron and a board of directors of 30 members, including a president, two vice-presidents, and a managing-director. In addition, it has five auditors and over 105 councillors, from whom directors are elected. Its offices are located at No. 7, Sakurada Hongo-cho, Shiba-ku, Tokyo.

The International Aviation Commission This Commission is a permanent body formed in accordance with the provisions of the Treaty relating to Aviation, and makes or receives proposals bearing on alterations and modifications of the provisions of the treaty to and from the signatory Powers, and reports to them such alterations and modifications as are adopted.

The International Aviation Federation This Federation consists of various corporations relating to aviation in different countries and chiefly aims at the progress of civil aviation through mutual consultation and also the promotion of mutual facilities. Besides, it undertakes recognition of world flying records. The Imperial Aeronautical Association represents Japan in the Federation.

The Aeronautical Institute The Aeronautical Institute was first established at Etchujima in Tokyo in April, 1918 by taking over the business of the Commission on Investigation of Aeronautics organized in the Tokyo Imperial University in April, 1916, with the object of making researches in aeroplanes, airships, balloons, motors, aviation psychology and other matters concerning aviation. Subsequently, in the earthquake and fire of 1923, the institute was destroyed and was newly constructed at Komaba in the grounds of the Department of Agriculture of Tokyo Imperial University in 1927. It is divided into the departments of air pockets, aeroplanes, physics, chemistry, metallurgy and material, and ranks first in the world in point of equipment.

Training Institutes Below are lists of institutes established for the training of aviators :

PRIVATE INSTITUTES AND SCHOOLS FOR THE TRAINING OF CIVILIAN AVIATORS

Name	Site	Representative
Sakai Seaplane Flying School	Shin-Koyenchi, Ohama, Sakai, Osaka prefecture.	Choichi Inouyé
Japan Flying School	Tachikawa-machi, Tokyo prefecture.	Tamotsu Aiba

CHAPTER XXVI

SEA TRANSPORTATION

Historical Background

The dawn of Japan's history is associated with maritime activities. The national mythology is rich in stories of sea adventures. Later authentic records fully demonstrate the energy and spirit of the early Japanese, who had to fight their way through stormy seas in the primitive craft of those days. The period covered by the latter half of the sixteenth and the beginning of the seventeenth century marks the golden age of marine activity in Old Japan. This was in a great measure due to the stimulus received by the natives through the appearance of Portuguese and other foreign ships in Japanese waters. Japanese vessels not only were in evidence in South China and the South Sea Islands, but cruised the Pacific as far as Mexico and fought their way through the Indian Ocean and round the Cape of Good Hope to Europe. Military rulers encouraged maritime enterprises and many large vessels were built. Thus the shipping trade between Japan and the South Seas and India, carried on under letters patent and numbering no less than two hundred ships at one time, engaged in commerce with twenty different countries, which were eventually dotted with regular Japanese colonies.

Ban on Shipping Activities Unfortunately, while the maritime prosperity of Japan was thus making progress by leaps and bounds, the Tokugawa Shogunate took the drastic measure of secluding the country and forbidding all foreign intercourse. Its first act was to place a strict ban on the propagation of Christianity in 1613. Subsequently, in 1634, all commercial relations with foreign countries were stopped, and in 1636 the construction of large ocean-going vessels was forbidden. For a period of more than two centuries thereafter the ocean trade of Japan was forcibly suspended.

The Well-timed Visit Commodore Perry's visit in 1853 was opportune, inasmuch as by this time many Japanese amongst the intelligent classes were dimly aware of conditions outside Japan, and the Shogun's Government, amid much confusion of opinion, took a firm step and signed the treaty. This event was followed in 1854 by the conclusion of similar treaties with the leading nations of Europe. Commercial intercourse with foreign countries was thus resumed, and the time-worn restrictions on navigation and ship-building were withdrawn. Then was formed the nucleus of the present mercantile marine of Japan. The Shogun's Government, finding the old Japanese methods of ship-building and navigation utterly out-of-date, promptly decided upon introducing the ideas of the outside world. For this purpose, students were sent abroad, while foreign experts were engaged to work in Japan. A ship-building yard was established in Yokosuka, and a naval school in Nagasaki.

After the Meiji Restoration

The First Steamship Co. In the third year of Meiji the Government promulgated the Mercantile Marine Regulations. In the same year, the pioneer steamship concern was inaugurated and a new leaf in the history of the Japanese mercantile marine was turned. The first company to be incorporated was the Kwaiso Kaisha, or Forwarding and Transport Company, which was later re-named the Teikoku Yusen Joki Kaisha (Imperial Mail Steamship Co.). Mampei Kimura was one of the chief promoters. A regular service was maintained between Tokyo and Yokohama and between Osaka and Kobé. Yataro Iwasaki, founder of the Mitsubishi interests, incorporated a shipping company called the Tsukumo Shokai, later renamed the Mitsubishi Shokai, in 1870 and inaugurated a regular passenger service between Tokyo and Kochi in Shikoku, from which place Iwasaki hailed. Three steamers formerly owned by Lord Yamanouchi, former feudal lord of Tosa, were employed in the service. When the Japanese Government sent a punitive force against Formosa in 1874, all foreign steamship companies interested in the Far Eastern shipping trade declared neutrality and rejected the Government's offer to charter their ships. Perplexed at this, the Government ordered the Mitsubishi Shokai and Teikoku Joki to offer their ships, and thus the transportation of troops was

smoothly effected.

The N. Y. K. Comes into Existence Shigenobu Okuma, then Minister of Finance, and Toshimichi Okubo, then Home Minister, made efforts to organize the Yubin Kisen Mitsubishi Kaisha after the termination of the expedition. The two above-mentioned firms were dissolved and the Government's ships were handed over to the new company. The Mitsubishi interests made large profits under Government protection. Kaoru Inouyé and Admiral Tsugumichi Saigo, who were Okuma's political opponents, organized a corporation to rival the Mitsubishi's as a means of overthrowing Okuma and ordered, in 1882, Eiichi Shibusawa, Takashi Masuda and others to form a semi-Government shipping company under the name of the Kyodo Unyu Kaisha. Keen competition later ensued between the two and threatened to lead them to ruin. Consequently, the Government ordered them to effect a merger. In 1885 the Nippon Yusen Kaisha was incorporated through the investment of ¥5,000,000 by the Mitsubishi and ¥6,000,000 by the Kyodo Unyu. At the time of founding, the company owned 58 steamers with an aggregate of 68,700 tons. The Pacific Mail Steamship Company of America was then operating a regular line between Yokohama and Shanghai with the s. s. Golden Age, the Costa Rica and two other ships, all of which were purchased by the Japanese Government in 1874 for the transportation of Japanese soldiers on the expedition to Formosa. Iwasaki waged a freight war with the Pacific Mail at that time and finally purchased these four ships for $8,000,000. This price included the Shanghai wharf now owned by the Nippon Yusen Kaisha at Whampoo.

The O. S. K. About this time the Osaka Shosen Kaisha was established in Osaka. It was then a small concern maintaining services in the Inland Sea of Japan, but later developed into a large company. The Nippon Yusen Kaisha, while maintaining the services originally inaugurated by its predecessors, opened new lines to Korea and North China, and one between Shanghai and Vladivostok; and in 1891, it inaugurated the service between Kobé and Manila and commenced to despatch occasional ships to Australia. In 1892, the N. Y. K. Japan-Bombay service was opened, the first regular Japanese steamship connection with a far-away foreign country. The rapid progress of Japanese shipping is attested by the fact that in the beginning of 1891 the total tonnage owned in Japan was 100,000, and one year later this figure had increased by 10,000.

The Sino-Japanese War During the Sino-Japanese War of 1894–5, when the greater part of Japanese shipping space was requisitioned for transport purposes, a large number of steamers were purchased or chartered by Japanese owners and Japan, having complete command of the sea, was able to maintain its established oversea services. At the close of the war Japan found that its merchant marine had grown by 100 per cent compared with the pre-war figures. Meanwhile the Nippon Yusen Kaisha lost no time in consolidating its established lines and in 1896 it inaugurated three trunk lines, viz., the Yokohama-London-Antwerp line, the Hongkong-Japan-Seattle line and the Yokohama-Manila-Australia line. In 1898 the Tokyo Kisen Kaisha was established, and it maintained a regular fast service between Hongkong and San Francisco via Japanese ports with three fine new passenger ships. The Osaka Shosen Kaisha opened a new line on the Yangtzekiang in 1898. In the following year, this company opened a line from Formosa to Hongkong, via Amoy and Swatow. The increase in Japanese tonnage at that time was remarkable. Whereas, at the end of 1897, it amounted to only 270,000 tons, it suddenly increased at the end of 1898 to 477,000 tons, the ratio of growth continuing, until the gross tonnage of steamers of 1,000 tons and over at the end of 1903 amounted to 521,000.

Foreigners' Services Mention must not be omitted of the valuable contribution made by foreign experts to the development of the Japanese mercantile marine. Through the remarkable foresight of Iwasaki, not only foreign captains, officers, engineers and pursers were freely engaged afloat, but numerous experts,business and technical, were employed on shore to conduct the business of the Nippon Yusen Kaisha. A large number of these foreigners remained in the company's service for a considerable time after its formation. Foremost among them were A. R. Brown, Alexander Macmillan, T. H. James, J. W. Ekstrand, W. H. Hasewell and Hector Frazer, whose names are still familiar to old timers in the Far Eastern shipping trade.

One noteworthy fact in connection with the development of the shipping business is the advance made by Japanese mariners. Japan imported the science of navigation from the West and early in the Meiji Era the captains, chief engineers and mates were mostly

foreigners. When the Nippon Yusen Kaisha was first organized in 1884 the company owned 57 steamers with a total tonnage of 60,000 and employed about 174 foreigners, the number being increased to 224 during the Sino-Japanese War. During the Russo-Japanese War Japanese mariners were the recipients of much praise, and their credit was greatly raised. After the war, in 1907, the number of foreigners was reduced to 87 and by 1920 there was not a single foreign officer in a Japanese ship.

The Russo-Japanese War The Russo-Japanese War broke out early in 1904, and Japan found herself compelled to undertake transport work of the biggest magnitude ever known in her history. This situation naturally created the necessity of purchasing additional tonnage, with the result that at the end of 1906 the total merchant marine reached a little more than one million gross tons, and Japan thus ranked sixth among the great maritime Powers of the world. Through the expansion of trade after the war, sufficient employment was found for these steamers. The Tokyo Kisen Kaisha opened its South American service before the war terminated. The Osaka Shosen Kaisha started in 1909 its Far East-Puget Sound service. Elsewhere the expansion was also pronounced, for in 1907 four large Japanese companies trading on the Yangtze-kiang pooled their interests and formed the Nisshin Kisen Kaisha (Japan-China Steamship Company) and the Osaka Shosen Kaisha in the meantime inaugurated the Tsuruga-Vladivostok and the Osaka-Kobé-Moji-Dairen lines. The general slump in the shipping trade which prevailed all over the world during this period was felt in Japan, but the country was not so badly hit as to prevent the further growth of its shipping, for, at the end of the year when the World War broke out, the total gross tonnage of ships flying the Japanese flag was 1,590,000, of which 1,310,000 tons represented ships of more than 1,000 gross tons each. Turning to the share which Japanese merchant shipping contributed to its foreign commerce, it was found that, whereas, prior to the Sino-Japanese war (1894–5), only 10 per cent of inports and exports were carried by Japanese ships, the proportion increased to 40 per cent after the Russo-Japanese War (1904–5), and just before the commencement of the World War, it had grown to 48 per cent.

The World War An extensive dearth of tonnage and the consequent pressing demand for space all over the world, caused by the World War, created a unique situation for Japanese merchant shipping, so much so that the total gross tonnage suddenly swelled by a million tons within a brief period and the yearly shipbuilding capacity increased from 50,000 tons to a half million gross tons. The share contributed by Japanese vessels to the transportation of imports and exports increased to nearly 80 per cent, the remaining 20 per cent being carried by foreign ships. Many new shipping services to all corners of the globe were opened one after another, and, besides rendering distinguished service to the cause of the Allies, the Japanese mercantile marine maintained a regular fortnightly Japan-England mail service, and despatched extra ships to European waters during the war. Furthermore, in response to the call of the United States after that country participated in the War a group of Japanese shipowners delivered a number of steamers aggregating 150,000 tons to the United States Government on charter at rates considerably lower than those which shipowners at that time could have obtained in the open market.

The inevitable aftermath of the war abnormalities—shipping depression—set in early in 1920, and this is still being felt all over the world. Japanese shipping in common with that of all other nations is undergoing a severe test of its perseverance and fortitude. Despite this Japanese shipping has considerably increased. The Tokyo Kisen Kaisha transferred all of its Pacific ships to the Nippon Yusen Kaisha, by which the latter became one of the greatest shipping companies of the world.

Working Agreements

Japan's three largest shipping concerns, the Nippon Yusen Kaisha, the Osaka Shosen Kaisha and the Kinkai Yusen Kaisha, the last-mentioned being a subsidiary of the first, entered into an agreement in April, 1931, on shipping co-operation as a countermeasure for the shipping depression. The basic principles involved in the agreement were the mutual respect of services operated by them, the readjustmnt of steamship routes, the extension of the pooling system and co-operative management. The agreement is to last for 10 years. As the result of this agreement, the Nippon Yusen Kaisha abolished its South American Atlantic service, leaving its operation to the Osaka Shosen Kaisha. The Osaka Shosen Kaisha discontinued the operation

of its Puget Sound line, leaving the entire interest of the service to the Nippon Yusen Kaisha, and the Osaka Shosen Kaisha entrusted the management of its North European line west of Suez to the Nippon Yusen Kaisha. The mutual use of agents, joint acceptance of passenger and goods transportation, joint utilization of shipping, land and sea equipment, and the joint purchase of fuel and ships' materials were agreed on among them.

Government Policies

While the means of improving our shipping business are necessarily diverse and cannot be decided simply and uniformly, the Ministry of Communications considers it most effective under the prevailing conditions both at home and abroad to adopt the following measures which are provided for as forming one of the major national policies by the budget estimates presented to the 70th session of the Imperial Diet :

1. Encouragement of the Construction of Superior Ships. It has of late been a common phenomenon of the shipping circles of the world to plan to turn tramp steamers into regular liners. This tendency is inevitably bringing about a demand for superior ships. The shipping policies of various nations also show that efforts are being made to replace superannuated "uneconomical" vessels with new superior ones.

The term "superior" does not necessarily mean of large size and high speed but signifies that vessels should be economically superior and strong in competition with others considering the conditions of the routes on which they are placed. A glance at the various routes established by Japanese shipping interests will reveal that the equipments should be improved and perfected by employing superior ships in not a few cases. The fact that the Japanese fleet of freighters in service between the Far East and New York has of late been successfully competing with various foreign fleets is also taken as a proof of the necessity of encouraging the construction of more of these superior vessels.

Such being the situation, the Ministry of Communications has worked out a plan to grant a subvention for the construction of superior ships having a tonnage of more than 6,000 tons and a speed of more than 19 knots each. This plan aimed to encourage the construction of 150,000 tons of passenger ships and 150,000 tons of freighters during the period of four years commencing with the 1937-38 fiscal year.

2. Encouragement of Shipping on Foreign Routes. Japanese ships have so far seldom been put in service between foreign ports although their activities in both the passenger and freight services between Japan and foreign countries have been such that no foreign vessels can compete with them. As much as 70 per cent of the foreign trade of this country is carried on by means of Japanese ships, the rest being divided among foreign ships.

In order to avoid inciting other nations to adopt and strengthen the policy for "transport of domestic goods by domestic ships" in retaliation, should the share of Japanese ships in the foreign trade of this nation be increased, it is considered advisable to effect the necessary shipping expansion of the nation through the development of foreign routes on the basis of the principle of mutual liberty with foreign ships. However, it is recognized to be exceedingly difficult for Japanese ships to develop foreign routes owing to the firm hold on these routes of the vessels of other countries. In view of this fact, the Government undertakes to give a subsidy for the encouragement of shipping on foreign routes.

The plan worked out by the Ministry of Communications is to grant subventions to ships in service between foreign ports for over 6 consecutive months during the period of five years beginning with the 1937-38 fiscal year. The Ministry intends to have 150,000 tons of ships placed on foreign routes during the first year of the period and 200,000 tons in subsequent years.

3. Financial aid for Shipbuilding. The financial facilities for shipping enterprises in this country are very unsatisfactory compared with those in other nations where the importance of maritime banking institutions has long been recognized in the form of legislation or by other means.

As yet there are no specific banking institutions in this country which are established especially in the interests of the shipping business, and bankers on account of their bitter experiences in connection with the constant fluctuations in the prices of ships immediately following the European War, still regard making advances on mortgage of ships as running a great risk. The Government is therefore endeavouring to promote the supply of funds to shipping business along with its policy for the encouragement of the construction of superior ships by lowering interest rates for advances on mortgage of ships, as well as to satisfy the general demands

of the shipping business men. The Ministry of Communications has formulated a plan in cooperation with the Ministry of Finance to make a total sum of ¥100,000,000 available as advance and the interest rate is fixed at 3.7 per cent, of which 1 per cent is to be borne by the Government which also undertakes to bear 70 per cent of any loss which the banker may sustain for making such advances.

4. Training of Seamen and Facilities for Testing and Experimenting. The adoption of the foregoing measures necessitates the training of more superior seamen and the establishment of facilities for testing and experimenting on ships. The Ministry of Communications has decided to grant a subsidy to the institutions for the training of seamen and to the establishments of testing facilities of ships and machines during the period of five years commencing with the 1937–38 fiscal year.

The Law to Control Steamship Routes The Law to Control the Steamship Routes passed the 69th session of the Diet, and regulations pertaining to its enforcement were issued later, and the law was enforced on August 1, 1936. The fundamental object of the law is to prevent unreasonable competition among steamship companies so as to promote the healthy development of sea transportation business in Japan, by establishing control over the operation of the routes. Ever since ocean transportation made an appearance upon the international stage for the first time early in the Meiji Era the Government has given protection to steamship companies, which have also been eager to develop themselves by their own accord along with the general industrial development of the country. This was especially true during the World War at which time it progressed by leaps and bounds. At present the country holds 5,000,000 tons of steamers and steamship lines spread over all the oceans, making Japan the third greatest seafaring nation in the world.

The reason that Japanese sea transportation made such a wonderful development was largely due to the fact that perfect freedom was given to the shipping business. In a country like Japan which was behind most other countries in this respect it was both necessary and wise to give the industry a free hand to enable it to develop quickly in line with other rapidly expanding industries and leave it without restrictions, to make profits by the spur of free competition.

Fortunately this laissez-faire policy coincided with the principle of the freedom of the sea, and so the sea transportation of Japan has attained its present prosperity.

But the economic power of shipping companies has made a rapid increase and the sphere of their activity has become very complex, so that their interests conflict, one with another, and each company is attempting to conquer its rivals by resorting to ruthless competition. Of course this may have had the good result of combining out some weak enterprisers, but such warfare injures all parties, causing waste of capital and diminishing the rate of development. Moreover, nationalism seems to be the watchword of the times and each country adheres to the principle of using its own steamers. In such circumstances, home companies must act as a unit in order to maintain Japan's supremacy in the international market and to overcome foreign competition.

Shipping companies in Japan, being aware of this situation, have organized a union to avoid the evils arising out of the situation. However, in the event of the union's inability to attain this object by itself, the State should take part in preventing shipping companies from goint too far in schambling after profits by using the power vested in it, and encourage the industry to run its business on a rational basis under well-regulated control. This is the reason that the law has come into existence.

Exercising in this manner a certain amount of state control over the sea transportation industry may appear at the first glance to be opposed to the policy which has long had "laissez-faire" as its traditional ideal. But the freedom of enterprise must always be subject to prevailing conditions to a certain extent. This law does not by any means deny the principle of the freedom of the sea transportation industry. Only when the domestic companies compete with one another on the same waters in disregard of the amount of traffic and space the State will interfere with the authority vested in it The gist of the Law to Control Steamship Routes is as follows :

(1) The law puts the promotion of Japanese sea transportation abroad as its main objective. But as the unification of the coastwise lines and the adjustment of the capital invested cannot be neglected for strengthening the power of her shipping business the law is to be applied to all shipping business run by the subjects, whether individuals or legal persons, of the Em-

pire in oceanic and coastwise shipping as well as to the following near-sea transportation :

(a) Districts where there are routes between Japan proper and Korea.

(b) Districts where there are routes between the mainland of Japan and Hokkaido, or Saghalien.

(c) Other districts where there are routes subsidized by the Government.

(2) In order to allow a healthy development of the sea transportation industry in Japan and to obviate ruthless competition as far as possible the Minister of Communications is authorized to resort to the following measures :

(a) First to advise the companies to stop competition.

(b) If they do not listen to this advice or if the advice proves inadequate to get any result, to order them to come to some agreement as to their routes.

(c) If they cannot come to any such agreement, to prohibit or restrict the management of the routes.

(3) The Governmental control of the route may result in the monopoly of a route by a certain company with its subsequent evils, and when the Minister of Communications considers the freights or other items in the management of shipping business on the route are against the public interest, he is authorized to issue orders to rectify them and to safeguard the interests of the general public.

(4) (b) and (c) in (2) and the order in (3) being important administrative procedure they will be enforced only after they have been fully discussed by the Commission for the Control of the Steamship Routes, except where secrecy is required for military or diplomatic reasons.

The organization and power of the Commission for the Control of the Steamship Routes is fixed by an ordinance, according to which the members of the Commission consist of those who are authorities in this field : namely, the Minister of Communications, who is made the chairman of the Commission ex officio, and fifteen men from among high officials of the Departments concerned, men of attainment and experience, persons engaged in the sea transportation business, and representatives of the freighters.

(5) This law does not apply to the shipping business carried on by foreign interests.

Encouragement of Shipping The new measures which are to be carried out by the Ministry of Communications for the encouragement of sea transportation business are (1) to subsidize those ships which continue service over 6 months' ocean transportation for the coming 5 years beginning in the fiscal year of 1937–38 so as to realize an oversea placement of 150,000 tons in the first year and 200,000 tons in the following year ; (2) to allow a loan of ¥100,000,000 under reasonable conditions to help ship owners in improving their ships and overseas transportation activities ; and (3) to subsidize schools for training seamen and to establish facilities for the examination of ships.

There are nine steamship companies working overseas and domestic services under governmental subsidy. These concerns are the Nippon Yusen Kaisha, the Osaka Shosen Kaisha, and Nisshin Kisen Kaisha, the Nanyo Yusen Kaisha. the Kinkai Yusen Kaisha, the Kokusai Kisen Kaisha, the Kita Nippon Kisen Kaisha, the Harada Kisen Kaisha and the Kuribayashi Shosen Kaisha. The subsidy is paid to these companies for a period of one year from April to March in most cases, while in certain cases the subsidy runs over a period of three years.

The N.Y.K. Yokohama-London service has Kobé, Shanghai, Honkong. Singapore, Colombo, Suez, Port Said and Marseilles as intermediate ports of call. Its San Francisco line has Honolulu as the only intermediate port of call on both outward and homeward (eastward-bound) trips. On the westward-bound trip it has Nagasaki, Shanghai, and Hongkong. The company's Yokohama - Seattle (eastward - bound) service has Victoria or Vancouver as ports of call and its westward-bound service has Kobé, Moji and Shanghai as ports of call. Its South American West Coast line between Yokohama and Valparaiso (eastward-bound) has Hololulu, Manzanillo, or Salina Cruz, Callao and Iquique as ports of call and its westward-bound line has as ports of call Kobé, Moji and Hongkong. The N.Y.K. Yokohama-Melbourne service has as ports of call Kobé, Nagasaki, Hongkong, Manila, Davao, Thursday Island, Brisbane and Sydney both ways.

The O. S. K. South American East Coast line (Yokohama-Buenos Aires) for its outward bound trip has as ports of call Kobé, Nagasaki, Hongkong, Singapore, Cape Town, Rio de Janeiro and Santos. When homeward bound the line has Santos, Rio de Janeiro and Cristobal as ports of call. The O. S. K. African East Coast line operates between Kobé and Cape Town and on its outward bound trip has Moji, Hong-

kong, Singapore, Colombo, Mombasa, Zanzibar, Dar-Es-Salaam, Beira, Loureço Marques and Durban. When homeward bound the line has Durban, Lourenço Marques, Mombasa, Zanzibar, Singapore and Moji as ports of call. These are the most important steamship lines operated under Government subsidy.

The Kokusai Kisen Kaisha, owner of motor and steam vessels aggregating 300,000 tons deadweight, has reached new heights of prosperity under the able management of Mr. S. Kurokawa, President, the net profit for the year ending December 31, 1936, having amounted to over ¥4,160,000. During the last few years seven speedy motor vessels have been built and placed in commission on the Orient-New York express service, whilst three 19-knotters were completed early in 1936. The latter have been allocated to the newly inaugurated Far East-North Europe fast service, which maintains four-weekly sailings in conjunction with two new freighters of the Nippon Yusen Kaisha. Furthermore, five motor and turbine super-freighters of about 9,200 tons deadweight each are now on order with the shipbuilders here in Japan and will all be completed before the end of the year 1938. The Kokusai Line, which was mainly engaged in tramp shipping before, now maintains several regular services of international significance, thus contributing much towards Japan's balance of foreign payments, which fact is worthy of particular mention at this moment when the importance of invisible exports cannot be too heavily stressed.

In addition, the Nanyo Yusen Kaisha operates under Government subsidy the South Sea line between Kobé and Sourabaya, Java, calling at Macassar, Sourabaya, Samarang and Batavia on the outward trip. Ships sail direct for Kobé on the homeward trip. The Nisshin Kisen Kaisha operates the China Coast line between Shanghai and Canton as the southern line and between Shanghai and Tientsin or Taku as the northern line. The company also maintains the Shanghai-Hankow line with Chenkiang and Nanking as ports of call, the Hankow-Ichang line with Shasi as port of call, the Hankow-Hsiangtan line with Changsha as port of call, Hankow-Changteh line, and the Ichang-Chungching line, all these five lines being known as the Yangtze River services.

The Kinkai Yusen Kaisha, affiliated with the Nippon Yusen Kaisha, operates a subsidized regular service between Kobé and Tientsin or Taku during the winter with Moji as port of call and also the Yokohama-Newchwang (Yingkow) service with Nagoya as port of call both under Government subsidy. It also runs a regular service between Hakodaté and Odomari in Karafuto. The N. Y. K., O.S.K. and Harada Kisen Kaisha jointly maintain a Kobé-Tsingtao regular steamer service. The Tsuruga-Viladivostok regular service is operated by the Kita Nippon Kisen Kaisha, which is affiliated with the Osaka Shosen Kaisha. The Kuribayashi Shosen Kaisha, Hokkaido, operates a regular service between Hakodaté and Petropavlovsk in Kamchatka seven times a year during the warm season. Stores and other supplies of daily necessity are carried by ships on the service for Japanese fishermen engaged in the Kamchatka fisheries. A regular connecting service between Aomori and Muroran is maintained by the Kita Nippon.

Nippon Yusen Kaisha regular liners sailing between Japan and Europe call on their outward trips at Istanbul and Beirut more than twice every three month, those sailing between the same places call on their outward and homeward trips at Piraeus more than twice every three months, and those sailing between Japan and the United States call on their homeward trips at Havana in Cuba once every two months, all under Government subsidy.

Open Ports The open ports in Japan proper are Yokohama, Kobé, Niigata, Ebisu, Osaka, Nagasaki, Hakodaté, Shimizu, Takétoyo, Nagoya, Yokkaichi, Uno, Onomichi-Itozaki, Tokuyama, Imabari, Shimonoseki, Hagi, Moji, Wakamatsu, Hakata, Karatsu, Suminoé, Kutchinotsu, Miiké, Misumi, Kagoshima, Izuhara, Naha, Hamada, Sakai, Miyazu, Tsuruga, Nano, Fushiki, Funakawa, Aomori, Otaru, Nemuro, Kushiro, Muroran, Sasuna, Shishimi, Miiké, Shiogama and Kamaishi.

Promotion of Seamen's Welfare

There are two important organizations for the promotion of seamen's welfare. They are subsidized by the Central Government. They are the Seamen's Aid Society of Japan and the Imperial Society of Life-Saving service.

Shipping Business and Japan's Income

Japan's foreign trade has continued to show an import excess since 1919. In her invisible trade the inflow of foreign capital is practically nil because of unfavourable international economic relations while investment by the Japanese in enterprises in Manchoukuo is continually increasing, and there seems to be

no other way of turning the balance of international payments in favour of Japan than by increasing exports and ordinary income in invisible trade. The rate of increase of exports, however, has began to lessen since 1935, and the income from sea transportation which has been the main stay in invisible trade in all years will become more important in the settlement of Japan's international payments. The balance of Japan's international payments through visible and invisible trade in the past 3 years is as follows :

	1934	1935 (In ¥1,000)	1936
Foreign trade: Excess of imports of merchandise	94,559	15,196	130,175
Excess of exports of silver	13,137	146,805	28,465
Excess of Imports	81,423	—	101,710
Exports	—	131,609	—
Invisible foreign trade: Excess of ordinary receipts	144,333	178,213	303,400
Excess of extraordinary payments	183,441	371,539	183,100
Excess of Receipts	—	—	120,300
Payment	39,108	193,326	—
(Figures for 1936 are estimates by Yokohama Specie Bank.)			
Balance: Excess of receipts	—	—	18,590
Excess of payments	120,530	61,711	—

The foreign trade of Japan in 1934 resulted in an excess of imports to the value of ¥81,000,000 including silver bullion, and the invisible trade in an excess of payments to the amount of ¥39,000,000. In 1935, export trade showed a great increase while exports of silver bullion also increased as an effect of the American silver policy, and the balance resulted in an excess of exports to the value of ¥130,000,000 ; but in invisible trade investments to Manchoukuo and other extraordinary payments increased and international payments exceeded ¥61,000,000 over receipts. In 1936 an import excess of ¥101,000,000 was more than covered by the excess of receipts to the amounts of ¥120,000,000. In the international payments invisible foreign trade plays an important part in national economy, ordinary receipts especially having the most important bearing on it.

The ordinary accounts of 1935 invisible foreign trade (given in full in the chapter on foreign trade) ended in an excess of receipts of 178,213,000 as follows :

	1935	1936
Receipts	¥820,553,000	740,375,000
Payments	642,340,000	596,042,000
Excess of receipts	178,213,000	144,333,000

Increase was shown both in receipts and payments and the excess of receipts increased by ¥33,000,000 over that of the previous year. It is largely due to the increase of receipts through sea transportation business and profits from undertakings abroad. Of the sea transportation accounts in the invisible foreign trade in 1935 the receipts and payments of items which have to do directly with international sea transportation business are as follows :

Receipts in connection with shipping	1935	1934 (In ¥1,000)
Freight for import merchandise	107,686	88,719
Freight for export merchandise	84,493	70,913
Freight for transportation of foreign goods between foreign countries	55,605	54,131
Foreign passenger fares	26,312	17,059
Hire of Japanese vessels	521	304
Miscellaneous receipts of shipping companies	3,135	2,159
Total	277,752	233,285

Receipts in connection with shipping	1935	1934
	(In ¥1,000)	
Payments in connection with shipping		
Office expenses abroad	9,452	8,587
Hire of foreign vessels	10,715	6,725
Equipments	23,673	23,351
Repairs	1,168	1,962
Loading and tonnage dues	63,803	57,890
Miscellaneous payments of shipping companies	16,709	8,391
Total	125,520	106,906
Excess of receipts	152,232	126,379

Both receipts and payments from shipping business in 1935 greatly increased and the net profit exceeded ¥25,800,000 (20 per cent) over that of the previous year. The relation of the net profit obtained through shipping business and the excess of receipts in the ordinary account of Japan's invisible foreign trade since 1923 has been as follows :

	(A) Net Profit of Shipping Business	(B) Excess of Ordinary Receipts Invisible Trade	Percentage of (A)to (B)
1923	68,379	169,769	40
1924	90,068	164,204	54
1925	104,331	154,918	67
1926	103,125	140,014	73
1927	113,663	147,850	76
1928	118,731	161,196	73
1929	137,560	180,954	76
1930	107,853	133,015	81
1931	86,868	83,620	103
1932	83,047	115,254	72
1933	107,533	87,209	102
1934	126,379	144,333	87
1935	152,232	178,213	85

The receipts in connection with shipping business come first in adjusting Japan's national income through the invisible trade in all years and they still have, as a whole, tendency to rise. But it is a notable fact that the world-wide activity of Japanese ships has not increased much since 1930 or 1931. When variations of exchange rates and friction over freight rates are taken into consideration it has retrogressed about 10 per cent in the past 5 years in spite of the unprecedentedly high amount of the net profit in 1935.

Shipping Business in 1936

Throughout 1936 the conditions of the shipping world in this country were the most prosperous since the European War. Improvement has been continuing for four years following the re-imposition of the gold embargo, but it was greatest during 1936. This is attributable to the fact that until 1935 the improvement was limited to Japanese shipping circles, while a world-wide shipping boom started during the latter part of 1936. The year 1936 may therefore be regarded as an epoch in the shipping business.

So long as the low exchange rates of the yen and the activity in the foreign trade of the nation suffer no change, there will be no unrest in Japanese shipping circles, and it is a fact that there exist no factors which would warrant pessimism over the quotations of the yen and the prospects of the foreign trade. It is true that the recent rise in the prices of commodities is causing a slight unrest but this upward trend of commodity prices is common to the whole world.

Further, as Japanese goods are comparatively cheap, it is unlikely that the export trade of this nation will decline. On the contrary, the increased activities in the munitions industry are expected to bring about a continued expansion of Japanese foreign trade. A total of some 600,000 tons of ships will be completed during 1937 and 1938 and when the new ships are put in service along foreign routes, there will be no depression in the general situation.

Generally speaking, the prospects of Japanese shipping circles during 1937 are bright and the shipping business of the world achieved a remarkable improvement. The recent soaring of freight rates has some temporary factors among its causes but nevertheless it clearly shows a fundamental improvement in the conditions of the shipping business. It is also clear that the world-wide rising tendency of commodity prices and the increasing activities of the munitions industry will serve to increase the volume of marine freight.

Thus, the business conditions of the shipping companies are expected to record a further improvement. According to circumstances, the Nippon Yusen

Kaisha and the Osaka Shosen Kaisha may even pay higher dividends to their shareholders.

Freight Rates The improvement in the conditions of Japanese shipping circles, which has been continuing since 1933 following the re-imposition of the gold embargo, is not only limited to the coastwise service but also applied to the foreign routes, which were for some time in a most depressed condition. As already stated, the shipping boom was confined within Japanese circles up to 1935 but extended throughout the world in the latter half of 1936. Let us first examine the changes in the conditions of the coastwise shipping service as shown in the following table :

COASTWISE SHIPPING SERVICE

	Rates for Coal (Wakamatsu-Hamamatsu)		Rates for Logs (Karafuto-Mainland)	
	Highest	Lowest	Highest	Lowest
1936				
January	¥1.80	¥1.60	—	—
February	2.40	1.80	—	—
March	2.60	2.40	¥1.35	¥1.30
April	2.50	2.15	1.50	1.40
May	2.50	2.35	2.00	1.50
June	2.40	2.30	1.70	1.60
July	2.20	1.80	1.70	1.60
August	2.05	1.80	1.60	1.30
September	1.90	1.65	1.30	1.15
October	1.85	1.60	1.30	1.20
November	2.00	1.80	—	—
December	2.00	2.00	—	—
1936	2.60	1.60	2.00	1.15
1935	2.30	1.60	1.60	1.20
1934	2.50	1.35	1.70	1.00

The above table shows that the rates for coal from Wakamatsu to Hamamatsu which are the best indications of the conditions of the coastwise service were ¥1.60 at the lowest and ¥2.60 at the highest during 1936. The lowest rate was the same as the preceding year but the highest represented an increase of ¥0.10. Further, while the lowest rate continued for many of the months of 1935, the year 1936 recorded the lowest rate only in two months. The average rate in 1936 was around ¥2.20, greater by ¥0.35 than the average rate in 1935. Similar conditions are also found in the rates for the timber produced in the northern region.

Principally accountable for the rise in the freight rates of the coastwise service was the fact that while there were more frequent movements of freight, the number of bottoms showed a tendency to decrease. The more frequent movements of freight were brought about by the increased activities in the munitions and other industries in the country while the decreasing tendency of bottoms was caused by the increase in the tonnage in service along foreign routes and the recall of foreign ships. In this respect, special mention must be made of the fact that the improvement in the conditions of foreign routes and the situation brought about by the civil strife in Spain combined to cause large-size ships to disappear from the coastwise service.

Ocean freightage also advanced in 1936 from the previous year, particularly in the latter half of the year, when the rates for principal goods all soared. Further details may be clarified by an examination of the following table :

FOREIGN SHIPPING ROUTES

	Rates for Cereals (Plate-Europe) (In Shilling)		Rates for Soy Beans (Dairen-Europe)	
	Highest	Lowest	Highest	Lowest
1936				
January	17.9	17.9	27.6	27.0
February	17.9	17.9	27.6	26.0
March	17.9	17.9	26.6	25.0
April	17.9	17.9	24.3	23.0
May	17.9	17.9	23.0	20.0
June	17.6	17.6	23.6	20.0
July	18.0	17.6	24.6	21.6
August	21.6	18.3	26.6	24.6
September	23.0	21.0	27.6	26.0
October	23.0	22.3	30.0	27,6
November	23.9	22.3	33.0	29.6
December	32.6	25.6	41.3	37.6
1936	32.6	17.6	41.3	20.0
1935	18.0	13.6	26.0	14.6
1934	17.6	13.0	29.6	22.6

The lowest rate for cereals during 1936 was 17 shillings and 6 pence, which represents a decrease of only 6 pence from the highest rate in the preceding year, while the highest rate in 1936 set a new record for all time since the European War, being 32 shillings and 6 pence. This rise becomes all the more remarkable when one considers the fact that ships can be profitably operated along foreign routes at the rate of 17 shillings and 9 pence. The highest rate for soya beans from Dairen to Europe during 1936, which was more than 41 shillings, also set a record for all time.

The soaring of ocean freight rates was caused by the increased demand for shipping space brought about by the shortage of provisions in European coun-

tries, the civil strife in Spain and the activity of the munitions industry in the whole world. This resulted in a rapid increase in the total tonnage of ships that the Japanese shipping companies put in service along foreign routes, which in turn served to further the improvement in the conditions of the coastwise service.

Firm Foundation

The Japanese shipping companies led the world shipping circles in recovering from the business depression because they have been operating on a firm foundation. Besides being supported by the low exchange rates of the yen and the expansion of the foreign trade of the nation, the shipping companies have been favoured by satisfactory relations of demand and supply. The improvement in these relations may be better appreciated through an examination of the following figures :

	Index Number of Trade	Index Number of Bottoms
1914	100	100
1924	163	223
1932	194	248
1933	224	242
1934	265	239
1935	289	239
1936	307	246

In this connection, it must be noted that the index number does not show the efficiency of the superior ships constructed in recent years. Further, if there are more ships in service along the coastal lines than needed, they can be commissioned on foreign routes and, on the strength of the low exchange quotation of the yen, Japanese ships can be profitably operated at such rates as would incur a loss to foreign ships. The low level of Japanese seamen's wages and their ability also cannot be overlooked in this respect. Suffice it to say that so long as the low quotations of the yen continue, there will be prosperity for the Japanese shipping circles.

As regards the foreign trade of the nation, there is little possibility of its declining at least for the time being. The expanding rate of foreign trade has slackened considerably but it will be some time before there can be any shrinkage in the trade volume. For the world-wide improvement in business conditions and the rising tendency of commodity prices cannot fail to affect the Japanese foreign trade. Further, the increased activities in the munitions industry are expected to cause the imports of raw materials to swell which in turn will promote the export trade of this country.

Although severe restrictions are being put on the import of Japanese goods by various governments, there is no need of pessimism. The present soaring tendency of the prices of commodities in this country is causing some unrest, but it must be noted that commodity prices are on an upward trend in every nation of the world. It is said that the increasing rate of commodity prices is higher in this country than in other lands, but even so no great pessimism is warranted, because the prices of Japanese goods have been comparatively low in the past.

The question that must be considered here concerns the tendency of shippinig space to increase in this country. Ships with a total tonnage of from 220,000 to 230,000 tons were completed during 1936 and it is estimated that the year 1937 will witness the completion of ships totalling around 300,000 tons in all. About the same figures are predicted for 1938. When passenger ships, tankers and whalers are left out of account, the figures of nearly 500,000 tons are expected to be recorded as an increase in the shipping space in this country during 1937 and 1938.

It may be impossible to say that the completion of so many ships will produce absolutely no effect upon the conditions of the nation's shipping business as a whole. Nevertheless, it is unthinkable that such an increase in bottoms will occasion a general depression in the shipping business. Particularly in view of the fact that most of the new ships will be commissioned on foreign routes, it is considered that their digestion will not be difficult in the face of the progressing recovery of the world shipping circles. In short, the Japanese shipping circles will in all probability continue to enjoy satisfactory business results.

CHAPTER XXVII

JUSTICE AND POLICE

Judicature

The Judicature's Position

Since the promulgation of the Japanese Constitution in 1889, the right of the sovereignty of the Emperor has been divided into the three distinct departments, of legislation, judicature and administration.

In accordance with Article 57 of the Constitution, "the Judicature shall be exercised by the Courts of Law according to law, in the name of the Emperor." Judges are appointed from among those possessing such qualifications as are determined by law and they are guaranteed by the Constitution against being deprived of their positions unless by way of criminal sentence or disciplinary punishment. Not only are the judges guaranteed their positions, but they have authority in exercising judicial power to judge on their own independent views, using the statutes as the sole standard of judgment without being in any way swayed by interference from others and unaffected by authority arising from any quarter.

Since the judges are entirely independent of the administration the results of judicial decisions are equally independent thereof, and the decisions are not affected by the administrative power except in cases of pardon or provisional release.

Composition of the Courts

In Japan, the ordinary Courts of Law for the adjudication of civil and criminal cases consist of (1) District Courts (Ku-Saibansho), (2) Local Courts (Chiho-Saibansho), (3) Courts of Appeal (Koso-in), and (4) the Supreme Court (Tai-shin-in). The District Courts, the Courts of Appeal and the Supreme Court are all collegiate courts with special divisions, in each of which sit a number of judges.

District Courts The District Courts are presided over by single judges. A three instance system is adopted in the adjudication of all ordinary cases, and any one may lodge an appeal against a judgment rendered in the first instance and demand revision of that rendered in the second instance.

In the matter of civil cases, the District Courts possess judicial power to adjudicate on the following matters in the first instance :

1. Demands for money less than 1,000 yen or for articles, the value of which is less than 1,000 yen.

2. The following cases irrespective of value :

(a) Legal actions brought by lessors against lessees, or vice versa, for the receipt, vacation, use, occupation or repair of houses or other buildings or parts thereof, or for the seizure of the furniture and fixtures or belongings of lessees by lessors.

(b) Legal actions only concerning the boundaries of real estates.

(c) Legal actions only concerning occupations.

(d) Legal actions brought by employers against employees, or vice versa, for contracts of employment, the terms of which do not exceed one year.

(e) Legal actions brought by travellers against hotel or inn keepers, or vice versa, for matters concerning board or lodging, or by travellers against water or land forwarding agents, or vice versa.

(f) Matters concerning bankruptcy.

In criminal cases, the District Courts, as the courts of law for adjudication in the first instance, possess judicial power concerning the following matters, provided they have not been subjected to preliminary examination :

1. Offences punishable with detention or fine.

2. Offences punishable with penal servitude, imprisonment for fixed terms or by imposition of fines, except those punishable with penal servitude or imprisonment for more than one year.

Local Courts In civil cases, the Local Courts possess judicial power concerning the following matters :

1. In the first instance :

Demands other than those falling under the jurisdiction of the District Courts or of the Courts of Appeal.

2. In the second instance :

(a) Appeals lodged against judgments rendered by the District Courts ;

(b) Demands determined by law for revision of decisions or orders render-

ed by the District Courts.

Further, with reference to criminal cases, the Local Courts possess judicial power concerning the following matters :

1. In the first instance :

Criminal cases falling neither under the jurisdiction of the District Courts nor under the special jurisdiction of the Supreme Court.

2. In the second instance :

(a) Appeals lodged against judgments rendered by the District Courts ;

(b) Complaints determined by law against decisions or orders rendered by the District Courts, except those falling under the jurisdiction of the Supreme Court.

Courts of Appeal The Courts of Appeal possess judicial power concerning the following matters :

1. Appeals lodged against judgments rendered in the first instance by the Local Courts.

2. Complaints determined by law against decisions or orders rendered in the first instance by the Local Courts, except those falling under the jurisdiction of the Supreme Court.

Powers to adjudicate in the first and second instances in civil cases brought against the members of the Imperial Family belong to the Tokyo Court of Appeal.

The Supreme Court The Supreme Court (Taishin-in) is the highest court of law and possesses judicial power concerning the following matters :

1. In the final instance :

(a) Appeals against judgments rendered by the lower courts ;

(b) Complaints determined by law against decisions or orders rendered in the second instance by the Local Courts or by the Courts of Appeal ;

(c) Complaints against decisions to reject appeals made by the District or Local Courts.

2. In the first, and at the same time, final instance : Preliminary examination and adjudication of offences against the Imperial House, offences of internal disturbance, and offences committed by members of the Imperial Family, for which punishment heavier than imprisonment should be imposed.

Public Procurators

A public procurator's office, with the necessary number of procurators, is attached to each court. The work of the public procurator is, in accordance with the code of criminal precedure, to take legal actions, to go on with necessary legal proceedings, to demand a right application of the law, and to observe the right execution of a judgment. According to the code of civil procedure, he also has rights to ask for a report whenever he thinks it necessary and present his opinions to the court on it, and as a representative of public welfare he carries out his supervising business as laid down by the law in all judicial and administrative matters related to the court. But the public procurator acts absolutely independently of the court.

Court Officials and Procurators

Qualifications Candidates for the office of judge or procurator are chosen by the Minister of Justice from among those who have passed the higher judicial service examination. The selected candidates then have to serve a term of over one and a half years of probation in the courts or in a public procurator's office and pass a further examination, after which, should the report on their estimated ability be favourable, they will receive an appointment as judge or procurator. But those who have been professors of law in the Imperial Universities or lawyers of over three years standing can be appointed as judges or public procurators without examination and estimation.

The following are not to be appointed as either judges or public procurators.

(1) Those who have been convicted of a grave crime, with the exception of those political offenders who have been rehabilitated.

(2) Those who have served sentences on minor offences.

(3) Those who have been adjudicated bankrupt and could not be exempted from the responsibility.

Position of Judges and Public Procurators Judges are permanent officials appointed by His Majesty directly, or by His Majesty's order indirectly, or by His Majesty's approval, according to the grade of their position. Unless by way of criminal sentence or disciplinary punishment judges are not to be moved to another post or place, be suspended from office, be deprived of position, or receive a reduction of salary, without their consent, except in so far as the Minister of Justice may order retirement from service by the decision of a general meeting of the Court of Appeal or the Supreme Court on account of disability caused through weakness of body or mind.

The retiring age is for the President of the Supreme Court 65 years, and for other judges 63 years.

The public procurators are appointed by His Majesty directly or by His

Majesty's order indirectly or by His Majesty's approval. Unless by way of criminal sentence or disciplinary punishment the public procurators are not to be deprived of their positions against their own will.

The Procurator-General at the age of 65 years and all other public procurators at 63 years of age must retire from service. A public procurator must obey the orders of higher authorities and judicial policemen must obey the orders issued by the public procurators or through them within the district of jurisdiction of the public procurator's office.

The Jury System

In 1923 the Jury Law was issued, and Japan finally adopted the jury system under which persons other than judges are allowed to take part in criminal trials. The jury system is used in such criminal cases as where the punishment may be capital, or penal servitude or imprisonment for life. Other criminal cases in which the sentence may be penal servitude or imprisonment for a term longer than 3 years are tried by jury only upon demand of the accused and when they come within the jurisdiction of the Local Courts. The following cases are not submitted to trial by jury :

(1) Offences which come under the special authority of the Supreme Court.

(2) Offences against the Imperial House, causing an internal disturbance, helping an enemy, disturbing international relations, and sedition.

(3) Violations of the Peace Maintenance Law.

(4) Violations of the Military Secrets Preservation Law, the Army or Navy Criminal Laws or any other offences in connection with military secrets.

(5) Violations of the Public Election Laws.

The accused can refuse to have his case tried by jury or withdraw his own demand to be tried by jury at any time previous to the statement of the case by the public procurator, under which circumstances the case cannot be referred to a jury.

The jury is composed of 12 men. At the trial, the chief judge, after having heard all the evidence for and against the accused, sums up the facts and main points of the case, and charges the jury to deliberate and render its verdict by a majority vote. The verdict must be a simple statement as to guilt or otherwise. If the court consideres the verdict improper the case may be referred to another jury.

In a case where sentence has been passed on a jury's verdict of guilt, no appeal can be made to the Court of Appeal, but a demand for revision may be presented to the Supreme Court.

Penal System

History It was in the time of the Empress Suiko, 620 A.D., that the first written Penal Code was issued in Japan. The code was very simple, but later the Chinese penal code, the "To", was introduced and the Japanese code was drafted in a more systematic manner and promulgated by the Emperor Mommu, in 702, as the "Taiho Ritsu-Ryo." Five kinds of punishment were mentioned, namely, flogging, whipping, penal servitude, exile, and death, but in most cases these could be varied to confiscation of property or payment of a fine. Grave crimes were treason, atrocities, blasphemy, undutifulness to one's parents, adultery, etc. Confession of the accused was required as a necessary procedure of a criminal suit, and naturally torture was recognized as an indispensable means of obtaining such a confession. Several hundred years after the issuance of the Taiho Ritsu-Ryo the Shogunate Governments adopted extremely terroristic penal systems with the purpose of preventing the occurrence of criminal cases. One of the most important of them was the One Hundred Criminal Regulations of the Tokugawa Shogunate. It was a secret criminal code which was not published and was accessible to the judges only, an expression of the despotism of the ruling class that had as its motto, "leave the people ignorant of the niceties of law."

With the downfall of the Tokugawa Shogunate the Great Emperor Meiji abolished the system of intimidation and reformed the old penal code. The codification of Civil Law was carried on under the advice of Monsieur Gustave Boissonade, a French scholar of jurisprudence who was invited to Japan for that purpose. A new Penal Code and Criminal Procedure Law, the characteristics of which were that, "though the lawful punishment of criminals is assured, the penalties are tempered with sympathy toward the accused and are in no ways severe," were enacted and promulgated. "No crime shall be punished unless there is a regulation in the law," (nullum crimen et nulla poena sine lege). is one of the guiding principles of the code, which was formulated on the French penal code of 1810. Within a few years it was found that the new code was out of date and various amendments were discussed from 1884 to 1907, in

which year a thorough revision was made and the present Penal Code issued. Since then the social conditions of the people have undergone rapid changes, more advanced theories regarding penalties have been gaining ground and so many defects have been noticed in the present code, that in 1926 the Extraordinary Legislative Committee passed a resolution that the Penal Code should be revised. A special investigation committee set to work and in 1931 an outline and draft of a revised penal code and prison law was drawn up. It is expected that the thorough study of the draft that is now going on will soon be completed.

Penalties Penalties are divided into six kinds, namely, the death penalty, penal servitude, imprisonment, monetary penalties, custody, and fines. Confiscation is recognized as an additional punishment. The death penalty is by hanging and is carried out in prison. Penal servitude and imprisonment are for limited terms and for life; limited terms extend from one month to 15 years. Under penal servitude labour is compulsory, but a prisoner serving a term of imprisonment is not compelled to work, though he may be allowed to do so at his own request. A monetary penalty is 20 yen and above, unless made lighter on decision. Custody is from one to under 30 days, and a fine is from 10 sen to less than 20 yen. Those who cannot pay monetary penalties and fines are kept in workouses as an alternative.

Suspension of Sentence and Provisional Release The present penal law allows probation. The execution of a penalty often leads to self-abandonment and turns comparatively harmless people, who are not yet addicted to criminal deeds, into habitual jail-birds. This is found to be especially so when the penalty is one of penal servitude for a short time, and it is, therefore, far better for people convicted of light and incidental offences to be excused from the real infliction of the penalty under special conditions and to be given proper admonitions in order to make them repentant by self-examination. Consequently, the Japanese courts are empowered, under certain conditions, to postpone the execution of sentence for from one to five years, beginning with the day of the sentence and according to the nature and condition of the case, on persons sentenced to penal servitude or imprisonment for less than 2 years.

Probation is cancelled (1) when the probationer, during the time of probation, commits another offence and is sentenced to imprisonment or is given a heavier sentence, (2) when the probationer is sentenced to imprisonment or a heavier penalty is imposed because of some other crime committed before the granting of probation, and (3) when, in cases not mentioned above, the probationer is found to have had at some previous time a sentence of imprisonment or some other heavier penalty inflicted on him. Should the term of probation expire without being revoked the sentence is automatically cancelled thereby. The draft of the penal code of 1931, besides confirming the system of probation, admits the principle of postponement of passing sentence in specially pitiable cases of a non-serious nature.

Release on parole was practised as early as 1790 in the House of Correction at Ishikawajima, Yédo; the present law admits it and it is widely practised. As reformation is one of the chief aims of punishment, when convicts are evidently repentant and there is no fear of their committing further crimes, it is unnecessary to continue the punishment. Therefore, it is stated in the present Penal Code, "when the convicts who are under penal servitude or imprisonment are found to be evidently repentant, provisional release may be authorized by the administrative office after they have finished one-third of the limited term or ten years of the term for life" (Article 28).

Provisional release may be cancelled (1) when the persons on parole have committed another offence during the term of the release and have been sentenced to a monetary or heavier penalty, or (2) when they are sentenced to a monetary or heavier penalty because of some other offence committed before the provisional release, or (3) when they were sentenced to a monetary or heavier penalty because of another offence committed before the provisional release and that penalty must now be fulfilled, or (4) when they break the provisional release rules. In this case the rest of the term of sentence must be served.

Juvenile Criminals Article 27 of the Code of Criminal Procedure says, "public suit may not be instituted when the suit is found unnecessary because of the character of the criminal, his age and environment, the condition of his crime and his behaviour after the incident," and leaves the decision as to whether proceedings should be taken to the public prourator. The existing criminal system of Japan is thus inclined to some extent to subjectivism, putting emphasis on the offender himself rather than on the offence. Its evident expression is

found in dealing with young offenders. According to the provisions of the Juvenile Criminal Law, 1922, young boys or girls who are under 18 years of age are called juveniles and their offences are dealt with, not under the penalty system, but by a system of protection. Even when they are punished, the penalty is inflicted in a special way. Protective measures are (1) to give admonitions, (2) to leave them to the guidance of school principals, (3) to let them solemnly declare their sincere repentance in a written statement, (4) to place them, under certain conditions, in the care of their parents, (5) to place them under the care of temples, churches, protective bodies or other proper persons, (6) to hand them over to the care of the juvenile probation officers, (7) to send them to reformatories, (8) to send them to houses of correction, and (9) to put them under proper treatment in hospitals. These measures may be continued till the juveniles reach the age of 23 years. When juveniles are admitted to probation or provisional release they are not put under police supervision as is the case with the adults, but are left to the care of the juvenile probation officers. For the protective disposition of juvenile offenders juvenile courts have been established.

Special Measures for Juveniles Special measures for the penal punishment of juvenile offenders are :

(1) The death penalty or penal servitude for life is not inflicted upon a person who is under 16 when the crime is committed. When the crime is so grave that the death penalty or penal servitude for life should be passed, the sentence is mitigated to penal servitude or imprisonment for 10–15 years.

(2) When a juvenile criminal should be sentenced to penal servitude or imprisonment for more than three years at its maximum, the minimum and the maximum limits are fixed within the scope of the penalty to be inflicted on the crime committed. And when he should be sentenced to a penalty of more than 5 years at its minimum, the term is diminished to 5 years. That is to say, in case of a juvenile convict an indeterminate sentence is admitted.

(3) Juveniles sentenced to penal servitude or imprisonment are put in a special jail or in a section of the common prison secluded from adults. If they reach the age of 18 during the term of confinement they may still be kept secluded till they reach the age of 23.

(4) Juveniles sentenced to penal servitude or imprisonment can obtain provisional release (a) after 7 years in case of a life-term sentence, (b) after 3 years in case of (1) above mentioned, (c) after serving one-third of the time in case of (2) above.

(5) Juveniles are not sent to work houses.

Second and Habitual Offenders

In case of those who repeat criminal deeds and commit other offences, especially in the case of professional and habitual offenders, it is necessary to put them into confinement for considerable lengths of time in order to give them time to reform their character and at the same time protect society at large from their depravations. To deal with these people Japanese criminal law provides a system of aggravating penalties for the recidivists and admits special dealing with habitual thieves as a complementary system.

Repetitious Offenders (Art. 56–59, Penal Code) When a person commits another crime and is sentenced to limited penal servitude within five years from the day of release from former penal servitude or from remission of execution of a penalty, he is classified as a second offender. Under the name of repetitious offenders come all second offenders and up. The cases of remission of penal execution are extinction of prescription, special pardon and the case stated in the Penal Code, Art. 5. Amnesty and probation not only remit penal execution, but cancel the effect of the penalty altogether, and the crimes concerned cannot be taken as the basis for forming a repetitious offence. Again, when a person commits a crime during a term of probation the offence for which the probation was admitted is not counted as the first offence. The penalty inflicted on a repetitious offender is aggravated.

Habitual Thieves Habitual offenders are most numerous in burglary and larceny cases. The habitual offenders often regard prison as their residence and repeat crimes immediately afer their release, to the great harm of the community, in order to get back "home". They have, therefore, to be separated from society by the infliction of comparatively long sentences. In many cases it has been impossible to increase the penalty, or when it has been increased it has still been too short, and as there is no provision in the existing Penal Code for unlimited imprisonment the Thief Prevention Law was enacted in 1930. According to this law, when persons commit burglary or larceny

habitually by the use of weapons, or by forming a band of more than two, or stealthily breaking into houses by night, they are punished by being sent to penal servitude for more than 2 years in the case of a thief and more than 7 years in that of a burglar. The draft of the revised penal law of 1931 adopts the system of incarceration for unlimited terms for habitual offenders (Draft, Article 91–95).

Peace Preservation

Penalties are imposed as deterrents, but are not always effective, especially in the case of insane people and habitual drunkards, as well as in that of habitual offenders. For that reason it is advisable that, in addition to meting out punishment for any wrong-doings, it should be possible to segregate such people from law-abiding society. To meet this need, most of the countries of the world have a supplementary system of Peace Preservation Laws, which restrict to a certain extent the freedom of released persons as long as their dangerous character is unimproved. In Japan the existing Penal Code makes no provision for such a system, but the draft of 1931 suggests four kinds of peace preservation regulations, namely, preventive surveillance, curative treatment, compulsory labour, and preventive detention.

Surveillance When persons who are defective in mind or body or are deaf-and-dumb are to be sentenced to imprisonment or some heavier penalty, the Court can decide to place them under surveillance. In case the sentence has already been passed for one reason or other, surveillance will follow the execution of the sentence, but in some cases it may be carried out before the commencement of execution or at any time during its course, (draft, Art. 127). Those who are put under this measure are to be kept in the surveillance house and receive treatment for their defectiveness, while being under surveillance. They may be released when further surveillance is found unnecessary by order of the administrative offices. In principle the time of surveillance is 5 years, but this may be renewed by the Court when thought necessary. When the sentence and the surveillance disposition are pronounced at the same time, the Court may choose either one of them as one of the two became unnecessary by the enforcement of the other.

Curative Treatment When drunkards or users of narcotics commit offences while in a state of intoxication or insensibility and it is found necessary to correct them of their bad habits, the Court may order them to be kept in Homes of Correction for a period of 2 years and receive proper curative treatment.

Compulsory Labour When persons who habitually commit crimes because of vagrancy or hatred of labour are to be sentenced, the Court may order compulsory labour together with the regular sentence for a period of 3 years, during which time they are to be kept in compulsory labour houses and compelled to work diligently under strict discipline in order to acquire the good habit of work. The chief official of the labour house may send them to work for the Government or to public or private factories, to farms or other places of labour, allowing them to stay outside the Compulsory Labour Houses, if deemed expedient.

Preventive Detention When the convicts who are to be released at the expiration of a term of penal servitude are found to be addicting to incendiarism or likely to commit murder or burglary, the Court may order them to undergo preventive detention, (draft, Art, 139). They are to be kept in Houses of Prevention and get the treatment necessary for leading them to full repentance. The duration of the treatment is 2 years in principle, but may be prolonged by the Court. This measure is to take effect after the expiration of the regular term of penal servitude, (Draft, Art. 140–142).

Criminal Thought Offence The Communist movement in this country has, since two or three years ago, been heading for its end and ruin on account of various factors, both internal and external, including the enforcement of a strict policy of the Government for rounding of the Communists and the enhancement of the national spirit brought about by the outbreak of the Manchurian Incident. The conditions, however, still remain such that no optimism can be warranted in regard to the future of the Communist movement.

The number of arrests made on charges of violation of the Peace Preservation Law since 1928 has exceeded 60,000 person. Of these, more than 10,000 persons have been granted a reprieve in their indictment or a stay of execution of this sentence, have served their sentence or have been released on bail. The minds of these men are of divers trends at present; some of them have recanted, others, are of a very ambiguous turn of mind, making it impossible to judge whether they are going to change their minds or not, while still

others seem to embrace rebellious ideas.

It goes without saying that those who have not yet changed their minds are liable to repeat their offence or commit similar ones. Even some of those who have already changed their minds may again commit some offence under the influence of their environment or because of social conditions unless some preventive measures are taken, in view of the fact that "thought" offences are attributable largely to social conditions. It is an urgent need, therefore, under the current situation both at home and abroad, that a prudential policy should be established for the termination of the rebellious movement by preventing repetition of similar offences in the future. The necessity is keenly felt for the establishment of adequate facilities to encourage those who have not yet changed their minds or who have changed their minds only partially to effect a complete change and at the same time enable those whose minds have been completely changed to lead a legitimate and orderly life no matter how social conditions may change in the future. It is in this necessity that the reason is found for the adoption of the protection and surveillance system.

Protection and Surveillance System The new rule which involves the creation of protection and surveillance stations and the establishment of a protection and surveillance commission is aimed at protecting persons who have once committed "thought" offences and preventing them from repeating the crime. It not only calls for placing old offenders under surveillance but aims at giving them positive guidance in order that they will not commit similar offences and will walk in the path of rectitude. This positive nature of the new system is expected to help in bringing about the defeat of Communism and elevating the Japanese spirit through encouraging those on the way of changing their minds to forge ahead, and assisting those who have already done so to earn a living. It constitutes an important link in the national "thought" defence line on the strength of its mission towards the preservation of peace and public order by preventing "thought" offences on one hand and on the other by serving to elevate and clarify the essential spirit of the nation.

Objectives of the New System The objectives of the protection and surveillance system are limited to persons who have committed offences in the light of the Peace Preservation Law. Offenders of other kinds do not come within its scope. Only those who have been granted a reprieve in indictment by the public prosecutor, or a stay of execution of their sentence by the law court, or who have been released on bail, or who have served their term, are placed under protection and surveillance. The invocation of this rule, however, must be made with the approval of the Protection and Surveillance Commission which is under the control of the Minister of Justice, and in such cases where the commission adopts a resolution against the invocation, the rule cannot be invoked.

Organs and Procedure The new system is enforced through the operation of 22 protection and surveillance stations throughout the country and a protection and surveillance commission. These stations are independent offices and are located in Tokyo, Yokohama, Mito, Mayebashi, Shizuoka, Nagano, Niigata, Osaka, Kyoto, Kobe, Takamatsu, Nagoya, Kanazawa, Hiroshima, Okayama, Fukuoka, Kumamoto, Sendai, Akita, Aomori, Sapporo and Hakodate and their staffs are composed of guiding officials, protecting officials and secretaries.

The guiding officials take charge of directing and supervising the protection and surveillance business and as such may be regarded as the central machinery of the protection and surveillance stations. The protecting officials cnoduct the enquiry and surveillance business under instructions from the station masters, who are selected from among the guiding officials. There are at present 33 whole-time protecting officials over all the country and the Minister of Justice may commission other suitable persons as part-time officials.

The protection and surveillance stations are to be notified by the authorities concerned when some "thought" offenders have been granted a reprieve in indictment, a stay of execution of their sentence, have been released on bail, or have left prison after serving their term. Upon receipt of such a notification, the station concerned must immediately institute an investigation into the career, environment, mental and physical condition, and changes in thought and other relative affairs of the person in question. In the investigation, special attention should be given to ascertaining whether the person in question has changed his mind or not and if so, the motive and extent of the change as well as the character and financial and family conditions of his guardian and whether there is any prospect of the person in question earning a living in

the future.

If the results of the investigation lead to a decision to place the person under protection and surveillance, the station concerned is to refer the matter to the protection and surveillance commission which must then pass a judgment. The station cannot place any person under protection and surveillance until it has received a notification from the commission that its decision has been approved.

Methods of Effecting the Protection and Surveillance There are three different methods for effecting the protection and surveillance. One is that the protecting officials concerned keep a personal surveillance over the person in question, another is to hand the person over to his guardian. In the third method, the person is put in the charge of some protective organization, temple, shrine, church, hospital, etc. In all the three cases, the station authorities concerned must explain to the person in question the significance of the decision to place him under protection and surveillance and caution him about his future conduct.

According to circumstances, two or even three methods may be employed simultaneously. The authorities concerned may also put restrictions on the abode, intercourse and correspondence of the protected if such a measure is deemed necessary or advisable.

The period of protection and surveillance is fixed at two years but it may be shortened or prolonged. Prolongation of the period, however, requires the approval of the protection and surveillance commission.

As already stated, the protection and surveillance system has, as its primary aim, the encouragement of "thought" offenders to change their minds and the assistance of those who have changed their minds in securing a living. It therefore is natural that adequate measures should be taken to guide such persons properly in thought and help them to enjoy life.

In view of the specific nature of "thought" offenders, the authorities follow a principle of respecting their social conscience and conception of justice while encouraging them to master the Japanese spirit. As a stable living has a close bearing upon the perpetuation of the change in mind, efforts are also made to secure suitable positions for persons under protection and surveillance and to assist them in making their own homes and appreciating the beautiful points of the Japanese family system. Facilities for attendance at school are also provided in some cases.

The adoption of the above system constitutes an epoch-making event in the history of criminal administration in this country in that it has extended the scope of state protection and assistance from juvenile offenders to some adults. It has long been a loud cry that the enterprises for aiding ex-convicts and persons under specified circumstances should not be left to the hands of charitably disposed civilian organizations and individuals alone but that the State should share the responsibility with society. The enforcement of the new rule forms an official action which recognizes the legitimacy of the contention.

It is considered a natural conclusion that this system will eventually lead to legislation recognizing that general activities in protecting and aiding discharged prisoners should be in the nature of State enterprise.

There has been another claim in this connection, that the management of this kind of public enterprise should be rationalized and expanded in scope, and that closer relations should be established between the enterprises and the law courts, public procurators, prisons, police and employment offices as well as local communities. This demand, it is to be noted, has also been partially met by the inauguration of the protection and surveillance system for "thought" offenders.

Thus, the new system is expected to help in promoting the progress of the enterprises for protecting and aiding discharged prisoners and in facilitating the fulfilment of the mission of such enterprises in preventing crime.

Criminal Compensation System

A nation has the responsibility of compensating innocent persons who have been wrongfully punished or have been kept in detention during trial. The Criminal Compensation Law was enacted in 1931. Cases to be compensated according to the Law are as follows :

(1) When a verdict of "not guilty" or an acquittal has been given by the examining judge to a person who has been kept in detention, the State makes compensation for the loss caused by the detention.

(2) In case a verdict of "guilty" is reversed by a higher court and the accused has already suffered the execution of the penalty or was kept in detention before the execution, the State makes compensation for the loss caused by the penalty or detention.

When the accused is dead, the bereaved get the compensation. The be-

reaved in the terms of the Law are meant to be the spouse, children, grandchildren, parents, grandparents and those whose names were in the same census registration at the time of the death of the accused.

As compensation for unlawful arrest or detention, a sum of less than 5 yen is paid against the warrant of arrest or for each day of detention after the arrest or for each day of detention after the execution of the warrant of detention.

As compensation for penal servitude, imprisonment, or detention, a sum of less than 5 yen is paid for each day of the whole period. The same rule applies to detention before the execution of the death penalty.

As compensation to the bereaved of a person who has mistakenly suffered the death penalty, a sum of money considered reasonable by the Court is given in addition to the compensation for detention.

As compensation for a monetary penalty or fine wrongly imposed, the amount of money corresponding to that of the monetary penalty or fine already paid is given back. In case a person was unable to pay the amount imposed and in lieu was kept in a Labour House, a sum of 5 yen for each day of detention is paid as compensation.

Claims for compensation should be made to the Court returning the verdict of "not guilty", or to the Court in which the examining judge pronounced the acquittal.

A Survey on Crimes The number of criminal code offences, first instance, was from 100,000 to 110,000 in the early part of the Taisho Era (1912–1917), but began to lessen in 1920 and stayed between the 80,000 and 90,000 mark for years. In 1933, it began to increase again and went over the 120,000 mark in 1934, the record high since 1912. The proportion to population was, on the average, 20 in every 10,000 in the early part of the Taisho Era, 16 in 1920 and 17.86 in 1934.

Comparing crimes in 1912–1915 with those in 1930–1933 the largest number pertained to gambling and lotteries, but these lessened from 10 to 7 in every 10,000 of population, those of theft from 4 to 3, of fraud from 2 to 1, and of usurpation from 1 to 0.4. On the contrary, the proportionate number of inflicting injuries increased from 1 to 1.4 and that of the unintentional inflicting of injuries from 0.1 to 0.8. Those of murder, burglary or incendiarism kept 0.1 in both periods.

In 1934 the total number of convictions in Japan proper was 120,854, of which gambling and lottery accounted for 59,145 or 48.9 per cent, theft for 21,748 or 18 per cent, inflicting injuries 10,299 or 8.5 per cent, fraud and threat 7,416 or 6.1 per cent, unintentionally inflicting injuries 6,226 or 5.2 per cent, usurpation 2,974 or 2.5 per cent, murder 1,041 or 0.86 per cent, incendiarism 938 or 0.77 per cent, and burglary 797 or 0.65 per cent.

When divided into crimes committed in city areas and those in country areas, the number of the former was 90,162 or 41.65 in every 10,000 of city population and that of the latter was 30,692 or 6.59 in every 10.000 of the country population.

Taking totals according to prefectures, Tokyo prefecture led others with 17,878, Osaka came next with 10,454, Hyogo 7,654, Aichi 5,749, Hokkaido 5,383 and Fukuoka 5,211. All other prefectures had less than 5,000 each, those which had less than 1,000 were Okinawa 472, Yamagata 634, Tottori 677, Ishikawa 680, Shimané 782, Miyazaki 790, Tokushima 820, Iwaté 863, Fukui 985 and Miyagi 996.

In proportion to every 10,000 of population in prefectures Tokyo again led with 29.11, followed by Kanagawa 27.80, Hyogo 27.35, Okayama 27.02, Osaka 26.66, Oita 25.34, Kyoto 24.77, Nara 24.77, Nara 24.22, Wakayama 22.69 Aichi 20.80, Hiroshima 20,30, and Yamagata came last with 5.65.

In proportion to every 10,000 of population in prefectures, according to the kinds of crimes, in gambling and lottery Kanagawa headed the list with 18.4 followed by Nara, Tokyo, Hyogo, Ota, Wakayama, Osaka, Kyoto, Okayama, Mié and Chiba, all exceeding 10. Kagoshima had the smallest number with 1.18. In general the districts around Tokyo and Osaka had the highest proportions while Tohoku (northeast) and Kyushu had the lowest proportions. In theft Osaka came first with 7.36, next came Tokyo with 7 followed by Kyoto, Aichi, Hyogo, Fukuoka, ending with Akita's 0.76. In this crime Tohoku districts had the least number again. In inflicting injuries Okayama was the highest with 3.87 followed by Ehimé, Hyogo, Yamanashi, etc., Nagano being the lowest with 0.57. In fraud and threat Kyoto came first with 2.33 and Okinawa was the last with 0.41. In unintentionally inflicting injuries Kanagawa came first with 1.90 followed by Tokyo, kyoto, Osaka, Hyogo and other prefectures and Yamaguchi ended the list with 0.15. In usurpation the first was Okayama with 1.45

and the last was Kagoshima with 0.2. In murder Fukuoka came first with 0.32 and Aomori, Ishikawa and Miyagi came last 0.5 each. In incendiarism Akita came first with 0.37 and Kyoto came last with 0.04. In burglary Tokyo and Kanagawa headed the list with 0.25 each and Kochi closed it with 0.01.

Statistics

The following are the statistics relevant to the judicature of the country :

I NUMBER OF COURTS (June, 1936)

	Supreme Court	Courts of Appeal	Local Courts	Branch Courts	District Courts	Branch Offices
	1	Tokyo	11	17	64	413
		Osaka	9	12	43	277
		Nagoya	6	9	30	203
		Hiroshima	6	13	36	252

Prison System

Historical Background

A short historical retrospect of our penal system will show that it is only in comparatively modern times that "Imprisonment" became the recognized method for the punishment of crime.

Up till recent times the idea at the root of the Japanese penal system was minatory. In other words, the so-called principle of general prevention by warning the people at large against the commission of crimes by imposing heavy punishments upon criminals was adopted. Accordingly, the punishments were principally capital and corporal and extremely cruel in character. For instance, the Criminal Code of the Yédo Period (1602–1867) recognized the exposing in public of the heads of persons executed; crucifying, burning at the stake and other similar cruel punishments were imposed. In those days the jails were used merely as places of detention for various offenders until their trial, not as places for reforming offenders. Imprisonment was a very unusual form of punishment, for prisons were unknown and imprisonment was not a legal penalty.

Exile and Banishment Punishments which brought loss of liberty for specified periods to the criminal were exile and banishment. Persons published with exile were sent to distant islands and places such as Satsuma, islands of the Goto group, Oki, Iki and Amakusa, and there they were forced to work under such miserable conditions that most of them died of starvation. Banishment was a penalty designed to expel persons convicted of crimes from certain fixed areas, and, as the result of the enforcement of this punishment in certain districts industries declined and farms and fields lay waste, giving rise to many social evils such as the increase in the number of ronin (masterless samurai), mushukumono (vagabonds) and other dangerous elements. In 1778, therefore, as a remedial measure, the Tokugawa Shogunate instituted the system of kozan-yékifu (mine labour) and, in 1790, that of ninsokuyoseba (places for the detention of convict-coolies). The system of kozan-yékifu dealt with vagabonds with no previous convictions. These were sent as coolies to pump water out of the Sado goldmine. In and after 1788, those who had been punished by flogging or branded as ex-convicts by tattoo marks and were homeless or those who, it was feared, might perpetrate crimes in the future were also sent there.

Prototype of Present Prisons The ninsoku-yoseba were to all intents and purposes the prototype of present day prisons and penal servitude. These places for the detention of convict- coolies were located at Ishikawajima and Tsukudajima in Yédo (Tokyo) and at Kamigo, Ibaraki prefecture, and there vagabonds and those who had been punished by flogging or branded as ex-convicts by tattoo marks were detailed to work as oil pressers or at other kinds of labour for a fixed wage, with the ulterior object of giving them such instruction and training as would fit them to lead the lives of respectable members of society. In and after 1820 those who were punished with banishment heavier than that from the confines of Yédo were put to forced labour for a fixed period of time in lieu of that punishment. Thus the ninsoku-yoseba, which had been instituted as workhouses for vagabonds, were turned into prisons for the reclamation of criminals through ordered life and labour. In its correctional idea ninsoku-yoseba was entirely identical with the London "Bridewell," which was established in England in 1550 "to punish, correct, and reform by labour of a diversified nature," and the Amsterdam workhouse (tuchthuis) founded at the end of the 16th century and well known for its motto, "Schrick niet ! ick wreeck geen quaet, maer dwing tot goedt, straf ist myn handt, mar lieflijck myn gemoedt." (Do not fear ! I will not take revenge upon you for your misdeed ; on the contrary, I wish to lead you to good. Although I am rigorous in handling you, my heart is filld with kindliness towards you.) In and after 1790 the prisoners detained in the ninsoku-yoseba who behaved well and showed notable signs of penitence were liberated on certain conditions and this may be taken as the

enforcement of provisional release of prisoners for the first time in Japan. When it is remembered that the system of provisional release of prisoners in Europe originated in a favoured release of prisoners from a convicts' colony in Australia in 1791, it is an interesting coincidence that the same system was inaugurated simultaneously both in the West and the East.

Improvement of 1872 In 1871, with a view to carrying out a great improvement in our prison system, the Emperor Meiji despatched the Vice-Director of Prisons, Mr. Jinsai Obara, to Hong Kong and Singapore to inspect and study the prison systems there, and, as a result, the Prison Regulations, the first written law concerning prisons in Japan, were promulgated in 1872. According to the provisions of these regulations, the reclamation and education of the inmates of prisons should be based on love and benevolence. At the beginning of the Regulations, it is stated: "Prison is a place for the incarceration of criminals for chastisement. They are placed there because of love and benevolence towards them and not because of any desire to inflict cruelty upon them; prison is intended for chastising them and not for subjecting them to hardships. Punishment is imposed on them because it is unavoidable and because it is a means of removing evil from the State. The authorities of prisons shall conscientiously observe this principle in treating prisoners." The Regulations were framed on a progressive system and on very advanced lines, but subsequently their operation was suspended for a time, and, in 1881, the Revised Prison Regulations were published. The Regulations were again revised in 1889, and with the revision of the Criminal Code in 1907 the existing Prison Law was enacted and published the following year.

Management of Prisons

Prisons are placed under the control of the Minister of Justice. Prior to 1900 they were under the control of the Minister of Home Affairs, but since that year they have come under the supervision of the Minister of Justice. With the transfer of affairs relating to prisons from the Department of Home Affairs to the Department of Justice, the Bureau of Prisons was established in the latter Department for the administration of matters concerning the execution of sentences, prisons, provisional releases of prisoners, and the identification of criminals by finger-prints. A director, several secretaries, a hygiene official of the Department, several clerks and three assistant-experts in finger-prints were appointed to conduct the business of the Bureau.

In 1935, there were 52 ordinary prisons, 3 reformatory prisons for minors, and 103 branch-prisons, and 1,215 detention rooms in police headquarters.

The kinds and regular number of prison officials in 1935 were as follows:

Governor	42
Assistant-governors	33
Doctors	135
Chaplains	141
Instructors	36
Industrial work experts	407
Pharmacists	10
Chief warders	441
(including 5 chief wardresses)	
Interpreters	3
Warders	6,473
Wardresses	127
Total	7,848

Prison superintendents are appointed from among officials ranking as governors and assistant-governors by the Minister of Justice, and branch-prison governors from among assistant governors and chief warders.

Classification

In the Japanese prison system there are four kinds of prisons: (1) prisons for those sentenced to penal servitude; (2) prisons for those sentenced to imprisonment; (3) houses of detention for persons destined to spend time in detention, and (4) prisons of confinement for (a) those sentenced to death, (b) those awaiting trial. In view of the different characters of these prisons, they should, in principle, be established independently of one another, and, in the case of their being erected in the same area, they are usually separated. At present, workhouses are not classified as prisons, but are attached to prisons for the sake of convenience.

Treatment of Prisoners

Object of Treatment As to what is the primary and fundamental purpose of punishment by imprisonment, nothing is stated in the Criminal Code or in the Prison Code now in force. Some Japanese jurists are of opinion that punishment must remain in its essence retributive and deterrent, and accordingly a prisoner must be made to expiate his offence by a dull, soulless, and monotonous servitude. But such new scholars of criminal law and penology as Dr.

Yeiichi Makino, Professor of Criminal Law, Tokyo Imperial University, Prof. Kameji Kimura and Dr. Akira Masaki, former Assistant Director, Bureau of Prisons, Department of Justice, interpret it as a form of education and emphasize its socializing effects. Be that as it may, Japanese juridical authorities have for more than ten years endeavoured to reform prisons on the latter principle. On April 4, 1924, Dr. Kisaburo Suzuki, the then Minister of Justice, declared at a meeting of officials connected with prisons and criminal affairs, "The enforcement of punishments consists in the adoption of such measures as may improve the quality of convicted persons and socialize them as good and law-abiding members of society." Further, at a meeting of the governors of prisons and reformatory prisons for minors, held on October 11, 1927, Kado Hara, the then Minister of Justice, gave the following instructions :

"The object of enforcing punishments on the inmates of prisons is to cause them to reflect on and repent their offences and to turn them into good members of society. There are many and various means of attaining this object, but they are, in the final analysis, to cultivate their character, to give them training for different occupations, and to maintain their health in good condition, while improving the circumstances which constitute the causes of their offences so as to enable them to lead a decent life. In order to realize the end aimed at, therefore, a mere confinement and watching of them is not sufficient ; on the contrary, it is necessary to know their individual characteristics and to inquire into and ascertain the motives and causes of their crimes, giving them thereby appropriate treatment."

Classification System Inasmuch as punishment by the restriction of presonal liberty is enforced today principally with a view to education, criminals are properly classified according to ages, characteristics, terms of imprisonment, numbers and kinds of offences, and are then confined in different prisons so as to facilitate the enforcement of adequate measures for their education in accordance with their categories and, further, to prevent prisons from becoming breeding-places of crime through mutual contact and contagion as the result of promiscuous confinement of all grades. When it is impossible to distribute them among independent prisons and they are confined in the same area, prisoners are usually classified strictly, and confined separately, according to their categories. There are prisons for minors at Odawara, Kawagoyé, Himéji, Okazaki, Iwakuni, Kurumé, Morioka, and Hochiojo, and in Hokkaido for the confinement of those under 18 years of age sentenced to penal servitude or imprisonment, prisons for aged persons at Hamamatsu and Yonago and for women at Tochigi, Miyoshi and Miyazu. Further, there are prisons for the confinement of persons sentenced to terms of imprisonment exceeding 10 years at Kosugé, Takamatsu, Hiroshima, Okayama, Miyagi, and Abashiri ; the Abashiri agricultural prison is intended for training prisoners as agricultural labourers. At Uraga, located in an old warship anchored off the port, is a branch of the Odawara prison for minors. There juvenile offenders are given training as fishermen, and sometimes engage in coastal and deep-sea fish-vessels or steamers.

In addition to the above-mentioned classified confinement, with a view to proper individualized treatment, they are examined by doctors, alienists, psychologists and educationists to find out their psychopathic idiosyncrasies, hereditary natures, physiological peculiarities, adaptabilities to occupations, educational possibilities, etc. in different prisons previous to their confinement. Further, a "social diagnosis" is made by collecting reports on them from city, town and village offices, police stations, schools, and organizations devoted to their protection in order that they may be suitably classified for treatment.

Progressive System A treatment on the progressive system is accorded to convicts who form the bulk of the inmates of prisons. This treatment aims at leading them to repent and their treatment is graded in proportion to their aspiration and diligence, thereby gradually bringing them to the conditions of ordinary social life. The relaxation of the enforcement of penalties not merely extends the scope of the personal liberty of convicts, but serves to cultivate a sense of responsibility on their part and strengthens their will for self-reclamation. In short, its chief purpose is not to make "good convicts", but to turn them into "good citizens." The treatment in question does not apply to persons who are sentenced to imprisonment for less than 6 months, aged and decrepit persons, and those of unsound mental or physical faculties. Any prisoner committed for the first time is kept in solitary confinement for a certain period of time and a close study is made of him. On the basis of the results he is classified according to character, physical and mental con-

dition, number of convictions, age, nature of crimes, term of service, home, health and thought.

The Four Stages The stages of the progressive treatment are: (1) those under investigation; (2) those in course of correction and training; (3) those in process of improvement; and (4) those who have developed a sense of responsibility. After being subjected to a study of character, convicts are received into the first class to begin with. Those who are accorded this treatment are given fixed marks according to their terms of imprisonment and promotion to higher classes is given only when a sufficient number of marks have been earned by diligence, good conduct, and growth of the sense of responsibility and of the will for self-improvement. Those belonging to the first and second classes are kept in confinement in association, while those belonging to the third class are kept in confinement in association in the day time, but in solitary confinement at night, those belonging to the fourth class are confined in a special room.

The Treatment Governors of prisons may cause convicts in each workshop to elect some from among them to keep the workshop in good order and look after other necessary matters. The elected ones must be popular, trustworthy and belong to the third class. Prisoners belonging to the third class must jointly, once a month, carry out the work of cleaning and sweeping the prison grounds and keeping them in order. Except in cases of special need, prisoners belonging to the fourth class do not undergo physical examination or have their cells searched, and, further, are permitted to talk with one another so long as it does not interfere with the maintenance of discipline. They are also permitted to elect two representatives that they may express their desires to the authorities. These representatives are nominated by the governor of the prison concerned from among several candidates elected by prisoners belonging to the fourth class. Prisoners of the fourh class may be permitted to take walks in a place designated for that purpose in the prison grounds in hours of recess, or hold meetings, take walks in a group, or hold athletic meetings on days free from labour. They give a pledge to the governor, holding themselves responsible for the physical examination of those of their own class, for the search of their cells and keeping them in order, and the maintenance of order among themselves. In case of any one of them violating the pledge, the privileged treatment will be suspended for some or all of them. Any one of those belonging to the first class who earns more than ¥5.00 for labour may be permitted to use less than one-fifth of the monthly total in buying postage stamps and in other ways that are deemed necessary; any one of those belonging to the second class, less than one-fourth of the monthly total; any one of those belonging to the third class, less than one-third of the monthly total; and any one of those belonging to the fourth class, less than one-half of the monthly total. While those of the first class are not permitted to change the kinds of labour they engage in, those of he second class and up are permitted to do so. Those who have superior skill or high efficiency and belong to the third class are charged with the task of directing industrial work and those who are similarly qualified in the fourth class are given the task of directing and supervising it. Those of the third class who have particularly superior skill and high efficiency are permitted to work for their own profit in time other than working hours, but that time is limited to two hours per day.

Moral Education Prisoners belonging to the first and fourth classes are chiefly given individual moral and religious instruction, while those belonging to the second and third classes receive the same instruction en masse. Listening to music broadcast on the radio and listening to the playing of gramophone records is permitted to those belonging to the second and higher classes. The time for the enjoyment of this privilege is fixed at twice a month for those belonging to the second class, which may be increased to three times and four times for those belonging to the third and fourth classes respectively. The governor may permit members of the third and fourth classes to hold moral cultural meetings, the number of times being limited to once for those belonging to the third class and twice for those belonging to the fourth. Prisoners of the fourth class are permitted to read books or see pictures in the prison library on days free from labour, and may also borrow suitable newspapers and magazines from it. Those of the third and fourth classes may be permitted to play athletic games, the number of times for such amusements being limited to once a month for those of the third and twice for those of the fourth class. While those belonging to the first class

are permitted to interview or send letters only to their relatives and those who are concerned with their protection, those belonging to the second and higher classes are permitted to interview or send letters to those who do not interfere with their moral instruction, besides their relatives. The number of interviews and the number of letters that may be written increase in proportion to advances in class.

Provisions, drinks and other articles for the maintenance of the health of prisoners are uniform and do not differ according to classes. Those belonging to the fourth class are given white garments, are permitted to decorate their cells with flowers or pictures, and are lent table-ware and other sundry articles for common use.

Suspension of Progress In case any prisoner violates the prison regulations, the treatment on the progressive system may be suspended for up to a period of 3 months, but in case it is recognized that there are certain circumstances which have to be taken into consideration before the suspension or in case the prisoner shows signs of sincere penitence the enforcement of the the sentence of suspension may be postponed for a fixed period of time. If he further violates the prison regulations during that period, the sentence of suspension will be enforced, but if he passes the said period without any further violation it will not be carried out. Further, in case a prisoner shows marked signs of penitence after the sentence has been delivered, this will be taken into consideration and the sentence repealed in full or in part. In case a prisoner who has been punished with suspension of the treatment again violates the prison regulations, he may be transferred to a lower class according to the circumstances of the case. When a prisoner who has been punished with such degradation shows marked signs of penitence he will be restored to his former category without reckoning his marks.

When any person of the fourth class has served one-third of his term of imprisonment and the prison governor considers him fit for provisional release his case should be reported on to the Minister of Justice. Even one who belongs to lower classes and who has served one-third of his term and shows notable signs of penitence and is considered to be fully adapted to social life may be specifically granted provisional release, subject to the approval of the conference for provisional treatment on the progressive system.

Prison Labour

Paragraph 2 of the Japanese Criminal Code provides : " Any convict sentenced to penal servitude shall be detained in a prison and subjected to a fixed amount of labour." This " fixed amount of labour constitutes prison labour. It is not legally imposed on convicts punished with imprisonment or custody, but its imposition is permitted in case they desire it. Since the institution of the ninsoku-yoseba at Ishikawajima hard labour has been recognized as an essential part of the discipline of prisoners, and present-day criminal theory in Japan is opposed to punishment by the restriction of personal liberty without the imposition of hard labour. Accordingly, prison authorities are encouraging industrial work at their own request by prisoners punished with imprisonment or custody.

The Three Systems Industrial work in prisons is managed on three systems, viz.: the public account system, the " made-to-order " system, and the contract system. Under the public account system, a prison itself purchases materials, provides itself with the necessary machinery, implements and tools and makes prisoners manufacture or repair articles or carry on labour under the direction of prison officials, and sells the products. Under the " made-to-order " system, the chief materials are supplied by the outside buyers and prisoners either manufacture or repair articles under the direction of industrial work experts and assistant industrial work experts on the prison staff, and when the articles are either manufactured or repaired the wages of the workers and the cost of requisites in the manufacture or repair are calculated and the prices of the articles fixed by the standard of current prices. The articles are then delivered to the buyers on payment of the account. Under the contract system, applicants have to supply not only materials, machinery, implements and tools, but also experts for the direction of work, a prison only offering the labour of prisoners and receiving their wages in exchange. Under the contract system now in force in Japan, the prison authorities undertake the supply of provisions, etc. to prisoners, as well as undertaking their supervision and selection for work, and nothing like the lease system that was in vogue in South American countries at one time is recognized.

Among the above-mentioned three different systems, the public account system does not permit any third party

other than prison officials to direct prisoners in the prosecution of their work as in the case of the contract system and, moreover, enables the prison authorities to select and impose on prisoners such kinds of work as are suited for their moral instruction and vocational education. In these respects, it is considered to be the most desirable for the enforcement of penological measures and its adoption is greatly encouraged.

Training for Occupations In imposing work on prisoners, the most suitable kinds of work are given them not only by taking into consideration health, economy, terms of imprisonment, ability, occupations in free life, and future means of livelihood, but also by scientifically examining their individual adaptabilities to occupations. Industrial work in prisons is the most suitable means of giving moral instruction to prisoners; in particular, training them in certain lines of work in the course of detention is the best way to prevent them from perpetrating crimes once again. Since 1926, therefore, houses for the training of prisoners for occupations have been erected in different prisons throughout the country and there prisoners have been trained for occupations requiring special skill, such as those of carpenters, joiners, furniture-makers, tin-smiths, plasterers, timber-mill workers, painters, smiths, shoemakers, etc. The term of training is 6 months, during which fundamental theories and practice are taught.

Rewards Given as Favours Working hours are from 12 to 13 hours a day and differ according to months. It is permitted to give educational or moral instruction to prisoners or allow them to take exercise within these hours. A time of recess—15 minutes in the morning and 25 minutes in the afternoon—is given them. All the income from the work of prisoners goes into the national treasury, irrespective of whether it arises from work or from wages. A prisoner who has worked may receive a reward as a favour. This gratuity varies from ¥0.20 to ¥10.00 per month and the sums are fixed according to conduct, character, kinds of work, and the results of the work done. Any one who does particularly superior work is given an additional reward not exceeding ¥10.00. The reward for his work is, in principle, not given a prisoner until he is released from prison, but (1) in case a prisoner is entitled to ¥10.00 a month or more, and the money is needed to support his father, mother, wife, child, or to compensate the sufferer from his crime, or to purchase books or other necessary articles, one-third of the amount may be given him while in confinement, and (2) in case it is particularly necessary to do so for the sake of a prisoner, the entire reward may be handed over to him, irrespective of its amount and the way of spending it. In case a prisoner has been injured or has fallen sick while at work, and has died in consequence or has become unable to carry on any work, he may be entitled to a pecuniary reward according to the circumstances of the case. This reward is fixed within the limit of from ¥50 to ¥180 according to the details of the case.

The Hito Prisoners are given moral instruction en masse on national holidays, on the first two days of January and the 31st of December, or on Sundays. The same instruction is also given prisoners individually in case it is deemed necessary. It is chiefly given by chaplains appointed from among priests of the Shinshu sect. Adult prisoners who are uneducated and those under age receive an elementary school education. The latter are also given military training, which gives very satisfactory results in the way of moral instruction. Prisoners are permitted to read books and look at maps and pictures, unless it is injurious to the good order of the prison, but writings concerning current topics are forbidden. As, however, it is needful to keep them acquainted with changes in the condition of society, lest they should fall behind the times, a specially edited newspaper, "Hito," (Man) is issued and distributed among them.

Aid of Discharged Prisoners

In its initial stage of development, the aid of discharged prisoners was largely undertaken by the Government. As already stated, the systems of "kozan-yékifu" and of "ninsoku-yoseba" were the origin of punishment by the restriction of personal liberty and incidentally of Government provision for the protection of ex-convicts. After the Meiji Restoration, in 1881, a system called "betsubo-ryuchi" (detention of discharged prisoners in separate quarters) was instituted, under which discharged prisoners who, after the expiration of their terms of sentence, had no one to go to, were detained in special quarters in prisons to enable them to make a living and to be protected by the authorities. As, subsequently, the number of these ex-convicts increased, this system had to be abolished in 1888, but feeling that if those who had served their terms and

had no one to look to or live with were allowed to live as they were inclined after their liberation, they might, it was feared, again lead a life of crime, the Government encouraged charitably disposed persons to carry on work for their welfare. Thus the aiding of discharged prisoners by individuals and private organizations grew in scope.

The Organizations Among these organizations, one noted for its systematic constitution and management was the Shutsu-gokunin Hogo Kaisha (Ex-Convicts Protection Co.) established by Mr. Meizen Kinbara in Shizuoka prefecture. In 1907, the Government decided to make an appropriation of ¥10,000 from the national treasury every year for the encouragement of the work and later, in 1912, the sum was increased to ¥30,000. With the development of the work the number of organizations grew and was returned at 211 throughout the country at the end of 1912. In 1913, Baron Hachiroyemon Mitsui, head of the House of Mitsui, donated ¥750,000 to the work, and with this money the Hosei-Kai, a foundation, was established for the control of, and extension of help to, various organizations interested in the work throughout the country. In 1925, the Government subsidy was increased to ¥100,000, and since 1923, the Imperial House has made an annual grant to encourage the work, with the result that the work has made steady development, the organizations today number approximately 800.

The Beneficiaries The persons protected by these organizations are not limited to those who have served the terms of their sentence, but include those who have been provisionally released; those, whose prosecution is suspended; those, the enforcement of whose sentence is suspended; and those who have been released from punishment for minor offences; as well as the members of the families of those who are detained in prisons. The method of protection is roughly classified into (a) quarters and protection, (b) indirect protection, and (c) temporary protection. Those to whom the method (a) is applied are quartered in places specially selected by the above-mentioned organizations and are given board, lodging and clothes as well as employment. Those to whom the method (b) is applied are not directly protected, but visits are paid to their fixed places of residence from time to time so as to give them advice and suggestions. Those to whom the method (c) is applied are given only temporary help at the time of liberation from prisons such as providing them with clothes and other necessaries and journey money.

Today, there exists in the Department of Justice the Section for the Protection of Ex-Prisoners which undertakes the direction and supervision of the welfare work of various associations, but as it cannot be expected that a small Section can thoroughly undertake such wide-spread work, it is increasingly advocated in different quarters that a system for the promotion of the welfare of ex-convicts should be instituted and the work connected therewith conducted by the State.

Police System

Its Fundamentals

There are two aims of the national administration. One is the administration of political affairs for the direct benefit of the nation as a whole, and the other is to protect the public welfare of the individuals who compose the nation. The function of the police is to look after the latter. There is a judicial function of the police that goes side by side with the first one, but the principal significance of the establishment of the police system is in its protection of public welfare. The work it performs can be considered more in a negative aspect than a positive one for it does not promote welfare work so much as it prevents and roots out matters which are, or may be, detrimental to peaceful social life. The police are endowed with authority to enforce the law or to give orders to the people. Police authority forms a part of the sovereign power of the State.

Authority Vested in State In Japan police authority is entirely invested in the State and is not delegated to other public bodies. In European countries, there are commonly the State police and the local police, the latter being under the jurisdiction of local authorities. In Japan all the police come under the direct administration of the State and no chiefs of local governments or local governments themselves have power over them except in a very few limited subjects. The police are administered in the name of the Emperor by the Minister of Mome Affairs through the Superintendent-General of the Metropolitan Police, in Tokyo pre-

fecture, governors of other prefectures and the Hokkaido procurator. Although nominally under the Governor of Tokyo prefecture, the Superintendent-General of the Metropolitan Police Board in Tokyo takes his orders direct from the Home Minister as the Board has many political responsibilities unknown in other prefectures. The appointment is actuarly a political one, the ordinary police business being carried out by the Chief of Police. In the Hokkaido and other prefectures the highest police official is the Chief of the Police Division. Under the Chiefs of Police are the police superintendents, inspectors, assistant inspectors and policemen. A police superintendent is appointed chief of a police station or secretary of a Police Division, or in Tokyo and Osaka prefectures he may be appointed inspector over several police stations. A police inspector or an assistant police inspector may, in some cases, be appointed chief or seretary of a police station. Policemen are divided into sergeants, indoor and outdoor service men, special service men, and police-detectives.

As mentioned above, police officials carry out judicial functions, and when acting in the capacity of judicial police officials and under the dictates of the public procurators they execute warrants of arrest or detention and arrest persons in flagrant offence. They may seize private possessions or search a house by order of a Court of Justice, an examining judge or a public procurator, or help a public procurator in the investigation of criminal cases.

In Times of Peace and Crisis In times of peace the maintenance of public order rests with the police. Individual policemen wear sabres. Pistols are carried only in special cases though in the police force there are troops of armed constables, while if matters become too serious and on special occasions, the gendarmerie is called on for help. The gendarme is a kind of military policeman, but at such times as the police force is too weak to keep public order, a Governor may ask for the aid of the gendarmerie. Moreover, at a time of crisis or extraordinary social disturbance, the army takes the place of the usual police force and acts with a despotic authority without limitation of the Law. The occasions which may call forth the military power for keeping public order are as follows : (1) when the country or a district is placed under martial law in times of war, (2) when a district is put under martial law for the maintenance of public order, (3) when the governor asks for the help of the army for subduing social disturbances, and (4) when a Divisional Commander recognizes the need of military power for keeping local order in an emergency in which the request from other authorities is too late.

Police Business

Police business in Japan is many-sided, and may be classified into 4 main lines and 24 kinds :

Public Peace (a) supervision of publications. The publication of all kinds of printed matter should be reported and a copy of each must be sent to the authorities. Secret publication is strictly forbidden. A sum of money as guarantee of good faith has to be deposited by the publishers of newspapers or periodicals which deal with political problems. The name of the person responsible for any publication must be printed on the publication. Secret matters which come under the control of the public procurators, the Ministers of War and Marine, and the Minister of Foreign Affairs must not be reported in newspapers or periodicals. The Home Minister may prohibit the publication of a periodical or any other printed matter which he considers detrimental to public welfare and morals.

(b) Supervision and care of public meetings, organization of societies and mass movements. According to the Public Peace Police Law, all public meetings on political questions and some other meetings which come under control of the authorities must be reported to a police-station beforehand. A policeman may be present at such a meeting and may stop a speech or close the meeting. The organization of such associations or societies as may endanger the existing form of Government and system of private property is strictly forbidden. The said P. P. P. Law inflicts heavy penalties on those who break these regulations.

(c) Supervision of businesses or commercial shops. Most businesses are free, but in some cases some kind of police supervision is necessary in the interests of public welfare, hygiene, prevention of damage, the safety of traffic, and social economy. For instance, such shops and businesses as inns, public baths, employment exchanges for geisha and prostitutes, credit information businesses, barbers, seal or stamp engravers, old clothes dealers, peddlers and stall-holders are inspected or taken care of by the police. Pawnshops and curio or second-hand shops are under special regulations and police inspection and

supervision is thoroughly practised as many stolen articles find their way into these shops, and lead to excellent results in the arrest of thieves and burglars. Guides, scribes and employment exchanges for profit are also under special regulations and strict supervision.

(d) Religion. It is the duty of the police to prevent the desecration of shrines and breaches of the peace in temple grounds. Superstitions and superstitious actions are prohibited by the Police Penal Law.

(e) Accidents. The police take charge in cases of fire, flood, explosion, of people being injured, etc. Regulations are issued on the handling of guns and explosives; the wearing of swords or the like is strictly forbidden; the handling or selling of poison is under a special regulation. Sulphur and oil businesses are under police care also. Buildings are under police supervision for their beauty, fire-proofness, and hygiene; factories, warehouses, theatres, and public resorts receive special attention. Crematories, slaughter-houses and incinerators must not be within residential or commercial districts of cities. Regulations regarding buildings are stricter than in Western countries because of the large number of wooden houses liable to fire and the constant fear of earthquakes. Electricity and gas businesses must not endanger the lives of people. Mines are under a special police regulation as they are most liable to fatal accidents. Prevention of floods also comes into the sphere of police business.

For the prevention and extinction of fires, fire-brigades are established in cities under the control of the Chief of the Police Division in the prefecture. In Tokyo prefecture, a fire division is established in the Metropolitan Police Board and firebrigade stations are located in different parts of Tokyo. In the larger cities, Osaka, Kyoto, Yokohama, Kobé and Nagoya special fire-brigade stations are established by the State. In the smaller municipalities fireguilds are established at the expense of local self-governments. The firemen are volunteers and differ from those in the said cities who are officials of the State.

(f) Public morals. The police look after the maintenance of good public manners and morals. Japan has a licensed prostitute system and forbids private prostitution and conniving at it. Through the efforts of Christian and other religious and public bodies and the growth of other means of pleasure, prostitution is growing less, but it is a duty of the police to see that the prostitutes are treated as humanely as possible as long as their term of service exists. All pleasure resorts such as theatres, places of performances, wrestling, movies, etc. are carefully supervised and any obscene or immoral performances prohibited.

Restaurants, dining rooms, bars, cafes and other eating places are under police supervision. The laws for prohibiting liquors and smoking to minors, the prohibition of lotteries, misbehaviour in the street or outdoors, and the regulations regarding street advertisements and the erection of monuments must be enforced.

(g) The care of men who are a danger to public peace and welfare, juveniles who are addicted to bad habits, ticket-of-leave men, the insane, beggars and vagrants are supervised by the police.

(h) Actions which may harm others such as forcing an interview, extorting contributions, blackmail, causing disturbances, obstruction, etc., are forbidden by the Police Penal Law. Deceitful actions, spreading false reports, and the mishandling of dead bodies come under the care of the police. Obstructing officials in pursuit of their duty is strictly forbidden. The care of lost articles, prohibition of deceitful religious actions, the supervision of "mujin-ko" and "tanomoshi-ko" or mutual financing associations come under police power to some extent.

Public Hygiene The problem of the health and hygiene of the people is one of the greatest concerns of the Department of Home Affairs, and in many points the responsibility of looking after such cannot be confined to the police alone, though in its direct management the police have much to do.

(a) Prevention of epidemics. For the prevention of epidemics there are many laws in force, the most important of them being the Epidemic Prevention Law, the Regulation for the Medical Inspection of Aviators, the Seaport Quarantine Law, the Vaccination Law, the Tuberculosis Prevention Law, the Trachoma Prevention Law, the Leprosy Prevention Law, the Venereal Diseases Prevention Law and the Parasites Prevention Law. The water police help in the medical inspection of passengers and goods arriving in vessels from abroad. The annual compulsory cleaning of individual houses and public buildings, drains, wells, dumping grounds, etc. is supervised by the police. When an epidemic breaks out policemen are used to try and confine it to as small an area as possible.

(b) Medical. As the health and wel-

fare of the people depend on proper medical attention, doctors, dentists, midwives, nurses, masseurs and acupuncturists are under special regulations, as also are druggists and pharmacists. Poisonous chemicals are well looked after.

(c) General Health. A law is in force prohibiting the sale of unwholesome food, and utensils for eating, drinking and preparing food are under police supervision. (See Chapter XXXII.)

Traffic Police (a) Road. The police are responsible for safety on the streets. "Walk and drive on the left" is the rule of the road in Japan.

(b) Vehicles. Railroads, electric cars, automobiles, trucks, waggons, rikishas, bicycles, etc. are under police supervision.

(c) Water police. The water police look after foreign-going vessels entering and leaving open ports, navigation in closed ports, rivers and lakes, and the business of steamship companies doing a coastal trade.

(d) Ocean navigation has many international ramifications and though there are countless matters which ought to come under police supervision it is separated from common police business and put under the administration of the Department of Communications.

(e) The aviation police are put under the management of the Minister of Communications.

(f) Colonial police come under the control of the Minister of Overseas Affairs except in some cases which may come under the supervision of local governments.

Police and the People

The function of the State, as far as it concerns the economic life of the people is largely protective and administrative and certain laws and ordinances of the State have to be imposed on various businesses in order that the people shall be fully protected. The police work by orders from higher authorities at the request of the Ministers of Agriculture and Forestry, Commerce and Industry, and Finance.

(a) Banks, savings banks, mutual financing associations, negotiable security businesses, trust businesses, insurance businesses, commercial exchanges, the central wholesale markets in the six largest cities, foreign trade business in important articles, weighing and measuring machine businesses, and auditors partially are under police supervision or limitations.

(b) Agriculture is supervised by the police in such matters as the prevention of the spread of noxious insects, the control of plants imported or exported, the fertilizer industry, agricultural warehouses, the sericulture industry and the control of rice imports and exports.

(c) The hygiene and prevention of epidemics among domestic animals is looked after by the police. Many laws are enforced regarding the improvement of animals, and police power is needed for a proper practice of them, especially in connection with horse-racing.

(d) Forestry police mainly prevent damage to the forests.

(e) Fishery police protect the propagation of aquatic animals and at the same time look after the safety of the fishermen. There are many laws and regulations on fisheries, whale-fishing, fishing boats, etc.

(f) The hunting of beasts and birds is limited to those mentioned in the revised Game Laws of 1918, the seasons and districts of hunting are put under police regulation.

(g) For the protection of labourers there are numerous laws in force, for instance, the Factory Law, Laws on the limitation of age of factory or marine workers, the Labour Accident Prevention Law, the Mine Law, and the Ordinance regarding the enlistment of workers. Policemen either help factory or mine inspectors or directly handle matters mentioned in these laws. Labour movements and disputes call for the use of police power frequently.

POLICE STATISTICS

	1932	1933	1934	1935
Police offices:				
Police stations	1,209	1,199	1,200	1,201

CHAPTER XXVIII

EDUCATION

Historical Background

Chinese letters and Confucian books were first introduced to Japan in the third century, and it was then that the civilization of the country made a real start. From the nearby peninsula of Korea came sericulture, weaving, brewing, and the art of the blacksmith. It was about his time that the Imperial Prince Wakairatsuko established a Court School.

In the sixth century Buddhism came to the Island Empire to give added material progress to the Japanese civilization, and in 607 the Imperial Prince Shotoku-taishi (see Chapter III) caused the Horyuji Temple to be built at Nara and there he established a shcool in the temple. These were the earliest schools of Japan.

In the latter half of the seventh century a college in the capital and some provincial schools were established to educate officials, according to the Taiho Laws. Later, in the Heian Age, the courses of study became encyclopædic and both public and private schools were established. In the Muromachi Age school education suffered a decline and only two places of study were recorded, namely, the Kanazawa Library and Ashikaga School, although there might have been private lecture halls kept secretly by scribes and Buddhist monks.

The Tokugawa Shogunate encouraged the study of Confucianism and several schools of this moral system and Chinese philosophy were introduced, and education extended to the common people. There were established many schools; the highest one was called the Shohei Hill Academy or Shohei School, which was established by the Shogunate. The central government had many other schools, while each local clan government also had its own schools. In addition to these, private schools and "tera-koya" appeared all over the country for the education of the people in general

"Tera-Koya" Education

The "tera-koya" needs some special explanation, as it played the most important part in the education of the masses before the Meiji Era, and laid the foundation for the remarkable progress of elementary education in new Japan.

The word "tera" means Buddhist temple and "koya" children's house, so the tera-koya was a school for children established by a Buddhist temple. It was originated many years before the time of the Tokugawa Shogunate by Buddhist monks. Side by side with Governmental schools for the samurai class, tera-koya education began to spread in the Yedo age among the common folks in business and farm quarters. It gradually ceased to be entirely in the hands of the monks, and assumed a form and nature quite different from the original.

The school-house was no longer in or attached to a temple; teaching was not restricted to the monks; the teacher might be a samurai, monk, doctor or Shinto priest. "Tera-koya" became merely a general name, and the founders tera-koya schools chose any name they liked for their own. The size of the schools was diverse, the largest one accommodating as many as two or three hundred pupils. There was rarely more than one teacher, but in the larger schools there might be an assistant. The age of the pupils ranged from 6 to 15 years. It was co-education, although the sexes sat apart. The courses of study were commonly penmanship, Japanese literature, and the use of the abacus, with such optional subjects as Chinese literature, poem composition, sewing, flower-arrangement or tea ceremonies. Many textbooks on moral precepts and letter writing were published and used in these schools. These schools were usually kept up largely out of the pocket of the school master himself, for his work was entirely voluntary, inspired by pure devotion to service, for which he gained the honour and respect of the community. According to the report of the Department of Education, there were 15,862 tera-koya in Japan at the beginning of the Meiji Era, or just before the establishment of the new elementary school system.

It must be remembered also that technical schools had made considerable progress in old Japan. Medical schools

in particular were established in the Taiho Era, and medical science made steady progress toward the middle of the Yedo Age. The Tokugawa Shogunate established a medical school in 1765, and local clan lords followed this example. There were several private ones well known to the people. But these taught the Chinese method of the science, and the "materia medica" was almost entirely of herbs and animal matter. The modern or Western medical and its system and practice were introduced through Dutchmen at the end of the Yedo Era, so we may say that medical science was the earliest of all the sciences that were learned by the Japanese people from the Westerners.

Educational Administration

The present educational system of Japan dates from 1872 the 5th year of Meiji, when elementary education was made compulsory. The new system was established, in the main, after the examples of the French system, and the entire country was divided into 7 university districts, each of them consisting of 32 middle school districts and each of which was again divided into 210 primary school districts, or one primary school for 600 of population. The national educational principles are stated in the Imperial Rescript on Education issued on Oct. 30, 1890. This world-renowned rescript was published to lay down leading ideas and principles for the guidance of the Japanese, and it reads as follows :

"Know ye, Our Subjects !

Our Imperial Ancestors have founded Our Empire on a basis broad and everlasting and have deeply and firmly implanted virtue; Our subjects, ever united in loyalty and filial piety, have from generation to generation illustrated the beauty thereof. This is the glory of the fundamental character of Our Empire, and herein also lies the source of Our education. Ye, Our subjects, be filial to your parents, affectionate to your brothers and sisters ; as husbands and wives be harmonious, as friends true ; bear yourselves in modesty and moderation ; extend your benevolence to all ; pursue learning and cultivate arts, and thereby develop your intellectual faculties and perfect your moral powers ; furthermore, advance the public good and promote common interests ; always respect the Constitution and observe the laws ; should any emergency arise, offer yourselves courageously to the State ; and thus guard and maintain the prosperity of Our Imperial Throne, coeval with heaven and earth. So shall ye not only be Our good and faithful subjects, but render illustrious the best traditions of your forefathers.

The way here set forth is indeed the teaching bequeathed by Our Imperial Ancestors, to be observed alike by Their Descendants and subjects, infallible for all ages and true in all places. It is Our wish to lay it to heart in all reverence, in common with you, Our subjects, that we may all thus attain to the same virtue."

The 30th day of the 10th month of the 23rd year of Meiji.
(Imperial Sign Manual)
(Imperial Seal)

All school education in Japan is supervised by the State, being partly entrusted to local public bodies such as the prefectural councils, towns and villages.

Private individuals are also allowed to found schools and universities, although here too the Government does not give much latitude of method or scope, and the uniformity of school education in all parts of the Empire has worked well in bringing the degree of advancement in modern ways and thought to almost the same level throughout the land, and greatly strengthening the national spirit and unity of the people.

The points entrusted to local public bodies are chiefly financial matters, pertaining to the establishment and maintenance of schools, some of which are obligatory while some are left to the discretion of local bodies. The obligatory matters are the establishment by Hokkaido and the prefctures of normal schools, middle schools for boys and girls, schools for the blind and for the deaf-and-dumb, technical schools by order of the Minister of Education, and that of ordinary elmentary schools by cities, towns and villages. Municipalities may not establish higher normal schools, and Hokkaido and the prefectures alone are authorized to establish universities, higher schools and normal schools.

The main principles regarding the nature and objects of schools, their scholastic terms, curricula, organizations, entrance qualifications, qualifications for the teachers, equipment, means of meeting the expenditure, and tuition fees are prescribed by Imperial Ordinances. The establishment of schools

by public bodies or private individuals must be approved by he local supervising authorities, which also exercise control to a certain extent over their methods of education and finances.

Religion is, on principle, excluded from the educational agenda of schools. In all schools established by the Government and local public bodies, and in private schools whose curricula are regulated by laws and ordinances, it is forbidden to give religious instruction or to hold religious ceremonies either in or out of the regular curricula.

Education in the colonies comes under the control or the colonial governments, and the military schools belong to the War and the Navy Departments, while there are some technical schools which come under the supervision of oher Departments. But with these exceptions, it may be safely said that the Miniister of Education has charge of all matters relating not only to school education, but also to what may be termed social education, such as art, science, literature and religion. He is assisted by the parliamentary councillor in the conduct of political affairs and in matters which are connected with the business of the Imperial Diet. The vice-minister assists him in the business part of the Department.

Of the affairs within the jurisdiction of the Department, those that are related to education, art, science, and literature are distributed respectively among the Bureaux of Higher Education, General Education, Technical Education, Social Education, School Books, and Student Control, and those pertaining to religion are under the direction of the Bureau of Religion. Those affairs which do not properly belong to any one of these bureaux are dealt with in the Minister's Secretariat. In addition there are school superintendents, who inspect schools and directly supervise educational affairs; supervisors of social education who direct and supervise social educational affairs; superintendents of compilation who compile and examine text-books; and supervisors of school hygiene who look after the sanitary conditions of schools. Various advisory committees with prominent men in and out of office as members are instituted to help the Minister of Education in matters of wider scope.

The Minister of Education is authorized to direct and supervise the Superintendent of the Metropolitan Police and the local governors in matters under his control.

The prefectural governors direct and supervise their subordinate officials and exercis supervision over the public and private schools, kindergartens and libraries within their jurisdictions. There is a Division of Educational Affairs in each prefecture which has control of matters relating to education. School inspectors and sub-inspectors in it inspect schools and conduct educational business directly.

The mayors of cities and towns and the heads of villages deal with affairs regarding elementary schools and exercise control over them. The mayors of cities, moreover, have authority to make recommenations to prefectural governors in the appointment of the principals and teachers elementary schools. The municipalities have school boards to look after elementary schools.

School Education

As is shown in the following tables, Japan is well provided with schools, ranging from kindergartens up to universities. Almost all the elementary schools are controlled by public bodies.

Conditions are different when we come to secondary education, for which there exist a considerable number of private schools, and in the case of schools of the highest grade the private establishments quite outrange in number those under official control.

Only 18 out of the 45 existing universities were built by the Government, 2 by public bodies and the rest by private bodies.

The total number of schools in Japan proper and their enrolment in the last five years, 1931–1935, is shown below :

Year	Schools	Students
1935	46,138	14,035,823
1934	45,903	13,760,200
1933	45,793	13,408,971
1932	45,766	13,073,854
1931	45,898	12,847,730

Classified according to types, the number of schools in Japan proper in March, 1935, with the number of students enrolled, was follows :

	Schools	Students
Elementary Schools	25,771	11,232,076
Middle Schools	555	330,992
Girls' High Schools	970	388,935
Business Schools	1,069	342,914
Business Continuation Schools	15,306	1,281,814
Higher Schools	32	18,905
Universities	45	71,162
Colleges	117	70,083
Higher Trade and In-		

	Schools	Students
dustrial Colleges	56	24,112
Normal Schools	102	30,420
Higher Normal Schools	2	1,775
Higher Normal Schools for Women	2	869
Special Institutes for the Training of Teachers	1	57
Institutes for the Training of Business School Teachers	4	356
Institutes for the Training of Business Continuation School Teachers	45	1,055
Schools for the Blind Schools for the Deaf and Dumb	140	9,907
Miscellaneous Schools	1,921	230,394
Total	45,903	13,760,200
Kindergartens	1,862	143,469
Young Mens' Training Institutes	15,795	818,681

The figures for schools refer to those existing on March 31, while the figures for students refer to those on March 1.

Elementary Education

Elementary education in Japan is compulsory and has attained to its present high level of excellence through many improvements since the promulgation of the School Ordinance in 1872. In the Imperial Ordinance relating to Elementary Schools the object of elementary education is defined as follows :

" Elementary schools are designed to give children the rudiments of moral education specially adapted to make of them good members of the community, together with such general knowledge and skill as are necessary for the practical duties of life, due attention being paid to their bodily development."

According to the system of compulsory education all children from 6 to 14 years of age are called school-age children, and those who exercise parental authority over them, or their legal guardians, must send them either to the ordinary elementary schools established by the cities, towns or villages until they complete the required course of study, or to schools established by the Government, prefectures or by private individuals, recognized as equal to the ordinary ones above mentioned. The law is not enforced when a child is unfit for study owing to physical or mental deficiency or cannot be sent to school by reason of extreme poverty. There is a provision which requires the employers of school-age children to see that the work imposed does not interfere with their going to school.

The responsibility of establishing ordinary elementary schools is placed upon cities, towns and villages, and they are making efforts to maintain schools even in the dire depression of the past few years. At the same time, however, special provisions permit the State Treasury to bear part of the expense, and the diffusion of elementary school education in Japan proper is all but ideal, the number of the school-age children attending schools maintaining the rate of 99.53% for the past five years.

The full figures are as follows :

These figures represent the condition existing on March 31 of the respective years.

Year	School-age Children	Children Attending Schools	Children not Attending Schools	Percentage of Children Attending Schools
1935	11,150,824	11,103,920	46,904	99.58
1934	11,024,532	10,978,718	45,814	99.58
1933	10,754,962	10,708,930	46,032	99.57
1932	10,392,794	10,344,642	48,152	99.54
1931	10,105,941	10,056,530	49,411	99.51

Elementary schools are divided into two grades, namely, ordinary or lower and higher. The former are for the beginners and their course extends over six years. The latter are for those who have completed the lower course, and their courses are of two or three years' duration. The subjects taught are morals, Japanese language, arithmetic, Japanese history, geography, science, drawing, singing, sewing (for girls only) and gymnastics. In the higher courses, either one or more subjects out of handicraft, agriculture, industry, commerce and domestic scinece (for girls only), are added, and if local circumstances make it advisable, handicraft in ordinary elementary schools and foreign languages and other useful subjects in higher elementary schools may also be taught.

An elementary school may comprise both the ordinary and the higher elementary school courses and may equip

itself with a supplementary course of not more than two years.

Under the present system of compulsory education the father's responsibility ends when his child has graduated from the lower elementary school. But the ordinary elementary education of children is not sufficient for the existing conditions of society, and many cities, towns and villages establish higher elementary schools either independently or in connection with ordinary ones. For the same reason, many business continuation schools are established to give elementary school graduates such education as may be of use in various trades.

The following table will give a general idea of the conditions of elementary schools as they were in 1935 :

Schools	Governmental	Public	Private	Total
Ordinary Schools	—	6,998	80	7,078
Ordinary and Higher Schools	4	18,498	19	18,521
Higher Schools	—	171	1	172
Total	4	25,667	100	25,771

Average	95.34	97.05	96.72	97.05

Teachers There are more male teachers than female in the Japanese elementary schools, and they are classified according to their education and special abilities, as (1) elementary school teachers (2) lower elementary school teachers, (3) teachers on special subjects, (4) assistant teachers, and (5) substitute teachers. The teachers belonging to the first two classes are regular teachers properly qualified for the elementary education of children.

ELEMENTARY SCHOOL TEACHERS CLASSIFIED

(March 1, 1935)

Ordinary Elementary Schools	Male	Female	Total
Regular teachers	117,787	55,794	173,581
Special teachers	3,782	6,749	531

Assistant teachers	66	4	1,604
Substitute teachers	1,186	348	42,651
Total	38,003	4,648	85,302
Grand total	173,597	78,997	295,245

Secondary Education

For the secondary grades there are middle schools for boys, girls' high schools business schools and business continuation schools.

Middle Schools The course of the middle school extends over five years,

and its object is to give boys such a higher general education as will fit them to be useful members of society after their graduation. The subjects taught are morals, civics, the Japanese language and Chinese classics, history, both Japanese and foreign, geography, a foreign language (either one of English, eign language (either one of English, German, French or Chinese), matheing, music, practical work (carpentermatics, science, technical studies, drawing, gardening, etc) and gymnastics.

From the fourth year upwards, the subjects are selected and arranged into two groups, the pupils making choice between the two. Under special circumstances, however, the Minister of Education may authorize a school in which either of the two groups may be dispensed with. This dual system of curriculum is of benefit on the one hand to the pupils who wish to take up employment immediately upon graduation, and on the other to those who wish to advance to higher-grade schools.

To the regular course a supplementary course of one year or less may be added, and, if local circumstances require, a preparatory course of two years may also be provided. A boy who desires to enter a middle school must complete either its preparatory course or the full course of an ordinary elementary school. Those who are twelve or more years of age and in possession of adequate scholastic attainments may be admitted upon examination. Those who have completed the fifth year (the course of the ordinary elementary school ends with the sixth year as mentioned above) of an ordinary elementary school and are physically well developed and have shown excellent scholarship are allowed to apply for the entrance examination, even though under twelve years of age; this is to give a chance to specially gifted boys.

The following are the figures for middle schools and their pupils on March 1 of each year:

Year	Schools	Pupils
1935	555	330,992
1934	554	327,261
1933	558	329,459
1932	558	336,186
1931	557	345,691

A general idea of the condition of the middle schools in 1934–35 may be obtained by the following table of figures:

	Governmental	Public	Private	Total
Schools	2	436	117	555
Classes, regular course	25	6,212	1,291	7,528
Number of boys in one class	39.08	44.16	42.86	43.92

Left sceool, regular course	29	17,977	6,862	24,868

Girls' High Schools The system of high schools for girls is made flexible to suit practical requirements. A girl who has completed elementary school or has equivalent scholastic attainments and is twelve years or more of age may be admitted to a girls' high school. The course of the girls' high school extends over four or five years, and those schools whose entrance requirement is the completion of the higher elementary school or the possession of the same

or higher scholastic attainments are allowed to shorten their course to three years. There is another kind of girls' high school which is called Girls' Domestic High School, where domestic science is the main course of study, and its regular course extends over two to four years. Girls who wish to take only one part of the course are allowed to do so on application. A supplementary course of two years or less may be provided for the benefit of those who wish to continue their study after completing the regular course, and a post-graduate course or a higher course of two or three years for the purpose of giving higher education. In the cases of the higher course, higher qualifications are required of the teachers and its standard is brought up almost to that of the higher school for boys.

The subjects taught in a girls' high school are the same as those taught in the middle schools, but with the addition of domestic science and sewing, the required hours of study being from 28 to 29 a week. In the case of the Girls' Domestic High School, technical study added and the hours for domestic science and sewing are double those of the ordinary high school, the time allowed for other subjects being shortened, and foreign languages omitted altogether. Under special circumstances the foreign language, drawing and music may be omitted, and if local circumstances require, pedagogics, manual arts, technical studies and other useful subjects may be taught in addition to the normal curriculum. In cases the total weekly hours may be increased to a little over 30. The curriculum of a domestic course of three years, the entrance requirement of which is the completion of the first year of the higher elementary school, is to be suitably drawn up on the basis of that of a domestic course of two years, the entrance requirement of which is the completion of the higher elementary school, and be submitted to the Minister of Education for approval.

The progress of female education is phenomenal in modern Japan and girls, high schools have taken very marked strides in recent years both in number and quality. At the end of March, 1934, there were 975 girls' high schools in Japan proper, many of them being provided with, or contemplating the provision of, a post-graduate course or a higher course.

The number of schools and girl students on March 1 of each year was as follows :

Year	Schools	Girls
1935	970	388,935
1934	975	371,807
1933	963	361,739
1932	980	362,625
1931	975	368,999

Business Schools Business schools of secondary grade are established for the purpose of giving young people the practical knowledge and skill necessary in various vocations, and much is left to the discretion of the founders as to the systems of schools in order to suit the special needs of different industries, trades and localities. The courses may extend from two to five years according to the nature of the school. A period of not longer than one year may be added to the maximum prescribed course. Further provisions are allowed to meet the needs of those who desire to take only a part of the curriculum, for those who, after completing the prescribed course, still desire to remain for further study, and for those who wish after completing the course of a middle school or girls' high school, to enter a business school with the object of receiving business education; and lastly for those who wish to receive instruction in a simple way for only a short period.

On March 1, 1935 there were 1,125 business schools. The figures for the years 1931–1935 are given gelow:

Year	Schools	Pupils
1935	1,125	367,026
1934	1,041	316,846
1933	1,024	298,893
1932	1,003	292,015
1931	975	288,681

Business schools are divided into two classes, A and B. Those schools which belong to A class admit boys and girls who have completed the course of the ordinary elementary school, while those which belong to B class admit those who have completed the course of the higher elementary school. And they are of six kinds, namely, Technical, Agricultural, Fisheries, Commercial, Navigation and Practical. Figures relating to these business schools in 1934–1935 are given below.

BUSINESS SCHOOLS (A)

	Schools	Teachers	Pupils	Graduates	Applicants	Admitted	Left School
Technical	99	2,336	37,206	7,432	30,552	10,795	1,889
Agricultural	246	2,870	51,875	14,555	24,214	19,122	2,782
Commercial	295	6,651	160,452	26,778	78,224	43,054	12,749
Navigation	10	138	2,263	564	855	598	149
Fisheries	12	154	2,119	463	861	609	132
Practical	199	2,752	45,046	16,415	24,705	20,417	2,360
Total	861	14,901	298,961	66,207	159,411	94,595	20,061

BUSINESS SCHOOLS (B)

	Schools	Teachers	Pupils	Graduates	Applicants	Admitted	Left School
Technical	28	368	5,718	1,728	7,671	2,653	575
Agricultural	94	778	8,422	5,823	7,829	7,058	1,067
Commercial	49	525	3,742	3,872	9,306	6,367	1,080
Navigation	1	10	60	43	115	100	107
Fisheries	1	—	49	8	24	24	11
Practical	35	360	5,962	3,206	4,178	3,599	408
Total	208	2,041	43,953	14,680	29,123	19,801	248

Of these schools, 14 technical, 13 agricultural, 134 commercial, and 131 practical schools were under private management.

Business Continuation Schools (See page 738). The object of these schools is to give to boys and girls engaged in vocations after graduation from the ordinary elementary school useful knowledge and skill relating to these vocations and at the same time to furnish education necessary in daily lie. Their courses are technical, agricultural, commercial, navigation fisheries and sewing; each school providing one or even all of these. The whole course is divided into two terms, the first extending over two years and the second over two or three years according to the nature of studies. The number of hours taught in a year ranges between 200 and 420 in the first term, and 160 and 420 in the second, according to studies and the grade of the class. Those who have completed the ordinary elementary school or are up to that standard may be admitted to the first term, and hose who have completed the course of the first term and the higher elementary school or are up to the same standard may be admitted to the second term.

A business continuation school may, if local circumstances require, provide itself only with the first or the second term. It may give further instruction to those who have completed the second term. Under special circumstances, a business continuation school of higher grade may be established for the purpose of giving specialized teaching.

The number of business continuation schools and that of their pupils for the years 1931–1935 were as follows:

Year	Schools	Pupils
1935	15,306	1,281,814
1934	15,140	1,271,530
1933	15,091	1,270,874
1932	15,083	1,271,971
1931	15,248	1,277,388

Higher Education

The institutions for higher education are higher schools, universities, colleges, and higher trade and industrial colleges.

Higher normal schools, institutions for training teachers of higher education, post-graduate or supplementary courses in secondary educational institutions and higher grade classes of the special educational institutions are mentioned under other headings, though they might be included here with the other higher educational organs.

The number of schools under this heading, higher normal schools and teachers training institutions and that of students on March 1 of each year follow:

Year	Schools	Students
1934	257	184,473
1933	261	183,792
1932	254	183,809
1931	258	183,952
1930	254	179,038

Higher Schools (Koto Gakko) The higher school is primarily an institution whose object is to complete the general education of young men. But it is as a matter of fact a preparatory school for universities or higher trade and industrial colleges in present-day Japan. No women are admitted. It is divided into two courses, the higher and the lower. The former extends over three and the latter over four years, making seven in all. A post-graduate course of one year may be taken after the higher course. Some schools have the higher course alone. On May 30, 1934, the higher schools with the higher course alone numbered 24, while those with both lower and higher courses numbered 8.

The entrance requirements for the lower course are practically the same as those for the middle schools. The higher course is divided into the literature and science courses and a candidate must be one who has completed the lower course of the same school or one who has completed the fourth year of the middle school or whose scholastic attainments are equal or superior to the same standard.

There are about the same number of preparatory courses of universities which correspond to higher schools and are directly attached to universities. The following figures for 1934-35 refer to the higher schools only.

HIGHER SCHOOLS

(1934-1935)

Schools	32
(Schools which have lower course)	(8)
Teachers	1,272
Lower Course	154
Students	16,417
Lower Course	2,488
Graduates	5,335
Lower Course	582
Applicants	30,058
Lower Course	3,838
Entrants	4,622
Lower Course	573
Left School	448
Lower Course	70

Of the 32 schools, 25 are governmental, 3 public and 4 private.

Universities A university (Daigaku), in its regular form, consists of several faculties, but a single faculty may also constitute a daigaku. Each faculty is required to have a post-graduate course, and in those universities which include several faculties a university hall may be established for keeping the various post-graduate courses in touch with one another. Under special circumstances a preparatory course may be provided.

Admission to a university is extended to the graduates from higher schools and from preparatory courses of its own, and to those who have the same scholastic attainments. When a student has studied in the university for three years or more (four years or more in the faculty of medicine) from the date of his entrance, and has passed a prescribed examination, he may assume the degree of "Gaku-shi" (lit. "learned gentleman") or Bachelor. He is also qualified to enter the post-graduate course. In many universities facilities are provided for those who wish to pursue studies only in some particular subjects according to prescribed regulations.

A university is authorized to confer a doctor's degree on persons who have pursued studies for a period of two years or more in the post-graduate course and whose theses have been approved by the faculty council. Those who have not pursued studies in the post-graduate course may also submit theses and apply for doctor's degrees. The degree is conferred when the faculty council is satisfied with the theses.

UNIVERSITIES, March, 1935

The oldest of the 46 universities is Tokyo Imperial University, which was founded in 1886. Keio-Gijuku and Waseda were founded much earlier, but they were raised to the present standard in 1920 according to the ordinances enacted at that time.

Of the total number of students and pupils, that of regular university students was 47,841 and that of pupils in the preparatory course or elective courses was 23,052.

The following figures as they stood on March 1, 1934 and 1935 show the number of students in these universities classified according to faculties.

	1934	1935
Post graduate course	2,133	2,307
Law	8,404	8,208
Medical Science	7,840	7,971
Science	1,101	1,098
Agriculture	2,443	2,430
Economy	5,816	5,804
Commerce	4,971	4,580
Law and Literature	4,326	4,456
Politics and Economy	1,277	1,236
Technology	3,958	4,017
Literature	5,287	5,030
Law and Economy	637	650
Science and Technology	753	820
Literature and Science	560	624

Tokyo Imperial University

To give an idea of Japanese universities the following information on Tokyo Imperial University is given here.

The university is situated in Hongo, Tokyo, occupying about one hundred acres. It fell a victim of the quake-fire of 1923, and one-third of the total floor space of the entire buildings was thrown out of use, while the remainder had to be repaired.

Besides ¥2,000,000 appropriated by the Government for immediate emergencies, the extraordinary session of the Diet held in the summer of 1924 made a grant of over ¥40,000,000 to enable the university to complete reconstruction in about 15 years. At present the restoration of all buildings, books, equipments is nearing completion.

History In 1854 the Tokugawa Shogunate opened the Yogaku-sho or an institute for foreign learning. The name of the institution was changed several times; for instance, the Kaiseigakko in 1868, the Daigaku-nanko in 1869, the Tokyo Kaisei-gakko in 1874. Another institute was opened by the Tokugawa Shogunate in 1857, which was called the Shuto-kwan or an institute for vaccination. This in time developed into a medical school and became known in 1874 by the name of the Tokyo I-gakko or Tokyo Medical School. In April, 1877, the above two institutions were merged into one institution, known by the new name of the Tokyo Daigaku or Tokyo University. A little later the Tokyo Law School and the Technical College were united with it under the name of the Imperial University in March, 1886. The university had five faculties: law, medicine, engineering, literature, and science. The Tokyo Agricultural and Forestry School was incorporated into it in 1890, and in June, 1897, the university assumed its present name of Tokyo Imperial University.

Organization The university is a State institution and is organized in accordance with the Government's requirements for a university. It is composed of 7 faculties: law, medicine, engineering, literature, science, agriculture, and economics.

Besides the 7 faculties above mentioned there is a library in connection with university. Hospitals and Dispensaries are connected with the Faculty of Medicine. An Institute for Historical Compilation is a part of the Faculty of Literature. Connected with the Faculty of Science are the Botanical Garden and the Marine Laboratory. Forests, farms, and the Institute for the Training of Agricultural School Teachers, are connected with the Faculy of Agriculture.

The Institute for the Study of Infectious Diseases, the Institute of Aeronautics, the Tokyo Astronomical Observatory and the Earthquake Research Institute are also institutions attached to this university.

The Faculty of Law includes the 2 courses of law and politics, with 34 professorial chairs. The Faculty of Medicine includes the 2 courses of medicine and pharmacy, with 35 professorial chairs. The Faculty of Engineering includes the 10 courses of civil engineering, mechanical engineering, naval architecture and engineering, aeronautics, technology of ordnance, electical engineering, architecture, applied chemistry, technology of explosives, mining and metallurgy, with 58 professorial chairs. The Faculty of Literature includes the 19 courses of Japanese literature, Japanese history, Chinese philosophy, Chinese literature, Oriental history, Occidental history, philosophy, Indian philosophy, paychology, ethics, theology and history of religion, sociology, pedagogics, esthetics and history of fine arts, philology, Sanscrit literature, English literature, German literature, and French literature, with 41 professorial chairs. The Faculty of Science includes 10 courses of mathematics, astronomy, physics chemistry, zoology, botany, geology, mineralogy, geography, and seismology, with 41 professorial chairs. The Faculty of Agriculture includes the 6 courses of agriculture, agricultural chemistry, forestry, veterinary medicine, fishery, and agricultural economy, with 42 professorial chairs. The Faculty of Economics includes the 2 courses of political economy and commerce, with 17 professorial chairs.

Those of adequate learning, aged 19, or above, who are desirous of attending the lectures or experiments for one or more subjects prescribed in the faculty courses, may be admitted as elective pupils in the Faculties, but only when there are vacant seats.

Auditors may be admitted to the faculties on application, when the study of the students is not inconvenienced by their presence. They must conform with the conditions prescribed by the faculties, unless they are entrusted by the Japanese or foreign governments. In addition, there are practical courses of agriculture, forestry, and veterinary medicine in connection with the Faculty of Agriculture. Applicants for admission must be graduates from middle schools, or those who are recognized as having equal attainments.

Students who remain in one course for more than 6 years (in the course of medicine, 8) are struck off the school roll. The pratical courses in the Faculty of Agriculture run for 3 years.

The period for scientific research by students in the University Hall is fixed at 2 years. If their research necessitates the prolongation of this period, the President may permit it, on their application, to the extent of 5 years. They are under the control of the dean of the faculty whose curriculum they follow. As to their teacher or teachers, the faculty concerned decides.

The university officials are the president, 234 professors, 156 assistant professors, 3 secretaries, 1 administrative official, 5 officials for student affairs, 2 librarians, 284 assistants and 29 minor officials.

In May, 1934 the number of students was 8,050 in all. Post graduate students were : law 71, medical 22, technical 28, literature 374, science 97, agricultural 56, and economics 28. Undergraduate students were : law 2,358, medicine 694, technology 1,039, literature 1,284, science 351, agriculture 1,034, and economics 1,290.

Tuition is ¥120 a year for under graduates and ¥75 for post graduates.

Annual salary of the professors is from ¥1,130, to ¥4,050 besides th stipend attached to a chair from ¥500 to ¥1,600.

The Budget The budget for the fiscal year 1937–38 is as follows :

REVENUE

Ordinary	
From the Government	¥3,835,453
Miscellaneous income	4,472,965
Total	8,308,418
Extraordinary	
From the Government	631,830
From the Endowment Fund	935,655
Contributions	30,000
Total	1,597,485
Total revenue	9,905,903

EXPENDITURE

Ordinary	
Salary	¥2,218,848
School disbursements	5,647,291
Salary of foreign professors	18,756
Pension allotment	414,705
Miscellaneous	8,818
Total	8,308,418
Extraordinary	
Buildings and repairs	1,290,837
Equipment and others	306,648
Total	1,597,485
Total expenditure	9,905,903

University Library Before the 1923 quake-fire the library contained approximately 700,000 volumes of books, but most of them were destroyed by the disaster. In order to make the loss good Marquis Yorimichi Tokugawa offered the university the whole of his Nanki Library with its precious collection of about 100,000 volumes, mostly Japanese and Chinese books. Contribution of books from nations of the world of over 325,000 volumes followed. The cases of books received for the British Committee for collecting English books financed by the British Government amounted to 271 in 1932. Gifts of books from all parts of the Empire amounted to 220,000 volumes including those of the Nanki Library. The acquisition of books by purchases, including those bought with the Government Fund and the Rockefeller Fund reached over 495,000 volumes.

In December, 1924, Mr. John D. Rockefeller, Jr. of New York offered a fund of ¥4,000,000 for the reconstruction of the library. The plan of the new library was completed in 1925 and the building in November, 1928. The building is fire-proof and earthquake-proof, and has a floorspace of 5,100 tsubo. The largest reading room contains seats for over 1,200 persons. The number of books now exceeds 1,000,000 columes

Summary of Doctor's Degrees The following is a summary of doctor's degrees awarded during the past 46 years, or from May, 1888 to the end of 1935.

Colleges, and Higher Trade and Industrial Colleges "College" is the usual translation of the Japanese "Semmon Gakko" or Speciality School. The required length of the course of a college is three years or more. For admission to an art or music school, the completion of the third year of the middle school or the girls' high school or the possession of equal or higher scholastic attainments is required, while for admission to all other colleges the completion of the course of the said second grade schools or similar or higher scholastic attainments is required.

In March, 1935, there were 117 colleges, 8 of them being founded and maintained by the Government, 9 by public bodies and the rest by private bodies. They may be classified as follows according to their nature :

Pharmacy	6
„ for women	5
Medical Science	5
„ „ for women	3
Dentistry	4
„ for women	2
Medical and pharmacy, for women	1
Nursing for women	1

Navigation	2	120	1,387	274	1,737	212	32
Total, 1934	54	2,146	23,082	7,004	43,042	8,278	934

Other Education

Besides the schools stated above, there are kindergatens, schools for the blind, schools for the deaf and dumb, and miscellaneous schools.

Kindergartens Kindergartens are found chiefly in larger towns. With general social progress, however, the necessity of their improvement and diffusion being greatly felt in spite of the recent financial depression, an Imperial Ordinance for Kindergartens has lately been issued to encourage their further development. Kindergartens receive children from 3 years of age to school age or full six years of age.

The following table gives the number of kindergartens and that of children attending in the years 1931–1935 :

Year	Kindergartens	Children
1935	1,862	143,469
1934	1,786	133,735
1933	1,708	129,001
1932	1,622	126,564
1931	1,510	121,975

Education for the Blind and the Dumb It has been the educational policy of the Japanese Government since the beginning of the Meiji Era that there shall be no illitrates in the country. Therefore, even persons with physical defects are admitted to elementary, middle or girls' high schools, provided that they are fit to attend a greater part of the lessons. But boys and girls who are blind or deaf and dumb are encouraged to enter schools specially founded for them. A special ordinance relating to the schools for the blind and schools for the deaf and dumb has lately been issued for the purpose of perfecting their elementary and secondary education. The following table gives the number of them and that of their pupils in the years 1931–1935

Year	Schools	Pupils	Blind	Deaf & Dumb
1935	140	9,907	4,830	5,077
1934	138	9,500	4,709	4,791
1933	137	8,939	4,613	4,326
1932	136	8,694	4,550	4,144
1931	125	8,137	4,306	3,831

Miscellaneous Schools Under the heading of "Miscellaneous Schools," the Japanese Government includes for convenience' sake all schools which do not fully come into any definite category of schools under the provisions in the laws and ordinances.

The following table gives the number of miscellaneous schools and that of their pupils in the years 1931–1935 :

Year	Schools	Pupils
1935	1,921	230,394
1934	1,950	209,674
1933	1,917	203,123
1932	1,935	196,903
1931	1,932	217,257

Of the total given above, 157 were maintained by public bodies and 1,793 by private persons or bodies. As to their category those which might be classified as elementary schools numbered 242, middle schools 109, girls' high schools 68, business schools 514, colleges 27, the blind and the dumb schools 8, and the professional 982. Among miscellaneous schools, there are not a few which to be highly estimated as educational institutions in their ideas and new methods of education. Many of the Christian schools are included among them.

New Educational Movements The educational system of Japan is so complete, as is specially the case with primary school education, that there has been hardly any room for such free educational movements as in Europe and America. The progress in other lines of national life, however, naturally stimulated the awakening of scholars and practical educators towards the end of the Meiji Era. The develop-

ment of major cities presented a large field for the experiment of new educational work. Influenced by Western thoughts and guided by scholars who gave expositions on European and American educational thoughts so as to adapt the characteristic environments in Japan, many new schools have been established in Tokyo and Osaka. Their scope of influence as well as their number is limited, and the new movement, which is more or less radical, is going through difficult times owing to the reactionary tendency in these years : but the existence of such schools as Mrs. Masako Yosano's Bunka-gakuin, Mrs. Motoko Hani's Jiyu-gakuen, and Mr. Kuniyoshi Obara's Seijo-gakuen proves the demand for and appreciation of new education among the more advanced quarters of urban population. The new educational movement among primary school teachers must not be overlooked. Their curriculum cannot deviate very much from that fixed by the government, but their efforts for handling materials so as to adapt the local environment of the pubils and to take in the propective method are bringing about good results. The representative schools are Tajima Primary School in Kawasaki, Urashima Primary School in Yokohama, etc. Primary schools of a similar kind may be found in many places throughout the country.

Training of Teachers

The Japanese Government, alive to the necessity of having a large supply of capable teachers, has spared no efforts in the completion of organs for their training. To give an outline of the present system, Hokkaido and the prefectures are called upon to establish and maintain at least one normal school each, and an institution for the training of business continuation school teachers when circumstances make it necessary, a responsibility which is also imposed on the cities. The Government itself undertakes the training of teachers of normal schools, middle schools, girls' high schools and technical schools by establishing and maintaining higher normal schools, higher normal schools for women, special institutes for the training of teachers, etc., and the students of these schools are given scholarships, covering part of their expenses, either by the Government or by the local public bodies. Moreover such of the students of universities, colleges and the like as intend to become teachers, receive aid out of public funds or may be exempted from the payment of fees. Persons who have proved themselves deserving extended aid are chosen for studying abroad in order that they may be better qualified to teach higher arts and sciences.

The following table gives the number of schools for training teachers and that of their students in the years 1931–1935 :

Year	Schools[1]	Students
1935	156	34,583
1934	155	36,849
1933	157	41,060
1932	167	44,609
1931	175	49,226

Organs for Training Elementary School Teachers The principal organs for training elementary school teachers are the normal schools, while the training course B grade of the Tokyo Academy of Music trains music teachers for elementarly schools.

A normal school consists of the regular and the post-graduate courses, the former is divided into the first and second sections. The course of study of the first section extends over five years and it takes in the graduates of higher elementary schools of a two years' course or persons of over 14 years of age who have similar attainments. The course of study of the second section runs for two years and it takes in graduates of middle schools, girls' high schools and persons of similar scholastic attainments.

The following table gives the number of normal schools and that of their students and graduates in the years 1931–1935 :

Year	Schools	Students	Graduates
1935	102	30,420	10,735
1934	103	32,817	11,669
1933	103	36,867	12,611
1932	104	38,868	11,033
1931	105	43,852	15,524

Organs for Training Teachers for Secondary Education As organs for training the teachers of secondary education, there are the higher normal schools, higher nomal schools for women, special institutes for training teachers, the training course in drawing of the Tokyo Academy of Fine Arts and the training course, grade A of the Tokyo Academy of Music. The sys-

1 Note: There are 4 colleges and their students included in this as well as in the number of the table on colleges.

tems differ more or less with the schools or the main subjects taught, but their entrance requirements are, generally speaking, the completion of middle school, girls' high school and normal school, or the possession of the same or higher scholastic attainments, and their courses extend over four, three or two years, with additional post-graduate and special investigation courses.

The following table gives the number of the schools for the training of secondary school teachers and that of their students and graduates in the years 1931–1935 :

Year	Schools	Students	Graduates
1934	7	4,456	854
1933	10	4,421	925
1932	15	4,245	—
1931	20	4,747	—

In addition to the foregoing, teachers' certificates are issued without examination to graduates of high grade schools both in Japan and in other countries in order to meet the deficiency in the supply of secondary school teachers. The main conditions are that the schools in question must be equal to or higher than the higher normal schools of Japan in entrance requirements and in curricula. Including those who passed examination there were 7,829 persons who received such certificates in 1933–1934.

Organs for Training Business School Teachers For the purpose of training teachers of practical subjects in technical schools, institutes are attached to the Government universities and colleges. They are of a three year course, the scholastic standard corresponding to that of the colleges.

The following table gives the number of such institutes and that of their students and graduates in the years 1931–1935 :

Year	Agricultural		Technical		Commercial		Total		Graduates
	Schools	Students	Schools	Students	Schools	Students	Schools	Students	
1935	1	116	2	144	1	96	4	356	111
1934	1	111	2	150	1	101	4	362	120
1933	1	116	2	150	1	105	4	271	113
1932	1	121	2	150	1	103	4	374	116
1931	1	117	4	151	1	97	6	365	113

As further means of providing business school teachers, certificates are issued without examination to graduates of certain specified schools. Including those who passed examination the number of persons who received such certificates in 1933–1934 was 430.

Organs for Training Teachers of Business Continuation Schools For this purpose there are institutes which Hokkaido, the prefectures and cities alone are authorized to establish. They are of one or two year courses above the secondary education. The following table shows the number of these institutes and that of their students in 1931–1935 :

Year	Institutes	Students	Graduates
1935	45	1,106	588
1934	43	1,014	529
1933	42	1,039	618
1932	44	1,122	656
1931	44	1,232	856

Training of High-grade Professors No particular schools are instituted for the training of high-grade teachers. Scholarships, however, are given to students of the post-graduate course of higher normal schools for training such professors. Further, persons of adequate career and experience are sent to foreign countries for a further prosecution of studies, their expenses being met by the Government. The following are figures concerning such persons at the end of March, each year :

Year	Students Abroad	Year	Students Abroad
1935	101	1932	191
1934	133	1931	219
1933	184	1930	361

As a further means of supplying higher grade professors, a professor's licence is granted to persons holding doctor's degrees and those who have graduated from universities and colleges. In 1934–1935 the number of persons who received Higher School Professor's licences was 1,198, of which 8 were women.

Training of Special School Teachers and Nurses of Kindergartens Teachers for the blind and the deaf and dumb are trained in the training courses in the Tokyo School for the Blind and the Tokyo School for the Deaf and

Dumb. The nurses of kindergartens are trained in the training courses provided in women's normal school, special courses in the higher normal schools for women and in the special institutions for the purpose established by private bodies. In 1934–1935 the number of kindergarten nurses' certificates given was 1,106.

Teacher's Certificate Given by Examination Persons who have similar scholastic attainments with the graduates of the schools mentioned above, may ask for an examination to get a teacher's licence. They have to undergo a strict examination by the special examination committees of the Educational Department. The number of persons who got certificates through such examinations and without examinations during 1934–1935 was 33,494. These may be classified as follows :

Teachers of	Applicants	Certificates Given
Elementary School and Kindergarten	55,432	19,936
Normal School, Middle School and Girls' School	21,178	11,767
Higher Department of Higher School	1,263	1,198
Business School	1,547	593
Total	79,420	33,494

Physical Education and School Hygiene

With a view to promoting the rational development of the young and to encourage and further the spread of gymnastics, games and athletic sports, both eastern and western, there was established in 1924 a national Institute for Research in Physical Training, where research work is now in active progress.

For school hygiene, special attention is paid to buildings and equipments, and efforts are being made to improve and strengthen the physical constitution of pupils and students by employing school physicians, dentists and nurses, by taking measures for the prevention of infectious diseases in schools, by making plans for open-air schools, vacation colonies, school feeding, school clinics and the like.

For the administrative organs responsible for the work referred to, Hokkaido and prefectures have school hygienic experts and directors of physical training, while the Department of Education has the Section of Phsyical Training, Supervisors of School Hygiene and the Institute for Research in Physical Training. In addition, there are provided in the Educational Department a School Hygiene Investigation Committee and a Physical Training Investigation Council, which investigate and make researches in important questions submitted to them by the Minister of Education.

Social Education

For the diffusion and development of social education there has been created a Bureau of Social Education in the Department of Education, and a certain number of supervisors of social education are appointed in the Department, and directors of the same in the local governments

Adult Education For the benefit of those adults who have had little or no chance to receive regulareducation, the Department has requested some of the schools under its direct control or under that of the local governments to start a series of lectures. Most of the adults who are gathered to these lectures are labourers or farmers, and fuller reference to this is made in the chapter on labour.

Libraries The spread of libraries in Japan hasbeen rather slow because of many reasons, but the place of the library in social education has been understood more and more clearly with the advancement of national and international life in recent years. The Government, therefore, established a national library at Ueno, Tokyo, and at the same time has given encouragement to local public bodies for establishing their own libraries by granting subsidies to them. It also tries to help them by holding short period courses for training capable librarians. The results of these efforts have been a notable progress in libraries, as may be observed in the following table :

Year	Public Libraries	Books	Readers	Daily Average of Readers of a Library
1935	4,794	11,376,000	24,666,000	—
1934	4,634	10,762,000	24,949,000	21
1933	4,686	10,563,000	24,766,000	20
1932	4,609	10,138,000	24,980,000	21
1931	4,609	9,636,000	23,355,000	19

In November, 1931, the Tokyo Science Museum was established by the Government. It is located in Ueno Park, Tokyo and exhibits 1,751 technical and machine models and 106,124 specimens of natural science. In 1933–1934 209,843 people visited it in 329 days.

Young People's School

On April 1, 1935, the Young People's School was established by the amalgamation of the Young Men's Training Institute and the Business Continuation School.

The purpose of the new institution is to elevate young people's attainment as citizens of Japan by training mind and body, by cultivating moral nature and by educating in knowledge and ability indispensable to their profession and practical life.

The course of study of Young People's School is graded into three, common, regular and post graduate. The common course extends over two years, the regular course five years for boys and three years for girls (four years for boys and two years for girls may be allowed according to local conditions), and the post graduate course over one year. Graduates of the lower course of elementary school may enter the common course of Young People's School; those who finished the common course may be advanced to the regular course, while the graduates of the higher course of elementary school have the same privilege; and graduates of the regular course or those who are in possession of an adequate scholastic attainment may take the post graduate course.

Subjects of study are, in the common course, morals, civics, some of subjects common to middle schools, agricultural subjects and gymnastics, with additional studies on housekeeping and sewing for girls only; in the regular course the same subjects are given in a more advanced grade; and in the post graduate course, morals, civics and certain studies selected from the subjects of the regular course. Special course may be added. Pupils are free of charge as a rule.

Young Men's and Young Women's Associations With the object of giving mental and moral culture to those young men and women who are no longer cared for in the schools, the organization of young men's and young women's associations has been encouraged so that there is at present hardly any city, town, or village where they are not established. These associations work, on the whole, according to the principle of self-government, quite different from the foregoing Training Institutes, and along the lines which they choose in view of the circumstances peculiar to themselves.

The following table shows the number of young men's and young women's associations and that of their members in the years 1930–1934:

Year	Y.M.A.	Members	Y.W.A.	Members
1935	15,469	2,456,505	13,537	1,507,778
1934	15,440	2,488,113	13,468	1,512,682
1933	15,300	2,497,166	13,378	1,522,041
1932	15,365	2,518,173	13,394	1,534,125
1931	15,202	2,495,708	13,225	1,567,123

Boy Scouts and Girl Guides The boy scout movement, which is also an important item in the social education of the young, has made much progress since the organization of the Japan Federation of Boy Scouts in 1922. The President of the Federation was the late Count Shimpei Goto, and its head office was located in the Department of Education building. The boy scouts which are affiliated with the Federation are scattered all over the Empire except 4 prefectures in Japan proper and the South Sea Mandated Islands. In 1925, the Marine Branch was established and it owns a training-ship.

The number of boy scout organizations and that of the members were approximately 1,100 and 90,000 respectively in March, 1935. The Federation is led by Count Yoshinori Futara at present.

The girl guide movement was first introduced into Japan in 1920. The earliest organizations appeared in Tokyo and Morioka, and the movement gradually spread over different parts of the country, although it has not yet achieved such progress as the boy scout movement, having only 27 guides with about 300 girls in 1931.

Educational Expenditure

Education in Japan, as previously mentioned, is principally controlled by the State, though it is partly delegated to local public bodies and partly carried on by private individuals or organizations by permission of the Government, and the expenditure incurred is met from these three different financial sources.

Part of the educational expenses of local public bodies, however, is met by the State Treasury in order that the teachers may be sufficiently paid and the burdens on the ratepayers may not be too heavy. Formerly the sum of ¥10,000,000 was yearly defrayed for this purpose, but it has been recently increased to ¥85,000,000 or more, and des-

titute municipalities receive special consideration in the apportionment of the grant.

Local governments are required to pay additional salaries at certin rates for long service to the teachers of schools for which they are directly responsible. To meet part of these expenses, the Government allocates a sum of money fixed annually in thte National Budget and divides it among Hokkaido and the prefectures in proportion to the number of teachers. In cases where a city, town or a village undertakes to pay for residences of elementary school teachers, the higher local body is required to share part of the expense.

In recent years educational undertakings have been greatly extended and the treatment of teachers considerably improved in accordance with the post-war programme of the country, nd this has caused the educational expenditure to swell in a remarkable degree. The following table shows the total governmental and public educational expenditure during the years 1930–1935 :

Year	State Treasury	Prefectures	Cities	Towns and Villages	School Associations	Total
1935	¥154,732,262	104,617,681	103,435,462	214,853,579	91,476	577,730,460
1934	152.105,765	100,103,429	102,318,577	202,816,370	87,274	557,434,115
1933	148,083,243	97,885,783	87,580,024	199,345,796	89,838	532,984,684
1932	137,239,255	106,856,178	77,676,969	197,723,655	87,829	519,583,886
1931	143.320,002	111,298,987	81,642,411	213,334,298	71,733	549,667,431
1930	144,373,838	114,502,616	96,687,293	235,899,221	79,182	591,542,150

The above table does not include the amounts expended on local educational administration.

In order to show the total expenditure, both governmental and local, the year 1934–1935 is taken and full details of the items of expenditure are shown :

GOVERNMENTAL EDUCATIONAL EXPENDITURE

1934–1935

Administration	¥2,438,427	Blind, Deaf and Dumb education	159,614
Elementary and Secondary education	90,638,850	Universities and libraries	31,094,196
Business education	637,937	Others	2,396,798
Social education	2,142,269	Total	129,508,091

PUBLIC EDUCATIONAL EXPENDITURE BORNE BY LOCAL PUBLIC BODIES

1934–1935

Kind of Education	Hokkaido & Prefectures	Cities	School Associations of Municipalities	Towns & Villages	Total
Elementary Schools	—	¥ 83,692,263	¥38,355	¥186,166,478	¥269,897,101

Y.M.A. and Y.W.A.	3,794,073	4,202,442
Libraries	453,995	262,550
Total	63,524,865	60,960,630

Other Schools

There are schools in Japan proper which do not come under the control of the Educational Department, and they have been excluded from the foregoing sections. But to complete the chapter on education we cannot pass without some mention of them. Fuller explanations may also be found in other chapters.

Peers' Schools They belong to the Department of the Imperial Household, and the purpose of their establishment is the education of the nobility, but admission to them is by no means restricted to children of titled families. They are called the Gakushu-in and Joshi (women) Gakushu-in. The former is for boys and is composed of three departments, namely, elementary, middle school, and college. The latter is composed of two departments, namely, high school and college.

Two Special Schools The Department of Foreign Affairs has two schools; one is the To-a Dobun Sho-in (Tung Wen College) in Shanghai and the other the Russo-Japanese Association School at Harbin.

The Jingu-Kogakkan This was established by the Home Department and is a Shinto seminary.

The Fisheries Institute This is under the Department of Agriculture and Forestry.

In the territories, schools are under the control of the Territorial Governments, as a matter of course, and full descriptions of them may be found in the chapters on territories. However, a list of the various universities and colleges is here appended.

CHOSEN
- Keijo (Seoul) Imperial University
- Keijo Imperial University Preparatory School
- Keijo Law College
- Keijo Medical College
- Keijo Technical College
- Suigen Agricultural and Forestry College
- Keijo Commercial College
- Eight private colleges

TAIWAN
- Taihoku Imperial University
- Taihoku College
- Four other colleges

KWANTUNG
- Ryojun (Port Arthur) Technical University
- Preparatory College for the same
- Four private colleges

Foreign Teachers and Students

The number of foreign teachers and students at the end of March, 1935, was as follows :

Schools	Teachers			Pupils & Students		
	Male	Female	Total	Male	Female	Total
Elementary	—	7	7	172	96	268
Normal	—	—	—	3	—	3
Higher Normal	5	—	5	103	—	103
Woman's Higher Normal	—	—	—	—	20	20
Middle Schools	34	7	41	32	—	32
Girls' High Schools	4	57	61	—	—	—
Higher Schools	78	3	81	107	—	107
Universities	124	2	126	646	23	669
Colleges	119	58	177	453	96	549
Business Colleges	62	1	63	119	1	120

Schools	Teachers Male	Female	Total	Puplis & Students Male	Female	Total
Business Schools	24	11	35	13	—	13
Blind Schools	1	—	1	—	—	—
Deaf and Dumb Schools	—	—	—	—	—	—
Miscellaneous	97	218	315	1,918	879	2,797
Total	548	364	912	3,566	1,115	4,681

The comparison for the five years, 1931–1935, is as follows :

Year	Teachers	Students
1935	912	4,681
1934	883	2,765
1933	1,059	2,232
1932	908	2,761
1931	940	4,983

World Education Conference

Worthy of special mention in regard to the educational circles in Japan during 1937 is that the seventh biennial conference of the World Federation of Education Associations was held in Tokyo. More than 1,000 delegates from 39 nations and 2,000 Japanese were present, which represented by far the greatest international gathering ever held in this country.

Among the foreign delegates were Dr. Paul Monroe, president of the World Federation of Education Associations and director of the International Institute of Columbia University ; Mr. Uel W. Lamkin, secretary-general of the W. F. E. A. and president of the Missouri State Teachers' College ; Mr. Fred Mander, vice-president of the W. F. E. A. and general secretary of the National Union of Teachers ; Mr. E. A. Hardy, treasurer of the W. F. E. A.; Mr. Francisco Benitez, derector of the W. F. E. A. and dean of the College of Education of Philippine University ; Miss Selma M. Borchardt, director of the W. F. E. A. and legislative representative of the American Federation of Teachers ; Mr. Henderson Thomas, director of the W. F. E. A. and general secretary of the Educational Institute of Scotland ; Mr. P. A. Inamdar, director of the W. F. E. A. and director of Public Instruction of Idar State in India ; Mr. D. D. MacDonald, director of the W. F. E. A. ; Mr. G. R. Parker, director of the W. F. E. A. ; Mr. H. N. Penlington, director of the W. F. E. A.; and chairman of the Elementary Education Section ; Miss C. Woodward, director of the W. F. E. A. ; Mr. P. Seshadri, director of the W. F. E. A. and principal of the Government College at Ajimer in India ; and Mr. Henry Lester Smith, director of the W. F. E. A. and dean of the School of Education of the University of Indiana.

The opening session of the conference was held on August 2. Mr. Hidejiro Nagata, vice-president of the W. F. E. A. and president of the Japanese Education Association, left his hospital bed especially for the purpose of addressing the opening general meeting of the World Education Conference which was held the same evening in the auditorium of the Tokyo Imperial University. Among other things, Mr. Nagata noted in his address the special importance of the conference meeting at a time when Japan was studying the improvement of its educational system. It is beyond doubt that the large gathering of world educators and scholars has awakened a new interest among the Japanese educators and scholars and at the same time enabled the former group to gain a deep knowledge of the characteristics of the Japanese people and features of the Japanese culture, which will go a long way toward promoting the understanding among foreign nations of Japan and things Japanese.

The World Education Conference lasted for six days and was formally closed at a general meeting of the participants held on the evening of August 7 in the auditorium of the Tokyo Imperial University. Ten-minute speeches were made on the occasion which were broadcast by JOAK in the interests of the general public. Among the speakers were Dr. Paul Monroe, President of the W. F. E. A. and chairman of the meeting ; Mr. Harry Hamphrey, of Great Britain ; Dr. E. C. Sobrepena, of the Philippines ; Mr. J. L. McCullough, of Canada ; Mr. P. A. Inamdar, director of the W. F. E. A. and delegate from India ; Dr. Joseph Gwinn, of San Jose State Teachers College in California ; Dr. Ishbel Garvice, medical officer of the Egyptian Education Ministry ; Mr. Rudolf Browner, of Australia ; and Mr. Hidejiro Nagata, president of the Japanese Education Association and vice-president of the W. F. E. A.

Proposed Conference Programme Details of the conference programme are given below for reference :

Adult Education Section

Chairman : Mr. Tamon Maeda, director of the Committee of Inquiry into the Municipal Administration of Tokyo.

Secretary : Dr. Frank W. Bouelle, former superintendent of Schools in Los Angeles, California.

Directorate Representative : Dr. Uel W. Lamkin, president of the State Teachers College in Maryville, Missouri.

First Session, August 4

"How to Organize Adult Education"

Mr. Tsunekichi Mizuno, superintendent of schools in the Japanese Education Ministry.

"How to Organize Adult Education"

Dr. James A. Moyer, of America.

"Adult Education in India"

Mr. P. A. Inamdar, director of Public Instruction in Idar State, Himatnagar, India.

Paper

Dr. Alexander Morgan, vice-chairman of the Scotish branch of the British Institute of Adult Education.

Paper

Mr. Robert E. Cavanaugh, director of the Extension Division of Indiana University.

Discussion

Second Session, August 5

"Rural Community Meeting"

Mr. Shintaro Sasai, vice-president of the Dai-Nippon Hotoku-sha, Tokyo.

"Adult Education Through Their Consultation"

Mrs. Waka Yamada, of the Tokyo Asahi Shimbun.

"Adult Education in the Philippines"

Prof. Aurelio C. Ramos, of the Philippines.

"Adult Education in Canada"

Mr. W. J. Dunlop, of Canada.

"Religious Elements in the Japanese Adult Education"

Prof. Keiki Yabuki, of Taisho University in Tokyo.

Short Papers :

1. Workers Education in Japan
(Central Association of Workers Education)
2. The Guiding Principle of Adult Education and of our National Cultural Movement
(Mr. Shigeru Matsui, managing director of the Foundational Union Federation of Cultural Corporations in Tokyo.)

Broadcasting

Chairman : Mr. Masao Seki, director of the Central Broadcasting Station in Osaka.

Secretary : Miss Mary Somerville, director of School Broadcasts, British Broadcasting Corporation, London.

Directorate Representative : Dr. Paul Monroe, president of the World Federation of Education Associations.

First Session, August 2.

"The Place of Educational Broadcasting in Modern Education"

Mr. Hanji Obi, director of the Education Department of the Broadcasting Corporation, Tokyo.

Miss Mary Somerville, secretary of the broadcasting section.

"Special Characteristics of School Broadcasting in Japan"

Mr. Misori Nishimoto, chief of education section of the Central Broadcasting Station in Osaka.

Mr. Koppen, of Germany.

"Broadcasting in the Philippines"

Prof. Gabriel Bernardo, of the Philippines.

Adult Education Broadcasting

"Educational Broadcasting in Japan"

Mr. Ryuji Nakayama, managing director of the Broadcasting Corporation of Japan, Tokyo.

"A Study in Radio Psychology"

Mr. Seishiro Aoki, assistant professor of Tokyo Imperial University.

Paper

Mr. G. W. Gibson, adult education officer of the British Broadcasting Corporation, London.

Second Session, August 3

"Radio Exercise in Japan"

Mr. Junji Shimizu, managing director of the Broadcasting Corporation of Japan, Tokyo.

"The Use of School Broadcasting Propaganda in our School"

Mr. Akira Noguchi, principal of Kinka Primary School, Tokyo.

Mr. Harry Carpenter, specialist in science, Rochester, New York.

"Broadcasting and the Curriculum"

Mr. Thomas Henderson, of the Educational Institute of Scotland.

"The Dramatized Lesson and Illustrated Talk"

Miss Mary Somerville, of the British Broadcasting Corporation.

Colleges and Universities

Chairman : Dr. Robert L. Kelly, president of the Association of American Colleges, New York City.

Secretary : Dr. Jeseph M. Gwinn, professor of education of the State Teachers College, San Jose, California.

Directorate Representative : Dr. P. Seshadri, principal of the Government College in Ajimer, India.

First Session, August 2

Topics including "Problems and Tend-

encies in Higher Education in the Far East," "Universities and Colleges of Present-day Japan," "Higher Education of Women in Japan," "University Freedom," etc. under the leadership in discussion of Dr. P. Seshadri.

Second Session, August 3

Topics including "The Functions of the University in a Twentieth Century Programme of Education," "What Are the Functions of a University," "Cultural Studies in Colleges and Universities," "The American College of Tomorrow," "The Key to Western Civilization," "The Place of Colleges and Universities in the Philippines," and "Women's and Girls' Education in the Bombay Presidency."

Commercial Education

Chairman : Dr. Teijiro Ueda, president of the Tokyo University of Commerce, Tokyo.

Vice-chairman : Dr. Tsuneo Tajiri, director of Yokohama Higher Commercial School.

Secretary : Dr. William Alonzo James, principal of Ball High School, Galveston, Texas.

Directorate Representative : Miss Selma Borchardt, chairman of the Committee on International Relations, American Federation of Teachers, Washington, D. C.

First Session, August 2

Topics including "Commercial Education and International Mutual Service," "Commercial Education in Canada and Its Relation to International Service," etc.

Second Session, August 2

"Commercial Education in Different Countries," "Practice Course on Commerce in Japanese Commercial Schools," "Speciality of the Commercial School in Japan," "Specialization in Commercial Education," "Commercial Education in Japan," etc.

Educational Legislation

Chairman : Miss Selma M. Borchardt, chairman of the International Relations Committee of the American Federation of Teachers, Washington, D. C.

Secretary : Mr. Aurelio Ramos, of the Philippine Teachers Organization, Philippine Islands.

First Session, August 5

"Trends in Educational Legislation," "Teacher Tenure," "The Danish Volkschule," "Recognition at Law of Various Abilities and Problems of Adjustments," etc.

Second Session, August 7

"Education—A Force for Social Reconstruction Outside the Class Room," "Adult Education—A Co-ordinating Force in the Promotion of Social Stability," "School Adjustment and Cultural Movements in Japan," etc.

Educational Crafts

Chairman : Mr. Honoroto Ramos, of the Philippines.

Secretary : Mr. Alfred Emms, of the Henry Lester School of Technology in Shanghai.

Directorate Representative : Mr. P. A. Inamdar, director of Public Instruction in Idar State, Himatnagar, India.

First Session, August 2

"Educational Crafts in Japan," "Hand Work as an Educational Medium," "Educational Crafts in the Philippines." Short Papers.

Second Session, August 3

"Eductional Crafts in the Girls' Higher Schools and Colleges of Japan," etc. Short papers.

Elementary Education

Chairman : Mr. H. N. Penlington

Secretary : Mr. Granville Prior

First Session, August 2

"Primary Education for Those Living in Rural and Urban Areas," "Elementary Education in the Philippines," "Art and Handicraft in Elementary Schools," etc.

Second Session, August 3

"Moral Education," "The Training of Teachers," "Character—Its Importance for Today's Civilization," "New Education in our Primary Schools," "Freedom, Unification and Authority in Education."

Third Session, August 4

"The Teaching of Calculation by the Use of Abacus," "An Authorized Textbook System," "Teaching of Language as a Problem for International Co-operation," "The Boys Clubs as a Factor in Good Citizenship."

Geography Section

Chairman : Dr. Takeo Kato, professor of Tokyo Imperial University.

Vice-Chairman : Dr. Junichi Takahashi, of Tohoku Imperial University.

Secretary : Dr. Julia M. Shipman, of Mount Holyoke College, Hadley, Mass.

Directorate Representative : Mr. Lloyd-Pierce, of England.

First Session, August 2

"Promotion of International Goodwill Through Geographical Education," "Suggested Procedures for Securing Closer Articulation of Geographic Education Throughout the World," "Comments by some Geography Teachers in the United States of America," "Recent Developments of Geographical Education in

Great Britain," "Recent Developments of Geographical Education in Japan," "Some Phases of Teaching the Geography of the United States," "Geography and Geography Education." Papers.

Second Session, August 3

"Remarks on School Atlases," "How to Realize International Exchange of Geographical Teaching Materials," "Work in Geography with Little Children," "The Changing Commercial Geography of China," "Changes of Distribution of Population in Japan Since 1970," "Study of Geographical Education in the Secondary Schools of Japan from the Viewpoint of the Pupils' Interest," etc.

Health Section

Chairman: Prof. C. E. Turner, Massachusetts Institute of Technology Cambridge, Massachusetts.

Acting Chairman: Mr. L. de Gielgud, of France.

1st Vice-Chairman: M. Georges Milsom, of France. (Not attending)

2nd Vice-Chairman: Dr. Y. Yoshida, of the Imperial Institute for Researches in Physical Education, Tokyo.

Secretary: Miss Sally Lucas Jean, of New York City. (Not attending)

Acting Secretary: Mr. Frank E. Midkiff, of Hawaii.

Vice-Chairman: Dr. Yukinobu Yoshida, of Tokyo.

First Session (Health Education)

"School Health Programmes in Denmark," "School Health Activities in Italy," "The A-I Child Health Programme in the Philippines," "School Health Activities in Palestine," "School Health Activities of the All-India Federation of Education Associations."

Second Session (Health Services)

"Health Education Activities of the Junior Red Cross," "Health Education in Tokyo Health Demonstration District," "Programmes and Progress in Health Education in India," "Education Aspects of Physical Examinations of College Students," "The Better Village Movement in the Pubjab and the Part Played by Schools," "Preparing Girls to Meet Health Problems in Rural Egypt."

Third Session (Physical Education)

"American Physical Education Association Activities," "Physical Measuring of Japanese Children and Application of the Result to Their Health Promotion," "Dental Health Education and Service for the Children of Hawaii," "Present Status of School Dental Hygiene in Japan," "Eye Health Programme for School Children."

Herman-Jordan Committee

Chairman: Dean H. Lester Smith of Indiana University.

Secretary:

First Session, August 2

"International Understanding and Goodwill Through Education," "Recent Progress in Peace Education," "The Effects of Peace Education on the Building of Character," "Women's Education as Seen Through International Understanding," "Cultural Relations of Japan and Roumania."

Second Session, August 5

"The Pacific Settlement of International Conflicts—An Orientation Course in Colleges," "Teacher Training for International Goodwill," "The Oriental Institute of the University of Hawaii and Its Place in the Cultural and Economic Developments of the Pacific," "The Van Loan-Thomas Plan."

Home and School Section

Chairman: Mrs. J. K. Pettengill, president of the National Congress of Parents and Teachers, Wayne University, Detroit, Michigan.

Directorate Representative: Dr. Uel W. Lamkin, president of the State Teachers College, Maryville, Missouri.

First Session, August 4

"A Synopsis of the Educational Philosophy Advanced By the Founder of the Parents National Education Union," "Parent Education in North America," "Japanese Home Life and Home Education," etc.

Second Session, August 5

"Home and School System of the New Italy," "Co-operation of Home and School," "The Home-School Contribution to World Fellowship," etc.

Joint Session of Pre-school and Kindergarten Section and Home and School Section

Chairman: Mrs. J. K. Pettengill, president of the National Congress of Parents and Teachers, Wayne University, Detroit, Michigan.

Special Subject (August 7)

"The Education of Mothers," "Education of Women."

Preparation of Teachers Section

Chairman: Miss A. E. Philips, of Avery Hill College, Eltham, London.

Secretary: Dean H. Lester Smith of Indiana University.

First Session, August 3

"The Preparation of Teachers—The Need for Well-ordered Experiments," "Some Experiments in Teacher Training in the United States," "Character of Japanese Teacher," "Preparation of

Teachers in Venezuela," "Teacher Training in Canada," "Training of Women Teachers in Japan."

Second Session, August 4

"Teachers of General Education During the Tokugawa Era (17–19 cent.)," "Teacher Training," etc.

Pre-School and Kindergarten Section

Chairman: Miss Frida Kruse, of MacDonald College, Quebec, Canadian Teachers Federation, Canada.

Secretary: Miss Edith U. Conard, of the Teachers College, Columbia University, New York City.

Directorate Representative: Dr. Uel W. Lamkin, president of the State Teachers College, Maryville, Missouri.

First Session, August 2

"Character Training in Japanese Kindergarten," "Childhood Education in Japan, Past and Present," "The Activity Movement and the Experience Curriculum," "The Arts in the Experience Curriculum," "Science in the Experience Curriculum," etc.

Second Session, August 3

Panel discussion on "The Fundamental Needs of Young Children Everywhere and How the School Can Meet Them," with Miss Alice Thorn presiding.

Rural Education Section

Chairman: Mr. W. Lloyd Pierce, of Llanfaircaereinion, Wales.

Secretary: Dr. Wm. Mck. Robinson, of the State Teachers College, Kalamazoo, Michigan.

Directorate Representative: Mr. Thomas J. O'Connell, of Dublin, Ireland.

First Session, August 3

"The Twentieth Century Problems in Rural Education," "Ireland and Rural Education," "How Scotland Solves Her Rural Education Problems," "New Trends in Agricultural Education in Japan," "The Place of Rural Education in Modern Producers' and Consumers' Co-operatives."

Second Session, August 4

"The Education of Infants in Rural Area," "New Aspects of Rural Education in Japan," "A Philosophy of Rural Education," "Equalizing Educational Opportunity," "Some Significant Phases of Rural Education in Iowa," "Ichthyology in Japan," "Some Aspects of Rural Education in Canada," "Discussion of Rural Education," "Rural Education in the Philippines."

Joint Session of Rural and Health Sections (August 7)

"Training in Health and Recreatinn of Rural Inhabitants," "The Conditions of Rural Schools."

Science Section

Chairman: Dr. Keita Shibata, director of the Science Department of Tokyo Imperial University.

Secretary: Dr. Otis W. Caldwell, of the Boyce-Thomson Institute for Plant Research, Yonkers, New York.

Assistant Secretary: Mr. Harry A. Carpenter, specialist in science of the Rochester Public Schools, New York.

First Session, August 5

"Present Status of Science Teaching in Elementary and Secondary Schools of Each Country Represented at the World Education Conference" and special topics including "Model Equipment for the Teaching of Science in Elementary Schools," "Suiting Biological Instruction to Human Values, Emphasizing Vital Health Factors," "Biology as an Educational Subject," "Education for Family Living."

Second Session, August 7

Demonstration of "Motion Picture as an Aid to Science Teaching" and general and special topics including "Science Teaching in Rochester," "The Relation Between the Local Education (Heimaterziehung) and the Nature Study in the Elementary Schools in Japan," "Types of Educational Research in Science Teaching," "Experiments and Observations in Natural Science in Japanse Middle Schools," "How Science Teachers Are Trained."

Third Session, August 7

"Japanese Morning Glory and Its Importance in Genetical Studies," "Earthquake and Mitigation of Earthquake Disasters," "The Scientific Research on Volcanoes," "Summary of Science Developments in the United States," "Significance of Scientific Research to Education and to Society," etc.

Secondary Education Section

Chairman: Mr. Oren E. Long, superintendent of Public Instruction in the Territory of Hawaii.

Vice-Chairman: Mr. John C. McGlade, of San Francisco.

Secretary: Miss Elizabeth Mck. Moore, of California.

Directorate Representative: Mr. G. R. Parker

First Session, August 4

"What Should Be Emphasized in the Promotion of International Goodwill and Understanding In Secondary Education," "Special Characteristics of Education in the Girls' High Schools of Japan," "'Special Characteristics of

Education in the Middle Schools of Japan," "Secondary Education in the Philippines," etc.

Second Session, August 5

"Four Fundamentals of New Education," "Tradition and Adventure in Education," "Freedom in Education."

Teachers' Organizations

Chairman : Mr. Roy Cloud, of the California Teachers Association, San Francisco, California.

Secretary : Mr. W. Humphrey, of England.

Directorate Representative : Dr. E. A. Hardy

First Session, August 5

"The Attainment of Professional Status Through Teachers' Organizations," "Teachers' Organizations in Japan," "Teachers' Organizations in the Philippines," "Association of Women Teachers in the Elementary and Secondary Schools of Japan."

Second Session, August 7

"Pension System of Private Schools in Japan," etc.

Visual Education

Chairman : Mr. Tsunekichi Mizuno, chief of the adult education section of the social education bureau of the Japanese Education Ministry.

Directorate Representative : President H. Nagata.

Session, August 5

"Promotion of International Goodwill Through Cisual Education," "Visual Education in Canada and Its International Relationships," "Visual Education in Japan," "Visual Education in the Philippines," etc.

CHAPTER XXIX

RELIGION

General Survey

From prehistoric ages Japan has had an indigenous cult which is now known as Shinto. Buddhism and Confucianism were introduced through Korea and China later, and Christianity more recently still. Islam, however, never gained a footing on her soil, though its literature has been introduced to some slight extent.

Shintoism has had little to do with the thought and life of the people, apart from its relations with the functions of the guardian deities, national and local, and bears some resemblance to the primitive cults of Greece and Italy. It is now divided into two, namely, national Shintoism, which is represented by the shrines, and sectarian Shintoism, which developed towards the end of the Tokugawa Shogunate.

Confucianism is rather a code of moral precepts than a religion, except in that it teaches some vague ideas regarding a heavenly God. In the realm of moral culture it has exerted great influence on the minds of the Japanese people and on their principles of daily life; that influence being very noticeable in the Imperial Rescript on Education of the Emperor Meiji. Further mention of Confucianism will be omitted here because it can hardly be regarded as a religious cult.

Buddhism has had still greater influence on all phases of Japanese life. Its fatalism has had a retarding effect on the material progress of the Japanese as with other Oriental nations, but has induced a habit of dauntless composure in their behaviour, and its broad philanthropy has given rise to a spirit of mutual help among the people, subduing egoism or individualism. Its philosophical literature fed the national thought, while its fine art has left many masterpieces enriching the cultural life of the Japanese. Buddhism is still the most powerful among the religions in Japan.

Christianity has made valuable contribution toward the civilization of Japan with its world-wide nature and positive teachings on human life. The number of believers is comparatively small, but its influence on the people's thought and morals is said to be even greater than that of Buddhism. It has raised Japan's moral standards, waging war against licensed prostitution, the low position of women, drinking and smoking, and polygamy as practised in a certain section of society. It has still to amalgamate itself with the life of the people in order to exert greater influence upon them, but its future is hopeful.

Shinto Shrines

Most Shinto shrines are supervised by the Shrine Bureau of the Home Department, which consists of one chief official and 64 minor officials. The budget of the Bureau for the fiscal year 1937–38 is as follows:

Running expenses	
Isé Great Shrine	230,000
Other national shrines	1,000,000
Ceremonies and rituals	7,105
Soldiers' shrines	14,255
Total	1,251,360
Incidental expenses	
Office of Isé Great Shrine	35,184
Investigations	9,000
Reconstructions	1,041,000
Education of priests	51,436
Total	1,136,620
Sum total	2,387,980

The Isé Great Shrine is the most honoured of all as the first national shrine. The Goddess enshrined in it is Amaterasu-Omikami, which may be translated as Heaven-Shining-Great-Goddess. According to the Japanese mythology, Amaterasu-Omikami sent down her grandson to the Nippon Islands to rule the people by the 'Kingly Way,' giving him the Three Sacred Treasures, which have been handed down even to the present Emperor as the sacred symbols of the Imperial Throne (see Appendix, The Constitution of Japan; The Imperial Household Law Article X; and Chapter III). In the Great Shrine and appendant shrines more than 10 gods, who represent the Imperial ancestors or personify natural powers, are installed beside the principal Goddess.

The name of the shrine comes from its location in Isé province or more ac-

curately on the Isuzu river, city of Ujiyamada, Mié prefecture. The whole sacred area of the Great Shrine includes 13,135 acres.

About 87 priests are attending it under a chief priest. There are established a seminary for the education of priests, a police station, two museums, and a library in connection with the shrine.

The budget for the fiscal year 1937–38 is ¥265,184.

According to the report of the Shrine Bureau, the Home Department, the number of other shrines at the end of 1934 was as follows :

Governmental and national shrines	197
Prefectural and village shrines	49,505
Private shrines	61,261
Soldiers' shrines	104

The number of private shrines in Japan proper has been steadily decreasing since 1889, lessening from 136,783 in that year to 61,183 in 1935. There were many too superstitious and barbarous ones among them and the decrease indicates the healthy progress of the religious ideas of the people and the radical policy of the government.

The total area of the sacred campus of these shrines in 1933 (not including soldiers' shrines) covered 76,948,646 tsubo, 65,721,332 of it being government property.

The total number of priests in Japan proper at the end of the year 1934 was 15,628.

For the education of priests there are one seminary of college grade at Isé as mentioned above, a department in Kokugakuin (Japanese literature) College of junior college grade, a middle school grade seminary affixed to the one at Isé, and 26 smaller places for giving a course of study, the total number of students being not more than 2,100. It may be said, therefore, that the education of Shinto priests is on a much lower scale than that of Buddhist priests or Christian pastors.

Sectarian Shintoism

Shinto Sect This sect is called by the general name given to the national cult before its later branches had developed. The principal ideas of the sect are to follow the "Great Way of the Gods," and to propagate the national cult indigenous to the people of this country. Its believers and devotees consider it their most important duty to cultivate reverence for the gods, cherish the spirit of patriotism, elucidate Heavenly Reason and Humanity, pay homage to the Emperor, and observe all the Imperial ordinances.

Kurozumi Sect This was founded by Munetada Kurozumi (1780–1850), who was born at a small village of Okayama prefecture. His main idea was to inhale, while contemplating the Goddess Amaterasu-Omikami, the energy of the sun, and thereby to fill up the heart with satisfaction and complaisance. He teaches to avoid the following seven evils, which are against the will of the gods : (1) to be faithless to the country of the gods in which one was born ; (2) to get angry and to worry over things ; (3) to be arrogant and spiteful ; (4) to entertain evil desires from seeing others do evil ; (5) to neglect one's household affairs while in good health ; (6) not to have sincerity even when one is entering upon the path of sincerity ; and (7) not to accept things gratefully for which one ought to be grateful every day.

Other sects of Shinto are as follows—the teachings of all being much the same, except that some lay particular stress on the worship of one or another of the early gods :—

Shinto-shusei	Found by Kunimitsu Nittá (1829–1902) born in Chiba Prefecture.
Taisha	Preached by Sompuku Sengé (1845–1918)
Fuso	Founded by Takekuni Fujiwará (1541–1646) and preached by Han Shishino.
Taisei	Founded by Shosai Hirayama (1815–1890)
Jikko	Founded by Hanamori Shibata (1809–1890)
Shinshu	Founded by Masamochi Yoshimura (1839–1916) Okayama prefecture.
Ontaké	The chief centre of this sect is Mount Ontaké, where the spirits of certain gods are enshrined.
Misogi	The sect of Water Purification. Founded by Masakané Inouyé (1790–1849) of Mié prefecture.
Shinri	Founded by Tsunehiká Sáno (1834–1906)
Konko	Founded by a farmer, Bunjiro Kawaté (1814–1883)
Tenri	Founded by a woman, Miki Nakayama (1798–1887) of Nara prefecture. Of all these sects the Tenri-kyo has perhaps the greatest number of believers ; it lays emphasis on personal

Tenri conduct and mental discipline, in addition to patriotism and obedience to the Emperor and Imperial ordinances. It particularizes the "eight forms of dust which must be swept away"; they are grudging, evil desires, impure attachments, hatred, enmity, anger, covetousness and arrogance.

Buddhism

It was in the thirteenth year of the Emperor Kimmei (552 A.D.) that Buddhism, first founded in India, came over to Japan after passing through China and Korea. Prince Shotoku, Regent from 593 to 628 A.D. and a devout Buddhist, was largely responsible for its rapid spread throughout the country. Six schools of Buddhism, that is, Sanron, Hosso, Jojitsu, Kusha, Ritsu, and Kegon, were introduced one after another. In the reign of the Emperor Kwammu (782–805 A.D.), Tendai and Shingon flourished. New schools such as Jodo, Zen, Shin, Nichiren and others then gradually developed. Through these long periods of its history Buddhism became further divided, owing to differences in the exposition of the doctrines and in the methods of propagation, into many sub-sects. Eleven of the principal sects still in existence are Hosso, Kegon, Ritsu, Tendai, Shingon, Yuzunembutsu, Jodo, Shin, Ji, Zen, and Nichiren; and these eleven are sub-divided into fifty-eight branches. The principal teachings of the eleven Buddhist sects are as follows:

Hosso Sect This sect was introduced into Japan by Dosho (628–700), a Buddhist priest who went to China in 653 and studied its teachings under Hsuantsang. The main teachings of Hosso are that all sentient beings find Salvation in accordance with the difference in character and endowments, of which five yanas are to be distinguished, that the doctrinal system of this sect and its scriptural texts are in full correspondence with the truth, that as all things are merely manifestations of pure consciousness, there are no real ego-souls and no real objects, and that the great fruit of Bodhi and Nirvana is attainable in and through the reality of the Middle Path, which is a peculiar combination of realism and idealism.

Kegon Sect Roben (688–776) of Todaiji Temple, Nara, the first propagator of this sect in Japan, learned its doctrines from the Chinese Buddhist priest Dokei who visited Japan during the Tempyo Era (729–749). The teachings of this sect are based upon the Kegon Sutra, which says that the ultimate reason of Suchness is absolute and infinite; the Ultimate and the Manifested are mutually related and intimately intertwined; each Manifestation too is so thoroughly and interminglingly related to another Manifestation that between the two there is no wall of individual separation. The teachings of the sect are, therefore, called the Perfect Doctrine. Those who, in accordance with the doctrine, understand the mystery of the mute evolution of the spiritual cosmos, and who practise goodness and are guarded in their conduct, are sure to attain Buddhahood and to realize the Ultimate Reason. The head-temple of this Sect is Todaiji in the city of Nara.

The term "Shinnyo", or tathatva, which we have translated "Suchness" in the foregoing, is a very comprehensive word, signifying "truth", "reality," or "the first principle of emptiness". The first character, "Shin" means "that which is true without any admixture of error". The second "Nyo", is the same as is usually translated "like". The two taken together have come to mean "the Absolute Itself". There are three main interpretations of it. The doctrine of the Kegon Sect, as one of these interpretations, identifies the absolute and the relative, the noumenal and the phenomenal, asserting that each separate phenemenon, being endowed with the qualities of the Absolute, has unlimited power to produce other phenomena. The doctrine derived from the Kegon Sutra teaches that even a single particle of dust has the manifold, infinite and absolute virtues of all things in the universe, and that so, if a man observes a certain practice, he is at the same time doing all other religious practices.

Ritsu Sect The Ritsu or the Sect of Moral Discipline ("Vinaya" in Sanskrit) was first propagated in Japan by Ganjin (686–763), a Chinese Buddhist priest, who came to Japan during the Tempyo Era (729–749). It obtains its name from the Vinaya-pitaka, according to which its followers strictly regulate their daily conduct. It teaches to observe, as ordered by Buddha, all the precepts ("sila" in Sanskrit) such as the Five Precepts, the Eight Precepts, the Six Novitiate Precepts, the Ten Precepts, or the Two Hundred and Fifty Precepts. Toshodaiji in Nara prefecture is the head-temple of this Sect.

Tendai Sect The founder of this sect was Chisha Daishi (537–597) of the Sui Dynasty.

The Japanese priest Saicho (Denkyo Daishi, 766–822) went over to China in the year 782 during the Yenryaku Era, and studied the principles of Tendai there. On his return to Japan, he became the chief exponent of the sect in this country. The teachings of the Tendai Sect are comprised in two divisions, metaphysics and meditation. It critically systematizes in its metaphysical part all the teachings of Sakyamuni, drawing a clear line between what is mere expedient and what really represents the spirit of the founder of Buddhism. As the result Tendai has come to consider Saddharma-pundarika Sutra (the Lotus of the Good Law) the doctrine of Sakyamuni, in which the reason of his appearance on earth is truthfully explained. The meditation part consists in applying our minds to all that is taught in the Sutra and realizing it in our daily practical life. Ten grades are distinguished in the practice of meditation, while its main object is to put a stop to disturbing thoughts and to get enlightened on the principles of the four classes of Buddhist doctrines. The ultimate end of all this is the realization of the mysteries of the Pundarika. When we perceive that the Hidden and the Manifest are of one and the same essence and realize that state of mind which is known to the Buddhas only, we have the central teaching of Tendai, that is we have attained the final enlightenment in which the spiritual and the material are thoroughly unified.

There are three sub-sects or branches in this sect, each of them having its own head-temple. They are: (1) the Tendai Branch, whose head-temple, Yenryakuji, is in Shiga prefecture; (2) the Jimon Branch, which has its head-temple in Onjoji in Shiga prefecture; and (3) the Shinsei Branch, the head-temple of which is Saikyoji in Shiga prefecture.

Shingon Sect The first exponent of this sect in Japan was Kukai (Kobo Daishi, 773–835), who went over to China soon after Saicho, the Japanese founder of Tendai. According to this sect, there are three fundamental conceptions, which are, Substance, Appearance, and Function. The Six Universals—earth, water, fire, air, the void, and consciousness—are Substances. The four systems of Mandala, that is, Great Mandala, Samaya Mandala, Dharma Mandala, and Karma Mandala, are Appearances. The three Secrets—body, words, and mind—are Functions. The Six Universals are the elemental substances of which all things are constituted. They take Apparances, which, though innumerable, can be classified under four headings. The first is the Great Mandala representing all living beings such as Buddhas, Bodhisattvas, Gods, evil spirits or human beings. The second is the Samaya Mandala which consists in Mudras and symbolic instruments of Buddhas, Bodhisattvas, devas, and spirits. The third is the Dharma Mandala containing all the names or titles of the Buddhas and other beings. The fourth and last one is the Karma Mandala in which are represented all the Functions as well as the outward bodily attitudes assumed by Buddhas and other beings. As the six Universals are infinite and mutually intermingle and are most intimately related, so the four Mandalas are also mutually related and intermingled. That is to say, the Buddhas' four Mandalas are also our own just as they are in the Buddhas, and conversely, our own Mandalas are those of the Buddhas. When the four Mandalas or Appearances are symbolized in our bodies and our fingers are "knotted" after the regular formulas, and the mouth recites the various Mantras and Dharanis, and the mind contemplates the sameness of the mind, Buddha, and all sentient beings, then the Functions of the three Secrets are completed. Let this completion be attained, and we are Buddhas while we are in this material existence.

"Mandala" has a large number of different meanings. It is often applied to concrete objects such as an altar, a platform, a circular plate, a picture, and possibly an image; but it came to have the abstract meaning of "growth", "perfection", or "a complete collection of all virtues."

This sect is sub-divided into eight branches, which are: Koya, Omuro, Daikakuji, Daigo, Toji, Yamashina, Ono, and Senyuji.

Three hundred years after the death of Kukai, the Japanese founder of the Shingon Sect, a priest called Kakuban known as Kokyo Daishi (1094–1143), established a new school of Shingon. Under this there are two branches now, one of which is Chizan and other Buzan. The head-temple of the former is Chishaku-in, Kyoto, while that of the latter is Chokokuji (Hasedera), in Nara prefecture.

Yuzu-nembutsu Sect This was founded in 1117 by Ryonin, known as Showo Daishi (1071–1132). Its principal teachings are that as all things are essentially of one nature and intimately relat-

ed, the virtues of one person must be also those of all others, and conversely; that the merits of the Buddha's name invoked by all earnest hearts will mutually grow, establishing a spiritual communion with one another in a most thorough manner; that therefore the invoking of the Buddha's name and contemplating him, even during this short period of one's earthly life, must bear the great fruit, if it is most sincerely done, of making us all attain to Buddhahood through the perfection of infinite merits.

The head-temple of this sect is Dainembutsuji of Osaka prefecture.

Jodo Sect The founder of this sect was Genku, known as Yenko Daishi or Honen, (1133–1212), and it was established in 1174. The basis of the doctrines of the Jodo Sect is laid upon the original prayers of Amitabha Buddha. Being convinced of the general sinfulness of human nature, which makes us incapable of enduring all the painful process of self-discipline and self-perfection, Jodo teaches us to throw all our reliance upon the strength of the original prayers of Amitabha Buddha, When we thus, absolutely believing in him, invoke his name with all the sincerity of the heart, we shall be born in future in his Pure Land. The head-temple, Chion-in, is in Kyoto.

One of Genku's disciples, called Shoku (1176–1247), established a new separate school at Nishiyama, which is known as the Seizan Branch of Jodo. This branch is again subdivided into three: (1) Zenrinji, its head-temple bearing the same title, is in Kyoto prefecture; (2) Komyoji; and (3) Fukakusa, Seigwanji, Kyoto, is its head-temple.

Shin Sect Shinran (1173–1262), who is known as Kenshin Daishi, founded the Shin Sect. He was a disciple of Genku, and the main doctrines do not vary so very much from those of his master except in this: that we, the ignorant, have no real existence, and however strenuously we may exert ourselves, we have no "causal germ" in us which will develop into Buddhahood. The priests of the sect can marry and eat flesh. The original prayers of Amitabha in which the invocation of the Buddha's name is highly recommended, testify that the causal germ of Buddhahood, by virtue of the efficiency of the prayers, will be planted in us, which means that all that is necessary for us to be reborn in the Pure Land of Amitabha is now sufficient and fulfilled.

There are at present ten branches of the Shin Sect: Hongwanji, Otani, Bukkoji, Takata, Kibé, Kosho, Idzumoji, Yamamoto, Seishoji, and Sammonto.

Ji Sect This was first promulgated by Ippen (1239–1289). The principal ideas of the sect are: Life is a frail and impermanent thing, and as every moment of it flits away, every act of ours must be regarded as the last one on earth. When, perceiving the truth of this fact, we do not neglect in every thought of ours to invoke the name of the Amitabha Buddha, we shall surely reach the final blissful state of Buddhahood.

The head-temple, Shojokoji, is in Kanagawa prefecture.

Zen Sect Under this name three Sects are comprised: Rinzai, Soto, and Obaku.

The Rinzai Sect of Zen was first taught by Yeisai (1140–1215) who came back from China in 1192. Soto finds its first Japanese exponent in Dogen (known as Joyo Daishi, 1199–1253) who studied Zen in China during the Sung Dynasty and returned to Japan in 1234. Obaku was introduced to Japan by a naturalized Chinese priest Yin-gen (1592–1673) in 1653.

The Zen Sect teaches the doctrine which is known only to the Buddhas and the transmission of which takes place only from one mind to another. It transcends logic and objective understanding. We do not have to purify ourselves from sins, nor is it necessary to seek after supreme knowledge. The ultimate truth is not in more learning, thinking, or in discipline. It is above doctrines and meritorious deeds, and also above any special attainment. Zen teaches us to abide right in the truth and reality of life, every act of which will then reveal thousands of Samadhis. Whether lying or sleeping, whether drawing water or hewing wood, every movement grows full of significance. That is why Zen sums up its teachings in the following four phrases: "No reliance on word or letter; a special transmission outside of the scriptural doctrines; a direct pointing at the soul of man; and attainment to Buddhahood by seeing into one's own mind."

There are fourteen branches in the Rinzai Sect: Kenninji, Kenchoji, Tofukuji, Engakuji, Nanzenji, Daitokuji, Myoshinji, Tenryuji, Yeigenji, Shokokuji, Hokoji, Buttsuji, Kokutaiji, and Kogakuji. The Soto Sect has two head-temples, Yeiheiji, and Sojiji. Obaku is undivided, and its head-temple is Mampukuji, Uji, Kyoto prefecture.

Nichiren Sect This was founded by Nichiren (1222–1281) on the merits of the Saddharma-pundarika Sutra. The life of the Sect is in the seven syllables of "Na-mu-myo-ho-ren-gé-kyo," which is

called "Daimoku," or a kind of theme. As this is the title of the Sutra revealing the absolute oneness of all opposites, even evil-hearted ones will attain to Buddhahood if they recite it in sincerity, and along with it all the ten universes will be equally benefited.

This sect is sub-divided into nine branches: (1) Nichiren-shu (the head-temple, Kuonji, is in Yamanashi prefecture); (2) Hommon-shu, (Hommon-ji at Ikegami, Tokyo, and six other temples in Shizuoka prefecture are its head-temples); (3) Hokké-shu, (its head-temple, Honjoji, is in Niigata prefecture); (4) Kempon-hokké-shu, (Kochoji and four others in Shizuoka prefecture are its head-temples); (6) Hommyo-hokké-shu, (its head-temple is Honryuji, Kyoto); (7) Nichiren-seishu, (its head-temple is Daisekiji in Shizuoka prefecture); (8) Nichiren-shu-fujufusé-ha, (its head-temple is Myokakuji in Okayama prefecture); and (9) Nichiren-shu-fujufusé-komon-ha, (the head-temple, Honkakuji, is also in Okayama prefecture).

Christianity

Before the Restoration Christianity was first introduced into Japan by Francis Xavier, a Jesuit Father, who came to Kagoshima in 1549. This was the time when Nobunaga Oda was at the height of his power, and he gave great encouragement to the spread of the Christian religion. Hideyoshi Toyotomi, his successor, too, was kindly disposed towards it. Combined with the devout and untiring work of the missionaries, this attitude on the part of the authorities made it possible for Christianity to gain followers with wonderful rapidity. Their number is reported to have run into hundreds of thousands.

Hideyoshi, however, changed his policy later on. Christianity was interdicted, its followers were persecuted, and the missionaries had to leave the country. When the Tokugawa Shogunate was established, still stricter measures were adopted, especially after the Shimabara Rebellion in 1637. Christianity had now no hope of prospering under the rigorous Government policy of exclusion. The only port open to foreigners was Deshima, Nagasaki, where the Dutch traders were allowed to carry on their business.

The American envoy, Commodore Perry, came to Uraga in 1853, demanding a friendly commercial treaty with his country. The Shogunate Government granted this request in 1854 not only to America, but to Russia, England, France and Holland, and in the year following the three ports of Kanagawa, Nagasaki, and Hakadaté were opened to foreign trade. A party of American missionaries were the first to avail themselves of the opportunity thus offered to them. Among them were the Rev. J. Liggins, of the Protestant Episcopal Church of the United States of America, and the Rev. M. C. Williams, who came to Nagasaki in 1859. These were soon followed by Dr. G. F. Verbeck, of the Presbyterian Church (1859), and J. Goble, of the American Baptist Missionary Society (1860), and others. In 1864, the Rev. J. H. Ballagh, of the Dutch Reformed Church, came from America, and in the following year came Dr. Thompson, of the American Presbyterian Church.

In 1869, the Rev. D. C. Greene made Kobé the basis of his mission work representing the American Board of Commissioners for Foreign Missions. The first woman missionary, Miss Kidder, of the Dutch Reformed Church, arrived here in the same year. In 1873, the American Methodist Episcopal Church and the Canadian Methodist Church sent their missionaries, and in 1876 the Evangelical Association of North America started its propaganda work.

The Restoration When the Tokugawa feudal system collapsed and the Imperial House was restored to power, the edicts prohibiting "Kirishitan" were withdrawn, in the sixth year of Meiji(1873), and missionaries were officially permitted to establish schools, publish religious tracts, and preach their doctrines in all the sea-ports open for foreign trade. In 1872, the Rev. Brown and Rev. Ballagh of Yokohama established, aided by their young followers, a Christian church to be known as the Yokohama Yaso Kyokai, which was the beginning of the Union Church. In the following year a sister church was organized at Tsukiji, Tokyo. This was the first Christian church in the metropolis. In 1876 Nagasaki saw another church established. Later all these churches were federated under the name of the United Church of Christ in Japan. This was the origin of the Nihon Kirisuto Kyokai. The Rev. D. C. Greene who started his mission work in Kobé established a church known as the Settsu First Christian Church. This was the first Congregational Church ever organized in Japan, and developed into the present Kobé Kumiai Kirisuto Kyokai. In the same year the Umemoto-Cho Church came into existence in Osaka, which later came to be called the Osaka Kumiai Kirisuto Kyokai. Some

time before this, thirty-five students of the Kumamoto Foreign School, who were converted to Christianity under the influence of their American teacher, Captain Janes, came up to Kyoto, and entered the Doshisha College just established by J. H. Neeshima, who had lately returned from America. After their graduation from the college they grew active as propagators of Christianity, and built up the foundations of the Nihon Kumiai Kirisuto Kyokai. In 1872, the Rev. Loomis and Rev. Ballagh conducted a Bible class for young men in the above-mentioned Church at Yokohama every Sunday afternoon. In 1873, a Congregational Missionary, Dr. Berry, set up in Kobé a Sunday-school, probably the first one conducted in the Japanese language. As to the vernacular translation of the Bible, in which Dr. Brown had been engaged for some time, the work progressed rapidly early in the Meiji Era, and the New Testament was completed in December, 1879, and the Old Testament in 1886. The chief translators were Brown, Verbeck, Greene, and Maclay, while among the native assistants were Takakichi Matsuyama, Masatsuna Okuno, Masahisa Uyemura, Kajinosuké Ibuka, Goro Takahashi, and others.

Y. M. C. A. In 1880, the Young Men's Christian Association was first organized in Tokyo, and among the leaders must be mentioned Hiromichi Kozaki, Kajinosuké Ibuka, Masahisa Uyemura, and Yoshiyasu Hiraiwa.

In 1870, Miss Kidder opened a school for girls in Yokohama. This was the first institution of the kind in Japan, and from it developed the present Ferris School for Girls. Four years later another girls' school, Kobé Jo Gakuin, was erected in Kobé by the Congregationalists.

According to the statistics of 1882, there were in that year 145 foreign missionaries, 93 organized churches, 13 of which were self-supporting, 4,367 adult members, 39 mixed schools, 15 girls' schools, 9 middle schools, 7 theological colleges, 109 Sunday-schools, 49 ordained preachers, 100 assistant preachers, 37 Bible women, and 5 hospitals.

In 1883, the Church of Christ sent missionaries to Japan, and in 1885 the Presbyterian Church of the United States of America did the same. The American Society of Friends, and the Evangelical Protestant Missionary Society of Germany and Switzerland also despatched their agents. In 1886, missionaries came from the Methodist Episcopal Church, South, and in Osaka a hall was set up for the Young Men's Christian Association. In 1887 the missionaries and representatives of the Episcopal Church of England and America had a conference, the result of which was the organization of the Holy Catholic Church of Japan. In the same year, the American Unitarian Association sent its representative, the Rev. A. M. Knapp, and following him came the Rev. Clay McCauley.

Freedom of Faith On February 11, 1889, the Constitution was promulgated, and freedom of faith was definitely guaranteed by Article XXVIII. In that year, L. D. Wishard, International College Secretary of the Young Men's Christian Association, came, and planned out a summer school for Bible study for the first time in this country. Since then every summer sees its work carried on. The United Church of Christ in Japan changed its name into the Church of Christ in Japan, compiled a fundamental law, settled on its creeds, and at last became an independent organization. Soon after, they put up a Board of Missions and made progress towards financial independence.

In 1890, the Universalist General Convention of America sent its missionaries. In 1895 officers of the Salvation Army came, and Gumpei Yamamuro joined it, and they at once started on their propaganda work. In the same year, the United Brethren in Christ started a mission.

Until 1901 the foreign missionaries, had not been allowed to hold land in Japan, which greatly inconvenienced their activities. In that year the Home Minister gave permission to the Baptist Missionary Society in Japan to organize a corporation which could hold and manage lands and buildings for missionary purposes.

In 1905 the Japanese Congregationalists planned to be financially independent of the foreign mission by the end of this year; in this they were later successful.

In 1907 representatives of the Mthodist Church of Canada, the Methodist Episcopal Church, South, and the Methodist Episcopal Church convened in Tokyo with a view to effect a confederation of the three denominations in Japan. The First General Conference of the Methodist Church of Japan thus took place, and Yoichi Honda was chosen to be its first Bishop and was duly consecrated. In the same year F. L. Brown, of the International Sunday School Association, arrived and the outcome of this visit was the organization of the Sunday School Association of Japan, marking an epoch in the history of the

Sunday School of the Christian Church. The conference of the World's Student Christian Federation was also held this year in Tokyo, in which 160 foreign visitors took part representing twenty-five nations. This was the first world's convention of any kind in Japan.

Roman and Greek Churches. The Catholic Church has been active ever since the opening of the seaports for foreign trade. Missionaries from the Societé des Missions Etrangères in Paris are working all over the country, which is now divided by them into seven districts: Tokyo, Osaka, Hakodaté, Nagasaki, Shikoku, Niigata, and Sapporo, with a Bishop resident in Tokyo. In Shikoku there is a Spanish Dominican mission, while in Hokkaido the Franciscans have found their principal fields of activity, where are two Trappist monasteries. The Jesuit missionaries reached here again in 1908, but instead of following up their predecessors' work, they have now a college established in Tokyo and concentrate their efforts on education. Besides the Jesuits, those that are chiefly engaged in educational work are the Missionnaires de Marie, Société des Soeurs de Saint Paul, Société de Sacré Coeur and others. In the prefecture of Nagasaki, Catholics, who have been at work for the last three hundred years, though secretly, are still in the ascendency.

The activities of the Greek Church centered in the person of the Russian priest Father Nicolai, who came to Japan first as priest attached to the Russian consulate in Hokkaido in 1859. He reached Japan after crossing Siberia, and after settling in Hakodaté he baptized Takuma Sawabé and two other Japanese. In 1872 he came to Tokyo where he began missionary work. In 1884 he started to build a fine large church in Tokyo, which was completed in 1891. The church was regarded at that time as the greatest and finest building of the sort throughout Japan. The internal disturbances in Russia which followed the great world war made it very difficult to maintain this beautiful edifice, until in 1919 the followers succeeded in organizing an independent church known by the name of the "Orthodox Church of Christ in Japan."

The Japanese Christian Movement for 1936 Dr. William Axling, Honorary Secretary of the National Christian Council of Japan and Honorary Secretary of Tokyo Misaki Kaikan has summarized it as follows:

In things undertaken and results realized 1936 must be characterized as an average year for the National Christian Council. It is therefore a good year on which to base an evaluation of the worthwhileness of the Council and its work.

The Movement for Nation-Wide Evangelism. In accordance with the action of the All-Japan Christian Conference held in connection with the 1935 Annual Meeting, the Council assisted in organizing the Nation-Wide Union Evangelistic Movement and sponsored its work throughout the year.

This movement adopted two major principles of policy. First, to limit its activities to areas of life and methods which lie beyond the range of individual denominations. Second, to make it a union effort in the largest possible sense through securing the active co-operation of the evengelistic departments of all the denominations and national Christian organizations and getting them to endorse the movement and financially underwrite its budget.

Most of the communions heartily responded to this request for endorsement and financial support. This movement is unique therefore in that it has the official backing of most of the denominations and is financially underwritten by them.

It also decided to put heavy emphasis on the use of Christian literature and to make the "Kingdom of God Weekly" its official organ. This weekly continues to have the largest circulation of any Christian publication in the Empire and is the Christian movement's most effective literary evangelistic medium.

The Central Committee of the movement circularized the Christian forces throughout the Empire asking them to indicate areas of life where this movement ought to undertake special evangelistic efforts and how it could best contribute to the evangelization of their immediate localities.

Based on replies received the movement determined to capitalize the present wide-spread interest in religious education and hold special meetings for educators. Meetings for the principals of private and public schools have therefore been held in Tokyo, Osaka and Nagoya and were largely attended. The movement also decided to hold training conferences for church officers and Christians and meetings for the masses.

When Dr. T. Kagawa returned from his American-European trip he was asked to make a Home-Coming Evangelistic Tour of Tokyo, Yokohama, Nagoya, Kyoto, Osaka, Kobe, Hiroshima and Sendai. On this tour he spoke 35

times. His meetings were attended by 37,305 people.

For 1937 the movement has adopted as its slogan "Volunteer Evangelistic Groups in Every Church" and will press for the organization of laymen's and laywomen's evangelistic bands in every church.

Church Union. Another task entrusted to the Council by the All-Japan Christian Conference was to use its staff and good offices in pormoting the work of the Commission on Church Union. This commission organized itself into four subcommittees, a drafting committee, a committee on creed, a committee on government and a committee on finances. The committees on creed and government were asked to make an intensive study of the questions of a creed and the form of government for a united church and to submit the results of their investigation and study to the drafting committee to aid it in working out a basis of union.

The year's study led the commission to the following tentative decisions:

That instead of pressing for organic union from the beginning church union be realized on a federated basis of organization giving the existing communions considerable autonomy for the present.

That a Central Headquarters be set up whose work it shall be to correlate the various denominations, unify their programs and gradually work toward complete union.

That all new evangelistic efforts both within and outside of Japan be cooperative in character and planned and carried forward under the auspices of this Central Headquarters.

That arrangements be made to facilitate the passing of members from one denomination to another in order to stop the tragic leakage and loss to the Christian church because of the large number of unnourished and unrelated absentee church members.

The Religious Organizations Control Bill. When the government announced its intention to introduce a bill into the coming Diet looking toward the control of religious organizations the Council set up a representative committee to study the proposed bill and press for the elimination or revision of unfavorable features.

This committee made a careful study of the government's draft and submitted to the authorities a statement pointing out danger spots in the bill and suggested a series of revisions.

The government's open-mindedness and goodwill is indicated by the fact that it invited the Chairman of the Council's Executive Committee to serve on its Commission for the Study and Revision of the Religious Organizations Control Bill. This has not only greatly facilitated the matter of getting a full hearing for the criticisms and suggestions of the Council's committee but in getting the Christian attitude and point of view fully understood by the authorities.

An Enlarged Constituency. The reorganization of the Conference of Federated Missions which resulted in the turning over of all its executive functions to the National Christian Council brings the missionary body definitely within the Council's constituency. Moreover this action makes the Council the one all inclusive clearing house for the Christian movement in the Empire.

On the Council moreover it places the responsibility and task of correlating the work of missions and missionaries so that they shall increasingly become an integral part of the indigenous Christian movement and be given a worthwhile sphere of action within the framework of the Japanese church.

An Enlarged Field. The visit of General Secretary Ebisawa to Manchoukuo in June resulted in the organization of a cooperative set-up of the Manchurian Christians and initiated closer relations between them and the Council. There are also prospects that as a result of his visit the Japanese Christian churches in Manchoukuo will unite in forming an organization which will be related in some way to the Council.

Secretary Ebisawa went to Manchoukuo at the invitation of the Manchurian Christians and the Missions connected with the Presbyterian church in that area and the initiative toward closer relation between them and the Christians in Japan was taken by them.

Rural Reconstruction. The Council's Commission on Rural Evangelism has been active in two directions. Through Rural Secretary Kuribara it has promoted the holding of Peasant Gospel Schools and Conferences on Rural Reconstruction in different parts of the Empire. Secretary Kuribara has served on the faculties of thirteen Peasant Gospel Schools, lectured in six Theological Seminaries, given addresses in four government schools, spoken before seven Cooperative Associations and visited and spoken in forty (mostly rural) churches.

This commission has also devoted itself to furthering the project of launching a Christian Rural Life Institute. The proposal being that 25,000 yen be raised,

half in Japan and half by the cooperating Mission Boards in North America, for the purchase of land and the erecting of buildings in some rural district fairly near Tokyo, for the establishment of a training school for Christian rural leaders and a demonstration center for rural reconstruction on Christian principles. A drive for funds is being made both in Japan and in North America for the realization of this project.

In the Educational Field. The Council's Education Commission in cooperation with the Executive Committee of the Christian Educational Association of Japan has held repeated meetings to consider the question as to how Christian educational institutions can best meet the present national situation and make their largest contribution to the nation's youth and the nation's life. For the same purpose two conferences attended by leading Christian educators have been held during the year.

Under the same auspices a Summer School for Christian educators was held at Gotemba in July. This was attended by representatives from practically all of the Christian schools in the Empire.

Several meetings have also been held to consider follow up work in connection with the Educational Survey made some years ago, especially as related to the long discussed question of the establishment of a Union Christian University in Japan. This matter is still in the study stage.

The commission has also cooperated in promoting the publication of the magazine entitled, "Religious Education", which is widely distributed in the Christian and government schools of the Empire.

Social Welfare Activity. The Council's Commission on Social Welfare has been furthering the campaign against licensed prostitution. It presented an appeal to the Department of Home Affairs and the Police authorities urging the early abolishment of this nefarious system. It also circularized on nation-wide scale Christian institutions and Christians urging them to actively affiliate themselves with the Purity League in its drive against this system.

Feeling the need of more educational efforts in the creation of a social conscience and the setting up of social ideals the commission has called the attention of Christian schools to the need of providing courses and departments covering this field.

The commission also devoted considerable time to the revision of the Council's Social Creed. In its revised form it sets up the following social changes as the Christian goal for our day :

Worshiping God as our father, living in fellowship with mankind as our brothers, making the Christianized social life our ideal, and through the actual realization of love and justice as revealed by Christ, we strive to be loyal and obedient citizens.

We repudiate all forms of materialistic education, all forms of materialistic thought, all forms of social reconstruction based on force and strive to further the progress of the Christian type of character education.

Moreover we pray that from our number there may go forth many who in accordance with the principles and spirit of Christ shall by their lives give themselves to the solution of social problems.

We would make Christ's life a live reality in the total social structure. Inasmuch as the source of all things comes from God and should revert to God, we believe that all earnings from them should be dedicated to God and made available and used for the prosperity and welfare of mankind.

Based on these ideals the following ten points are advocated :

1. The freedom and equality of personal rights and equal opportunity for all peoples and races.

2. The sacredness of marriage and equal responsibility for chastity on the part of both men and women.

3. The betterment of the treatment accorded women educationally, socially, politically and in industry.

4. Respect for the personality of children and the prohibition of juvenile labor.

5. Encouraging the practice of making Sunday a public rest day. (With the expectation that wages will be paid.)

6. The abolition of licensed prostitution.

7. An aggressive advocacy of temperance on a nationwide scale.

8. The enactment and enforcement of social legislation such as : a social insurance law, a national health conservation law, a minimum wage law, a law legalizing labor unions, a law protecting tenant-farmers, an old age pensions law, a housing improvement law, a law for the protection of mothers and children.

9. An ethical regulation of the economic life such as : the enocouragement of cooperatives, the extension and perfection of urban and rural social betterment facilities and an impartial system of taxation.

10. The implementation of the Paris Peace Pact. The maintenance of the International Court of Arbitration. The

promotion of world peace.

Christian Literature. The Commission on Christian Literature has promoted the establishment of a Central Christian Library. This project has been definitely launched. It is housed on the seventh floor of the beautiful Christian Literature Society building where it has attractive and commodious quarters.

In order to promote the publication of Christian literature the commission called a conference of the publishers of Christian books and publications. As a result of this conference these publishers formed an organization which would enable them to cooperate more closely in the work of providing the nation with a greater variety and better type of Christian literature.

In the Student Field. The Council has also cooperated with the Spiritual Renewal Movement in its work of sending speakers to government and private educational institutions to address the faculties and students on subjects related to the inner life. During the year 104 such meetings have been held attended by 25,000 students and members of faculties.

Other Activities. In addition to the activities outlined above there have been interviews with government officials, conferences with Christian workers, the welcoming of prominent visitors from abroad and the arrangement of their schedules, keeping up vital contacts with the International Missionary Council and with the National Christian Councils in neighboring and other lands and a multitude of other matters. All in all the National Christian Council is filling an ever enlarging niche in the work of the Christianization of Japan.

State Regulation of Religions

Supervising Office A wholesale change of the governmental system took place at the time of the Restoration, and in the third year of Meiji (1870) the Mimbusho was established to take care of various affairs of the state, such as general home affairs, communications, etc. In the fourth year, this office was abolished, and the office of religious affairs was transferred to the Finance Department. With the establishment of the Kyobusho, or Department of Religions, in 1872, the shrines and temples were placed under the care of the new office. Then the Government appointed Shinto and Buddhist priests as official religious instructors who were to preach and educate the people according to the moral principles as follows: (1) to cherish reverence for the gods and the spirit of patriotism; (2) to elucidate Heavenly Reason and the principle of humanity; and (3) to honour and pay homage to the Emperor and to observe the Imperial ordinances. Afterwards the Kyobusho was abolished too, and all the business conducted by this office up to that time was transferred to the Department of Home Affairs which was established in 1873. The official appointment of religious instructors (Kyodo-shoku) was discontinued in 1884, and the business of appointing preachers was entrusted to the head-priests (Kwancho) of the various religious sects, together with the right of selecting the resident priest (Jushoku) for the temples under their jurisdiction. Each sect was, moreover, given the power of managing its own affairs under the supervision of the Government. Religion was thus separated from politics. With the promulgation of the Constitution on the 11th of February in the 22nd year of Meiji (1889), the principle of religious freedom was firmly established. In April, 1900, the former Bureau of Shrines and Temples was divided into two sections, i.e., the Bureau of Shinto Shrines and the Bureau of Religions. All administrative policy concerning the Shinto Shrines is now in charge of the former and is entirely independent of the policy governing religions. The Bureau of Religions was transferred to the Education Department in 1913, and is under its jurisdiction at present.

Administration of Religions At present, there are three kinds of religions in Japan. These religions are dealt with by the Government each in a different way, because Japan is still without specific laws defining the political status of these religions in connection with the State, though the principle of the administrative policy can recognize no such difference, as the Constitution gurantees freedom of faith. The Government, however, finds it natural not to mete out a uniform method of supervision over all these religions; for Buddhism, which has been in very close relation to the State and society for over one thousand years, and Shinto, which is the national cult of Japan, and Christianity, which was introduced to this country only half a century ago (putting aside the fact that it was once in this country a few centuries ago) can hardly be treated in a uniform method with satisfactory results.

From a practical point of view, the religious denominations or sects which are officially recognized and come under the proper jurisdiction of the Bureau of Religions at present are Shinto

and Buddhism. A religious order is a congregation of preachers and adherents following a definite system of creeds having temples or preaching halls from which their religious movements issue. Shinto and Buddhist sects have not yet special regulations concerning cases of secession or incorporation, inasmuch as they are not allowed to make such regulations without the approval of the Education Minister. But affairs concerning the inner policy of the various sects are generally left to their own self-government, though the religious sects concerned are required by the State to compile fundamental rules defining their administrative policies approvable by the Education Minister.

Alteration of Rules The approval of the Education Minister is also required when they abolish or alter these rules. Each sect, Shinto or Buddhist, is required by the Government to select a head-priest, or Kwancho to govern and represent that sect. The appointment of a head-priest also requires official approval. In the compilation of a constitution for each sect they have to define the following particulars: (1) the fundamental law, (2) the status of the preacher and his official title, and (3) the grades of preachers and their appointment and dismissal. These particulars are to be regulated by each Shinto head-priest. Meantime, each Buddhist head-priest is to regulate the following particulars: (1) the fundamental law, (2) rules concerning the management of temples, (3) the status of the priest and preacher and their official titles, (4) the appointment and dismissal of the resident priest, or Jushoku, of a temple, and grades of preachers, and their appointment and dismissal, and (5) the preservation of old historical documents, treasures, and properties belonging to the temples.

Besides thus defining the particulars as stated above, the constitution of each sect has to regulate, through practical necessity, various affairs concerning its self-government. It must define, for instanace, the functions and powers of the head-priest and the method of election; the organization and power of the council; functions of various officers; financial affairs; organization of a temple or a preaching hall; qualifications of a resident priest; affairs relating to the personnel, such as conferring honours or giving punishments; missionary work; education; and other functional activities.

While all the Shinto and Buddhist sects are thus placed under the direct supervision of the Government as far as such fundamental affairs as are mentioned above are concerned, they are left to the care of the local governments concerning the practical functionings of their propaganda work. When the Shintoists or Buddhists want to build their temples or preaching halls, for instance, they must approach the local governments for permission. As Buddhist temples are, on account of their historical significance, regarded as legal persons, the use of the temple grounds, changes in their acreage, cutting down of the trees, and disposition of immovable property, temple treasures, historical documents, or fundamental funds, etc. all require the approval of the local governor concerned.

Special Treatment of Christianity The Government gives no official recognition as regards the Christian denominations, because they, as such, stand in no legal relationship to the Government. In the case of Christianity, therefore, the official supervision does not go further than looking after its missionary activities, selection of preachers, establishment of churches or preaching halls, etc. The Ordinance No. 41 of the Education Office issued in 1899 requires that those who wish to engage in missionary work notify the local governor of the name of their religion and methods of preaching, with their personal history. When they want to build churches or other establishments for religious purposes, they have to approach the local authorities for permission, stating details of these establishments, methods of management and maintenance, qualifications of the preacher, and the process of selecting such preacher. In other words, the Government has special provisions for the Shinto and Buddhist denominations because of their peculiar historical status, while it is contented with being a mere overseer as regards Christianity. As far as their religious functions are concerned, however, the Government makes no distinction whatever between Shinto and Buddhism and Christianity. All religious sects are left to themselves unmolested as long as they do not disturb the peace of the country or practise immorality in connection with the propagation of their doctrines and the carrying out of their respective religious rituals.

Educational Institutions There are a large number of educational institutions established by various religious sects for the purpose of bringing up properly qualified preachers. Like other professional or general educational establishments, these religious schools are under the supervision of the Education Minist-

er. Meantime, charity works such as reformatories, dispensaries and other organizations financed by the religious bodies are placed under the jurisdiction of the Home Minister similarly with activities maintained by all other bodies.

Religions Movements in 1935–37. The religions revival in 1934 (see The Japan Year Book, 1935, P. 824) gave opportunity for the rise of many new religious bodies. People unsatisfied with old sects or denominations turned to preachers who were clever enough to attract believers by new doctrines taken from existing cults. "New religions" have become the vogue in the past three years. The rapid increase of their adherents has drawn the attention of the general public and especially of the authorities concerned.

Ōhmoto-kyo (see The Japan Year Book, 1934, p. 814) was founded in 1892, a link between the old and the new. In recent years it made great advances, but in directions viewed unfavourably by the authorities. On October 8, 1935, the Kyoto police raided the headquarters of the Ōhmoto sect at Ayabé, Kyoto, on the charge that the doctrines and activities of the sect were against public peace and amounted to lèse-majesté. A little later they arrested Onisaburo (or Wanisaburo) Deguchi, head of the sect, and many of its high priests, and in May, 1936, destroyed over 100 temples and buildings at Ayabé and Kameoka, Kyoto. The 3,000,000 believers in the faith are scattered all over Japan, Manchoukuo and other parts of the world without their leaders.

The Hitonomichi (the Way of Man) sect was first organized by Tokuichi Miki at Osaka, in 1925, as a branch of the Fuso sect of Sectarian Shinto. With its teachings on personal happiness and conjugal harmony obtainable by prayer, service and "O-furikayé" or transfer of physical ailments or family troubles to priests who would vicariously bear those burdens for the devotees, Hitonomichi gathered thousands of people to its temples and gained 1,000,000 adherents within but 10 years. Its early morning prayer-meetings, in Osaka and Tokyo drew over 1,000 people each regularly and became the wonder of Japanese religious circles. But this cult, too, was suppressed by the police in September, 1935, because of its founder's misdoings and as being against public peace, and ordered by the authorities to close its temples and cease preaching.

Of the Shinri (truth) movement, led by Entai Tomomatsu, a Buddhist priest who had become popular by his lectures broadcast in 1934 through JOAK, much had been expected in educated circles; but recently it has died down, owing mainly to its leader's lack of originality.

The Seishono Iyé (House of Growth) movement of Gashun Taniguchi has a large number of adherents among the salaried men in the larger business corporations. His book "Seimei no Jisso" (True Aspect of Life) which is bound in the Bible style and is indeed called "Seiten" (Holy Book)—compared with "Seisho" (Holy Book) which is the Japanese for the Bible—is said to have sold in millions. In this book the author includes verses extracted from the Bible, Buddhist and Shinto sacred books, and Confucian writings, and asserts that God is in no other place than one's own mind, that all ailments, whether physical or spiritual, are nothing but illusions of the unsound soul which seeks salvation in the world outside, and that one must find God and salvation in one's own mind. Salaried men who live in moderate comfort are easily caught by such doctrines in Japan as well as in other countries. These teachings bear a strong resemblance to Christian Science, and emphasise self-healing of diseases by finding God in the self and recovering peace of mind therefrom. Taniguchi's books, published successively on all subjects of the cultural life of the people, have gained a large circulation in the past three years.

Religious Statistics

The following are the statistics of preaching halls, preachers and adherents of various religious sects and denominations:

SECTARIAN SHINTO

(End of 1933)

Denomination	Preaching Halls	Preachers			Adherents (in 1930)
		Men	Women	Total	
Shinto	638	3,531	706	4,237	1,206,778
Kurozumi	454	3,850	544	4,394	551,236
Shusei	261	1,771	261	2,032	411,801
Taisha	208	2,914	145	3,059	3,343,477
Fuso	507	4,131	1,347	5,478	486,906

Denomination	Preaching Halls	Preachers Men	Women	Total	Adherents (in 1930)
Jikko	259	1,960	619	2,579	403,519
Taisei	208	2,132	503	2,635	728,373
Shinshu	331	2,163	802	2,965	2,039,381
Ontaké	777	6,020	2,357	8,377	738,647
Shinri	305	1,391	289	1,680	1,412,332
Misogi	36	1,381	200	1,581	337,283
Konko	1,186	2,083	921	3,004	747,869
Tenri	9,943	38,125	24,393	62,518	4,118,238
Total	15,113	71,452	33,087	104,539	16,525,840

Note : The "kancho" or the executive head of each denomination is not included in the number of preachers.

BUDDHISM

(End of 1933)

Denomination	Temples	"Kancho"	Priests Men	Women	Total	Adherents (in 1930)
Tendai	4,425	3	9,516	1,523	11,039	2,134,369
Shingon	11,922	10	12,999	685	13,684	8,526,867
Jodo	8,254	4	7,099	850	7,949	3,997,875

CHAPTER XXX

SOCIAL PROBLEMS AND SOCIAL WORKS

Social Problems

These may in the main be snmmarized under 5 headings :

(1) Poverty and Its Relief. In Japan the gap between rich and poor may not be quite so great as in some Western countries, but nevertheless it exists, and tends in some ways to become greater with the industrialization of the country. Poor-relief is one of the greatest problems of the authorities, for it must include the city slums, the beggars, and the increasing number of peasant paupers. In May, 1935, the number of the poor listed as coming under the poor relief protection law was 1,989,203, or 2.8 per cent of the total population in Japan proper.

(2) Condition of Labourers. This, with the attendant matters of pay and hours, especially in relation to international labour conferences and agreements, calls for careful Government handling : the protection of child and woman labour particularly so.

(3) Position of Women. The protection of women and the elevation of their social and legal status is in some ways especially an Oriental problem. Socially their position has been much raised of late years, till now it approximates nearly to that of men ; but the old discriminative laws enacted in the Meiji Era still handicap women in many respects. In regard to the age-old question of licensed prostitution the Government is planning the entire abolition of the system within a year or so, but statistics show, unfortunately a slight retrogression, for the number of women involved has slightly increased, owing perhaps to the recent financial depression.

(4) Public Health. In a country which carries such a dense population this is a matter of vital importance. Medical science in Japan is second to none in the world with regard to its recent progress and present position, her doctors and surgeons having made contributions of inestimable value to mankind, and in some cases paid for them with their lives. But difficulties attend its application. The cost of treatment and of drugs and chemicals is high, and suggestions have been made for the nationalization of all medical business in order to help the poor.

(5) Thought Guidance. The guidance of the people's thought through the eddying turmoil of modern ideas and theories, from Marxism to Fascism with all intermediate shades, and the handling of practical matters connected therewith, are of the very gravest concern to this country, and are engaging the deepest attention of the authorities. The final settlement of these matters must be largely dependent on that of the preceding problems, though some consider that more radical and direct action is necessary for its attainment than merely so-called social work. But inasmuch as most of these movements, radical or reactionary, include schemes for the sudden overthrow of the existing social system, neither the Government nor the people at large can regard them with unconcern.

The fourth problem, relating to Public Health, is specially treated in Chapter XXXII, while further reference is made to the others in the chapter on Labour.

Social Work

Before Meiji Era Prince Shotoku, Regent, established, in 593, Hidenin (a house for the poor), Sheyakuin (a medicine house for the poor) and Ryobyoin (a house for the sick). In 730 the Empress Komyo founded Hidenin and Sheyakuin at Nara. She herself washed the bodies of the poor and nursed the lepers.

Among other benevolent work which he did at places where he stayed during an evangelistic journey through the country Gyoki, a Buddhist monk who lived at the time of the Emperor Shomu (724–749), established 9 public lodging houses and a public bath-house at Arima hotspring near Kobé.

Hokin-in, a Buddhist nun and sister of Wake-no Kiyomaro, a famous loyalist, made an appeal for, saved, and took under her care 375 rebels who were sentenced to death in 764. When a little later, at the end of the 8th century, famine struck Kyoto and children were abandoned on the streets she gathered 83 under her motherly care. This was the beginning of orphanges in Japan. Her example was followed by the Empress Masako, consort of the Emperor

Junna (823–833), who took care of many orphans and abandoned children in Kyoto, and who in 876 established a leper asylum in the precincts of Daikakuji temple, Kyoto.

In 1180 Jugen, a monk, built 15 public bath-houses for the poor. Kosho, another Buddhist monk, worked for prisoners, taught beggars and outcasts to refrain from drinking, and instructed prostitutes in the doctrines of Buddhism.

The monk Ninsho of Seidaiji temple, Nara, followed the example of Prince Shotoku and repaired houses for poor patients and lepers. For lepers he built an asylum which is still standing at Kitayama, Nara, and is under Government protection as a specimen of social work of early times. Later he became the superior of Gokurakuji temple at Kamakura and established, in 1287, an asylum for the poor. In the following 20 years the asylum accommodated over 57,250 patients, of whom over 46,800 were cured. At the foot of Kamakura hill he also built a house for sick horses.

Public baths for the poor were prevalent in the Kamakura Age (1192–1337). It was during this period that nunneries were first opened for the protection of women who were maltreated by their husbands, something in the manner of the 6 cities for refuge mentioned in the old Testament, Numbers, chap. 35. Two of these have remained to the present day: one, Tokeiji at Kamakura which was rebuilt in 1285 by Sadatoki Hojo for his mother; the other, Mantokuji in the country of Nitta, Gumma prefecture, which in the year 1591 was to accommodate a daughter of the Tokugawa. These nunneries were highly admired because of the nuns who came from warrior aristocrats and could stand against local authorities in protecting the weaker sex who took refuge in the nunneries. They became know as Enkiridera or divorce temples.

In 1670 Tsunanori Mayeda (1643–1742), the lord of Kaga, present Kanazawa prefecture, established public lodging houses for beggars and poor patients on a hillside south of his castle in Kanazawa. There were 45 houses, each measuring 12 by 120 feet. When opened 1,753 beggars and outcasts were taken in. Poor travellers were given expenses at leaving and unemployed artisans were cared for till they found suitable posts, while others were taught small trades. One of the latter was skilled in sword making and swords signed by the swordsmith "Hinin Kiyomitsu" or beggar Kiyomitsu are highly admired as masterpieces.

The blind were early protected by the Imperial House and in the Nara Age the Kugas took charge of them by Imperial order. Music was taught them to enable them to earn a living, there thus arose many first class blind musicians of the "biwa" or the "koto". In the Yedo Age the blind received relief money or were trained in acupuncture and massage. In 1722 the Tokugawa Shogunate built an asylum at Koishikawa, Yedo (Tokyo) for patients of the poorest class. The capacity at first was 40 beds, but later it was increased to 150.

Kanonko, a Buddhist corporation, was established in 1830 by Sukenari Naha of Akita. Later 72 donors came to his help and the aged, invalids, the sick, the deformed and the mentally deficient were cared for. In 1930 the corporation had a fund amounting to ¥51,887 and 2,760 koku of rice.

The above are a few examples selected from among numerous recorded instances of social work in old Japan. It must also be noted that relief work either by the government or individuals necessarily followed natural calamities in all ages on a considerable scale.

Meiji Era The Nagoya earthquake in 1891, the North-Eastern tidal wave damages and the famine in 1896, had quickened the development of orphanage work, and at the time of the Sino-Japanese and Russo-Japanese wars relief work for soldiers, child protection, and free medical treatment were also being taken up but mostly by philanthropic individuals so they hardly differed from the old-fashioned benevolent and rescue work. The World War served as a great stimulus for the development of modern social work, for the economic, social and moral changes suddenly brought about at that time and after the great conflict raised various kinds of social problems and at the same time accelerated progress in all kinds of social work, such as relief of the poor, free medical treatment, provision of houses, employment exchanges, child protection, settlement work and the like. The great earthquake of 1923 was an epoch-making event from the standpoint of the development of such work.

From the beginning of the twentieth century the Japanese Government has passed many laws on social work, the most important of them being:—the Military Relief Act of 1917, the Tuberculosis Prevention Act of 1919, the Employment Exchange Act and the Housing Association Act of 1921, the Health Insurance Act of 1922, and the Insanitary Houses Improvement Act and the public Pawnshops Act of 1927.

Social Bureau In regard to the ad-

ministrative organization of social work, before the World War there were only a few officials engaged in reform and relief work, and these were tucked away in one corner of the Department of Home Affairs. But in August, 1917, a relief section was established in its Local Government Bureau. In 1919, this section was called the Section of Social Affairs and in 1920, it became the new Bureau of Social Affairs and a central organization for social work; in 1922, the present independent Social Bureau came into existence and the administration of all social work throughout the country was brought under its control. The present social work in Japan is summarized in March, 1932 as follows: the existing number of social work institutions and organizations, both public and private, was 6,278, with an annual expenditure of ¥41,769,538 and the total amount of their property was estimated at ¥215,025,943.

The present tendency of Japanese social work is paving the way for the transformation of social work into a definite governmental social policy. While the old benevolent work has developed into the present social work, the fundamental idea and methods have undergone a great change. The present social work is carried on not necessarily with the idea of benevolence but rather on the principles of social solidarity and mutual help. From the standpoint of public welfare and mutual responsibility, modern social work has as its aim the solution of social problems and positive social reconstruction to accomplish the social welfare policy in co-operation with legislation on labour and social insurance.

Imperial Participation The Imperial House has been one of the leading factors in the promotion of Social work in Japan. Not to speak of the Imperial gifts in olden times, the Imperial donation of ¥1,500,000 in 1907 was the commencement of modern social work in Japan on a considerable scale because it called forth contributions from the people amounting to ¥24,350,000, and a society was organized for medical treatment for the poor. The annual Imperial donation for representative social work all over Japan was begun in 1921. The Imperial House has always taken the initiative in giving large amounts of money for social work of different kinds with a full understanding of the aim of modern social work.

Administration and Expenses

Social Work Administration The matter of paramount interest at the beginning of 1937, was the improvement of the administrative system of labour exchanges, the institution of the Mother and Child Protection Law, and the revision of the Military Relief Law, the Relief Law, and the Ainu Protection Law, which were passed during the 70th session of the Diet.

In order to investigate all phases of social work the Social Work Investigation Commission increased the number of its members in July, 1936, and the above social laws were drawn up according to the advice of the Commission.

Legalization of Homen Iin (Block Committee) System The Homen Iin or Block Committee system is to appoint, by prefectural governors or other responsible bodies, honorary committees of those private persons who are interested in social work and are able to get in easy touch with the people who need relief, so that proper relief is given the poor and the maximum results obtained. The system originated with the establishment of an advisory committee to the Saiseikai association in Okayama prefecture in 1917. Since then, partly because of the recent trend in social affairs and partly by the recognition of the good results brought about by the activities of the Committees, the system has spread to not only all prefectures in Japan proper, but also to Taiwan and Chosen. The promulgation of the revised Relief Law in 1931 required greater activity of the committees.

At the beginning of 1936 the number of the Block Committees reached 40,700 in Japan proper and some 1,300 in the Colonies. The managing bodies of this system are the prefectural authorities, though there are a certain number of city, town or other private organizations. At the end of 1934 the system was established in 8,236 cities, towns and villages, while there were 3,297 without it.

The number of matters handled by the Block Committees increases every year, it reaching in 1935 as many as 6,000,000. The number of poor families registered on the cards of the Block Committees all over Japan proper reached 490,000 with over 1,990,000 people at the end of 1934, the percentage to the total population of the country being about 5% in urban and 2.5% in rural districts.

Inasmuch as the Block Committees exercise a function which bears upon the fruits of the social policy and enterprises of the country, the necessity of legalizing the system has been pointed

out not only by the committees themselves but also by others. Reasons for legalizing the system are: first, by giving it legal status the Government may utilize the system for carrying out smoothly various kinds of administrative work and may increase efficiency in the administration of social work; in the second place, the function of the committee is not only to give material aid to the needy but also to improve their moral character. Their guiding principles, therefore, should be clearly set out in law; and in the third place, the work of the committees has in the past been carried out independently in the various districts so that the management and results have differed widely and national unification and proper control have become necessary. The Imperial Ordinance for Block Committees (Imperial Ordinance No. 3,980 of 1936) was promulgated on November 14, 1936 and was enforced as from January 15, 1937. The principal points to be noticed in the Ordinance are that guiding principles and the duties of the committees are clearly stated; that except in Tokyo and Yokohama the work is to be under prefectural management; that the selection of the committees has been made very strict; that the Block Work Commission has been established and that heads of cities, towns and villages are to be present at the meetings of the commission to make the relations between the committees and city, town and village authorities closer.

CONDITIONS OF THE WORK OF THE BLOCK COMMITTEE

(March, 1935)

Number of committees.

Prefectural	City	Town and village	Private bodies	Total
45	6	26	3	80

Number of blocks.

In towns and villages	In cities	Total
29,502	9,752	39,254

Number of families and their members in cities, towns and villages where the system is established and the number of poor families and their members which are registered.

Kinds		Total number of families	Registered Serious cases	Registered Ordinary cases	Registered Total
Families	Cities	4,571,777	114,916	155,582	270,498
	Towns and villages	6,665,963	55,696	169,369	225,065
House members	Cities	21,975,800	459,470	640,906	1,100,376
	Towns and villages	35,396,049	183,331	706,367	889,698

Revision of the Ainu Protection Law As regards the protection of the aborigines or Ainu of Hokkaido the Ainu Protection Law was enacted in 1889. But since the Ainu have advanced in many ways, and conditions in Hokkaido have changed with the progress of development work in the island, it became necessary to revise the law to conform with the changes in the life of the Ainu and their environments. The revised Ainu Protection Law which was passed in the 70th session of the Diet recognizes the use of land to some extent, as a means of extending relief.

For Koreans The number of Koreans in Japan proper which was 118,000 at the end of 1924, increased to more than 608,000 at the end of 1935. Their language, manners, and mode of living, differ so widely from those of the Japanese that they were liable to cause much trouble, and it was decided to educate, lead and encourage them to raise their standard of living. For that purpose a sum of money was budgeted and proper facilities given.

Expenses The expense for social work are derived from three sources, State, local and private. These expenses have increased on account of the rapid development of the work, especially since the rice riots in 1918 and the Great Earthquake of 1923. The estimated expenses of social work borne by the National Treasury for 1937-38 reach ¥18,172,156.

Child Protection

Child protection in Japan is divided into the following nine main classes :— (1) Care for women in pregnancy or confinement, (2) care for infants, (3) for weakly children, (4) for children of the very poor, (5) for the education of children, (6) for child-workers, (7) for maltreated children, (8) for children to be reformed, (9) for abnormal children and (10) for mother and child.

Women in Pregnancy or Confinement The infant mortality rate of Japan was lower until 1900 than in Western countries, but since then it has gradually risen, till it reached the deplorable figure of 189 deaths for every 1,000 births in 1918. Though there has been a decrease since then, in 1933 the rate was still as high as 12.1 per cent. As for the stillbirth rate, though there was some tendency towards a decrease, it was 5.2 for every 100 births in 1934, the total number of still-births reaching 113,043, that is, 1.66 for every 1,000 of the population. The greatest emphasis in child protection is laid on the protection and aid of expectant mothers, or the protection of children before and at the time of birth. For this kind of work there are at present such organizations as maternity hospitals, visiting midwives and confinement advisory institutes, besides legislation for maternity protection. In 1934 there were 48 maternity hospitals throughout the country, while visiting midwives' organizations numbered 493. Legislation for maternity protection is included in the Factory Law, the Mining Law and the Health Insurance Law. The first two laws provide that owners of industrial and mining plants shall not require expectant mothers to work if they apply for leave of absence ; after child-birth the mother shall not be required to resume work for 6 weeks, though if she requests work after 4 weeks and a doctor certifies her as fit, she may be allowed to resume it.

According to the Health Insurance Law, persons insured are to receive 20 yen for the expenses of confinement and also a daily amount corresponding to 60 per cent of each day's wage throughout the non-productive period for 28 days before and 42 days after childbirth.

Infant Protection The institutions now existing are divided into the following four kinds :—(a) hospitals for the unweaned pauper infants, (b) day-nurseries, (c) institutions for providing milk or other nutritious food for sickly and undersized children, and (d) infant health consultation institutes.

(a) Infant hospitals. There were 20 infant hospitals in the country in March, 1934. Of these 5 were established by public authorities and the rest were managed by private bodies or individuals.

(b) Day-nurseries. The demand for this work has become greater year by year, owing to the recent development of industry and the influx of population into cities. The oldest institute for this work was the one established by Mr. Shobi Akazawa in the city of Niigata, June, 1890. In March, 1934 there were 697 in the country, of which 135 were public establishments.

(c) Institutions for providing nutritious food. The work for providing milk was first undertaken by the Hygiene Bureau of the Home Office with the help of the city of Tokyo as an emergency measure immediately after the Earthquake of 1923, for infants whose parents were quartered in parks or other places of the city. There were 6 such organizations.

(d) Infant health clinics. The first independent organization for this kind of work was the Osaka Children's Clinic established in 1919. In March, 1934 there were 144 such advisory institutes.

Child-Protection As for the legislation for the protection of poor children, it is provided for in the part concerning children in the Regulations for Relief of the Poor promulgated on April 2, 1929. According to the national survey made by the Bureau of Social Affairs 1926, the number of widows and their children and children of widowers or whose parents were destitute of daily necessities was 133,588.

(a) Orphan Asylums. As was the case in Western countries, the orphanage may be said to have been one of the earliest institutions that led the Japanese toward social relief work in general. The work has made remarkable progress and is supported by the public with better understanding and large contributions. In March, 1934, there were 129 orphan asylums in the country of which only 5 were founded by public bodies. The total expenses of these asylums in 1933–34 were ¥850,941 for 7,596 children, chiefly met by incomes from the funds, incomes from business, subscriptions and public or private donations.

(b) Protection of weakly children. Physically weak children are cared for in recreation houses located near the sea or in the woods. The first example of this kind of work was that of the Tokyo Child-Nursing Institute which took a certain number of weakly children to the seashore of Boshu in 1900. Later, in June, 1926, the Child Protection Society, a corporation established in the compounds of the Bureau of Social Affairs, took up the work and has since provided a model example. As for the medical treatment of weakly children, the Children's Charity Hospital and the Children's Department of the Osaka Branch Hospital of the Japan Red Cross Society have been producing good results.

(c) Protection of Children of School Age. The elementary school attendance in Japan surpasses most of the nations of the world in its high rate. But there are a certain number of children who are kept from school partly through the operation of Article 33 of the Regulations for Elementary Schools, which recognizes as right in certain cases the non-attendance of children of school age, and partly because of poverty of the family. In March, 1933, the number of such children was 31,271. Encouragement of school attendance of these children, in some way or other, is made by the Government and various private bodies. Every year the Education Department gives Common Education Encouragement Grants to prefectures for the purpose of encouraging children to attend school. Owing to this help, the rate of school attendance of children in general has increased in a notable degree, and the percentage of daily attendance was 99.58 in the school year 1934–35.

The number of schools for giving poor children compulsory education and the number of those which have evening classes for the same purpose was 37 with 6,759 pupils. Besides these schools there were 16 nurse-maids' schools with 504 pupils, at the end of March, 1934.

The heavy depression in farm and fishing villages deprived many elementary school children of their lunch and the Government bore the expenses for their lunch for three years, from April, 1932 to March, 1935. The disbursement

of the National Treasury for the purpose was ¥668,101 for 1932–33 ¥1,069,536 for 1933–34 and ¥1,481,873 for 1934–35. The number of children benefited was 425,628 in 13,865 schools during the year 1932–33, and 512,632 in 13,614 schools during the following year.

(d) Protection of Child Workers. The International Labour Conference paid great attention to this problem of protection of child workers, and its first conference, in 1919, adopted an agreement relating to the minimum age of child workers employed in industries and to child night work; at the second Conference, in 1920, an agreement relating to the minimum age of child workers at sea, was reached; and at the third Conference, in 1921, an agreement relating to child workers in agriculture was arrived at. In Japan, there had been some laws in force already, but the International Labour Conference, and recent labour conditions necessitated the revision of these laws and regulations. The legislative measures now in force for protection of child workers are the Revised Factory Law of 1923, the Minimum Age of Industrial Workers Law of 1923, the Regulations for Relief of Miners of 1926, and the Minimum Age of Seamen and Certificate of Health Law of 1923. In the Revised Factory Law Article III provides that children under 16 years of age and women shall not be employed more than 11 hours a day (exception being 15 hours for certain kinds of occupations.) Article IV prohibits their night work, and Article VII states that they shall not be employed in dangerous work. In the Minimum Age of Industrial Workers Law Article II provides that children less than 14 years of age shall not be employed in industrial work, but those children over 12 years of age who have finished the ordinary elementary school course shall be exempted from this rule. In the Regulations for Relief of Minors Article VI provides that children under 16 years of age and women shall not be employed more than 11 hours a day, and Articles XII and XIII that children under 16 years of age shall not be employed in dangerous work. In the Minimum Age of Seamen and Certificate of Health Law Article II provides that children less than 14 years of age shall not be employed, and Article III that in case of children under 18 years of age being employed a doctor's certificate of health must be obtained. Just before the enforcement of these laws, that is, at the end of 1925, there were 474 children over 10 and under 12 years of age and 6,709 children who were over 12 and under 14 years old who had not yet finished their compulsory education but were employed in industries. However, the Minimum Age of Industrial Workers Law enforced on July 1, 1926, has since prohibited their employment.

(e) Reformatory Work. In March, 1900, the Reformatory Law was enacted and the establishment of prefectural reformatories was encouraged by the Government. According to this law, however, their establishment was voluntary. In 1908, the law was revised and Prefectural authorities were compelled to found reformatories. Within two years of the enactment of the Law 30 reformatories were founded, both public and private. In August, 1917, an ordinance in regard to the founding of a national reformatory, which had been pending for many years, was promulgated, and in March, 1919, a State Reformatory, named the Musashino-Gakuin, was founded in a suburban village of Tokyo. The bills for juvenile courts and houses of correction, passed by the Diet in April, 1921, as the Juvenile Law and the House of Correction Law were revised and promulgated in May, 1933, as the Juvenile Protection Law, effective from October 1, 1934.

In October, 1935 there were 53 reformatories, the capacity being for 2,688 children. The estimated expenses amounted to ¥677,312 for 1934–35. In addition to these reformatories, there are 31 Correction Societies which are taking care of boys and girls who are not under the direct care of the reformatories.

(f) Protection of Abnormal Children. Blind and deaf-mute children are taken care of in blind schools and deaf-mute schools. The number of organizations for protecting feeble-minded and other mentally defective children was 8 in all, of which only one, that is, the Imamiya-Gakuen established by the City of Osaka, is a public one, the aggregate number of inmates was 249, in March, 1934. It is estimated that there are over 5,000 such children left entirely to the ineffective care of their parents.

(g) Prevention of Maltreatment. The Law for the Prevention of Child Maltreatment, which was promulgated with Law No. 40 in April, 1933, lays down the power of prefectural governors to give adequate warning against maltreatment of children by the people who have power over them, makes provisions for putting such children under the care of suitable persons when necessary; and prohibits having such children engage in such performances as acrobatics and circuses or in infamous houses. It was put in force on October

1, 1933 and in the half year from October 1, 1933 to March 31, 1934, the number of children protected by the Law was 593; of the total 179 were because of maltreatment by parents or relatives, while 414 were forced to overwork in petty shows or as street singers, geisha girls, etc.

The number of children protected by the Law in 1934–1935 was as follows:

Kind of Protection	Boys	Girls	Total	Maltreated by Parents and the Like	Maltreated by Others
Advice	68	76	144	79	65
Left with parents or others on condition	9	16	25	21	4
Protected by severing from the maltreating persons	70	64	134	119	15
Total	147	156	303	219	84
Prohibition of the use of such children			352 cases	16 indicted	

Mother and Child Protection With the institution of this new law the State has taken the responsibility of assisting unsupported mothers, who are unable to educate their children on account of poverty. According to investigations made by the Social Bureau in May, 1935, there were 95,000 such mothers and children in Japan proper. Hitherto the protection of helpless mothers and children has been carried out by many public and private benevolent bodies, and under the general Relief Law. The conditions of the relief of mothers and children under the general Relief Law, in 1932–34 were as illustrated by the following table, not including other homes or dormitories for the same purpose which totalled 42 in all Japan.

RELIEF OF MOTHERS AND CHILDREN, 1932–34

(Amount in yen)

Year Fiscal	Children under 13 years old		Nursing Mothers		Total	
	Number	Relief Money	Number	Relief Money	Number	Relief Money
1932	63,140	1,301,395	1,352	35,571	64,492	1,337,096
1933	84,566	1,984,723	1,758	58,098	86,324	2,042,821
1934	91,946	2,052,264	999	19,445	92,945	2,071,709

In order to make the relief of these mothers and children more complete the new Mother and Child Protection Law was passed at the 70th session of the Diet. Article 1 of the Mother and Child Protection Law states that those mothers or grandmothers who have children under 13 years of age and have to keep living on their own sole responsibility and cannot live or bring up children because of poverty are protected in accordance with the provisions of the law.

Economic Protection

Supply and Improvement of Houses (a) Building and Management of Houses by Public Bodies. In the year 1918, to meet the pressing need of supplying economical and at the same time sanitary houses a note was issued to encourage public bodies to build and supply houses, the building cost of which might be loaned from the Funds of the Deposits Bureau of the Finance Department. This loan together with a loan from the Reserve of the Post Office Life Insurance greatly facilitated the building work. Several other means were adopted to facilitate the work, namely, the sale of building materials produced from the Government forests at low cost, reduction in or exemption from freight charge for transportation of building materials, application of the Land Expropriation Law, if necessary, in case of buying land for the building of houses of public bodies, and freedom from the Registration and Construction Taxes.

The Government issued the Housing Association Law in April, 1921, and it was put into force the same year. Associations are to be legal persons possessing several privileges in respect of taxation, acquisition of land, etc., working funds being loaned to the associations from the Funds of the Deposits

Bureau of the Finance Department through the prefectural offices. The Dojun-kai, a building corporation, established immediately after the great earthquake of 1923 with a fund of ¥10,000,000, a part of the contributions for the reconstruction of Tokyo and Yokohama, has supplied many dwellings and apartments for the people in these two cities, independent of the government measure.

The sum of low interest-rate money advanced by the Government since 1921 amounts to more than ¥135,000,000. Demands for dwelling-houses gradually decreased after 1929, and the sum advanced for the purpose has decreased accordingly. The number of dwelling-houses built under the law up to 1935 reached 83,000 (of which 6,000 were built through the Wooden Stores Construction Fund.) At the end of 1936 the number of the Building Societies was 2,813 with a membership of more than 31,620, and total sum defrayed for buildings reached ¥69,300,000.

In addition to the supply of dwelling-houses in general the Government subsidized the reconstruction of a great many houses damaged by the Great Earthquake and Fire in 1923, the earthquakes in Hyogo prefecture in 1925 and in 1927, in Izu peninsula in 1930, by the tidal waves in the north-eastern districts in 1933 and by the typhoon in the Kansai districts in 1934.

(b) Enforcement of the Insanitary Dwelling Site Improvement Law. Supply or dewelings is one aspect of this question and their improvement is another. The first step taken by the Government in the latter was to improve and remake the sites in cities where poorly built houses were crowded together. A nation-wide investigation made in June, 1925, showed that there were 217 such quarters with over 72,600 families and over 309,9000 inhabitants. The land level was generally low, the quarters naturally damp, and an intricate network of unpleasant marrow roads, together with a congestion of small but not at all compact houses lacking in proper light and ventilation, made the place an unplanned hodge-podge. For the start of their programme, the Government, taking up a plan to remake such quarters existing in the so-called six largest cities (Tokyo, Osaka, Nagoya, Kyoto, Kobé and Yokohama) and in the rural districts contiguous to them, enacted in March, 1927, the Insanitary Dwelling Site Improvement Law which was enforeced in the same year. Subsidies granted to local governments from the national treasury for this purpose amounted to ¥3,200,000 in 1927–1935. The work is to be continued till 1943 with a subsidy amounting to ¥1,707,685.

Public Lodgings Single working men, unemployed persons and the like, as a rule, sleep at imperfectly-equipped doss-houses or cheap lodgings, or live with others. In 1925, there were 8,873 doss-houses with 92,861 monthly sojourners who had families, 200,518 single persons and 208,775 one-night lodgers, amounting to 502,154 persons in all. This situation was not at all desirable viewed from any angle, and the preparation of sheap yet healthy public lodging- houses seemed an urgent need for the welfare of labourers and the like. The number of such lodgings in March, 1934, was 154, with 3,476,659 one-might lodgers in 1933–34. Of the total number of lodgings 67 are free, the rest charging 10, 15 or 20 sen a night.

Public Markets The public markets are retail markets managed by public bodies or public welfare organizations having as their aim a cheap supply of food-stuffs and other daily necessaries. According to the investigation made in November, 1921, by the Bureau of Social Affairs, the average cost of food-stuffs of the poor families in the city of Tokyo was 54.7% of their total living expenses. In August, 1918 a rice riot, which was started by the poor housewives at a small village of Toyama prefecture, spread over the country like a prairie fire. The situation awakened Imperial solicitude, and ¥3,000,000 was granted for relief from the Privy Purse. The Government also provided ¥10,000,000, and the amount of contributions by wealthy men and benevolent persons reached ¥25,000,000. This money was used in giving rice to the poor in the country and in opening establishments where rice was sold at lower prices. In December of the same year. The Government issued a note encouraging the establishment of public markets, and made available loans at a low rate of interest for the necessary expenses in establishing such markets. In March, 1934, there were 277 such markets opened in all prefectures but 6, and sales for the fiscal year amounted to ¥52,939,432.

Lunch Rooms The object the people's lunch rooms, whether attached to a public lodging-house or independent, is to provide labourers, small-salaried men and the like with simple, wholesome and sanitary meals at cheap rates. In March, 1934, there were 68 of these people's lunch rooms, most of them managed by public bodies and located in cities and towns, with 882,191 meals taken in a month. Each meal cost from 12 to 20 sen.

Public Baths Japanese people greatly enjoy their baths, but only a small proportion of them can do so in private. The majority have to utilize public baths. Moreover, it is not very infrequently the case that people take fewer baths than they require as the bath-charges are not low enough, herein lies the need of sanitary, well-equipped, cheap or free public baths. The number of public baths in March, 1934, was 166, partronized by 1,925,620 bathers a month.

Public Pawnshops The pawnshop and the money-lender are utilized by the people of small means as a simple and popular means of monetary circulation. The Public Pawnshop Law, promulgated in 1927, regulated managing bodies subsidies of 50 per cent of equipment expenses from the national treasury, loans, compulation of interest and term of pledge. The present financial depression throughout the urban and rural districts has caused unprecedented tightness of money among the salarymen, labourers and farmers of smaller means, and the need for public pawnshops has become more acute. The estimated amount of subsidies for the public pawnshops for 1937–38 is ¥90,000.

The number of public pawnshops which was only 71 at the time of the enactment of the Public Pawnshop Law, has increased every year since and reached 1,091, at the end of April, 1936. Since the economic crisis of 1932, money has become tight in the rural districts, so that the Government has been making special efforts to establish pawnshops in those districts.

However, when the above mentioned number of public pawnshops is compared with that of private pawnshops which numbered 12,700 at the end of 1934, it is still larging far behind. In view of this the Government is determined to make further efforts for their establishment.

In examining the number of people who are benefiting from the use of pawnshops, classified according to the kinds of occupation, we find labourers are greatest, followed by small retailers, small-scale manufacturers, farmers, salarymen and fishermen in the order named. It will be specially noted that the member of fishermen and farmers has increased conspicuously since 1932.

PAWNERS AT THE PUBLIC PAWNSHOPS

	Pawnshops	Pawners							
		Labourers	Day-labourers	Small Industrialists	Small Merchants	Farmers	Fishermen	Others	Total
1931–32	314	393,762	112,888	129,556	229,502	77,590	44,976	176,101	1,164,375

Protection of Unemployed

Employment Exchanges There have been from olden times private employment exchanges called "Keian" or "Kuchiireya" conducted by individuals. But there were no free exchanges until 1901, when in Hongo Ward of the city of Tokyo there was established a free lodging-house for low class labourers and the unemployed, and along with this charitable work the first private free employment exchange was founded for the lodgers in 1906. The earliest public employment exchanges were established in Tokyo in 1911. At the close of the Great War the Home Office felt the urgent necessity of extending and developing the employment exchanges in order to meet the needs of the time. In 1920, the Office put into circulation a low interest loan for the establishment

of employment exchanges to cope with the demands caused by an extreme business depression. And in June of the same year, the Home Office, in order to systematize the work of employment exchanges, took charge of all the affairs relating to them, and in order to extend, unite and develop them, allowed the Kyocho-kai to start a central managing office of all the employment exchanges in the country.

(a) Employment Exchange Law. Complying with the general demand, the Employment Exchange Law was issued in 1921. According to this Act, employment exchanges are, in principle, public organizations. They are voluntarily established and conducted by the heads of cities or towns, but in some instances the Home Minister gives orders for the establishment in places where he thinks the conditions demand it. The National Government subsidizes them to the extent of one-half of the expenses for buildings and equipment at the beginning, and one-sixth or less of other expenses. One Central and several Local Employment Exchange Bureaux have been founded for the those exchanges in the country, and the work is under the supervision of the Home Minister and the Directors of these Bureaux. A standing committee is established to direct the management of the exchanges. There may also be established private free employment exchanges with the permission of the administrative authorities, and the aid afforded by all these employment exchanges must be free of charge.

After the enforcement of this Law, in November, 1922, the convention relating to unemployment, adopted by the First International Labour Conference at Washington, was ratified and published for the encouragement of this kind of work. In addition to the provision above mentioned, the Regulations for Enforcement of the Employment Exchange Law were revised, 1924, in order to systematize the connections among employment exchanges, and there were also newly-introduced regulations for the establishment of seasonal-employment exchanges, and of employment exchange committees in cities and towns for the promotion of this work. It is true that there are still a great many employment exchanges run for profit, but owing to the increase and improvement of public employment exchanges they are gradually decreasing. And to conform with a resolution adopted at the Washington Conference of 1919, the National Government enforced from the 1st of January, 1927, Regulations for the Control of Employment Exchanges for Profit.

In 1936 an improvement was made in the administrative organization concerning employment exchange and a subsidy was granted, as a piece of relief work, for the establishment of facilities for training the unemployed.

In view of the results obtained so far since the enactment of the laws in connection with employment exchanges the Revised Employment Exchange Law was presented to and passed at the 69th Session of the Diet in 1936, and put in force as from September of the same year.

Important points of the revision are as follows: (1) According to the old system co-ordination, control and supervision of the work was in the hands of the central and local employment exchange bureaux, seven in all, but this has now been transferred to the Home Minister and prefectural governors. Under the old system the director of the Employment Exchange Bureau had the supervising power on employment exchange business alone, but did not possess the authority in general over cities, towns and villages which are the principal managing bodies of labour exchanges, so his activity was very limited. On the other hand emergency work for the relief of the unemployed, industrial training or handicraft directing work, supervision of employment agencies run for profit, supervision of recruiting labourers, and emigration which are directly connected with employment exchange work, were under the supervision of the prefectural governors, it was therefore thought advisable to transfer the supervision of employment exchanges to the prefectural governors, and thereby develop the work of employment exchanges in co-ordination with the affiliated works just mentioned.

(2) In the past, the principal managing bodies have been, as a rule, cities, towns and villages. But the new Act has made it possible for prefectures to act in that capacity, thus doing away with any financial difficulty and making the selection of suitable locations for the employment exchange offices easier and better for further promotion of the work in all parts of the country.

(3) The revised Act makes those who intend to employ labourers en masse notify prefectural governors as to the items necessary for employment. This has been an entirely new addition, and is intended to enable prefectural governors to have ready knowledge as to the demands on labour. This provision applies to an employer who intends

to employ more than 30 labourers at one time and makes him advise prefectural governors as to the sex, kinds of industry and the number of labourers required.

It is proposed, however, that since the employment exchanges are nation-wide they should come under the direct control of the State, and in the 69th session of the Diet the House of Peers passed the Revised Employment Exchange Law with an additional clause of request for the State control of the work. The question remains for future study.

Conditions of the Work The number of employment exchanges which was 135 in 1923 when the Employment Exchange Bureau was established had increased to 693 at the end of 1936, of which exchanges specially for day-labourers numbered 62, for female labourers 8, for boys and girls 2, for the intelligentsia 1, and for Koreans 4.

The employment exchanges which succeeded in finding jobs for more than 310,000 people, excluding day-labourers, in 1923 were able to increase the number to 840,000 in 1935, and 540,000 in the first 8 months of 1936.

Day-labourers got 1,090,000 working days in 1923, through employment exchanges, this was increased to 16,770,000 working days in 1933. In 1934 and 1935 the number decreased but they were still considerable. The business conditions of employment exchanges are as shown in the following table :

EMPLOYMENT EXCHANGE

	1923	1926	1929	1933	1935	1936 (1st 8 months)
General						
Situations vacant.	817,427	729,720	720,521	1,451,998	1,917,983	1,377,521
Situations sought.	720,438	780,615	882,491	1,528,291	1,679,568	1,208,431
Situations filled.	312,550	222,563	263,669	663,315	741,642	543,794
Day-labourers						
Men wanted	1,158,134	2,522,177	3,015,195	16,897,143	12,988,711	9,592,309
Jobs wanted	1,318,648	2,793,384	3,473,237	20,124,272	14,463,730	10,501,605
Day's work secured.	1,091,047	2,477,746	3,010,280	16,779,159	12,867,295	9,415,448

For ex-soldiers the exchanges got 7,600 positions in 1935, an increase of 3,000 as compared with the number in 1934. In the introduction of juvenile workers, about 48,000 boys and girls who graduated from primary schools in March of 1936 were successfully placed by May of the same year, showing an increase of about 5,000 over the preceding year, and of young people under 18 years of age 158,000 were placed in 1936.

As to the conditions of employment agencies which are run for profit, the number of which reached 10,000 in 1923 when the Employment Exchange Bureau was established, was reduced to 3,300 with the enforcement in 1927 of the regulations on the supervision of the employment agency business, and at the end of September, 1936, the number had been further reduced to 2,086. The number of persons who avail themselves of these agencies is about 1,000,000 per year and the number of those who succeed in securing positions is about 500,000, but this number also is declining. According to the figures obtained during the last three years, the number of persons who called on these private agencies in 1933 was 770,000, in 1934 720,000 and in 1935 740,000. The decline is specially marked in the case of female workers.

Labourers from the country Farmers in rural districts emigrate to cities in the intervals of farming, mostly in winter time when the farms are snow-bound. According to the investigations conducted by the Central Employment Exchange Bureau, there are about 1,000,-000 such emigrants every year throughout the country, of which about 150,000 or so get jobs through the good offices of employment exchanges. The way of finding work for these emigrants and their protection has been a question for many years, and the State has taken measures to supervise the private employment agencies, while the public employment exchanges do all in their power to find them employment and give them protection. Moreover, the establishment of associations for the protection of these emigrants are encouraged, and travelling expenses are advanced for penniless ones. For the young boys and girls of the 6 north-eastern prefectures who are sent to cities and factories to help their families special officials are appointed in villages to guide their employment and protect them from falling into bad hands.

Study of Adaptability of Labour for Employment At present only 8 categories of adaptability for employment are standardized in Japan while at least 90 analyses are needed to meet the requirements of the times. Experts on the examination of adaptability are appointed in the Social Bureau, Ministry of Home Affairs, to accomplish such analyses and train employment exchange officials in their task.

Conditions of Unemployment In order to know of unemployment conditions the Social Bureau has collected prefectural reports on unemployment as on the 1st of every month since 1929. According to these reports, the number unemployed in January 1930 was 346,000, after that it increased month by month without a break up to September, 1932, when it reached 506,000. Since the end of 1932, owing to relief work and the turn for the better in the munition and export goods industries, the number has gradually decreased. It was 463,000 in December, 1932, 365,000 in September, 1934, 346,000 in September, 1935, and 330,000 in September, 1936. The decrease in salaried class and day-labourers is slight as compared with ordinary labourers in mills and mines.

Comparing the number of people dismissed with those taken on in factories and mines employing more than 50 persons the number of newly employed labourers has exceeded the number of dismissals since the latter half of 1932. The number of labourers was 1,610,000 in factories, 262,000 in mines, and 161,000 in Government mills at the end of July, 1936, which, as compared with the figures of the same month of the preceding year, showed an increase of 125,000, 31,000 and 3,000 respectively.

Emergency Enterprises for the Unemployed. Among the measures taken for the relief of unemployment, the civil engineering work begun in 1925 was the most important. Among others, the establishment of Business Training Institutes for the unemployed began in 1936.

The civil engineering work was first undertaken by public bodies affiliated with the 6 largest cities in the country, the bodies and scope of the work have since gradually widened. The Government has, also, since 1932, directly been undertaking civil engineering work, reclamation work, the adjustment of farm-lands, munition industries, etc., and has been encouraging large cities where unemployed labourers swarm, to increase enterprises for their relief by granting subsidies or advancing money at low rates of interest. Since 1929 the relief of the low-salaried class has been carried out in the 6 largest cities, and prefectures in which they are located, by giving them work on statistics, investigations, or adjustment of written matters or documents, one half of the expenses has been borne by the State. In the next table a summary of the relief work conducted in the last three years is given :

Unemployment Relief Enterprises in 1933-1936
(Subsidized ones only)

Fiscal Year	Kinds of Enterprises	Expenses in Yen	Wages in Yen	Aggregate number of work days
1933-34	Enterprises for ordinary labourers	34,882,642	12,053,138	9,157,047
	For low salaried class	1,803,635	1,662,208	1,369,509
	Total	36,686,277	13,715,346	10,526,556
1934-35	Enterprises for ordinary labourers	22,890,537	6,750,623	5,157,600
	For low salaried class	1,537,267	1,417,195	1,150,352
	Total	24,427,804	8,167,818	6,307,952
1935-36	Enterprises for ordinary labourers	15,378,527	4,710,145	3,472,024
	For low salaried class	1,499,193	1,385,942	1,130,929
	Total	16,877,720	6,096,087	4,602,953

As to the encouragement of the business training of the unempleyed which was started in 1936 the Government bears one half of the expenses required for the institutes.

BUSINESS TRAINING INSTITUTES FOR THE UNEMPLOYED

Manager	Mode of Management	Number of Institutes	Capacity	Estimated expenses	Subsidy req'ed	Instructors	Length of Term
Tokyo city	Direct management	1	60	11,560	5,780	3	18 weeks

Poor Relief

General Poor Relief The Regulations for Relief of the Poor were promulgated as early as 1874. The revised Relief Law was promulgated on April 2, 1924 and was put in force on January 1, 1932. The regulations maintain the old spirit of mutual help among relatives and neighbours and, at the same time, emphasize social solidarism and public responsibility of relieving impoverished people. Those who are relieved by the law are old poor people above 65, helpless juveniles under 13, pregnant poor women, helpless invalids and cripples, those who are handicapped by sickness, wounds or mental disorders, and poor mothers who are nursing infants under one year of age.

The period of relief should generally be for as long as it is required, but sometimes, especially when the case is taken up by a Block Committee, it is fixed, for example, at three or four weeks. The method of relief is of two kinds, indoor and outdoor, and as for the former, such large cities as Tokyo or Yokohama have their own homes or other relief institutions, otherwise the smaller municipalities entrust the relief of the poor to those orphanages, asylums or charity hospitals which are managed by private persons or organizations.

The results of the operation of this Act since 1932 are given in the following table :

RESULTS OF RELIEF WORK

(Units 1,000 people and ¥1,000)

Kinds of relief	1932	1933	1934	1935	Average
Living cost:					
(1) Number of the relieved	39.7	176.8	185.9	149.9	167.5
(2) Expenses defrayed	3,169.6	4,548.1	5,055.9	2,547.9	4,257.8
Medical treatment:					
(1) Number of persons	15.1	33.1	34.7	19.9	27.6
(2) Expenses defrayed	420.2	608.4	738.6	343.9	589.1
Maternity cases:					
(1) Number of women	2.3	3.2	2.4	0.8	2.6
(2) Expenses defrayed	13.4	14.8	11.1	3.5	13.1

Kinds of relief	1932	1933	1934	1935	Average
Help for working:					
(1) Number of Persons	0.4	0.4	0.5	0.2	0.4
(2) Expenses defrayed	4.7	5.0	4.7	1.8	4.8
Total					
(1) Persons	157.6	213.5	223.5	170.8	198.2
(2) Expenses defrayed	3,607.9	5,176.2	5,810.3	2,897.0	4,864.8

Note : For 1935, figures for 6 months only between April and September, are given.

The economic difficulties which many towns and villages have been experiencing in recent years have weakened their financial strength and increased the number of persons who need relief. Accordingly the burden which was imposed on towns and villages in the ratio of 2-1-1 on city, town and village, became too heavy for them, and was an obstacle to the efficient operation of the law. The ratio has therefore been changed to 7-3-2, by the revised Relief Law.

Special Poor Relief Special poor relief, as against general poor relief, includes (1) Proper attention for those found sick, dying or dead by the roadside, (2) Relief of sufferers from natural calamities, and (3) Relief of impoverished soldiers and their bereaved families.

Regulations now in force, issued in 1899, aim at relieving those people who are found sick on the road, the disposal of dead bodies, and care of the children who are with them. The heads of the cities or towns where they are found must apply to the prefectures concerned for authority to take charge of them in case there are no relations on whom they can depend. The expenses for their relief, if not met by those who are relieved themselves or their supporters, must be defrayed by the prefectures concerned, and they may be handed over to public or private institutions for further help. There is no limit of time fixed for their relief.

Calamity Relief Japan suffers particularly from natural calamities owing to its climate and volcanic activities, losses from fires and floods alone amount to nearly ¥70,000,000 every year. To relieve the sufferers from these calamities, the Natural Calamities Relief Fund Law and Sea Disaster Relief Fund Law were passed in 1899.

Previous to this date the Central Government in co-operation with the prefectural authorities had been working under the Biko Chochiku Law of 1880, according to which ¥1,200,000 had been paid out of the National Treasury each year, and further appropriations made from public saving funds. Consequently, the total of the funds both of the Central Government and Prefectures had been enormous.

At the end of April, 1935, the total amount of the funds was ¥91,496,777, a decrease when compared with the preceding year. The reason was the unusual disbursements for relief in 1934–35 amounting to ¥3,671,388. Besides the special donation from the Imperial House which amounted to over ¥53,000 for sufferers in prefectures, the public contributed ¥7,640,075 through the Social Bureau in that year.

In April, 1936, the total of the Natural Calamities Relief Fund amounted to ¥89,500,000, and, if Okinawa prefecture and Hokkaido were excepted, the average fund for each prefecture reached ¥1,980,000. Though particular items for which the fund is expended differ and change according to the nature of calamities, the largest amount of the fund is expended on food, shelters, and for business funds.

With the sad experience at the time of the Great Earthquake of 1923 fresh in the public memory, Osaka and Kyoto introduced the Great Calamities' Relief Regulations soon after that terrible event, according to which the Prefectural Offices, the Municipal Offices, the Army Division, and the Gendarmerie Corps are to co-operate in cases of great emergency.

The annual number of marine disasters off the coasts of Japan is over 1,000, and the average number of persons killed, injured or missing in these disasters reaches 600 or 700 a year. For the relief of these persons, the Sea Disaster Relief Law was issued in 1899, by the terms of which the heads of municipalities are invested with certain powers to give relief at the expense of the captain or owner of the ship concerned, but in case the money is not refunded by the captain or owner, or the relief proves insufficient, the expense incurred is paid by the National Government.

The Revision of the Military Relief Act The Military Relief Act has been in force since January of 1918, a part of it being revised in March, 1931. It aims to give relief at State expense to

those non-commissioned officers and men who are injured or suffer illness in war or during their term of service, and are, on that account, dismissed from the services, or to their families or the bereaved; to the families of soldiers and sailors who are called up for service; and to the bereaved of those soldiers and sailors who die of injuries or during their service if they find it difficult to get a living.

The relief, given under this Act, has greatly increased in recent years owing to the economic depression, the effects of the Manchurian Campaign and because of a better understanding of the purpose of the Law. In 1934–35 the number of people who received relief reached 105,772 persons or 31,996 families, the amount expended being more than ¥2,800,000. In 1935–36 the original estimate for relief was ¥2,074,000, but ¥867,000 was added later.

The purpose of the revision of the Act was to extend its sphere, and to ameliorate the conditions or qualifications, under which relief is given, so that the young men who serve in the army or navy may discharge their duties without worry about their families.

MILITARY RELIEF 1930-1935

	Number of Persons Relieved	Amount (In yen)
1930–31	51,856	1,586,695
1931–32	71,643	1,731,614
1932–33	99,023	2,427,496
1933–34	98,905	2,702,935
1934–35	105,772	2,809,248

Private Military Relief The organizations for private military relief work numbered 31 at the end of March 1929, the Japan Red Cross Society and the Imperial Military Aid Society being the most prominent. The organizations are mainly engaged in the giving of relief, generally temporary, to those who are outside the application of the Military Relief Law.

Health Protection

From very long ago, the Imperial Household has paid attention to the care of the sick. Hospitals for the Poor were established in 593, by Prince Shotoku. The present Saisei-Kai, a foundational juridical person, established by the wish of the Emperor Meiji to give medical treatment to the poor, continues the work of these ancient hospitals.

Free Medical Treatment There are many organizations which give free medical treatment, hospitals, medical consultation offices, visiting treatment societies, visiting nursing societies, etc. The Government decided to extend the work to farm-villages and fishing communities with ¥6,000,000, a part of which was donated by the Imperial House. There are 142 hospitals and 313 smaller branch hospitals or medical clinics, according to the statistics of 1932. In 1933–34 persons treated by the hospitals alone numbered 895,526.

Cost-Price Treatment The Emperor Meiji pointed out, in his edict, that Japan, in general with the rest of the world, was suffering great hardships and that it was most regrettable to see faithful but poor subjects suffering from illness unable to get medical treatment, and that there was acute need to give suitable relief to them; and, as elsewhere mentioned, he donated a large sum of money for this purpose.

The thing most dreaded by the labouring classes is sickness or injury. Once smitten by sickness or rendered idle by injury a workman is thrown out of work, no matter how much he may desire it, and has no means of getting medical treatment; his days of unemployment may be prolonged, and finally he may be stripped of all his possessions and his family may starve.

The Cost-Price Medical Treatment Association, a corporate juridical person, was organized on the 5th September, 1911 by the effort of Mr. Suzuki and Dr. Kato.

The Association has its headquarters in Tokyo and four branch offices in Tokyo, Yokohama, and Osaka and there are now 41 cost-price medical treatment offices established by public bodies in different parts of Japan, and 112 hospitals in which the working-class patients are treated at cost-price.

The Do-ai (or mutual love) Hospitals in Tokyo and Yokohama, the Imperial Charity Association, the Red Cross Hospital, the Jikei (or benevolence) Association Hospital have recently begun cheap medical treatment. The Do-ai Hospitals in Tokyo and Yokohama were established with the money given by the American people at the time of the Great Earthquake, 1923, as a memorial of their kind assistance in that period of trial. Mr. Suzuki, who has played a brilliant part in the promotion of this kind of social work, is now insisting upon the national management of all medical business for the thorough protection of the life of the people in view of the unreasonable high cost of medical treatment by common practitioners and consequent loss of life and impoverishment.

Sanatoria, Asylums and Special Hospitals There is to be found a regulation concerning mental disease in the Taiho Laws issued in 701. But the number of sufferers increased in direct proportion to the advancement of civilization. Statistics record the fact that at the end of 1912 there were 32,964 insane persons, by the end of 1922 the figure had risen to 50,891, and in 1933 it stood at 76,039, an increase of 2,499 as compared with the preceding year the ratio being 11.31 in every 10,000 of the population, an increase of 0.22 as compared with the preceding year.

(a) Laws and regulations concerning insane persons. The Law for the Custody of Insane Persons was enacted in 1900, with the object of protecting the public from harm at their hands. It provides for the appointment of a responsible person to take an insane person under his custody, and if necessary, by the approval of the prefectural governor, to confine the said insane person. The expenses, according to this law, shall be borne by the estate of the insane persons or by responsible persons, as the case may be, and in case any insane person protected by the order of the head of a municipality is unable to reimburse the money advanced by the municipality, the prefecture shall bear the expenses.

The Insane Asylums Law, which may be taken as a sub-division of the previous one, gives power to the competent Minister to order and bring prefectures, if necessary, under obligation to establish insane asylums or hospitals (Art. 1), and makes provisions concerning the State subsidy.

(b) Present condition of insane asylums and hospitals. At the end of 1933 there were 8 public hospitals for the insane and 112 private asylums, with combined capacity for 15,996 patients. At the end of 1933 there were 5,070 inpatients in these hospitals and asylums.

(c) Tuberculosis. It is almost impossible to get the exact number of cases of tuberculosis in this country, but the ratio of patients per 1,000 of the examined in accordance with the provisions of the Law for the Prevention of Tuberculosis was 0.26, a decrease of 0.05 as compared with the previous year. In 1932, 87,427 died from pulmonary tuberculosis, that is 74.4 in every 1,000 deaths, the highest ratio for five years. The Government issued regulations in 1914 for the establishment of tuberculosis sanatoria in cities of more than 30,000 population, and regulated the State subsidy thereto. The present Tuberculosis Prevention Law was enacted in 1919.

(d) Leprosy. For the prevention of leprosy, the Leprosy Prevention Law was issued in 1908. By this law, aid for indigent lepers out of public funds, the order of the competent Minister for the establishment of leper-asylums by united prefectures, or the use of private ones in lieu of public ones and other such matters are provided for. The whole country, in conformity with this law, was divided into five Divisions. Besides 9 public leper-asylums, there are 8 private ones. The Koyama Fukusei In, established by the Roman Catholic Church in Shizuoka prefecture, the Ihai En in Tokyo prefecture, the famous Kumamoto Kaishun Byoin founded by an English lady, Miss Riddell, and the Tairo In in Kumamoto prefecture have done valuable work for many years, being managed by Christian missionaries. (See Chapter XXXII on these subjects.)

STATISTICAL TABLE OF SOCIAL WORK IN JAPAN

CHAPTER XXXI

LABOUR AND LABOUR MOVEMENTS

Labour

Vocational Classification

Statistics classifying the population in Japan proper according to the kinds of work actually engaged in and the number of employees in each occupation can be obtained from the Report of the National Census of 1930 as follows :

CLASSIFICATION OF PEOPLE IN JAPAN PROPER ACCORDING TO OCCUPATIONS

(The 1930 Census)

	Total	Male	Female	Total	Employee	Female
Total Population	64,450,005	32,390,155	32,059,850			
Unoccupied	34,830,365	13,359,918	21,470,447			
Occupied	29,619,640	19,030,237	10,589,403	20,037,851	10,676,109	9,397,742
Farming	14,140,107	7,743,065	6,397,042	9,133,417	3,173,283	5,960,334
Marine	546,624	501,078	45,546	314,378	271,258	43,120
Mining	251,220	210,174	41,046	241,430	200,496	40,934
Industry	5,699,581	4,269,151	1,430,430	4,037,681	2,808,985	1,228,696
Commerce	4,478,098	3,013,903	1,464,195	2,282,556	1,299,831	982,725
Transport	1,107,574	1,028,595	78,979	925,268	848,020	77,248
Public service	2,044,151	1,691,803	352,348	1,821,237	1,532,051	289,186
Domestic	781,319	84,203	697,116	781,319	84,203	697,116
Miscellaneous	570,966	488,265	82,701	536,365	457,982	78,383

According to investigations made by the Labour Section of the Social Bureau the classifications of labourers according to kinds of occupation at the end of 1935 was as follows :

Factory workers	2,791,902
Mine workers	274,804
Transport and communication	544,475
Day-labourers and others	2,295,408
Total	5,906,589
Male	4,146,960
Female	1,759,629

Labour Conditions

Factories and Labourers The number of factories where more than 5 operatives are employed in Japan porper at the end of 1935 was 85,174, an increase of 4,863 or 6.1 per cent as compared with the previous year.

The number of labourers employed in the 85,174 factories above mentioned at the end of 1935 was 2,369,277 (1,287,575 men, 1,081,702 women), gaining 205,824 or 9.5 per cent over the previous year. Classification of the same according to kinds of industry follows :

NUMBER OF FACTORY LABOURERS BY INDUSTRIES

Sex Distribution

	Number	%	Male	Female
Industry:				
Textile	1,006,703	42.5	193,866(19.3%)	812,837(80.7%)
Metal	217,612	9.2	201,595(92.6%)	16,017 (7.4%)
Machinery, tools, etc.	367,263	15.5	335,061(91.2%)	32,202 (8.8%)
Ceramic	92,698	3.9	73,741(79.5%)	18,957(20.5%)
Chemical	228,638	9.6	148,803(65.1%)	79,835(34.9%)
Lumber and wood-working	85,107	3.6	77,247(90.8%)	7,860 (9.2%)

	Number	%	Male	Female

Unemployment The first thorough investigation on unemployment in Japan was made at the national census of October 1, 1935; the number of jobless labourers and salaried-men at that time was 322,527. Annual estimates had been made by the Social Bureau since 1929, based on the reports sent in by local governments at the beginning of every month. The number had increased from 268,000 in September, 1929 to 505,000 in September, 1932. But the tendency turned at the end of 1932 as the result of the Government's emergency measures and an increased demand for labour in the heavy industries and an increase in the number of men called up for the services; the number of unemployed fell to 346,000 in September, 1935. The rate of decrease of unemployment is greatest for factory and mine labourers as is shown below:

UNEMPLOYMENT BY KINDS OF LABOUR

(Compiled by the Social Bureau)

(In 1,000)

	Total			Salaried Men

Wages According to investigations made by the Department of Commerce and Industry, the average wage of factory labourers per hour was 12 sen, in 1935, same as in the previous year. The lowest 8 sen, was to be found among textile industry labourers, for a large number of women and juvenile workers are to be found in this industry. Details follow :

Labour Conditions

Owing to industrial prosperity, the number of labourers has increased greatly in recent years. According to investigations made by the Social Bureau the number employed was 2,971,878 at the end of June 1936, which, as compared with 2,791,902 at the end of December, 1935, showed an increase of 180,000. The Bank of Japan index number of labourers in mills under private management was 107.1 in September of 1936 (base : 1926). The rate of increase was highest in 1934 with 11 per cent and since then it has shown a downward tendency, being 9.4 per cent in 1935 and 6 per cent in 1936.

The change in the index number of labourers in recent years is as shown below. The boom in the munition industries has caused a great increase in the number of labourers employed. The increase is much smaller in the case of female labourers than in that of male labourers. This is explained by the fact that the industries which are showing activity are those which require male labour.

Classified according to the kinds of industries the index number is shown in the following table. From the index number of September, 1936, we find almost all industries, except the cotton spinning and silk reeling industries, show increase over the previous year, the increase being specially marked in shipbuilding, machinery and instrument making, and other metal industries, and in the artificial fertilizer, knitting, and pharmaceutical industries. The heavy industries are busy because of defence re-armament; the the artificial fertilizer and pharmaceutical industries are new and rising industries; and the knitting goods industry is active owing to the increase in exports.

The sudden expansion of industries caused by inflation resulted in a scarcity of skilled labour and the recruiting of much unskilled labour, but as a precaution against reaction, which might set in at any moment, a large number of labourers are hired only temporarily.

The scarcity of skilled labour is a great problem to industry and great efforts are being made to overcome it in co-operation with the Department of Education, but skilled men cannot be trained in a day. The increase in the number of temporarily-hired labourers has been a matter of discussion since 1935, and the authorities have been making endeavours to either improve or abandon the system. But there is still much room for further study. According to investgations made at the end of 1934 by the Social Bureau the temporarily-hired labourers represented 16.7 per cent in factories which employ more than 100 labourers. In factories where more than 50 labourers are employed they represented 12 per cent in Tokyo prefecture in February, 1934, and in Osaka prefecture in January, 1935, 24 per cent of the workers in factories where more than 5 persons are employed.

INDEX NUMBER OF FACTORY LABOURERS CLASSIFIED ACCORDING TO PRINCIPAL INDUSTRIES

(1926=100)

Industries	1933	1934	1935	Jan. 1936	Feb. 1936	Mar. 1936	Apr. 1936

According to investigations made by the Social Bureau the estimated number of unemployed in August, 1936 was 333,634, or 4.24 per cent, the figures falling still lower by the end of the year.

THE RATE OF UNEMPLOYED FOR THE LAST 4 YEARS (IN %)

Months	1936	1935	1934	1933	Months	1936	1935	1934	1933
January	4.64	4.87	5.16	6.17	July	4.29	4.60	4.97	5.81
February	4.61	4.96	5.24	6.06	August	4.24	4.55	4.91	5.65
March	4.58	4.84	5.17	5.84	September	4.18	4.52	4.87	5.45
April	4.40	4.72	5.14	5.70	October	4.07	4.52	4.86	5.36
May	4.51	4.74	5.13	5.91	November	4.07	4.46	4.79	5.19
June	4.42	4.59	5.06	5.89	December	4.08	4.52	4.89	5.11

The downward tendency of wage rates which had persisted for some years was checked about the middle of 1935 and remained steady until March 1936, when it again took a downward course, reaching the bottom in June and picking up again slightly in August. When classified by industries a sharp decline was witnessed in the heavy industries where the increase of the number of labourers was most remarkable. This may be explained by the fact that a large number of temporarily-hired low-paid labourers is included, the index number as a whole consequently becoming lower. Industrial prosperity seems to be benefiting only a very restricted number of skilled labourers so far as the labouring class is concerned.

INDEX NUMBER OF WAGE RATES, COMPILED BY BANK OF JAPAN

(Base 1926=100)

In spite of wage rates taking a downward course actual earnings kept, after 1931, an upward tendency, the peak being reached in December, 1936. Actual

earnings increased in but few industries, the rate of increase was, also, not large. On the other hand, in several industries earnings decreased considerably, especially in the munition industries, instrument making, metal ware and vehicle manufacturing industries. Perhaps this may be explained by the fact that the expansion of factories has somehow reached the limit, that the income of labourers from extra hour-work has reached its maximum point, and that the number of temporarily hired labourers with low wages has increased to the extent that it has come to affect the earnings of regular labourers.

INDEX NUMBER OF ACTUAL EARNINGS

(Base, 1926=100)

Months	1936	1935	1934	1933
January	91.3	91.0	87.8	89.5

Labourer's Earnings and Commodity Prices. By dividing actual earnings by the Bank of Japan index number of retail prices and converting the answer to the base of 1926=100, the "Oriental Economist" made the first of the following tables the real value of wages.

The second table, compiled by the Asahi Shimbun, is also interesting as an index of living costs, as it shows a rise of 20 between the average for 1932 and the figures for October, 1936.

THE INDEX NUMBER OF THE REAL VALUE OF WAGES

(Base, 1926=100)

	Retail prices	Real value of Wages	Increase or decrease as compared with the previous year in %		Retail prices	Real Value of wages	Increase or decrease as compared with the previous year in %

Working hours exclusive of extra work are shown below, the figures being obtained by multiplying the actual hours worked in a day by the number of working days in a month, the investigations being made by the Bank of Japan. January is a short month because of the New Year Holidays, which last 3 days.

WORKING HOURS

(Exclusive of extra working hours)

	1936			1935		
	Hours	No. of days	Total hours in a month	Hours	No. of days	Total hours in a month

The number of working hours in each of the principal industries is shown below, the average for 1936 is of the first nine months only. In each industry an increase is shown up to 1935, but all showed a falling off in 1936, though the figures for that year were greater than 1933. The increase in the machinery and instrument making, and chemical industries is specially marked, due to their connection with the munition industries. The textile and dyeing industries show a decrease since 1934 because of the decline in exports.

TOTAL MONTHLY WORKING HOURS IN THE PRINCIPAL INDUSTRIES

Industries	1936	1935	1934	1933
	h m			
Textile and dyeing	264.04	266.29	267.28	263.37
Machinery and instrument making	267.27	270.41	269.47	265.13
Chemical	266.02	267.01	264.14	262.48
Foodstuffs	264.00	264.32	262.12	259.25
Miscellaneous	258.06	259.58	257.08	253.05
Average	263.56	265.44	264.10	260.50

HOURS AND DAYS WORKED PER MONTH IN THE PRINCIPAL INDUSTRIES

Industries	1936		1935		1934		1933	
	No. of hours	No. of days	No. of hours	No. of days	No. of hours	No. of days	No. of hours	No. of days
Textile and dyeing	9.49	26.9	9.50	27.1	9.50	27.2	9.48	26.9
Machinery and instrument making	10.01	26.7	10.06	26.8	10.04	26.8	9.56	26.7
Chemical	9.49	27.1	9.49	27.2	9.45	27.1	9.44	27.0
Foodstuffs	9.36	27.5	9.33	27.7	9.30	27.6	9.26	27.5
Miscellaneous	9.40	26.7	9.42	26.8	9.40	26.6	9.33	26.5

It will thus be seen that labour is being strained in all its phases, especially in the munition industries, and if things go on in this manner, labourers will be soon forced into a harder living as their wages are not being raised in proportion to the rise in prices and the extra work that is being forced upon them.

The working hours in the above statistics prepared by the Bank of Japan do not include time for rest. But time for rest has been shortened since 1929. The average in 1935 was 57 minutes, but in the munition industries it was much less than the average, as is shown in the following table taken from Labour Statistics for 1936.

REST PERIODS IN THE CHIEF INDUSTRIES, 1935

	Average for all industries	Metal industry	Machinery and instrument making industries	Shipping and vehicle making industries
Average 1935	0.57	0.51	0.46	0.49

Statistics for factory accidents, which have been published include only those figures up to 1934, but it is estimated that accidents have increased since. The number of the casualties which took place while labourers were at work, during 1934, according to the publication of the Social Bureau, numbered 62,117, exclusive of factories to which a portion of the Factory Law applies, and showed an increase of 13,744 over the previous year. The number of accidents, as compared with the total number of labourers, began to increase suddenly after 1933. Among the casualties in 1934 female workers numbered 3,917 which corresponds to 6 per cent of the total number of accidents. The reason that the number of casualties in the case of women is comparatively small is explained by the fact that labour is more forced in factories, where male labour constitutes the bulk of the workers. Legal restrictions are also placed on female workers as protected labourers, and this contributes to the lessening casualties in their instance.

Year	Private Factories	Total number of Factories including Government-managed ones.
1926	2.23%	2.71%
1927	2.66	3.13
1928	2.56	2.92
1929	2.72	2.99
1930	2.62	2.86
1931	2.17	2.38
1932	2.14	2.31
1933	2.41	2.57
1934	2.85	2.89

The total number of casualties is shown below. When the sum of those killed and seriously injured is compared with the total number of casualties there was an increase from 24.7 per cent in 1932 to 25.8 per cent in 1934, which proves that not only is the number of accidents getting larger but the nature of the accidents is getting worse. The increase of casualties is partly due to the sudden increase in the number of labourers, which include many unskilled men, since 1932, but the rate of increase of casualties, which was 28.4 per cent greater in 1934 than in the previous year, is more than double the increase in the number of labourers, which was 14.1 per cent.

According to industries the metal refining industry has the highest percentage with 162.1 per 1,000 labourers, followed by 120.03 in the artificial fertilizer industry, and 69.73 in the machinery and instrument making group.

TOTAL CASUALTIES IN INDUSTRY

Year	No. killed	No. seriously injured	No. slightly injured	Total
1932	250	4,058	24,925	34,233
1933	404	10,802	37,157	48,363
1934	555	15,510	46,052	62,117

Labour Accident and Mortality In 1934 the number of labourers injured while at work in factories was 62,117 of which deaths numbered 555.

1932	65,724	686	65,374	66,060
1933	66,929	833	66,340	67,173
1934	73,239	880	72,807	73,687

Marine Accidents The number of fishing boats and vessels without engines wrecked in 1934 was 12,596, and that of vessels with engines 2,900, increasing 513 and 1,456 respectively as compared with the previous year. The crews wrecked with those boats and vessels totalled 4,448, a decrease of 1,381 on the previous year; 596 of the total perished or were missing. The increase of marine accidents in 1934 was largely due to the typhoon that raged over the western and central districts of the Main Island in September.

MARINE ACCIDENTS

	Total Number of Fishing Boats and Vessels	Fishing Boats and Vessels Wrecked		Amount of Loss (In ¥1,000)	Total Number of Fishermen	Crews on the Wrecked Boats and Vessels

Labour Hygiene. The hygienic equipment of factories is legally required, but progress of installation and improvement is rather slow and partial. In compliance with the requirements stated in the new ordinance on labour hygiene, factory managers are endeavouring to make improvements under the guidance of the Government and prefectural authorities, and good results have been reported as to the health of factory labourers where the work has been carried out. (See Chapters on Agriculture, Fisheries, and Mining.)

Labour Movements

General Survey for 1936

Labour Administration Labour circles were affected in 1936 economically by the prosperity caused through the demand for war supplies; politically, with the lively activities of the Proletarian Parties which had increased in strength at the general election of February with the passing of the Retiring Allowance Fund Bill and the Retiring Allowance Bill, the Shakai Taishu-to (The Social Mass Party) and the Guild Conference, which supported the Bill have made favourable progress. On the contrary, the patriotic labourers' movement has left but a faint trace of its activity, the Council for Current Topics.

In examining wages, which is the principal object of labour administration, it is found that the level was about the same as the previous year, though there were some fluctuations after January, a slight increase being witnessed in the munition industries. The fact that the monetary income of labour is stationary while the indices of production, stocks, foreign trade, and profits, are rising, is a matter to be seriously considered, for of the total labour disputes of 1,793, which took place between January and November of 1936, the so-called positive disputes numbered 605 cases, of which 508 cases were demands for increases in wages.

The number of trade unions was 965 in 1934, 993 in 1935, and 950 at the end of June, 1936. The members numbered 387,964 in 1934, 408,662 in 1935 and 407,928 at the end of June, 1936, at which latter date 219,569 men, or more than one-half the total, were connected with the Japan Council of Labour Unions, the members affiliated with the Social Mass Party.

The members who support nationalistic parties, numbered about 44,000, and those prone to rational leftism numbered about 15,000.

Administration of Labour Organizations As regards the problem of trade unionism the Government has taken an indifferent attitude ever since it failed to pass the Trade Union Bill in 1931. The trade union movement is a means for labourers to protect their interests under the capitalistic régime, and it is unreasonable for the Government to repress it as long as the capitalistic system is left as it is, and unless the trades unions step outside their economic activities and threaten public peace and order. It was specially noticed in 1936 that both in the labour administrators' conferences and in capital and labour conferences a clearer recognition of the real situation on the part of capital was necessary.

One thing which must be specially recorded regarding the administration of trade unions is that the Army advised workmen employed in mills under the Ministry of War to withdraw from the Federation of Trade Unions of Government Labourers. About 8,000 workmen in the Army factories followed the advice and seceded from the Federation. According to the statement of the Army, the step was taken in accordance with the principle of army discipline which does not permit of any connection of men in the army, even labourers, with outside bodies.

(1) The Retiring Allowance Fund and the Retiring Allowance Acts The Re-

tiring Allowance Fund Bill and the Retiring Allowance Bill which were voted on during the Extraordinary Session of the Diet in May, 1936, were promulgated on November 30, and became effective on January 1, 1937.

In Japan, a customary retiring allowance has been given by large factories and mines since their early days, the Retiring Allowance Fund Law and the Retiring Allowance Law are to rationalize and perfect the old system for the protection of labourers in general.

Those factories and mines which employ 50 workers or more in normal times are subject to the new law which may also be applied, with or without modifications, to factories or mines which usually employ less than 50 workers at the request of the factories or mines.

In principle the new rule is applicable to all workers in the employ of such factories or mines as come within the purview of the new law, but exceptions are made for workers employed for a fixed period of less than six months, day-labourers and those engaged in seasonal work.

Employees' Savings System The new system concerning the savings of employees has legalized the policy hitherto followed by some employers of compelling their employees to lay aside a part of their wages as deposits to be drawn upon their retirement and at the same time made the hitherto voluntary savings of employees compulsory in some cases. Under this system, the employer must take two hundredths of the wage of each employee and deposit the sum in the name of the employee with a post-office or bank or keep it by such means as is approved by the competent local authorities. The primary purpose of this system is to provide for the employee against his retirement. The term "wage" in this connection implies money and material as well.

Thus savings of this kind are formed by deductions from wages and as such are the deposits of the employees themselves, although the employers act as the depositors. It follows that every employee is entitled to withdraw his deposits thus made upon his retirement, regardless of the circumstances under which he retires. The said law, however, also provides that the deposits shall not be withdrawn before retirement of the employee no matter what reason may exist for him to desire to draw them.

The employer may utilize the savings of his employees with the permission of the competent local authorities and the consent of the employees. Interest at a reasonable rate must, however, be paid on the amount thus utilized. This rule is intended to continue the practice of some employers of encouraging savings among their employees by paying interest on the savings through their utilization. As a means of protecting the employees from sustaining any loss on account of such utilization, the competent local authorities order the employers desiring to utilize such savings to deposit a certain amount of national bonds with the authorities.

Retiring Allowance Fund The proprietors of factories or mines where 50 or more workers are employed in normal times must pay a retiring allowance to their employees upon retirement. To meet this need, the proprietors are required to keep a necessary fund. The new law provides that this fund may be kept by either of two methods, one of them being to keep a retiring allowance fund and the other to maintain a reserve fund.

The annual amount to be laid aside as such a fund must represent two hundredths of the wages of the employees. In some cases where more business profits are yielded than usual, it is stipulated that an additional amount representing three hundredths of the wages must be included in the said fund.

Every retiring employee is entitled, as a rule, to receive a retiring allowance. The employer, however, may refuse to pay the allowance to any employee who, being in the employ for less than three years, retires of his own accord without good reason or who is dismissed for a breach of faith or similar reasons. Further, the employer may pay only half of the specified amount of retiring allowance to any employee who, though serving for over three years, retires of his own accord without good reason or who, though serving for over three years but less than ten years, is dismissed for misconduct which is not so serious as a breach of faith.

The surplus arising from such non-payment and reduced payment is to be used for paying an additional allowance to the employees who are dismissed for reasons of the employers. The rates of this additional allowance are fixed at 20 days' standard wages for those who have served for over one year but less than three years and 35 days' standard wages for those who have served for over three years.

As in the case of the savings of employees, the employer may utilize the retiring allowance fund with permis-

sion of the competent local authorities, but without securing the consent of the employees.

The annual amount to be set aside in the form of a reserve fund relative to the payment of retiring allowance, though not strictly provided for, is generally considered to represent 3.3 per cent of the wages of the employees at the least.

With a view to protecting the rights of workers, the Government prohibits the transfer of the right of the employee to withdraw his deposits upon retirement or to receive the retiring allowance and the seizure of the deposits or retiring allowance by his creditors. Both the retiring allowance fund and the reserve fund relative to the payment of retiring allowances are exempted from taxation.

Enquiry Commission Those who desire to take civil action in connection with the payment of retiring allowance are required to refer the matter first to a Retiring Allowance Enquiry Commission. This system has been adopted for the dual purpose of facilitating a solution of such dispute by means other than civil action and passing a judgment in conformity with the actual circumstances surrounding each dispute.

Each prefecture is to have such a commission which is to be headed by the governor of the prefecture and composed of from 6 to 9 members including government officials, scholars and business experts.

(2) Revision of the Labour Accident Relief Laws. On December 21, 1936 the Ordinance for enforcing the Factory Law, the Ordinance for enforcing the Labour Accident Relief Law, the rules for Giving Allowances to Miners in distress, and the Ordinance Giving Allowances to temporary employees, all of which aim at assisting labourers who suffer from accidents, were revised, and enforced as from January 1, 1937 along with the revised Factory Law, the revised Labour Accident Relief Law and the revised Mine Law.

Experience of several years had revealed many defects in these laws for aiding labourers or their bereaved, and it was thought advisable to revise parts of them in order to increase the assistance to labourers and also to adjust and rationalize it. These revised laws and ordinances were promulgated in 1936.

The principal points in the revisions were as follows :

(a) The amount of allowance to the bereaved of labourers who die by accidents while at work, and the allowance for labourers who are suffering from disabilities have been increased.

(b) The minimum sum to be allowed to the disabled and the bereaved, etc. have been fixed regardless of wages.

(c) The new rules recognise that the mutual aid associations, which are joint enterprises of employers and labourers, may act as proxies in the matter of payment of the allowances.

(3) Labour Accident Relief Legal Insurance. The business conditions of this insurance business from April, 1935 to March, 1936 were as follows :

Income from premiums,	
(1) Received during the year	¥1,900,902.76
(2) Brought forward from the previous year (fund for payment)	¥588,982.64
(3) Brought forward from the previous year	¥449,536.34
Payments,	
(1) For medical treatment	¥743,470.73
(2) Assistance for absentees	¥380,075.82
(3) For the disabled	¥200,622.00
(4) For the bereaved	¥230,868.00
(5) Surrender	¥ 19,224.00
Total	¥1,574,260.55
Carried forward	608,915.58
Carried forward (fund)	527,687.16
Number of cases	32,675.69
Number of enterprises insured	8,000.69
Aggregate number of labourers working in the enterprises insured	Male 58,585,491
	Female 3,699,392

In 1906 a foundational juridical person called "the Japan Association for Assisting Labourers Employed by Civil Engineering and Building Enterprises" was established and will take care of injured workers after they have received the protection provided for in the law.

The rate of insurance premium was revised on December 24, 1936, the aim being to raise the premium on workers employed in the construction of hydro-electric power plants, and steel framed or reinforced concrete buildings which involve greater dangers, and to lower the rate on workers employed on less dangerous work such as construction of roads, or other ordinary building enterprises. The new rates came into force on January 1, 1937.

(4) Safety and Hygiene on Civil Engineering and Building Jobs The accidents which occur on civil engineering and building jobs to which Article 1 of the Labour Accident Relief Law refers have been large in number and

show a tendency to increase every year. During 1935 the number of deaths reached 780 and the number of injured was as high as 27,000, in spite of which there are no regulations as to the prevention of such accidents. In July of 1934, the Government circulated, through prefectural governors, notices that care should be taken for the safety and hygiene of people engaged in civil engineering and building jobs so as to prevent accidents and preserve their health. It has since maintained a vigilant attitude and is preparing to draw up a draft bill on the subject.

ACCIDENTS ON CIVIL ENGINEERING AND BUILDING JOBS DURING 1932-1935

	1932	1933	1934	1935
Number of labourers employed (Oct. 1)	142,789	410,378	329,946	362,411
Number of injuries and deaths:				
Deaths	424	589	685	781
Injured (badly)	5,916	11,942	18,968	26,804
Injured (slightly)	4,452	9,390	13,831	16,583
Total	10,792	21,921	33,484	44,168
Rate of injuries and deaths				
Deaths	0.29	0.14	0.20	0.21
Injured (badly)	4.14	2.91	5.74	7.39
Injured (slightly)	3.11	2.28	4.19	4.57
Total	7.55	5.34	10.14	12.18

General Meetings of International Labour

In 1935 the International Labour Conference held two general meetings, the ordinary general meeting, and an extraordinary general meeting to discuss marine labour.

The Twentieth International Labour Conference was held at Geneva, from June 4 to 24, Japan being represented by Toshizo Yoshizaka, Representative of the Government, Director of the Imperial Office of International Labour; Juitsu Kitaoka, Secretary, Social Bureau; Masao Shibusawa, Representative of capital, Director, the Japan Iron Works; and Mitsu Kono, Representative of labour, Vice-President, the All-Japan Federation of Labour.

Health Insurance The total number of the insured at the end of September, 1936, was 3,282,729. Classified according to the bodies under whose charge the business of Health Insurance falls, they are as follows:

	Total	Compulsory	Voluntary	Prolonged
Total	3,282,729	—	—	—
Under charge of Government	2,260,464	2,256,848	3,549	67
Under charge of associations	1,022,265	—	—	—

(Remarks: Lack of complete statistics precluded the classification according to kinds of the insured under charge of associations).

The total number of mills, working places and undertakings was 119,010, classified as follows (under Governmental charge only):

Establishments under the Factory Law	67,298
Establishments under the Mine Law	1,482
Other undertakings	49,694
Total	118,474
Undertakings where persons voluntarily insured are employed	536
Grand total	119,010

Guaranteed Payment

(1) Classification of Guaranteed Payment Insured persons are entitled to benefit when they are injured or become ill, or in case of maternity. In case of death benefits are paid to their

dependents. The total guaranteed payments during 1934–35 amounted to ¥31,185,992 to being distributed among 7,477,269 cases classified as follows :

Payment for,	Cases	Amount paid (In Yen)
Medical treatment	6,604,640	19,266,583
Prolonged treatment	7,717	146,653
Injuries	747,644	10,056,192
Child birth	101,814	1,105,952
Death	15,454	610,612
Total	7,477,269	31,185,992

Medical organization of the Health Insurance under direct charge of the Government at the end of September, 1936 was as follows :

Kinds	Number
Physicians,	43,457
General practitioner	31,261
Dentists	12,196
Pharmacists	7,108
Midwives	32,042

Medical organization under charge of the Health Insurance Associations at the end of 1934 was as follows :

Kinds	Ordinary	Dental
Physicians	45	68
Private clinics	192	74
Clinics of medical associations	24	12
Physicians and dentists under contract	334	266

In the fiscal year 1935-36 22 health insurance consultation rooms were established in 8 prefectures, and in 1936–37, another 39 rooms were added in 36 prefectures and Hokkaido.

(4) Expenses In 1936, the amount borne by the Treasury was ¥2,962,859.

Owing to the prosperity in the munition industries and economic circles in general the income from premiums has greatly increased.

Labour Disputes

The number of labour disputes in Japan reached its climax in 1931 with 2,456, but the number steadily went down until it was only 1,872 in 1935. The days when left wing proletarian parties and trade unions were the leaders of the workers seemed to have passed, and the patriotic or national socialistic elements had begun to have their say. Harmony among all parties in industry became the slogan of labourers, and labour differences settled by mutual agreement until, through rising costs of living unaccompanied by increase in wages towards the end of 1936, a series of disputes broke out.

In 1936, the number of labour disputes was 1,919, with 90,137 participants, or an increase of 47 cases and a decrease of 13,825 persons, compared with the previous year. The number of participants per case was 47, a decrease of 9 persons.

The nature of demands in these disputes was positive in character, as was the case in the previous year. Negative demands, such as opposition to decreases in wages, fell to 129 from the 142 of the previous year.

Disputes in connection with dismissals numbered 296, an increase of 24 as compared with the previous year.

Tenant Disputes

In the past 5 years tenant disputes centred round the protection of the tenant rights, or the demand of tenants for the continuation of their tenure. The difficulty for a farmer to get another farm has become much greater than that of finding work for a labourer in a city. To lose one's farm is to starve, and tenant disputes along this line are accordingly acute. In 1935 the number of tenant disputes was 6,824, an increase of 996, as compared with the previous year.

TENANT DISPUTES

1929–1934

	Number	Tenant Participants	Area Included (In ha.)
1931	3,419	81,135	59,866
1932	3,414	61,499	38,705
1933	4,000	48,073	30,343
1934	5,828	121,031	85,129
1935	6,824	113,164	70,160
1936 (estimates)	5,750	55,500	35,980 (cho)

The causes, demands and results of disputes in the past 5 years have been as follows :

TENANT DISPUTES

By Causes

	1931	1932	1933	1934	1935
Raising tenant rents	45	60	86	114	115
Bad crops	1,171	1,057	646	1,940	2,451
High tenant rents	97	74	99	85	66
Unbalanced production cost	13	14	16	7	6
Cancellation of tenant rights	1,307	1,520	2,275	2,704	3,031
Arrears of farm-rents	174	313	485	505	734
Others	612	376	393	473	421

By Demands

	1931	1932	1933	1934	1935
Temporary lowering of tenant rents	1,609	1,267	1,013	2,168	2,616
Permanent lowering of tenant rents	136	95	105	96	96
Against raising tenant rents	41	60	72	112	114
Continuation of tenant rights	1,085	1,367	2,097	2,421	2,862
Recognition of tenant rights	103	66	49	44	45
Compensation for lost tenant rights	116	101	120	166	123
Others	329	458	544	821	968

Results of Disputes

	1931	1932	1933	1934	1935
Compromised	2,078	2,101	2,568	3,764	5,131
Demands accepted	417	481	523	922	381
Demands withdrawn	83	61	92	157	160
Naturally settled	26	53	56	76	82
unsettled	815	718	761	909	1,070

The above table shows that the disputes in connection with tenant rents are on the decrease, while those connected with tenant rights show a remarkable increase, and, in 1934 and 1935, disputes caused by the cancellation of tenant rights or withdrawal of land by landowners constituted over 45 per cent of the total number of disputes. Among the disputes included in the item "arrear of farm-rent" there were many which were caused by the strong attitude of landowners to cancel contracts because of the arrears.

The continuous increase of disputes on tenant rights comes from the following causes :

(1) Landowners, suffering from arrears of farm-rent, are compelled to take drastic measures, such as the withdrawing of farm-lands ; (2) The price of land is going up as one of the effects of the Rice Control Law and smaller landowners are tempted to dispose of their lands ; and (3) smaller landowners no less than tenants have been severely hit by bad crops.

Disputes in 1936 The following is a summary of the report of the Department of Agriculture and Forestry regarding tenant disputes in 1935 :

(1) Tenant Disputes in 1935. The number of tenant disputes was 5,512, an increase of 1,504 as compared with the year before. Details follow :

TENANT DISPUTES IN 1935

	In 1935	Compared with 1934
Number of disputes	5,512	+1,054
Settled	4,191	+1,194
Unsettled	1,321	— 140
No, of participants		
Landowners	20,474	1,934
Tenant peasants	76,797	13,868
Area of land under dispute		
Paddy fields	40,222.1 cho	5,204.4 cho
Dry land	4,272.5	638.5
Others	348.3	800.5
Total	44,842.9	3,765.4

Natural calamities that followed one after another in 1934 and 1935 increased disputes on the reduction and exemption of farm-rent, which had been decreasing since the fall of 1934. Accordingly the number of participants and the area of land involved in the disputes increased. There has been an increasing tendency to demand the return of tenanted lands owing to the sales of farmlands, the increase of small landowners who till their own farms and arrears of farm-rent. The number of cases which had relations with the return of tenanted lands comprised 48.8 per cent or about one-half of the total cases. The disputes in connection with bad crops numbered 1,681 or 30.5 per cent and showed an increase of 730 cases or 9.2 per cent, and disputes against the demand for payment of farm-rent increased 634 or 11.5 per cent as compared with the previous year. As in the previous year disputes in the Tohoku (north-eastern) districts were the greater in number. In the Kwansai districts disputes arising out of bad crops were many. Among the prefectures where a specially great number of disputes arose, Akita prefecture headed the others with 436 cases, followed by 393 cases in Yamanashi prefecture, 331 in Okayama prefecture, 325 in Tochigi prefecture, 238 in Miyagi prefecture and 227 in Fukuoka prefecture. Fukushima, Yamagata, Niigata and Aomori prefectures had more than 200 disputes.

(2) Mediation in Tenant Disputes. Appeals for arbitration in accordance with the Tenant Dispute Arbitration Law was 6,315 on 4,061 disputes, an increase of 895 cases.

ARBITRATION IN TENANT DISPUTES IN 1935

	Number In 1935	Increase as Compared with 1934
Number of appeals	6,315	1,862
Number of disputes concerned	4,061	895
Complainants		
Landowners	1,397	325
Tenant peasants	2,505	519
By mutual agreement	117	31
By both sides	42	20
Participants		
Landowners	8,942	1,804
Tenant peasants	22,419	2,990
Area of land involved	9,535 cho	1,032 cho

In addition to the above, cases mediated in by Tenant Officials, outside of the Tenant Dispute Arbitration Law, numbered 290, the cause of most of which was bad crops.

(3) Landowners' and Tenant-farmers' unions in 1935.

1935	1,748	202,785

Trade Unions

Annual Meetings of Trade Unions. The fifth annual meeting of the Japan Trade Union Council (Nippon Rodo Kumiai Kwaigi) was held at Yokohama on October 18, 1936, Komakichi Matsuoka presiding over the 69 delegates who were present. Ten decisions were arrived at, of which the most important were "Recommendations to the Government for the establishment of a Ministry of Labour," and a "Resolution against the suppression of the trade union movement among Government factory labourers," besides the declaration of the fifth council which voiced its stand in liberalism in sympathy with the Social Mass Party.

The Japan Trade Union Council lost the Japan General Federation of Trade Unions (Nippon Rodo Kumiai So-rengo) in 1935 from among its important members and was further weakened, in September, 1936, by the prohibition of the trade union movement among labourers in Government factories belonging to the War Ministry. The Council, however, was successful in bringing about the formation of the All-Japan General Federation of Labour and the National Trade Union Federation in 1935, and added to its power by the coming in of the Japan Federation of Ceramic Trade Unions in 1936, it thus remains the largest organization of trade unions in Japan, with a membership of 9 bodies and 263,914 labourers.

The new officials and the present members of the Japan Trade Union Council are as follows :

President, Komakichi Matsuoka
Vice-president, Manryo Yonekubo
Chief-secretary, Aiichi Kamijo
Adviser, Bunji Suzuki
Executive Committee : Shinichi Yagi, Suehiro Nishio, Bunsaku Hamahashi, Choei Horiuchi, Hidekichi Koizumi, Yasutaro Kawamura, Kichitaro Numada, Eiichi Iwanaga.

	Number of Members
Members :	
Japan Seamen's Union	104,306
All-Japan General Federation of Labour	94,926

Japan Iron Labourers' Union	12,500
Japan General League of Labour	6,068
Tokyo Electric Company Workers' Union	2,450
Japan Federation of Ceramic Trade Unions	3,500
9 bodies Total	263,914

The first meeting of the All-Japan Convention of Patriotic Trade Unions (Aikoku Rodo Kumiai Zenkoku Konwakwai) which was organized in April, 1936, by the union of all patriotic or nationalistic trade unions with reactionary ideas in general politics, was held at Tokyo on September 27, 1936. The meeting was carefully watched by the public as the Convention stands in opposition to the Japan Trade Union Council. With six planks in its platform "Propagation of the Japanese Spirit", "Demand for the Establishment of an

Industry and Labour Council," "Institution of a Law for the Control of Industry and Labour," "A Thorough Industrial Service for the Country," "Nationalization of a Labour Festival peculiar to Japan" and "Unity of the War Front of Labourers and Farmers," the meeting proceeded under the leadership of President Tsunekichi Yamazaki. There were 168 delegates from the different member unions present. Among several reports, there was one which showed the attitude of the Convention towards the Government prohibition of the trade union movement in Government factories. The standing committee had requested the authorities to allow Government factory workers to enter patriotic trade unions only, but apparently in vain.

It passed 6 resolutions, the chief being, "Nationalization of Electric Power," "Request for the Organization of a New Patriotic Political Party" in opposition to the old social and democratic parties, and "Destruction of the People's War Front." They denounced present social and democratic thought as being mere imitation of the West and contrary to Japan's national constitution, and upheld a reorganization of all trade unions in the spirit of love for the country in the true Japanese spirit.

The Council is composed of 15 unions with an aggregate membership of 80,278. Its officials and member unions are as follows :

Officials :
Standing Committee,
Kyuzo Takayama, Nisaburo Nishiyama, Harufusa Ohashi, Kenji Tsuyukubo, Kisaburo Yao, Tsunekichi Yamazaki, Shizuma Yagasaki, Tokuju Niizuma.
Treasurer, Shuji Okubo
Secretary, Rikichi Minagawa

The 15th anniversary of the All-Japan Farmers' Union was celebrated at Osaka for 3 days September 7–9, 1936. This union, which was first organized by M. Sugimoto and T. Kagawa, has the oldest history of all farmers' unions in Japan and occupies the most important position in the trade union movement among farmers. A short history of farmers' union movement in different prefectures is published.

The general meeting was held on September 8, with 399 delegates present. The meeting passed resolutions requesting, (i) the institution of tenant and tenant union laws ; (ii) opposing the proposed increase of taxes that fall on the masses ; (iii) requesting the lowering of the price of electric power, (iv) declaring the intention of the union should be to obtain the security of farmers' living by (a) better tenant and farming conditions, (b) the securing of land for practical farmers and ousting of the landowners, (c) the improvement of land and farming technique and management so as to bring about better returns to farmers, (d) organizing an all-Japan farm workers union inviting tenant and half-landed farmers and farm labourers to belong, and finally, (e) establishing a new society through the activities of the All-Japan Farmers' Union in co-operation with city proletarians.

The president of the standing committee of ten is Motojiro Sugiyama and the chief-secretary is Minoru Ito. The number of members of the union is over 40,000.

The first general meeting of the Japan Industrial Labour Club (Nippon Sangyo Rodo Club) was held at Tokyo on October 24, 1936. The club was inaugurated in June, 1933, as a patriotic organization of trade unions on the principle of oneness of capital and labour and no class antagonism, but had had no opportunity

of calling a general meeting before. At the meeting 647 representatives were present, and under the leadership of Kumazo Ishii they passed resolutions on the organization of a new patriotic political party and the establishment of an Industry and Labour Council, confirming similar decisions passed by the September meeting of the All-Japan Convention of Patriotic Trade Unions mentioned above, for this club is one of the strongest members of the Convention. The club is composed of 18 smaller unions with an aggregate membership of 18,550.

The tenth general meeting of the Japan General Federation of Trade Unions, another powerful member of the All-Japan Convention, held at Tokyo on November 15, 1936. This Federation had seceded from the Japan Trade Union Council in September, 1935, and entered the Convention, turning from liberalism to nationalism. The meeting passed 10 resolutions among which the most important was that regarding "the promotion of a political war front of patriotic trade unions." The officials of the Federation on the day of the meeting was as follows :

Officials :
President, Kyuzo Takayama
Vice-president, Bukichi Imai
Chief-secretary, Eiichi Mori
Advisers, Kesaya Yamazaki, Chukichi Kaneko
Central Executive Committee, Fusaji Ohashi, Minekichi Takahashi, Keiji Takahashi and others.
Membership :
43 unions with an aggregate membership of 29,802.

The 3rd general meeting of the All-Japan Council of Trade Unions was held at Tokyo on November 15 and 16. Among trade unions in Japan this body is most inclined to the left, and is close to the Japan Trade Union Council, their slogans being, "Institution of a Trade Union Law," "Institution of a Labour Protection Law," "War for Higher Wages," "Union of Anti-Fascist Bodies," and "War against the Increase of the Tax Burden of the Masses." At the meeting Kanju Kato presided over the 190 representatives present, who expressed their hope to be united with the Social Mass Party in political matters and with the Japan Trade Union Council in trade union matters. The All-Japan Council of Trade Unions is composed of 42 unions and about 15,000 members. Present officials are :

President of the Central Executive Committee, Kanju Kato
Chief-secretary, Hideo Yamahana
Central Executive Committee, Minoru Takano. Toraichi Nanba, Shikaichi Yasuhira, and others.

TRADE UNIONS

(Compiled by the Social Bureau)

	Unions	Members	Total Number of Labourers	Union Percentage
1024	469	228,278	4,245,619	5.3
1925	457	254,262	4,485,810	5.6

1934	965	387,964	5,764,277	6.7
1935	993	408,662	5,906,589	6.7

Farmers' Unions Farmers' unions are changing from temporary to permanent organizations, and are steadily increasing in number. According to the Ministry of Agriculture and Forestry in 1921 there were only 681 tenant-farmers' unions, and their growth is shown below. The number of landowners' unions correspondingly increased from 192 in the same span of time. Opposition between the two is apparently much wider in scope and deeper in nature.

FARMERS' UNIONS

	Landowners		Tenant-farmers		Landowners and Tenant-farmers	
	Unions	Members	Unions	Members	Unions	Members
1929	655	55,138	4,156	315,771	1,986	244,943

Business in Japan and Labour Employed in it

During the ten years between 1920 and 1930 the number of people engaged in business increased from 3,660,000 to 4,900,000, an increase of 1,240,000. This number corresponded to 52 per cent of the increase in the number of employed people. Shops and the entertaining business absorbed 1,180,000, or 95 per cent of the total increase of 1,240,000

In spite of competition from department stores many small retail shops were opened. In the entertaining business restaurants, cafés and bars in-

creased in large numbers, creating a demand for waitressess and barmaids. In the theatrical business new theatres and cinema houses have been opened giving employment to actors, dancers, etc., as well as to ushers of cloak rooms, attendants and others. In the exchange and insurance businesses, there has also been a conspicuous increase in the number of salaried employees.

In Japan the ratio of persons connected with commerce to those employed in industry is greater than in foreign countries, for example, in Great Britain 19 per cent in commerce against 40.2 per cent in manufacturing industries; in the U.S.A. 18.2 per cent against 29.4 per cent in manufacturing industries; and in Germany 13.6 per cent against 36.3 per cent in manufacturing industries. In each case the percentage of population engaged in commerce is less than one half of that in industry. On the contrary, in Japan, those engaged in commerce comprise 16 per cent of the population while those engaged in industry account for only 20 per cent. Professor Torakichi Nakanishi has given three reasons for this. Firstly, the large number of small-scale merchants in Japan; secondly the demand for consumption goods is much greater than that for production goods; and thirdly, Japanese people live in separate individual houses and do not make much use of markets.

In commerce, male labour predominates over female labour. According to the census of 1930 male labour constituted 70 per cent of the whole, with female labour predominating only in the entertaining business, in the ratio of 6 : 4.

In manufacturing, mining and transportation industries, the rate of increase of female and child labour has slackened, owing to the enforcement of the Factory Law, the rationalization of industries and the advance in general education.

The standard of education of the employees in shops is now much higher than it used to be, due to the result of the propagation of education in the country as a whole, the modernization of business, systematized shop keeping, increased difficulty of management, and the demand of customers to be served by well-informed and educated assistants.

Home Industries in Nagoya City

Home industries form a prominent part of the manufacturing industry of Japan, and if their management is improved they are bound to develop further with the expansion and progress of manufacturing industries in factories. Home work serves to supplement the income of poor families by finding work for otherwise unoccupied hands in the family, but out-work is likely to be "sweated" work and as it is considered a low-class part of the industrial system and it cannot be unconditionally encouraged, development of labour conditions in these households is imperative both socially and economically.

The fact that neither the State nor any social organ is directly giving any protection to out-workers, nor considering to give any positive assistance to them, is a matter to be most keenly regretted. Out-workers should be protected by law as are labourers in factories. Moreover, as they are mostly female workers and scattered, no unions can be organized to try and better their conditions, which, especially in case of old and juvenile workers are very bad, no restrictions being placed on their employment regardless of the kinds of work they are engaged in.

Of 13,041 out-workers on whom investigations were made, 12,375 or 94.89 per cent were women, 55 per cent of whom were between 21 and 40 years of age. There were 666 male workers, of whom more than one half were old and juvenile workers, while the rest were those whose health was below the average.

The number of households of these out-workers was 11,440 (the total number of households in Nagoya, according to the census of 1935, was 219,737), the members of these households numbered 52,700 and out-workers 13,041, so that the number of out-workers per household was 1.14. The number of job-workers classified according to sex and age was as follows :

Age	Sex	No. of Jobworkers	Total	%
Below 14	Male	157	510	1.20
	Female	353		2.70
Between 15–20	Male	55	790	0.42
	Female	735		5.64
„ 21–25	Male	31	1,489	0.24
	Female	1,458		11.18
„ 26–30	Male	14	1,924	0.11
	Female	1,910		14.65

Age	Sex	No. of Jobworkers	Total	%
Between 31–35	Male	19	1,998	0.15
	Female	1,979		15.18
„ 36–40	Male	23	1,599	0.17
	Female	1,576		2.08
„ 41–50	Male	57	2,255	0.44
	Female	2,198		16.85
„ 51–60	Male	154	1,546	1.18
	Female	1,392		10.67
Over 60	Male	156	930	1.19
	Female	774		5.94
Total	Male	666	13,041	100.00
	Female	12,375		

Kinds of Home Work There are several hundred kinds of jobwork, all of them being for the manufacture of parts and accessories and are mostly of seasonal kinds. They are jobs, mostly unhealthy and but few which appeal to women's artistic sense. Home work is classified into ten major classes subdivided into 458 kinds, the making of articles for daily use comes first with 147 kinds, and the making of personal ornaments is next with 87 kinds.

The numbers of out-workers classified according to the ten classes are as follows :

Class	No. of Kinds	%	No. of Workers	%
Personal ornaments	97	21.18	3,555	27.26
Toys and seasonal articles for amusements	34	7.42	711	5.45
Articles for daily use	147	32.10	4,181	32.06
Stationery and sporting goods	25	5.46	320	2.46
Plate-making, printing and book-binding	5	1.09	67	0.51
Artistic goods	38	8.60	2,172	16.66
Foodstuffs	19	4.15	882	6.76
Medical instruments and medicine	10	2.18	28	0.22
Chemicals	33	7.20	496	3.80
Miscellaneous work	50	10.92	629	4.82
Total	458	100.00	13,041	100.00

Wages for Out-work Wages are generally low. This is principally due to the intrinsic defect of the system and to defective management. For the supply of out-workers there are brokers who stand between the wholesale suppliers of work and the workers, the method of determining wages is irrational, and the fact that the workers are mostly women and young folks tends to make wages low.

The minimum wage for out-work in Nagoya is lower than in other cities, therefore the average monthly earnings per worker is also very low.

The total wages earned by 13,041 out-workers in a month was ¥45,632.60 as seen from the following table, which should be read in conjunction with the previous one.

Articles	Total Monthly Wages in yen	Percent of whole	Average Monthly per capita wage in yen
Personal ornaments	12,631.82	27.68	3.553
Toys and seasonal articles for amusements	2,429.36	5.32	3.417
Articles for daily use	16,707.67	36.61	3.996
Stationery and sporting goods	1,118.41	2.45	3.495
Plate-making, printing and book-binding	248.20	0.54	3.704
Artistic goods	5,800.17	12.71	2.670
Foodstuffs	2,992.24	6.56	3.393
Medical instruments and medicine	138.30	0.30	4.939
Chemicals	1,328.08	2.92	2.678
Miscellaneous works	2,238.41	4.91	3.559
Total	45,632.66	100.00	

As seen from the last column of the above table the average monthly earning of a worker was only ¥3.449 (the average in Tokyo, according to investigations made in 1935, was ¥6.73). Medical instrument makers got the highest with ¥4.939 but there were only 28 of these, of whom 12 were skilled workers.

The average daily wage was ¥0.171, male worker ¥0.214 and female worker ¥0.169. (According to investigations in Tokyo it was ¥0.27).

The rate of wage is fixed by suppliers of work, and there are wide discrepancies between the highest and lowest wages according to the ability of workers, the difficulty of the work, and acuteness of demand.

Information on wages per unit of articles is given below :

1. Variegated dyeing. The wage is fixed by a unit piece of cloth. The wages differ according to the kinds of articles, which include clothing, "obi" (Japanese sash), "furoshiki" (wrapping cloth), etc., and also according to the ability of workers. The highest is ¥9. per piece, while the lowest is as low as ¥0.02, the average being ¥0.35.

2. Glove knitting. The highest ¥0.23 a dozen and the lowest only ¥0.01, the average being ¥0.05.

3. Clog-thong making. The highest is ¥0.20 per 100 pairs and the lowest ¥0.04, the average being ¥0.09.

4. Wrapping wheat-gluten. The highest wage paid is ¥0.10 per unit of 100 pieces and the lowest ¥0.03, with an average of ¥0.04. In the wrapping of caramel 1 kwan makes a unit, and the highest wage paid is ¥0.13, the lowest ¥0.02, average ¥0.05.

5. "Kimono" making. The unit is one completed piece. The wage for this kind of work in Nagoya is low, the highest being ¥1.80 and the lowest ¥0.10 with an average of ¥0.48.

6. Papering Japanese lanterns. One lantern constitutes a unit. The unit cost differs according to the types of lanterns such as "Tahoto type", "Gifu lantern," "Akamaru", etc. The highest pay is ¥0.04 and the lowest ¥0.002, with an average of ¥0.01. During the demand season, wages increase by about 50 per cent.

In order to raise wages it would be necessary to form unions of out-workers according to their kinds of work. For this purpose, social machinery like the "Jusanjo" (public organ for supplying out-work to house wives) is perhaps the most adapted for giving proper guidance to these workers.

In the second place the wages per unit basis should be raised. In Japan, which has not benefited much by legislation for social welfare, enacting laws on minimum wages cannot be expected, therefore, though rather negative, the occasional publication of standard wages by social organizations in cooperation with trade associations may go some way towards improving present conditions.

In the third place, the workers must be taught to rationalize their work in order to increase their efficiency.

The utilization of by-products of the articles they manufacture may be considered as one way to increase the income of these workers.

Income and Expenditure The average aggregate monthly income of an out-worker's family is ¥48.628. When this is compared with the average monthly income of the poor (those who need public protection) of Nagoya, which is ¥21.07, it may appear large. However, when it is compared with the average monthly income of Japanese registered unemployed labourers, which is ¥40.62, the income of the former exceeds that of the latter only by ¥8, and shows how poorly families of out-workers are faring. By way of comparison, the average monthly income of an out-worker's family in Tokyo is ¥35.31.

The average monthly income from home work of a family in Nagoya is ¥3.989, which is only 8.2 per cent of the total income above mentioned, while that of Tokyo is ¥6.90 and constitutes 19.5 per cent of its total income.

The aggregate expenditure of families of out-workers reaches ¥551,627.05 or ¥44.722 per household.

The purposes for which the income which accrues from out-work is expended is explained by the following table :

Purposes for which income was spent	No. of Home-workers	%
For household finance	8,504	65.21
Pocket money	2,568	19.69
Savings	989	7.58
Education	456	3.50
Preparing for marriage	95	0.73
Others	429	3.28
Total	13,041	100.00

Working Hours The supply of out-work is very spasmodic, and workers are kept busy only intermittently. When they are not busy, workers spend only about two hours a day, while in busy times they spend as much as twelve hours. About 70 per cent of out-workers

work on an average between 4 and 9 hours, the average number of working days per month of these workers is 20 days. The number of those who work between five and six hours is 2,796, or 21.44 per cent; between seven and eight hours, 2,188, or 16.78 per cent; work between eight and nine hours, 1,563, or 11.99 per cent; and between four and five hours 1,447, or 11.1 per cent. Those who worked less than two hours a day numbered only 67, or 0.51 per cent.

Classified into those who work less than four hours a day, those who work between four and nine hours a day, and those who work over nine hours, the following are the figures.

Hours spent in a day	No. of out-workers	%
Less than four hours	1,898	14.55
Between four and nine hours	9,131	70.02
Over nine hours	2,012	15.43

CHAPTER XXXII

MEDICINE AND SANITATION

General

Foreign Physicians "Where there are three doctors there are two atheists" says the old proverb : yet medicine has ever been the hand-maid of religion, and it was through a Christian missionary, St. Francis Xavier, that Western bodily healing first reached the shores of Kyushu. Later, when trade between foreign countries and Japan was the privilege of Dutch merchants only, the physicians who came with them proved a priceless source of knowledge to those Japanese who travelled secretly to Nagasaki in order to learn these new things : and the Bavarian scientist, P. F. von Siebold, spent three years in Yedo instructing the Shogunate doctors in his art. Then, as the Meiji Era opened the gates to foreign learning of every sort, Western medicine entered on the flowing tide, submerging, at least for a time, the native or Chinese system that had obtained for so many centuries, and of which further mention will be found on another page. Europeans were engaged to organize hospitals and to teach medical science in the colleges ; and though Germany soon came to dominate the field in the latter case, it was an Englishman, Dr. Willis, who was the first to be officially engaged ; he and Dr. Anderson being appointed to the Military and the Naval hospitals respectively in Tokyo.

It was largely through the influence of the late Dr. Baelz, who successfully attended an Imperial patient when the latter was dangerously ill, and of Dr. Scriba, the wellknown surgeon, that Japan soon turned to Germany for almost all her medical instruction, though the late Baron Takagi, founder of the Tokyo Charity Medical College and Hospital and formerly head surgeon of the Navy, kept his institution for many years representative of the English school of medicine.

Among Americans might be mentioned Dr. A. E. Vedder, naval surgeon, Dr. Hepburn, and Dr. Eastlake, the father of American dentistry in Japan, though perhaps both were more famous as dictionary-makers ; and, more recently, the late Dr. Teusler of St. Luke's Hospital in Tsukiji.

Health Preservation Work

Control of Foods and Beverages Milk. In the following table are given the actual number at the end of 1935 of persons engaged in the milking, handling and selling or milking and selling, or handling and selling or selling of cow's milk, and of dairy firms, milk plants, and of milk-cows, as well as the quantities of milk produced during the same year :—

Persons engaged in milking, handling and selling of milk	5,868
	* 25
Persons engaged in milking and selling of milk	17,655
Persons engaged in handling and selling of milk	2,526
Persons engaged in selling of milk	3,649
Dairy firms	24,087
	* 25
Milk plants	8,435
	* 25
Number of milk-cows	94,169
	* 369
	(Litres)
Quantity of milk produced	227,086,304
	*614,937
Quantity of milk handled	143,956,732
	*406,330

Note :—* Refers to special milk. Of 25 persons who were engaged in the milking, handling and selling of special milk, 21 had some other additional business, and of 143,956,732 litres of handled milk 64,878 litres was skim milk.

GOAT'S MILK

	1935	Compared with 1934
	(Litres)	
Persons engaged in production and sale of goat-milk	560	44 (incr.)
Number of goat-milk dairies	558	43 („)
Number of milk-goats	5,942	260 („)
Quantity of goat's milk produced	1,274,958	93,142 („)

MILK-PRODUCTS

	kg
Condensed milk	1,393,630
Unsweetened condensed milk	639,205
Condensed skim milk	36,399
Powdered milk	87,806
Unsweetened powdered milk	113,991
Powdered skim milk	15,120
Butter	941,717

Snow and Ice The number of traders in snow and ice (those who gather and sell natural ice, and those who manufacture ice artificially and sell it for the purpose of consumption) at the end of 1935 and the quantity of snow and ice gathered and manufactured during the year compared with the figures for the preceding year are given in the following table :—

	1935	Compared with 1934
Traders is snow and ice	1,719 persons	14 (incr.)
Artificial ice	2,726,676,633 kg	535,872,910 („)
Natural ice	105,484,921 „	21,020,361 (decr.)
Snow	1,706,024 „	919,447 („)

Non-alcoholic Drinks The number of manufacturers of non-alcoholic drinks at the end of 1935 was 3,570, showing a decrease of 134 on the preceding year.

	1935	Compared with 1934
Mineral water and Plain Soda Water	599	13 (incr.)
Ramuné	1,883	21 (decr.)
Cider	1,598	84 („)
Lemonade (including Fruit water, Peppermint water and Cinnamon bark juice)	2,004	71 („)
Fruit Juice, Syrup and others	1,671	17 (incr.)
Acid drinks made from milk or milk-products	184	10 („)

The following table gives the quantity of non-alcoholic drinks manufactured in 1935 :—

	1935	Compared with the Preceding year
Mineral Water and Plain Soda Water	8,013,707	679,378 (incr.)
Ramune	38,434,950	5,350,662 (decr.)
Cider	56,474,509	2,768,888 (incr.)
Lemonade (including Fruit water, Peppermint and Cinnamon bark juice)	18,298,970	4,429,201 (decr.)
Fruit Juice, Syrup and others	16,211,910	2,689,486 (incr.)
Acid drinks made from milk or milk-products	1,729,480	69,636 („)

The total quantity of refreshing drinks as given above, when compared with the total population for the year, comes to 2.01 litres per inhabitant, showing a decrease of 0.08 litres compared with the preceding year.

Waterworks During the year from April, 1935 to March, 1936, sanction was given for the construction of waterworks in 20 localities. Those places which obtained permission to construct waterworks may be classified as follows :

Undertaken by	No. of Waterworks to be constructed	No. of Waterworks Completed
Cities	107	102
Towns and Villages	376	332
Towns or Villages Association	6	6
	* 1	
Prefecture	4	3
Private parties	106	99
Total	600	542

Note :—Refers to those established by the city, town or village guild.

Sewerage During the year 1935, permission to construct sewers was given to 4 places, namely ; Chiba City (Chiba prefecture), Nishinomiya City (Hyogo prefecture), Seido village (Hyogo prefecture) and Naha City (Okinawa prefecture).

Removal of Refuse The following

table gives a general idea of the removal of foul matter conducted in 1935 in 128 cities, under the provisions of the Law for the Removal of Refuse.

Number of houses within the districts in which removal of refuse was carried out		4,425,759
Removal from the above-mentioned houses	Rubbish	3,156,992,841 kg
	Dirt	627,160,963 ,,
	Night-soil	1,471,210 kl
Average amount removed per house	Rubbish	713.3 kg
	Dirt	141.7 ,,
	Night-soil	0.3 kl
Number of houses from which the holder of the land removed refuse under Art. XXI of the Regulation for Enforcement of the Law		94,422
Number of incineration plants		123
Amount of refuses burnt		1,465,655,501 kg
Water-closets with purifying equipments		14,407
Number of water-closets directly connected with the main under Art. 12 of the Regulations for the Enforcement of the City Building Law		30,087

Slaughter-houses. The total number of slaughter-houses at the end of 1935 was 703, of which 87 were established by cities, 370 by towns and villages, 43 by live-stock raisers or industrial associations, and 203 by private individuals. When compared with the figures of the preceding year, it shows an increase of 1 in city slaughter-houses, 13 in those established by towns and villages, and a decrease of 2 in those of live-stock raisers' or industrial association, and of 3 in those privately established.

Slaughtering The number of animals of various kinds slaughtered in 1935 for food purpose and its comparison with the figures for the preceding year are given here (those slaughtered in emergencies or for household use are not included) :—

Kind of Animals	No. of Cattle slaughtered in 1935 (heads)	Compared with 1934 (increase)
Cattle	292,423	2,682
Calves	30,854	1,862
Sheep	1,379	22
Goats	2,918	16
Pigs	1,018,313	79,903
Horses	89,794	494

The following table gives the weight of meat from the slaughtered animals in 1935 and a comparison with that of the preceding year :—

	Total weight		Average weight per head	
	1935 kg	Compared with 1934 kg	1935 kg	Compared with 1934 kg
Beef	55,536,173	1,774,496 (incr.)	189.92	4.37 (incr.)
Veal	1,524,603	110,981 (,,)	49.41	0.65 (,,)
Mutton	26,207	1,458 (,,)	19.00	0.76 (,,)
Goats' flesh	29,099	67 (decr.)	9.97	0.08 (decr.)
Pork	51,087,884	4,643,340 (incr.)	50.17	0.68 (incr.)
Horse-flesh	13,154,200	544,882 (,,)	146.49	5.29 (,,)

The number of cases of emergency slaughter in 1935 (slaughtered outside slaughter-house without formal steps being taken on account of injuries or helpless condition by accident, difficulty of delivery, puerperal anesthesia, or acute tympanitis) was 1,258 of cattle, 61 of calves, 270 of pigs and 902 of horses and the number slaughtered in the same year for private use consisted of 347 calves, 70 sheep, 733 goats and 20,388 pigs.

Inspection of Imported Meat The total amount of imported meat in 1935 at the ports of Yokohama, Tsuruga, Osaka, Kobé, Ujina, Shimonoseki, Moji, Nagasaki and Izuhara was 12,212,441 kilogrammes, of which 3 kilogrammes were condemned. Compared with the preceding year, the amount of meat inspected increased by 117,214 kilogrammes, and condemned meat decreased by 82 kilogrammes. Classified by the kinds of meat, it was as follows :—

	The weight of meat inspected (in kg)	The weight of meat condemned (in kg)	Ratio of condemned meat (%)
Fresh Beef	932,932	—	—
Chilled Beef	6,740,268	—	—
Frozen Beef	4,497,530	3	0.00
Mutton	39,945	—	—
Pork	1,766	—	—

Poisoning The total number of persons poisoned in 1935 was 14,699 (decrease of 244 on the preceding year), of which 8,434 (57.38 per cent) took poison intentionally, 6,236 (42.42 per cent) by accident, and 29 (0.20 per cent) were poisoned by others; and of these persons poisoned 3,153 died, of which 2,795 were those who took poison intentionally, 345 those poisoned by accident, and 13 those poisoned by others, so that 33.14 per cent of those who took poison intentionally died, 5.53 per cent of those accidentally poisoned also died, and 44.83 per cent of those who were poisoned by others also succumbed. Of poisonous substance the frequently used by suicides and poisoning by others were chemicals, especially a rat-poison containing phosphorus; accidental poisoning was mostly due to eating poisonous animals, plants or putrefied food.

Burials and Cremations The total number of burial-grounds at the end of 1935 was 978,040 and their total area was 23,021 hectare, making the average area of burial-ground 0.02 hectre, and the total number of crematoria at the end of the same year was 34,718 in which 658,247 bodies were cremated during the year, so that a crematorium burnt on an average 18.96 bodies. In the same year 625,968 bodies were buried uncremated so that those cremated came to 51.3 per cent and those buried uncremated to 48.7 per cent of the total number of burials, which, when compared with the percentage for 1934 showed a decrease of 0.3 per cent in those cremated.

Insane Persons At the end of 1935, the total number of insane persons was 83,365, showing an increase of 4,230 on the figures for the preceding year. Its ratio to the population of the country in that year was 12.04 per 10,000 of population, which, when compared with the preceding year, shows an increase of 0.44.

	Actual Numbers			Percentage		
	Males	Females	Total	Males	Females	Total
Admitted into Insane Asylums under the Law concerning Asylums for the Insane	1,399	749	2,148	2.65	2.45	2.58
Admitted into Substitute Asylums under the same Law	2,054	1,237	3,291	3.89	4.04	3.95
Under Custody in the Asylums or Hospital	3,228	1,835	5,063	6.12	6.00	6.07
Under Custody in other places	5,860	1,328	7,188	11.10	4.34	8.62
Under Temporary Custody	115	36	151	0.22	0.12	0.18
Not requiring Admission or Custody	40,114	25,410	65,524	76.02	83.05	78.60
Total	52,770	30,595	83,365	100.00	100.00	100.00

Tuberculosis The following table shows the results of health examinations conducted in 1935 by the prefectural governments, in accordance with the provision of Art. IV, Clause I of the Law for the Prevention of Tuberculosis:

	1935	Compared with the preceding year (incr.)
Estimated number of persons requiring health examination	1,998,544	120,505
Number of persons examined	1,676,760	113,492
	*84,393	*1,959
Number of persons diagnosed as tuberculosis patients	538	99
Ratio of the patients per 1,000 of the examined	0.31	0.04
Number of persons ordered to suspend from work	113	50

Note:—The figures marked with asterisk are those for whom more than two examinations were made.

Trachoma The following table shows the result of examinations conducted by the prefectural government during 1935, in accordance with provision of Art. 4, clause 1 of the Law for the Prevention of Trachoma :—

	1935	Compared with preceding year.
Number of persons examined	5,981,741	300,607 (incr.)
	*528,152	*419,579 (decr.)
Number of trachoma cases:		
Severe cases	33,820	3,814 („)
Mild cases	376,994	47,240 („)
Suspected cases	116,533	2,916 („)
Total	527,347	53,970 („)
Ratio of cases per 100 persons examined	8.10	0.67 („)
Number of patients ordered to refrain from work	113	114 („)

Note:—The figures marked with asterisk are those for whom more than two examinations were made.

Health Examination of Prostitutes The prostitute quarters actually existing at the end of 1935 (the term prostitute quarters does not here and hereinafter necessarily mean segregated quarters, but is also intended for convenience' sake to include all places where licensed prostitutes have been permitted to carry on their trade) numbered 411, being a decrease of 11 from the preceding year. The daily average during the year of licensed prostitutes in these quarters was 43,709, showing a decrease of 2,171 from the preceding year.

The number of health-examination offices for these prostitutes was 384, showing a decrease of 29 on the preceding year, and the total number of examination made in these offices was 2,645,374, showing a decrease of 73,445 from the preceding year, and in 54,821 cases the prostitutes were found diseased. The ratio of cases of diseases to the total number examined was 2.07 per cent, i. e. 0.02 per cent higher than in the preceding year. The number of hospitals for admitting these diseased prostitutes (including places for treatment lacking hospital accomodations) was 142, and the average number of times a prostitute was admitted into hospital during the year was 1.25 or 0.04 more in the preceding year.

The following table gives the number, classified according to diseases, of prostitutes in the whole country who were during the year found to be diseased upon examination.

	No. of cases in 1935	Ratio in percentage to the total number of cases of diseases			
		1935	1934	1933	1932
Syphilis	3,479	6.35	6.31	6.92	7.02
Gonorrhoea	24,751 (1,020)	47.01	48.46	48.03	49.99
Chancroid	15,718 (2,033)	32.38	32.19	30.84	30.08
Ulceration	3,674 (1,427)	9.30	8.01	7.66	7.14
Infectious skin-diseases	130 (40)	0.31	0.44	0.49	0.41
Tuberculosis	12 (3)	0.03	0.01	0.02	0.04
Leprosy	— (—)	—	—	—	—
Trachoma	785 (118)	1.65	2.04	2.23	2.96
Other diseases	6,272 (228)	11.86	10.75	10.58	10.98
Total	54,821				

Note:—In the percentage of cases of diseases, the diseases which are found in one and the same person are taken as separate cases, so that their total exceeds 100.

Cholera In 1935, there was no cases of cholera.

Dysentery, Including Ekiri The total number of cases of dysentery in 1935 was 48,968 and there were 15,066 deaths therefrom, an increase of 6,016 cases and 276 deaths over the preceding year. The ratios of these cases and deaths to the population in the same year were 7.07 cases and 2.18 deaths per 10,000 inhabitants, an increase of 0.77 cases and 0.01 deaths.

The total number of cases of dysentery which broke out in urban districts only

during the year under review was 31,148 which corresponds to 63.61 per cent of the total number of dysentery cases throughout the country. Of these, there were 8,153 deaths. The rates of cases and deaths per 10,000 of urban population were 13.72 and 3.59 respectively, showing, when compared with the preceding year, an increase of 1.27 and a decrease of 0.08.

Typhoid Fever The total number of cases of typhoid fever in 1935 was 38,357 with 6,843 deaths, showing a decrease of 4,238 cases and 188 deaths over the preceding year. The ratios of these cases and deaths to the population in the same year were 5.54 cases and 0.99 deaths per 10.000 inhabitants, a decrease of 0.71 cases and 0.14 deaths.

The total number of cases of typhoid fever reported for urban districts only, during the year was 17,496 being 45.61 per cent of cases for the whole country, and 3,190 deaths.

The ratios of the cases and deaths per 10,000 urban population was 7.71 and 1.41 respectively, a decrease of 1.28 cases and 0.33 deaths.

Paratyphoid Fever The total number of cases of paratyphoid fever in 1935 was 4,207 of which 270 ended fatally, a decrease of 275 cases and 70 deaths.

The ratios of these cases and deaths to the population in the same year were 0.61 cases and 0.04 deaths per 10,000 inhabitants, decrease of 0.05 cases and 0.01 deaths.

The total number of cases of paratyphoid fever reported for urban districts only in 1935 was 1,933 being 45.95 per cent of the total number of cases for the whole country, and the deaths therefrom numbered 114.

The ratios of cases and deaths per 10,000 of urban population was 0.85 and 0.05 respectively, an increase of 0.02 and 0.01.

Smallpox In 1935 smallpox broke out in Osaka and other 14 prefectures, the total number of cases being 113 with 15 deaths. The ratios of these cases and deaths to the total population in the same year were 0.02 cases and 0.00 deaths per 10,000 inhabitants. The largest number of cases occurred in Gifu prefecture, where there were 46 cases with 5 deaths : in the other prefectures the number of cases was less than 25. (In 1934 there were 320 cases with 36 deaths). The total number of cases of smallpox in urban districts was 43 (7 deaths), corresponding to 38.05 per cent, of the total number of cases for the whole country, and the ratio to 10,000 of urban population shows 0.02 cases and 0.00 deaths.

Typhus In 1935, 16 cases of typhus broke out in the prefecture of Tokyo (with 1 death) (inurban district) and one each in Hyogo and Yamaguchi prefectures (in urban district). (There were 26 cases in 1934 with 3 deaths).

Scarlet Fever The total number of cases of scarlet fever in 1935 was 16,509 with 513 deaths, a decrease of 179 cases and increase of 4 deaths.

The ratios of these cases and deaths to the population in the same year were 2.38 cases and 0.07 deaths per 10,000 inhabitants. Compared with the preceding year, there was a decrease of 0.07 in the ratio of cases while the death-rate remained stationary.

Diphtheria The total number of cases of diphtheria in 1935 was 28,200 with 4,373 deaths, a decrease of 1,909 cases and 717 deaths.

The proportion of these cases and deaths to the population in the same year was 4.07 cases and 0.63 deaths per 10,000 inhabitants, a decrease of 0.35 cases and 0.12 deaths.

Epidemic Cerebrospinal Meningitis The total number of cases of epidemic cerebrospinal meningitis in 1935 was 1,304 of which 739 ended fatally, an increase of 117 cases and 82 deaths. The proportion of these cases and deaths to the population in the same year was 0.19 cases and 0.11 deaths per 10,000 inhabitants, an increase of 0.02 cases and 0.01 deaths over the preceding year.

Plague No cases of plague occurred in 1935.

The following table gives the statistics of cholera and four other infectious diseases in the country during the fifty years since 1886.

FIFTY YEARS OF INFECTIOUS DISEASES

	Cholera		Dysentery		Typhoid Fever		Smallpox		Diphtheria	
	Cases per 10,000 Inhabitants	Deaths per 1,000 deaths from all causes	Cases per 10,000 Inhabitants	Deaths per 1,000 deaths from all causes	Cases per 10,000 Inhabitants	Deaths per 1,000 deaths from all causes	Cases per 10,000 Inhabitants	Deaths per 1,000 deaths from all causes	Cases per 10,000 Inhabitants	Deaths per 1,000 deaths from all causes

Note:—Among the number of dysentery since 1922 (October) includes ekiri.

Vaccination The total number of 1st period vaccinations performed in 1935 was 1,977,440, of which 1,854,419 showed positive results and 66,088 negative while 56,933 were not examined as to the result. Compared with the figures of the preceding year, there was a decrease of 61, 072 in the total number of vaccinations, of 36,731 in the number of positive vaccination, of 21,855 in negative vaccinations, and of 2,486 in the cases of which result was not examined.

The total number of 2nd period vaccinations was 2,004,672 of which 1,188,-111 proved positive, 788,094 negative while 28,467 were not examined of their

result, showing, compared with the figures of the preceding year, a decrease of 2,220 in the total number vaccinated, and 3,033 in the positive takes, and an increase of 4,457 in the negative, and a decrease of 3,644 in the number of unexamined cases.

The following table gives the number of public and private vaccinations both for the first and second times in each period :—

			1st Time Vaccination	2nd Time Vaccination
First Period	Public Vaccination	Positive	1,737,482	63,936
		Negative	47,781	16,974
		Not yet examined	51,654	5,279
		Total	1,836,917	86,189
	Private Vaccination	Positive	52,235	766
		Negative	912	421
		Total	53,147	1,187

			1st Time Vaccination	2nd Time Vaccination
Second Period	Public Vaccination	Positive	1,094,575	89,960
		Negative	495,456	289,999
		Not yet examined	23,731	4,736
		Total	1,613,762	384,695
	Private Vaccination	Positive	3,082	494
		Negative	1,747	892
		Total	4,829	1,386

The special vaccinations were carried out in 1935 in Iwate and 20 other prefectures, and the total number of persons vaccinated was 2,116,354.

Port Quarantine The total number of vessels inspected in 1935 by harbour offices of the Custom Houses and temporary port quarantine stations was 21,283 Japanese vessels (with a total tonnage of 72,040,600) and 4,860 foreign vessels (with a total tonnage of 34,040,646), making a total of 26,143 vessels (with a total tonnage of 106,081,246). The total number of persons inspected was 2,506,372 of which members of ship's crews numbered 1,467,400 and passengers 1,038,972. Compared with the corresponding figures of the preceding year, the number of vessels increased by 2,638 and that of crews and passengers by 121,626. By these inspections were found 4 persons suffering from smallpox, one from scarlet-fever and 31 from other notifiable infectious diseases (with 1 death), making a total of 36 cases (1 death). Compared with the preceding year, this shows a decrease of 5 cases with the same number of death.

Of the above mentioned vessels inspected, 4 vessels and 135 persons thereon were subjected to disinfection. When compared with the preceding year, there was a decrease of 10 vessels and 128 persons. The vessels subjected to detention numbered 2, being a decrease of 7 when compared with the preceding year. The destruction of rats and insects was carried out on 1,483 vessels and 7,350 rats were caught, which, compared with the preceding year, shows an increase of 186 in the number of vessels and of 1,343 in that of rats.

Rabies In 1935, there was only one case of rabies in men which occurred in Fukuoka prefecture. The number of rabid dogs reported in 1935 was 7 in Tokyo prefecture and 4 in Fukuoka prefecture, bringing a total to 11, the same figures with the preceding year. In 1935 there was no rabid animal other than dogs. The number of persons bitten by rabid dogs in 1935 was 33, showing an increase of 24 on the preceding year. The number of persons who had preventive injection for rabies in 1935 was 3,600, showing an increase of 706 on the preceding year. Of the above number, 33 were those who had been bitten by rabid dogs, and 3,567 by animals suspected of rabies.

Bacteriological Laboratories The number of bacteriological laboratories at the end of 1935 was 210, of which 147 were established by prefectural governments, 23 by cities, and 40 by private individuals, showing an increase of 6 in the total number on the figures of the the preceding year.

The number of bacteriological examinations made by these laboratories in 1935 were 3,674,206 of which those connected with the notifiable infectious diseases were 3,338,599 and those not connected therewith 335,607, an incease of 99,288 in the total number of examinations over the preceding year.

Medical Affairs

Medical Practitioners The total number of medical licences issued in 1935

was 3,313 (besides, 12 to foreigners), showing a decrease, compared with the preceding year, of 8 licences (the number issued to foreigners being decreased by 5). In the following table is given the number of persons to whom licences were issued, classified and compared with the preceding year's figures :

	1935	Compared with preceding year
Graduates of universities	1,763	71 (incr.)
Completed course in Government or public colleges of medicine	225	14 (decr.)
Completed course in approved private colleges of medicine	1,316	61 („)
Completed course in foreign colleges (including examination)	8	—
Passed examination	1	4 (decr.)
Total	3,313	8 („)

The total number of medical practitioners at the end of 1935 was 57,581 (besides 32 foreigners), showing an increase on the preceding year of 2,565 practitioners (an increase of 1 among foreigners). The following table gives the number of medical practitioners at the end of 1935 classified and in percentage (the percentages for the preceding four years are also given for comparison) :

	At the end of 1935	Percentage 1935	1934	1933	1932	1931
Graduates of universities	18,822	32.69	30.96	29.51	27.09	25.16
Completed course in Government, public or approved private colleges of medicine	27,992	48.61	48.80	48.33	48.65	48.94
Completed course in foreign schools (including examination)	68	0.12	0.12	0.12	0.12	0.13
Passed examination	10,071	17.49	18.82	20.42	22.27	23.43
Licensed on account of official career	33	0.06	0.07	0.09	0.11	0.14
In practice from before promulgation of the Law of Medical Practitioners	520	0.90	1.08	1.36	1.55	1.96
In practice within limited districts	75	0.13	0.15	0.17	0.21	0.24
Total	57,581	100.00	100.00	100.00	100.00	100.00

Of the above total number, those who actually engage in the diagnosis and treatment of patients were 51,597 being 89.61 per cent of the total.

The total number of those medical practitioners who were actually engaged in the diagnosis and treatment of patients at the end of 1935 was at the rate of 7.45 practitioners per 10,000 inhabitants (1,342 inhabitants per physician). The ratio of practitioners per 10,000 inhabitants in the prefectures, in Tokyo prefecture had the highest ratio of 14.84 practitioners, followed by Kyoto with 14.23, Osaka with 10.29, Ishikawa with 10.22 and Hyogo with 8.23 ; and prefectures of Miyagi, Chiba, Tokushima, Okayama and Shimane had also high ratio of medical practitioners. The prefecture with the smallest ratio was Okinawa which had 3.14, followed by Fukushima with 4.50, Ibaraki with 4.53 Iwate with 4.68 and Yamagata with 4.86 ; and other prefectures with low ratios were Miyazaki, Saitama, Tochigi, Nagano, Akita and Nara.

As to the distribution of medical practitioners between urban and rural districts, there were 12.72 practitioners per 10,000 of population in the urban districts while the corresponding ratio was 4.88 for rural distriicts.

Dental Surgeons The total number of licences issued to dental surgeons in 1935 was 1,219, being an increase of 65 when compared with the preceding year. In the following table is given the number of persons to whom the licences were issued in 1935, classified and compared with the preceding year's figures :

	1935	Compared with preceding year
Completed course in Government or approved private dental colleges	1,126	73 (incr.)
Completed course in foreign schools (including those who passed examination)	6	4 (,,)
Passed examination	87	12 (decr.)
Total	1,219	65 (incr.)

The total number of dental surgeons at the end of 1935 was 20,010 (besides three foreigners), showing an increase on the preceding year of 1,012 (number of foreigners remained stationary); the following table gives the number classified and in percentage (the percentage for the preceding years are also given for comparison) :—

	At the end of 1935	Percentage 1935	1934	1933	1932	1931
Completed course in Government or approved private dental colleges	11,206	56.00	53.62	50.82	48.14	44.57
Completed course in foreign schools (including examination)	79	0.40	0.41	0.43	0.43	0.45
Passed examination	8,722	43.59	45.95	48.72	51.40	54.94
In practice from the time before the promulgation of the Law of Dental Surgeons	3	0.01	0.02	0.03	0.03	0.04
Total	20,010	100.00	100.00	100.00	100.00	100.00

Of the above number those who were actually engaged in practice numbered 18,428 which corresponds to 92.09 per cent of the total number of dental surgeons.

The total number of those dental surgeons who were actually in practice was at the rate of 2,66 per 10,000 of the population, and if we examine the ratio of the dental surgeons in prefectures, we find that the highest ratio was that of Tokyo prefecture with 6.29 per 10,000 inhabitants, followed by Osaka with 3.66, Kanagawa with 3.42, Aichi with 2.79, Kyoto with 2.77 and Hyogo with 2.73; the lowest ratio was that of Okinawa which was 0.59, followed by Iwate with 1.17, Kagoshima with 1.38, and Yamagata with 1.39; and among the low ratios were those of Toyama, Miyazaki, Shiga, Akita, Fukui, Fukushima, Miyagi, Aomori and Niigata.

As to the distribution of dental surgeons in cities and districts of the country the ratio was 4.84 for cities and 1.60 for country districts per 10,000 inhabitants.

At the end of 1935, besides the above mentioned number of dental surgeons, there were 89 medical practitioners who specialized in dentistry.

Pharmacists The total number of pharmacist's licences issued in 1935 was 1,681 (besides one foreigner), showing an increase, when compared with the preceding year, of 260 licences. In the following table is given the number of persons to whom licences were issued in 1935, classified and compared with the preceding year's figures :—

	1935	Compared with preceding year
Graduates of universities	18	7 (decr.)
Completed course in Government or public colleges of pharmacology	*384	86 (incr.)
Completed course in approved private school of pharmacology	1,229	170 (,,)
Completed course in foreign school (including examination)	1	2 (decr.)
Passed examination	49	12 (incr.)
Total	1,681	259 (,,)

Note:—Including the graduates from pharmacological department attached to government or public medical universities.

The total number of pharmacists at the end of 1935 was 24,957 (besides 1 foreigner), showing an increase, compared with the preceding year's figures, of 1,674 (the number of foreigners remained stationary); and the following table gives the number classified and in percentage (the percentages for the preceding four years are also given for comparison) :—

	No. at the end of 1935	Percentage 1935	1934	1933	1932	1931
Graduated from universities	305	1.22	1.23	1.32	1.21	1.27
Completed course in government, or public or private approved colleges of pharmacology	*14,061	56.34	53.26	50.02	46.57	42.46
Completed course in foreign school (including examinations)	33	0.13	0.13	0.14	0.12	0.13
Passed examination (including examination under former regulations)	10,558	42.31	45.38	48.52	52.10	56.14
Total	24,957	100.00	100.00	100.00	100.00	100.00

Note:—*Including graduates from pharmacological department of the government or public medical college or from the pharmacological department attached to the government or public medical universities.

Of these pharmacists, (1) the number of practising pharmacists (those who were engaged in the dispensing of medicines in the pharmacies, those who were engaged in the sale of medicines and those who were engaged in the manufacture of medicines) was 16,440 (2) the number of those who being employed by hospitals or other dispensaries, were engaged in the dispencing of medicines was 2,791 and (3) those who were exclusively engaged in the sale of patent medicines numbered 1,551. Those coming under (1) corresponds to 65.87 per cent of the total number of pharmicists while (2) and (3) represented 11.18 and 6.21 per cent respectively.

Phamacies and Dealers in Medicines Pharmacies. The number of pharmacies at the end of 1935 was 12,303 of which 12,130 were run by pharmacists and 173 by non-pharmacists, showing an increase, when compared with the preceding year, of 287 pharmacies run by the pharmacists and 28 pharmacies managed by non-pharmacists.

Dealers in Medicines. The total number of persons engaged in the sale of medicines at the end of 1935 was 30,237 showing an increase of 619 persons on the preceding year; among them, the qualified pharmacists who were engaged in the sale of medicines without opening pharmacies numbered 735 and druggists 29,502. Of these druggists those who were qualified to deal in approved medicines numbered 4,307, of which those employing pharmacists were 2,075, those coming under the provisions of Art. XXXVII, Item 4 of the "Regulations for the Trade in Medicines and the Handling Thereof" were 119 and those coming under the second clause of the supplementary provisions of the same regulations were 2,113.

Medicine-Manufacturers. The total number of medicine-manufacturers at the end of 1935 was 4,083, being an increase of 116 over the preceding year. Of these manufacturers, 1,282 were pharmacists, 1,027 those employed pharmacists, and 1,774 neither pharmacists nor those employing pharmacists.

Midwives The total number of midwives at the end of 1935 was 59,560 (besides two foreigners), showing an increase of 1,290 (no change in the number of foreigner) over the preceding year; they may be classified as 4,955 persons who completed the course in approved schools or training institutes, 51,157 who passed the examination, and 2,989 who have been in practice from time prior to the operation of the Midwives Regulations, and 459 who practise in limited districts.

Distribution of Midwives The total number of midwives was at the ratio of 8.60 per 10,000 inhabitants, being an increase of 0.06 on the preceding year as to the distribution of midwives between urban and rural districts of the country, the ratio was 11.45 in the urban districts and 7.21 in the rural districts per 10,000 inhabitants, showing, when compared with the ratio in the preceding year, a decrease of 0.31 in the urban districts and an increase of 0.16 in the rural districts.

Nurses The total number at the end of 1935 of nurses who had obtained licence from the prefectural offices was 106,857 (of which 3,889 were under-nurses) showing an increase of 3,936 on the preceding year (the number of under-nurses decreased by 335). The ratio of the above total number to 10,000 of population was 15.43, showing an increase of 0.34 on the corresponding figures of the preceding year.

The number of male nurses at the end of 1935 who had obtained licences from the prefectural offices was 322, showing an increase of 17 on the figures of the preceding year.

Acupuncture, Moxicautery, and Massage The following table gives the number of persons engaged in acupuncture, moxicautery, and massage who had obtained licences from the prefectural offices at the end of 1935.

	Not Blind			Blind		
	Males	Females	Total	Males	Females	Total
Acupuncture	2,559	579	3,138	1,541	326	1,867
	*15,783	*2,986	*18,769	*10,443	*2,146	*12,589
Moxicautery	3,168	904	4,072	705	153	858
	*15,956	*3,154	*19,110	*7,506	*1,439	*8,945
Massage	7,996	3,714	11,710	15,205	9,295	24,500
	*14,236	*4,850	*19,086	*23,165	*10,960	*34,125

Average number of days a patient stayed in leprosarium	307.55	249.53	37.44	271.33

Hospitals for Prostitutes At the end of 1935 there were 121 hospitals for prostitutes with a total accommodation for, 5,074 (of which 9 were in the infectious diseases rooms). Compared with the preceding year, there was a decrease of 12 in the number of hospitals and of 356 in admitting capacity. The number of patients who had remained over from the preceding year in the hospitals was

1,203 and those who entered them in 1935, 47,182 making a total of 48,385 (of whom 397 were private prostitutes admitted under the provisions of Art. III of the Administrative Execution Law).

The following table gives important ratio respecting facts connected with the above mentioned hospitals for prostitutes ;—

Average capacity per hospital	41.93 patients
Average number of patients admitted per hospital	399.88 ,,
Average number of days a patient remained in hospital	18.35 days
Average number of days a private prostitute remained in hospital	23.48 ,,

Infectious Diseases Hospitals, Isolation-wards, and Isolation Houses (Established under the provision of the Law for the Prevention of Infectious Diseases). The total number of hospitals for infectious diseases at the end of 1935 was 1,294, (an increase of 8 hospitals on the preceding year), consisting of 119 established by cities, 964 by towns, villages and other similar public corporations, and 211 established by town or village associations or similar bodies. The admitting capacity of these hospitals was 27,273 in total (an increase of 227 on the preceding year), making an average of 21.08 per hospitals. (an increase of 0.05).

The isolation wards at the end of the same year numbered 7,117, (a decrease of 134 on the preceding year) consisting of 47 established by cities, 6,712 by towns, villages or similar public corporations, and 358 by town or village associations or similar bodies : and the accommodation in these isolation wards was 66,058 in total, (a decrease of 261 over the preceding year, the average per ward being 9.28 (an increase of 0.13).

The total number of isolation houses at the end of 1935 was 70, (an increase of 40 on the preceding year) of which 10 were those established by cities, 58 by towns, villages or similar public corporations, 2 by the town or village associations or similar bodies. The estimated total capacity of these isolation houses was 1,704 (a decrease of 11 over the preceding year) the average capacity per house coming to 24.34 persons (a decrease of 1.64).

At the end of 1935, there were 47 disinfecting stations (established under the provision of the Law for the Prevention of Infectious Diseases), showing no change in their number with that of the preceding year.

Medicines The total number of persons who reported the sale or import of non-pharmacopoeial medicines or preparations thereof in 1935 to the respective prefectural offices was 607, and the number of medicines reported 2,890, showing, compared with the preceding year a decrease of 2 persons and of 197 medicines.

In the tours of inspection made during 1935, 25,014 places (a decrease of 1,038 when compared with the preceding year) were visited ; and the following table gives the places visited and the results of the inspection :

	No. of places visited	No. of places visited per 100 places to be visited	No. of deleterious medicines discovered per 100 places visited		No. of violators of the regulations punished per 100 places visited
			No. of places	No. of medicines

Patent Medicines At the end of 1935, the total number of patent medicine dealers was 42,125, showing an increase of 577 compared with the figures of the preceding year. Of these, there were 11,384 pharmacists, 3,447 medical practitioners and veterinary surgeons, 2,793 who employ pharmacists, 17,657 who come under Art. XXIV of the Patent Medicine Regulations and 6,785 who came under Art. XXV of the same law, while there were 59 who were engaged exclusively in the importation and sale of patent medicines.

At the end of 1935 the total number of patent medicines for which permission of manufacture or importation was given was 325,851 (of which 201 were imported), showing an increase of 16,591 when compared with the figures of the preceding year, (Permissions for importation decreased by 2).

Patent medicines manufactured or imported in 1935 amounted in value to 90,348,212 Yen (of which 777,863 yen represents the import from foreign countries and the territories), showing an increase of 4,879,835 Yen which compared with the preceding year (the amount of importation increased by ¥264,944), as to amount of the manufacture and importation combined to the population in that year the ratio came to 1.30 yen per person, being an increase of 5 sen compared with the preceding year. At the end of 1935, the total number of retailers in patent medicines was 267,840 indicating a decrease of 11,495 when compared with the figures of the preceding year.

Health Condition The birth-rate of Japan went down after the peak year of 1920 until 1935, when it rose to 31.6 per 1,000 of the population, keeping above that of the five countries of France, Germany Great Britain, Hol-

land and Italy. The death-rate has continued to fall, being 16.8 per 1,000 of the population in 1935, but the rate is still greater than in the other countries. These facts may be taken to indicate a somewhat better health condition in this country in recent years.

But diseases such as tuberculosis, syphilis, leprosy and trachoma are still very prevalent. Tuberculosis especially occupies the first position among the causes of deaths, killing 131,525 persons in 1934, or 19.3 deaths per 10,000 of the population. Of trachoma there are some 7,400,000 cases per annum. In the number of lepers Japan shares with China and British India an unenviable reputation, having over 15,000 lepers in 1935. Internal parasites are present in 30 per cent of the population of farm villages. Diseases of the alimentary organs such as typhoid and dysentery are also very common.

The average duration of life in Japan is 44.8 years for males and 46.5 years for females, being about 10 years shorter than in other countries. According to the investigation of the Education Ministry into the physical conditions of school boys and girls, statistics show a continued progress in their height and weight, but their chest measurement has not correspondingly increased. The results of the physical examinations conducted by the Military authorities for conscription show a smaller number in A and B classes and a greater number in C and D classes in recent years. The physical strength of the youth is weakening, the proportion of rejections increasing annually at the rate of 10 in 1,000 of the young men examined for conscription.

These facts have drawn the attention not only of the authorities concerned but also of the public and the improvement of national health is considered one of the most important aims of Government policy, and plans therefore have been drawn up by the Health Bureau of the Home Ministery. They are (1) the establishment of health offices, (2) the supply of medical equipment to country villages, (3) the prevention of tuberculosis, (4) the extermination of leprosy, (5) the increase of general medical establishments, and (6) measures for the protection of insane persons.

The first plan is to establish 550 health offices and 1,100 sub-offices all over Japan proper under a 10 year programme, one office for each district which has 30,000 adults, at an estimated expense of ¥20,000 for an office and ¥1,500 for a sub-office, being an aggregate expense of ¥12,650,000 allotted evenly to the national Treasury and local governments. Their running expenses will, it is estimated, amount in the aggregate to ¥10,230,000, one-third of which is to be borne by the national Treasury and two-thirds by local governments. The sanitary control of local districts hitherto left to the police will be changed to a policy of active assistance after the establishment of these health offices.

The second measure is to supply medical equipment and medical practitioners to the country villages which have no doctors. The number of doctors is increasing by over 2,000 annually, but their distribution is proportionately much less in the country places. There are 15 small towns and 3,228 villages, with an aggregate population of 8,160,000, which have not a single resident medical practitioner. It corresponds to 28 per cent of the total number of the country towns and villages in Japan Proper at the end of May, 1936. Some of them, however, have means of access to doctors in adjacent towns or villages and the number of those which are included in the new plan is 1,400 with an aggregate population of 3,650,000. One consultation office for each 5,000 people will be established under a 5 year programme. The expense for creating 750 such offices will, it is estimated, reach ¥1,125,000, to be evenly allotted to the national Treasury and local governments; and the national Treasury will annually bear ¥1,000 of the running expenses of each office.

DEATH RATES IN CITY AND RURAL DISTRICTS

(Per 1,000)

Year	City districts	Rural districts
1925	18.9	20.64
1926	17.68	19.60
1927	18.02	20.33
1928	17.60	20.61
1929	17.66	20.79
1930	16.46	18.71
1931	17.46	19.48
1932	13.78	19.40
1933	15.79	18.63
1934	16.00	19.07
Average	16.94	19.73

As the table shows the health conditions of the people living in rural districts are bad as compared with those living in urban districts. The average Japanese death rate in 1933 was 17.8 per 1,000 as compared with 15.8 of

France, 13.5 of Italy, 12.3 of Great Britain, 11.2 of Germany, and 8.8 of Holland; that of the last-named being exceptionally low. The death rate of Japan is astonishingly high compared with those of other countries. Furthermore, while the rate has a marked tendency to decline further abroad, this tendency in Japan is only very slight and is showing no great sign of improvement.

Next, the average life of the people of Japan is about 44.82 years for males and 44.54 for females, and the people are very short-lived as compared with those of Great Britain, Germany, and France.

One-tenth of the total number of deaths in Japan is due to tuberculosis and it is estimated that over 1,000,000 persons are suffering from the disease. The loss thus sustained is especially great because the victims are mostly among the young people of the nation, and the Home Ministry has decided to add 30,000 beds to the present 10,000 in the course of the next 10 years, 2,500 in the National Tuberculosis Sanatorium to be built for ex-soldiers, 25,800 in the Public Tuberculosis Sanatoriums for the general public and 1,700 in the tuberculosis sanatoriums to be established in connection with the national health insurance. The total expense for completing the plan is estimated at ¥28,300,000; ¥15,400,000 of this is to be borne by the national Treasury while the rest is to come from the treasuries of local governments.

The total number of lepers in Japan Proper is approximately 15,000 and the three national leper asylums and various private ones can accommodate about 7,000 lepers. The Mitsui-Hō-ko Kai (a social service foundation established by the Mitsui interests) has contributed ¥2,090,000 for the equipment of 3,000 beds for lepers, and with this money the Home Ministry is going to establish 3 new national asylums in the coming 3 years to provide 10,000 beds for the poor victims of leprosy.

The number of insane persons in Japan is estimated at about 80,000, and the total accommodation for them is only 5,000 beds (2,000 in public asylums and 3,000 in additional private asylums. The Home Ministry intends to increase the annual subsidy to ¥100,000 for the establishment and enlargement of these asylums.

Number of Patients The Nippon Ishikai (The Japan Physicians' Society) conducted a survey of present medical conditions in Japan by collecting reports from its members. The society has approximately 60,000 members all over Japan Proper and 36,734 questionnaire cards were sent out to them, receiving 25,754 replies, 70 per cent of cards sent in which the number of patients classified according to the kinds of diseases, who visited doctors on October 10,1936 was reported.

According to the survey the total number of patient reported was 1,431,104, (male 805.630 and female 625,474), from which it is estimated that over 2,044,000 may have visited doctors on that day. This number forms 2.9 per cent of the total population in Japan proper.

As to the percentage of patients arranged according to prefectures the highest was 5.9 in Niigata prefecture, Fukuoka comming next with 4.8. As a rule those prefectures which have large cities had high percentages, rising above 3.5 per cent, for instance Tokyo 4.4, Aichi (Nagoya) 3.8, Osaka 3.9 and Hyogo(Kobe) 3.8.

NUMBER OF PATIENTS ACCORDING TO PREFECTURES

(Per 100 Of Population)

Hokkaido	2.2	Ishikawa	3.1	Okayama	2.9
Aomori	1.5	Fukui	2.7	Hiroshima	3.4
Iwate	1.5	Yamanashi	1.5	Yamaguchi	2.5
Miyagi	1.9	Nagano	2.7	Tokushima	2.6
Akita	1.6	Gifu	1.9	Kagawa	2.1
Yamagata	1.8	Shizuoka	2.1	Ehime	2.4
Fukushima	2.0	Aichi	3.8	Kochi	3.9
Ibaraki	1.6	Mie	2.2	Fukuoka	4.8
Tochigi	1.6	Shiga	1.7	Saga	2.8
Gumma	1.6	Kyoto	2.8	Nagasaki	3.2
Saitama	1.9	Osaka	3.9	Kumamoto	2.1
Chiba	1.3	Hyogo	3.8	Oita	2.7
Tokyo	4.4	Nara	1.8	Miyazaki	2.1
Kanagawa	2.9	Wakayama	2.4	Kagoshima	2.5
Niigata	5.9	Tottori	2.3	Okinawa	0.9
Toyama	2.2	Shimane	2.1		

NUMBER OF PATIENTS CLASSIFIED BY DISEASES (October 10, 1936)

(According to The Japan Physicians' Society)

Questionnaires 36,734; Answers 25,754

	Male	Female	Total
Organic diseases	317,693	251,340	569,033
Tuberculosis	59,141	44,901	104,042
Diseases of digestive organs	110,919	85,042	195,961
Others	147,633	121,397	269,030
Insanity	12,126	6,894	19,020
Epidemic diseases	5,488	4,928	10,416
Surgical cases	127,500	56,604	184,104
Diseases of urethra and genitals	51,943	18,175	70,118
Skin diseases	31,130	22,576	53,706
Female diseases	—	51,337	51,337
Children's diseases	96,154	78,229	174,383
Tuberculosis	8,189	6,764	14,953
Diseases of digestive organs	44,689	34,869	79,558
Others	43,276	36,596	79,872
Diseases of eyes, ears, etc.	163,596	135,391	298,987
Diseases of eyes	95,251	86,873	182,124
Diseases of ears, nose and throat	68,345	48,518	116,863
Total	805,630	625,474	1,431,104

One remarkable conclusion from this survey is that female patients is smaller in every kind of dieases except diseases peculiar to the sex. The percentage of female patients to the total female population of Japan was 2.5 against 3.3 of male patients. A corroborative evidence appeared in a survey conducted by an expert in the Cabinet Statistics Bureau in 1936. According to the survey of the Bureau children of primary schools graded as 'A' in respect of being adequately nourished comprise 50 per cent, and in middle schools a little more than 50 per cent, while in girls' high schools the girls in the same category comprise 60 per cent. In physical development of A grade boys in primary schools the proportion is from 16 to 20 per cent and girls of the same class comprise from 17 to 28 per cent; in the secondary education the contrast is still greater and girls schools have 50 per cent A grade girls against 40 per cent A grade boys in middle schools.

Prevention of Tuberculosis It is estimated that over 1,000,000 people are at present suffering from tuberculosis, and from 120,000 to 130,000 people die of it each year. It is especially regrettable that the victims of this disease are mostly young men.

The Government has long been making strenuous efforts for preventing and exterminating the disease, but it is still far from being successful. They have set aside a sum of 100,000 to make a nation-wide campaign for to prevention.

National Campaign Commission for the Prevention of Tuberculosis In order to make the propaganda for the prevention of the disease thorough and effective, it was considered advisable to have the cooperation of the authorities concerned, the directors of various public bodies, and the experts on the subject, and the National Campaign Commission for the Prevention of Tuberculosis has been organized. The Commission met on July 18, 1936, drew up plans and started work accordingly.

An outline of their plans for launching a popular movement for the prevention of tuberculosis is as follows: 1. Basic Course of Action. The whole country will be divided into the following six districts, and under the auspices of the Home Department a 'tuberculosis prevention exhibition' will be held in one place in each of the districts. During the course of the exhibition, propaganda will be made in various ways with the exhibition as the centre.

District No. 1. Tokyo, Kanagawa, Saitama, Gumma, Chiba, Ibaraki, Tochigi, and Yamanashi Prefectures.

District No. 2. Osaka, Kyoto, Hyogo, Nara, Shiga, Wakayama, Okayama, Hiroshima, Tottori, Shimané, Tokushima, Kagawa, Ehimé, and Kochi Prefectures.

District No. 3. Miyagi, Fukushima, Iwaté, Aomori, Yamagata, Akita, and Hokkaido Prefectures.

District No. 4. Ishikawa, Toyama, Niigata, and Fukui Prefectures.

District No. 5. Aichi, Shizuoka, Gifu and Miyé Prefectures.

District No. 6. Fukuoka, Yamaguchi,

Oita, Saga, Nagasaki, Kumamoto, Miyazaki, Kagoshima, and Okinawa Prefectures.

2. The Tuberculosis Prevention Exhibition. (1) Two sets of materials for this were prepared and, at the end of 1936 and early in 1937 local exhibitions were already opened as follows :

Set A. At Tokyo from October 26 to Novemebr 3, 1936, at the Annex of the Tokyo Science Museum.

At Sendai from November 15 to November 21, 1936, at the Sendai City Auditorium.

At Nagoya from December 1 to December 7, 1936, at the Nagoya City Auditorium.

Set B. At Osaka from November 1 to November 15, 1936, at the Osaka Prefectural Industrial Hall.

At Kanazawa from November 22 to November 28, 1936, at the Kanazawa City Auditorium.

At Fukuoka from January 12 to January 18, 1937, at the Fukuoka Prefectural Auditorium.

There was established in the compound of the exhibition a health consultation room and an infant health consultation room, where all information required was given free of charge, while lectures, round-table conference, broadcasts and moving pictures accompanied the exhibition.

During the term of the exhibition each district held a tuberculosis prevention campaign week and printed matters were distributed in the compounds of the exhibition and in other places.

3. Making Film are produced for use at these exhibition, lectures and round-table conferences.

4. The Home Minister's speech on the prevention of tuberculosis has been recorded and included in a talkie film.

5. The encouragement of prevention work in local districts. Prefectures are to carry out the following activities, expenses being partly borne by grants : Holding of lectures, round-table conferences, picture-shows and exhibitions ; establishment of temporary health consultation-rooms and a permanent tuberculosis prevention committees ; advertizing for prize mottoes ; instituting tuberculosis-prevention; campaign weeks, and distribution of posters, health textbooks, and other printed matters.

CHAPTER XXXIII

PROGRESS OF SCIENCE

Botany

Plant Fossils from the Stegodon and Elephas Beds near Akashi

By Shigeru Miki

(Botanical Institute, Dep't of Science, Kyoto Imperial University; Japanese Journal of Botany, Vol. VIII, No. 4, March 20, 1937.)

Introduction In the Inland Sea of Japan (Seto Naikai) dredges often bring up the fossil remains of Stegodon, Elephas etc., but their palaeontological characteristics are not fully known. In the north eastern border of the sea, Byobu-ga-Ura, Harima, there are very distinct Stegodon and Elephas Beds which contain remains of various mammals, shells and plants. Investigations up to the present have shown that the fossil flora there contain at least 65 species. The floral elements and composition give clues not only as to the geological age of the beds and the origin of some neogene extinct or relic species, but also to the ecological conditions of those ages and the probable course of migration of Japanese alpine plants.

I wish to express here my sincere thanks to Prof. K. Koriba, under whose direction and courtesy this study was undertaken. Further I wish to express thanks to Prof. J. Makiyama, who kindly informed me of this interesting material and gave valuable suggestions concerning geological questions. Thanks are due also to Prof. G. Koizumi, Prof. A. Kikuchi, Assist. Prof. T. Abe and Mr. Z. Tashiro who kindly identified the fossils.

The site and structure The fossil beds studied lie on the sea coast about 25 km. west of Kobé. They extend 4 km. between Eigashima and Fujie near Akashi, forming a sea-cliff about 20 m. high. They are of nearly horizontal strata and are grouped into two parts separated by a well-marked unconformity. There is a white tuff layer 10 cm. to 1 m. thick near the top of the lower beds. This layer forms a convenient line of demarkation between the upper and lower beds.

The upper beds consist of gravels and sandy clay (the Harima group of Shikama). In general the fossil remains in the upper beds are poor except at Taniyagi, where the beds contain many brackish water shells, a few seeds and branches, and, to our great surprise, a piece of the metatarsal bone of a deer engraved crosswise at one end by a human hand. At Nishiyagi there are found some teeth of Elephas, so that upper beds may be designated as the Elephas Beds.

The lower beds are mainly composed of bluish clay with vivianite particles and sands in places, but no gravels. The beds contain many remains of mammals (Stegodon, Elepharus, Cervus etc.), fresh water shells and also plants; specially they are rich at the two places between Nakayagi and Eigashima. In contrast to the upper Elephas Beds, this group may be named the Stegodon Beds (the Akashi group of Shikama).

The fossils and the lithological characters of the strata clearly indicate that the upper beds are of a brackish water origin, while the lower beds are a lacustrine formation.

General Remarks on the Fossil Plants The fossil plants in these beds have not hitherto been well studied except for occasional observations made by Naora (26), Endo (4, 43) and Shikama (35), after whom three interesting species from the Stegodon Beds, viz. Sequoia, Juglans cinerea L. and Carya are known.

The remains include roots, trunks, branches, halms, winter buds, spines, leaves, fruits and seeds, some of which are very delicate and fragile, so that the utmost care had to be taken during the course of their preparation.

Muddy rocks including the fossils were rinsed in their fresh state for one or two days in concentrated caustic soda until the mud has been loosened, then washed with running tap water and neutralized with HCl. Seeds, fruits, spines etc. were preserved in glycerin-alcohol, while leaves, being still black in colour, were rinsed again in alkali, until the venation becomes visible, and

after adequate procedure embedded in Canada-balsam.

Some fossils retain very distinctly their diagnostic characters. For instance, the trunk and branch of Zelkova, though flat, show a characteristic xylem arrangement; likewise, the branch of Rosa is identifiable by its prickles, Gleditschia by its branched spines, Elaeagnus by its star-shaped hairs, and Salix by its galls probably of Cercidomyia salicis Schrank.

Big fruits are usually not well preserved. The lignified endocarp, the ligneous exocarp of Carya, and the corky exocarp of Paliurus are the only exceptions. The seeds of Sapium and Magnolia are well preserved because of their waxy or fatty covering. The sculpture of seeds of Fagara and Phellodendron and the seed epidermis of Staphylea and Euryale are excellent for diagnostic purposes. Otherwise the palisade tissue is the most important of the fossil remains.

Leaves may be identified not only by their shape and size, but also by their epidermal structure when the cuticle is well developed as in Buxus, Ilex and Viscum, and by the hairs as in Elaeagnus, Rosa and Gleditschia.

Leaves, barks and the innes surface of seeds and fruits are often covered by pustules of perithecia or pycnidia of fungi, and this often makes the determination of species rather difficult. There are found commingled with the plant remains some catapillar excrements. They remain hard even after the alkali treatment and have a regular form, so that they are easily mistaken for seeds.

Description of the fossil Plants (omitted)

List and Distribution of the Fossil flora (omitted)

Floral Composition and its Characters Among the 58 species just enumerated, 18 species are completely extinct, or at least so in Japan to day.

It is noticeable that the flora is closely related to that of the southern half of Japan and that 16 species among them are at present found about 500–1000 m above sea-level. Extinct ones are intimately related to the flora of Central China and Manchuria and a few to those of the Mediterranean and Caucasus regions and of North America.

It is also interesting to note that broad deciduous leaves have round tops and fine serrations at their margin as in fig. 11. The species or their allies with such a leaf form extend from the Caucasus to the Mediterranean and are found also in Central China.

From those facts it is probable, that formerly the climate of the Stegodon Beds was in general about 5°C. colder than it is now, but as Euryale, a big summer annual occurred there, the summer temperature must have been as warm enough as it is at present. Those form such as Zelkova Ungeri Kovats., Xanthoceras sorbifolia Bge., Paliurus nipponicus Miki and Ilex cornuta Ldl. et Paxt. which grew luxuriantly at that period, are now found together with their allies in arid regions on the continent. Many species with prickles or spines on twigs or leaves suggest also an arid climate. From these evidences it is conceivable that the Stegodon Beds were formed during a more arid condition than exists at present.

The age of these beds were thought by Takai (37) to be Lower Pleistocene or Upper Pliocene, while Shikama took them to be Upper Pliocene(35).

Viewed from their floral composition, they are found to contain the so-called Arcto-Tertiary elements, viz. Sequoia, Juglans, Pterocarya, Zelkova, Betula and Fagus etc. They are therefore very similar to those of the Pliocene age of Europe, viz. Upper Pliocene in the Main Valley near Frankfurt (Engelhardt and Kinkelin 5) and somewhat like that of Limburg (Reid and Reid 29). In Japan this flora nearly corresponds to that of Mogi in the Hizen Province, that of Amakusa in the Higo Province (Nathorst 27, and Florin 7) and that of Omi in the Shinano Province (Konno 13) which are designated to be the Pliocene age.

The upper beds were formed in shallow sea, and the age was considered by Shikawa (35) to be early Pleistocene. The climate of the age in question has not yet been determined definitely on account of the scantiness of the fossil remains but it seems to have been colder than at present, as indigenous temperate trees such as Styrax Obassia S. et Z. and Quercus crispula Bl. occur there. It is interesting to note that in this bed there were found such remains as Sapium sebiferum Roxb. var. pleistoceaca Miki and Lagerstroemia indica L., both of which are extinct in Japan, although imported anew.

As to the palaeolithic remains in these beds, there is a report by Naora (26), who took some uncertain remains in the sandy gravel layer at Nishiyagi. The writer found a part of the metatarsal bone of a deer which has been engraved crosswise at one end. From these remains we are obliged to infer that some anthropobiotic modifications of the vegetation already existed at this

age. Connected with this fact it is interesting to find there Juglans Sieboldiana Max., Melia Azedarach L. and Lagerstroemia indica L. Which are associated with human habitation at the present time as well.

Palaeogeographical Consideration The vivianite in the beds is the most unusual feature. The formation of vivianite in the present lake is reported in Northern Germany (1).

In modern Japan this occurs only at the middle eastern border of Lake Biwa(14).

The mode of the vivianite formation is not simple but it is very common in limestone districts. In Northern Germany, where the vivianite formation is noted, the lakes are irrigated with rich calcium containing waters (1). The amount of calcium found there is in general considerable, even more than 25 mg. per litre being recorded, while in Japan, after Yoshimura (45) it is gnerally less than 15 mg. per litre and in Lake Biwa 8.5–13 mg. per litre. The characteristic to be mentioned concerning that lake is however the fact that its calcium content is particularly rich compared with other Japanese lakes, viz. it amounts to 30% of the total solid.

From the above evidences the fossil lake might be taken as a hard water lake. The existence of fresh-water shells indicates that the lakes were not distinctly moor-like. These two facts taken together explain the preservation of various parts of plants in such excellent conditions along the shore and also the existence of few water plants in dwarf condition. The preservation of leaves infected by fungi (they seem to belong to the Sphaeriaceae judging from their perithecial shape) should also have depended on the water character, otherwise the decomposition would have taken place as in ordinary water.

The occurrence of vivianite is reported in various districts of Japan (8). Further research as to their geological age would be very interesting.

How was the hard water lake formed? There is no trace of lime stone in this region, but the calcium may have been originated from elsewhere in the environs, where the arid climate predominates. In other words, it has the hard water characteristic of the inland lakes of continents.

It is interesting to note then that the floral composition also corresponds to the arid state. The arid and colder climate of this age can not be understood from the modern climate and topography of the Islands of Japan, or it agrees only with the assumption that these beds were higher by from 500 to 1000 m. than now and formed a continuous block with the Asiatic Continent. All the biologists who have studied the fauna or flora of the Japanese Archipelago believe that a connection with the continent of Asia existed at some recent geological time, though the age and the mode of connection is not yet clear. This interesting problem was raised by Prof. Yabe and Tayama (39), who noticed the drowned valleys on the lower shelf encircling the Japanese Islands about 720 m. in depth. Prof. Yabe (40, 43) supposed their ages to be Pliocene.

Nathorst (27) and Florin (7) stated that the climate of the Mogi fossil flora was colder than that of the present age, but Prof. Yabe and Endo (42) explained that the cold condition was due rather to the fact that the district belonged to the more elevated continental stage and not due to the condition of general lower temperature during the Pliocene times in Asia. My conclusion also confirms the latter view.

It can be inferred that Japanese Islands as a whole have been stable since the Pliocene epoch from the facts that those drowned valleys show nearly a constant depth of 720 m, and that the floral composition in Southern Japan as given in the examples of Mogi and Akashi, which lie on the same level of the same climatic region, are alike.

Extinct and Relic Plants in Japan Many species are found to have become extinct since the Pliocene age. The cause is often attributed to the vigorous climate of the glacial age or to some other environmental variations.

However the extinction can not be explained by the former reason. In Asia in addition to many Arcto-Tertiary elements (6,16), there are the so-called living fossils. There is no positive evidence of a more extensive glaciation than the small glaciers in the Hida Mountains.

The extinction of species, especially the arid and open land plants, may be due to the change of climate from the arid continental to the humid oceanic by the subsidence of Japanese Islands. These topographical and climatic changes brought about the luxuriant growth of the mesophytic vegetation now prevailing, giving rise to the extinction of the arid ones.

It is a further noteworthy fact that Buxus, which, judged from the amount of fossil remains, seemed to be very common in that age, is rarely found at present except in the lime stone region. Indeed, it survives now as a

relic in the lime stone regions not easily invaded by the mesophitic vegetation.

The fact that in Central Japan there still exist many species in common with Northern China and Manchuria, as for example Chosenia bracteosa Nakai, Betula davurica Pall, Trifolium Lupinaster L., Lespedeza daurica Schindl., Oxycoccus microcarpus Turcz. etc., may indicate also the intimate geological and climatic relation of Japan with the continent in the past, as Prof. Nakai (25) has stated. The volcanic activity in Central Japan since then seems to have been favourable for the preservation of those open land plants as the relics of the continental age.

The existence of open land plants such as Paliurus nipponicus Miki, Zelkova Ungeri Kovats. and Sapium sebiferum Roxb. var pleistoceaca Miki etc. in the Lower Pleistocene of Yamashiro (22) may be similarly understood, because the age was not very remote from the continental age and the conditions on the sea shore were still nearly alike.

The Age of Migration of the Alpine Plants in Japan In the alpine regions of Japan there are found many boreal elements (12). The age of their migration is generally supposed to be the ice ages of the Pleistocene. But as has been already stated, the glaciation in this country believed not to be so large as to give a favourable condition for the migration of boreal plants. On the contrary, it is rather probable that the southward migration took place during the continental period in the Pliocene before the isolation of Japanese Islands, when the sea-level was much lower than at present. They could have been distributed naturally over the entire highlands and after subsidence, in consequence of the upward advance of the lower forest region, they exist now usually as alpine plants.

Summary 1. The cliff of Byobu-ga-Ura in Province Harima is composed of upper and lower beds. Elephas remains are found in the upper beds and Stegodon remains in the lower ones. The upper beds are called therefore the Elephas Beds and lower one the Stegodon Beds.

2. The Elephas Beds seem to be of a brackish water formation and contain some palaeolithic remains, but the Stegodon Beds are supposed to be of a fresh water lake containing hard water.

3. The age of the Elephas Beds may be considered as Lower Pleistocene but that of the Stegodon Beds as Pliocene.

4. Nine species of plants belonging to eight genera and eight families, have ben indentified from the Elephas Beds and 58 species representing 48 genera and 33 families from the Stegodon Beds.

5. In the Stegodon Beds there are found 18 species (31%) either extinct or not now found in a wild state in Japan, among which six are new to science. Similarly 2 species are found in the Elephas Beds. Most of these species either grow wild in China and Manchuria or have allied forms in these regions.

6. The living species found in the Stegodon Beds are common with those in China and Manchuria and there are 16 species including Thuja japonica Max., Picea polita Carr., Parabenzoin trilobum Nakai, Fagus crenata Bl. etc., which grow in the southern half of Japan about 500–1000 m above the sea level.

7. The climate of the Stegodon Beds are considered to have been continental and arid on account of the floral composition and of the formation of vivianite.

8. The mean temperature of the Stegodon Beds are supposed to have been about 5°C lower than at present because of the existence of the 16 species mentioned above, though in summer it was warm enough to permit the growth of Euryale.

9. The cold and arid climate of the Stegodon Beds is thought to be due to the topographical condition of Japan at that period, namely, Japan formed a continuous block with the Asiatic Continent and was 500 to 1000 m. higher than at present. The fossil beds in question must have been located near the margin of that continent.

10. The extinction of some neogene species that represent the arid and open land plants in nature is supposed to be due to the formation of Japanese Islands by the general sinking of the continental land and to the subsequent change in climate from the arid continental to the humid oceanic one. These topographical and climatic changes brought about the vigorous growth of plants adapted to the mild climate then prevailing and the extinction of the arid and open land plants. It seems unjustifiable to attribute the extinction of these plants to the lowering of the temperature.

11. The present distribution of Buxus in Japan and the existence of many species in Central Japan in common with Northern China and Manchuria may be easily understood if they are taken as relics from the continental Pliocene age.

12. The alpine plants now growing in

Japan are concluded, therefore, to have migrated southward chiefly during the continental period of Japanese Islands in Pliocene rather than in Pleistocene.

Zoology

Studies on Japanese Mysidea

By Naoyoshi Ii

(Fisheries Institute, Faculty of Agriculture, Tokyo Imperial University; Japanese Journal of Zoology, Vol. VII, No. 1, October 25, 1936.) (Figures omitted.)

Genus Parastilomysis n. gen. Definition. First, second and fifth pleopods of the male rudimentary, unjointed and of the same form as in the female.

Third pleopod of the male biramous; endopod an unjointed plate; exopod 4-jointed and terminated by 2 short setae.

Fourth pleopod of the male biramous; endopod an unjointed plate; exopod long and 4-jointed, the third joint armed with a strong spinous seta on the outer distal corner, the fourth joint terminated by 2 long spinous setae.

Antennal scale narrowly lanceolate, setose all round and 2-jointed; apex rounded.

Mouth parts show no very marked difference from those in other genera of the tribe Mysini.

First thoracic limbs have a small masticatory lobe on the second joint, but not on the third and fourth joints.

Propodite of the third to the eighth thoracic limbs divided into 3 joints.

Female has three pairs of oostegites.

Telson cleft at the apex, cleft furnished with a pair of plumose setae and small spines on each margin, lateral margins armed throughout their length with spines.

Inner uropod with a row of spines along the inner margin.

Type: Parastilomysis paradoxa n. sp.

Remarks. The present genus belongs apparently to the tribe Mysini according Illig (1930), i.e. II D in his key, and is very closely allied to Stilomysis Norman (1892) and Nanomysis Tattersall (1921) in the structure of the pleopods of the male.

I have been considerably puzzled as to the number of joints on the exopod of the fourth pleopod of the male in the present genus. In the type species the basal part of the inner terminal seta on the exopod of the fourth pleopod is thick and swollen as shown in Fig. 12. The thick part is furnished with a tiny spine on the inner distal corner and there can be sometimes seen an obscure transverse line at the distal end of the said part. Therefore, the part gives us the impression that it may be a small joint. If we assume that the thick part is a small joint, the character of the pleopod of the present genus agrees absolutely with that of Stilomysis, and if we assume that the part is not a joint, the character approaches to that of Nanomysis.

After careful and close examination, however, it is revealed that the thick part is not a joint, but in fact only a swollen base on which the tiny spine grows. Though sometimes there can be seen an obscure transverse line at the distal end of the thick part, there exists no mark to enable one to recognize a joint on the outer margin of the seta. In some species belonging to the genera, Neomysis, Acanthomysis and Praneomysis, it is not a seldom occurrence that the same part of the seta is more or less thickened and provided with a tiny spine, so that it seems that the said thick part is rather a common character of the seta found in these allied genera.

It is a regret for me to be unable to say anything about the terminal small joint of the fourth pleopod in the genus Stilomysis as I could not obtain any specimens of Stilomysis. In 1928, Marukawa described S. camtschatica from the coast of Kamchatka, but he made no mention about the pleopods of the male in his description. So I think it doubtful whether the species described by him actually belongs to the genus Stilomysis.

The present genus agrees with stilomysis in the third pleopod of the male. The descriptions regarding the number of joints on the exopod of the third pleopod of the male in the genus Stilomysis are contradictory according to authors in several literatures. Zimmer in both of his papers (1904, 1909) described the pleopod as 4-jointed and in the latter paper he gave a figure of the pleopod with 4-jointed exopod. However. Zimmer (1915) in his key to the genera of the tribe Mysini described the pleopod as 3-jointed, and also Illig (1930) in his key to the Mysidae described it as 3-jointed. Reviewing all the referable literatures, I can only suppose that Zimmer mistook in describing the number of joints, or the number was misprinted in his key and Illig

carelessly cited the description of Zimmer's key.

At any rate, the present genus is very closely allied to both Stilomysis and Nanomysis, especially to the former, in the structure of the pleopods of the male. However, the only striking point of difference between the present and those genera lies in the character of the telson. As far as I am aware no members of the tribe Mysini, except Kainommatomysis Tattersall, have a telson cleft and furnished with a pair of plumose setae at its apex.

The form of the telson had been very largely used as an important generic character in the past, until Zimmer (1915) in his revision of the genera of the Myshini attempted to systematize the species of the tribe mainly on the character of the pleopods, so that some genera have been obliged to be characterized not solely by the shape of the telson, but raher by laying a greater generic importance on other characters. Tattorsall (1927), however, in his remarks on Kainommatomysis, says "the telson is more Leptomysini than Mysini in character. No members of the Mysini, as far as I can remember, has a pair of plumose setae at the apex of the telson. This feature, on the other hand, is characteristic of the Erythropini and of the Leptomysini." And I think the character of the telson in the present genus is also sufficient to warrant generic independence. Thus, here I separate the present genus from Stilomysis and Nanomysis mainly on the character of the telson.

Kainommatomysis is clearly distinguishable from the present genus in having the corneal lens and the third pleopod of the male rudimentary and of the same form as in the female.

The present genus is also distinguishable from Nanomysis by the absence of the masticatory lobes on the third and fourth joints of the endopod of the first thoracic limbs, by the number of joints of propodite of the third to the eighth thoracic limbs and of the oostegites and particularly by the characters of the telson and inner uropod.

Parastilomysis paradoxa n. sp. Localities. Off Hukuoka, Tusima Straits.

Type specimen. Abundant adult males and females (presented by Mr. K. Tuzinaga).

Misaki, Kanagawa Prefecture. About 20 adult specimens of both sexes.

Description. Front margin of the carapace produced into a short obtusely rounded rostral plate. Below the rostrum is a prominent pseudo-rostral process, triangular and acute in both dorsal and lateral views. Antero-lateral corners of the carapace rounded.

Eyes large, about as long as broad in dorsal view and somewhat flattened in lateral view; cornea occupying half of the eye in dorsal view; stalk with a tiny blunt spiniform process on the inner dorsal surface.

Antennular peduncle in the male with the first joint about as long as the third; male sexual appendage well developed and about as long as the third joint. In the female the first joint of the antennular peduncle almost as long as the 2 distal joints combined.

Antennal scale 7½ times as long as broad, apex rounded, 2-jointed, distal joint about 1/14 of the entire length of the scale, the scale extends for about 2/5 of its length beyond the antennular peduncle. Basal joint, from which the scale arises, with a prominent spine on the outer distal corner.

Front margin of the labrum without spinous process but produced into a short triangular process with rounded apex in ventral view.

Other members of the mouth parts show no very marked difference from those in other genera of the tribe.

First thoracic limbs have a small masticatory lobe on the second joint, but not on the third and fourth joints

Third to the eighth thoracic limbs with propodite divided into 3 joints. Basal plate of the exopod of all thoracic limbs with a small spine on the outer distal corner, but in the last thoracic limbs the spine is always very obscure.

Sixth abdominal somite 1 3/4 times as long as the fifth.

Third pleopod of the male biramous, endopod unjointed plate; exopod about twice as long as the endopod, extending to the first one-third point of the fifth abdominal somite, 4-jointed, the first joint slightly shorter than the half of the expond, the second joint about 1/3 of the first, the third joint about 1½ times as long as the second, the fourth about half as long as the third and terminated by 2 very short setae.

Fourth pleopod of the male biramous; endopod unjointed plate; exopod long, extending backwards to the statocyst, 4-jointed, the first joint slightly longer than the half of the exopod, the second joint about 1/4 of the first, the third joint about 1 1/3 times as long as the second and with a single strong spinous seta on the distal outer corner, the fourth joint about 1/3 of the third and terminated by 2 strong spinous setae, which are about 4 times as long as the joint and about as long as the seta on the third joint.

Telson about 1 1/6 times as long as the sixth abdominal somite and about 1 2/3 times as long as broad at the base, cleft for about 1/6 of its length; the cleft triangular, rounded at the apex, armed with a pair of plumose setae which are slightly longer than twice the length of the cleft, and with about 12 spines on each margin; lateral margins armed with 35–40 subequal spines extending throughout their entire length, the proximal spines more distantly placed than the distal ones; terminal lobes with the apex rounded, almost truncate, and armed with four spines, the inner pair of which are subequal, longer than the outer ones and about 1/10 of the length of the telson, the outer ones are about as long as the lateral spines.

Inner uropod about 1 1/3 times as long as the telson, the inner margin armed with a row of about 50 spines extending from the statocyst to the apex, the spines gradually widely spaced and increase in size to the apex, reach the greatest size at the second one-third point from the statocyst and then slightly decrease in size toward the apex. Statocyst large.

Outer uropod slightly shorter than twice of the length of the telson.

Length. Adult males and females, 15 mm.

Remarks. This species is very closely allied to Stilomysis grandis (Goës), but clearly distinguishable from it by the much different character of telson, and also slightly differs in the structure of the fourth pleopod of the male.

Genus Paracanthomysis n. gen. Definition. First, second, third and fifth pleopods of the male rudimentary, unjointed and of the same form as in the female.

Fourth pleopod of the male biramous; endopod short, unjointed and with a well developed side lobe; exopod long, unjointed and terminated by 2 strong spinous setae.

Antennal scale narrowly lanceolate, 2-jointed and setose all round; apex rounded.

Mouth parts, first and second thoracic limbs show no very marked difference from those in the genus Neomysis.

Propodite of the third to the eighth thoracic limbs many-jointed (about 5–8).

Telson is entire and not split.

Type: Paracanthomysis hispida n. sp.

Remarks. The present genus belongs to the tribe Mysini and apparently to Illig's (1930) group III, A, 2). It agrees with Limnomysis Czerniawsky (1882), Indomysis Tattersall (1914) and Idiomysis Tattersall (1922) equally in having the fourth pleopod of the male with the exopod unjointed, but differs from all of them in having the exopod terminated by 2 strong spinous setae.

The present genus is also very closely allied to Acanthomysis, which genus has been separated by the present author (1936) from Zimmer's (1915) comprehensive genus Neomysis. The only difference between the present genus and Acanthomysis lies in thte character of the fourth pleopod of the male.

Paracanthomysis Hispida n. sp. Localities. Misaki, Kanagawa Prefecture. Common in the growth of sea-weeds in the environs of the Misaki Marine Biological Station.

Type specimen. Abundant, adult males and females.

Port Huzan, Chosen (Korea). Abundand, adult males and females.

Oma, Aomori Prefecture. Abundant, immature males and females. Length, 8 mm.

Description. Body bright vermillion in life.

Carapace leaving the last thoracic somite exposed dorsally, hispid with dense minute spines; front margin of the carapace produced into a short triangular rostral plate with sharply pointed apex; antero-lateral corners of the carapace produced into acute spines.

Eyes, including the stalk. about 1½ times as long as broad; cornea occupying about 1/3 of the entire eye in dorsal view.

Antennular peduncle in the female slender and about 1/3 of the length of the carapace. In the male the antennular peduncle is considerably stouter and longer than in the female and about half as long as the carapace; the third joint almost as long as the first and provided with a dense group of about 20 spines on its inner distal corner, the second joint also provided with a spine on its inner distal corner; male sexual appendage about half as long as the third joint.

In the male the outer flagellum of the antennule is very stout, about twice as broad as the inner and curved like a cattle horn in the proximal part; inner flagellum normal. In the female the inner flagellum of the antennule characteristically shaped, narrowly lanceolate in shape, about thrice as broad as the outer and slightly longer than twice of the length of the peduncle; outer flagellum normal.

Antennal scale about 10 times as long as broad, 2-jointed, distal joint about 1/18 of the entire length of the scale; basal joint, from which the scale arises, with a spine on the outer distal corner. The scale in the male slightly shorter

than the antennular peduncle, but in the female extending beyond the antennular peduncle for about 1/3 of its length.

Antennal peduncle about half as long as the scale.

Mouth parts, first and second thoracic limbs show no very marked difference from those in the genus Neomysis.

Third to the eighth thoracic limbs with propodite divided into 5 joints. The fifth joint of the propodite armed with 2 peculiarly armed setae on each side of the dactylopodite.

The last thoracic somite and each of the 5 anterior abdominal somites armed with 2 broad transverse band of dense minute spines. The sixth abdominal somite slightly longer than the fifth, and hispid with dense minute spines almost all over the surface.

Fourth pleopod of the male biramous; basal joint short; endopod short and with well developed side lobe; exopod long, very stout, extending to the posterior end of the last abdominal somite, unjointed and terminating into 2 strong spinous setae which are about 3/7 of the length of the exopod. Proximal part of the exopod broadened and the outer proximal corner raised into a keel. The exopod slightly swollen and armed with 1–2 plumose setae on the inner margin at 4/7 point from the base and gives the impression that there is a joint, but there can be observable no chitinous transverse demarcation.

Telson linguiform, about 1 2/3 times as long as the last abdominal somite and about 2 1/3 times as long as broad at the base; lateral margins abruptly narrowing and concave in the first 1/3 part, slightly convex in the second 1/3 part and then gradually narrowing towards a bluntly rounded apex; the lateral spines near the base stout and rather widely spaced, about the middle of the margins the spines are grouped into about 8 series, each series composed of a large spine followed with 2–7 small ones, in the last 1/4 of the margins the spines are short, very closely set and of even size, appearing like a row of closely set teeth rather than articulated spines; the apex armed with 2 pairs of spines, the outer pair slightly longer than the neighbouring lateral spines, the inner pair slightly shorter than the outer.

Inner uropod slightly shorter than the telson, the ventral inner margin armed with about 5 spines near the statocyst.

Outer uropod about 1 1/3 times as long as the telson.

Length. Adult males and females, 18 mm.

Remarks. The present species shows many points of resemblance to those of the genus Acanthomysis, but differs from them in the character of the fourth pleopod of the male. The unique form of the outer flagellum of the antennule in the male and the inner flagellum of the same in the female are quite characteristic for the present species and unlike any other Mysids hitherto known.

Paracanthomysis Kurilensis n. sp. Locality. Suribati Bay, the Island of Horomusiro, Tisima (Kurile) Islands. Type specimen. 2 males, 30 females.

Description. Carapace leaving the last thoracic somite exposed dorsally; front margin of the carapace produced into a short triangular rostral plate with rounded apex; antero-lateral corners of the carapace rounded.

Eyes, including the stalk, 1½ times as long as broad; cornea occupying about 2/5 of the whole eye in dorsal view; stalk stout, hispid with short hairs and provided with a tiny spiniform process on the inner dorsal surface.

Antennular peduncle in the female rather slender, about ¼ of the length of the carapace and shorter than the antennal scale, the third joint shorter than the first and provided with about 4 long plumose setae on the inner distal corner. In the male the antennular peduncle considerably stouter and longer than in the female, about 1/3 of the length of the carapace and slightly longer than the antennal scale; the first joint shorter than the third.

Antennal scale about 6½ times as long as broad, 2-jointed; distal joint about 1/16 of the length of the scale; basal joint, from which the scale arises, with a spine on the outer distal corner.

Antennal peduncle in the female about half as long as the scale. In the male the antennal penduncle stouter and longer than in the female.

Flagella of both the antennule and the antenna in the female shorter than those in the male.

Mouth parts, first and second thoracic limbs show no very marked difference from those in the genus Neomysis.

Third to the eighth thoracic limbs slender; propodite of the third and fourth limbs is 8-jointed, and that of the fifth to the eighth limbs 7-jointed; meropodite strong and longer than carpopodite. Basal plate of exopod of all thoracic limbs provided with a tiny spine on the outer distal corner.

The last thoracic somite and the somites of the abdomen with transverse folds of chitinous integument which give the impression that each somite is sub-divided into subsidiary somites.

The last thoracic somite with 2 and each of all abdominal somites with 3 such folds. In the 4 anterior abdominal somites the foremost fold is widely broken off on the dorsal surface and divided into a pair of folds developed only on lateral sides. In the fifth and sixth abdominal somites each of the folds or the posterior margins of each subsidiary somite narrowly broken off at the mid-dorsal line and slightly produced into a pair of short broad plate overhanging the next subsidiary somites on each side. The sixth somit 1 ½ times as long as the fifth.

Fourth pleopod of the male biramous; basal joint short and broad; endopod short and with well developed side lobe; exopod long, extending to the posterior end of the last abdominal somite, unjointed and terminated by 2 strong spinous setae; about ¾ point from the base the exopod armed with a plumose seta on the inner margin and the point appears very like a joint, but there can be seen no chitinous division.

Telson long triangular, about twice as long as the last abdominal somite and about thrice as long as broad at the base; apex narrowly rounded; lateral margins armed throughout their whole length by many slender spines, the proximal 1/3 of the margins with the spines rather widely spaced, the remaining part of the margins with the spines grouped into 10–12 series, each series composed of a large spine followed by smaller ones; the smaller spines gradually grow longer posteriorly and the groups of the smaller spines varying in number 1–2 proximally to 5–6 in the distal groups; the larger spines decreasing in size posteriorly toward the apex and near the apex they became almost as long as the smaller spines; the apex armed with a pair of extra small spines in the narrow gap between the last pair of lateral spines.

Inner uropod slightly shorter than the telson and with 4–5 spines on the ventral inner margin near the statocyst.

Outer uropod 1/5 longer than the telson.

Length. Adult males and females, 13 mm.

Remarks. I have been somewhat puzzled as to the systematic position of the present species, for my material contains only 2 adult male specimens with more or less damaged fourth pleopod. In all samples the exopods of the fourth pleopod have been more or less abnormally bent at a short distance from the base. The bent part looks very like a joint. However, after close examination I have reached the conclusion that the part is not a joint on the following grounds that (1) there can be observable no chitinous transverse division on that part and (2), moreover, the relative situation of the part differs, though slightly, in each sample.

In other respects the present species very closely agrees with the character of the genus Paracanthomysis, which I have established for the species, P. hispida n. sp., and I am sure of the correctness of identifying the present species as belonging to the genus. I hope that male specimens with perfect fourth pleopod will be found some day, and the correctness of the identification may be further demonstrated.

The present species is distinguishable from P. hispida by the flagella of the antennule, the armature of the telson and the presence of the folds on the abdominal somites.

Astronomy and Geophysics

Reports on Solar Eclipse Observations on June 19, 1936

Solar Eclipse Observation at Mombetsu on June 19, 1936. Preliminary Report of the Eclipse Party from the Astronomical Institute of the Imperial University of Tokyo. Yusuke Hagihara, Masaki Kaburaki, Mitsumasu Toda and Toshitsugu Oowaki. (Japanese.) [Tokyo Astr. Obs. Report, 4 (1936), 158.] The aim of the observation of the party was to take the photographs of the corona in two different colour ranges in order to determine its intensity distribution and also to take the photographs of the flash spectra and the coronal spectra through an objective prism. The observing station was chosen on the ground of the Mombetu primary school. In the beginning of the partial eclipse the sun was seen through a cloud but at about 40 minutes before the totality the sun was covered by thick clouds and it even rained. Fortunately the totally eclipsed sun came out of the clouds 40 seconds after the second contact.

The instruments and the program:—

1) An equatorial with a visual telescope (aperture 16.2 cm, focal length 245 cm) by Mertz together with a photographic telescope (aperture 18 cm, focal length 213 cm) by Cooke attached to it. By the former

telescope four photographs of the corona were taken through a Riken "ultrazin" filter No. 4 and twenty-two photographs of the partial eclipse through a Riken "ultrazin" filter No. 5. By the latter telescope two photographs of the flash spectra were taken through a 15°-objective prism. The spectra of the corona could not be photographed.

2) A camera with a 6-inch Dallmeyer photographic quartet lens (aperture 6 inch, focal length 85 cm) was attached to a 5-inch Cooke equatorial. Four photographs of the outer corona were taken with a diaphragm of 8 cm aperture with exposure 1^s, 4^s, 16^s, 1^s. The same exposures with a diaphragm of 4 cm aperture were planned, but the weather prevented from pursuing the program.

3) Four direct photographs of the corona were taken through an optical wedge by Zeiss with exposures 1^s, 4^s, 16^s, 16^s. A cylindrical lens was placed in front of the wedge in order to gather the coronal light, except the last exposure. The four exposures were made on one and the same plate to be used for the photometry of the corona.

4) During the twilight of the same evening two photographs of the same part of the sky were taken both through the camera and through the optical wedge without the cylindrical lens, in order to determine the light gathering power of the camera lens.

5) Two photographs through the camera of a zenith star and a star with the same altitude as the totally eclipsed sun were taken in the same night in order to determine the atmospheric extinction.

6) Several laboratory photographs of a standard lamp through the wedge with various exposures and with different distances from the lamp were taken for the purpose of the photometric investigation of the corona.

7) Direct photographs of a full moon in August were taken in Tokyo through the cylindrical lens in front of the wedge.

Ilford soft gradation panchromatic plates were used throughout and the development was done very carefully after arrival in Tokyo. On account of the weather condition during the totality the plates did not seem so satisfactory for precise photometric measurement.

The work was assisted by the students of the Institute.

A Short Report on the Observation of Einstein-Effect in the Total Solar Eclipse of Hokkaido on June 19, 1936. (Japanese) **Kiyofusa Sotome and Gemma Yoshida.** [Tokyo Astr. Obs. Report, 4 (1936), 137–138.] The observation was made by means of an astrographic refractor, English mounting, with a Cooke triplet of 30 cm aperture and of 3.5 m focal length, which was set at the south eastern corner of the playground of the primary school of Memanbetu, a country village near Abashiri of Kitami Prefecture. 50-second exposures were made on two plates, through a gap between passing cloud masses. Owing to the unfavourable weather condition, the plates could show no star image. Also the corona images do not appear to be available for the investigation of the structural details, nor for any photometric measurement owing to the extreme over-exposure. Cinematographic observation was also tried, but with no good result. Visual observations of contact times made with a telescope of 20 cm aperture gave the following result:

First Contact:	5h	10^m	$43^s.3$ (U. T.)
Second Contact:	6	21	37 .8
Third Contact:	6	23	26 .0
Fourth Contact:	7	27	35 .0

Observation of the Total Solar Eclipse of June 19, 1936, made at Nakatombetsu, Hokkaido. (Japanese) **Masa Hashimoto and Toyozo Okuda.** [Tokyo Ast. Obs. Report, 4 (1936), 139–140.] The observations were limited mainly to the corona spectra, an aim of taking flash spectra being appended to the program. The weather was almost clear about the phase of totality and two photographs were taken successfully with the exposures of 75^s and 20^s together with iron arc comparison spectra. The instrument used was a visual refractor of 20 cm aperture and 306 cm focal length, to which was attached a three prism spectrograph. The spectrograph was composed of the following optical parts:

Collimator:	aperture 5 cm, focal length 81 cm;
Camera lens:	aperture 6 cm, and focal length 22 cm.

The spectrogram of 57^s exposure showed only three emission lines of corona, namely λ 4231, λ 4566, λ 5303. No Fraunhofer line was recognized.

Further details are reserved for a later investigation.

Short Report on the Observation of the Total Solar Eclipse of 1936, made at Kunneppu, Hokkaido. (Japanese) **Okuro Oikawa** [Tokyo Astr. Obs. Report, 4 (1936), 141–143.] The author's aim was to take flash spectra with a moving plate devise, at a place near the southern limit of the totality. The observation was made, assisted by Mr. H. Aida, a research student of the Astronomical Institute of the Imperial

University of Tokyo, by means of a refractor with a Brashear quartet of 20 cm aperture and 1,27 m focal length, to which was attached a system of objective prisms. The latter was composed of two prisms, one of 18 cm aperture and 45° refracting angle, made by Steinheil u. Söhne, Ltd., and the other of 15 cm aperture and 15° refracting angle, made by Cooke and Sons, Ltd. The observations were interrupted by clouds and the plate taken showed no measurable lines, though a number of ill-defined chromospheric lines are recognized.

Observations of the Total Solar Eclips of June 19, 1936, made at Nishin Camp of Memanbetsu Village near Abashiri, Kitami Pref. Hokkaido. (Japanese) **Masao Notsuki, Shigeo Ishii and Yoshio Fujita.** [Tokyo Astr. Obs. Report, 4 (1936), 144-149.] The main program of observations was to take flash spectra with a plane grating and with a prism spectrograph. The particulars of the instruments are:

1. A plane grating of 36 cm² ruled surface, with 14000 lines per inch, was used with a camera lens of 10 cm aperture and 1.55 m focal length and a collimator which is composed of two concave mirrors, one being of 15 cm aperture and 1.55 m focal length, and the other of 13.5 cm aperture and 2.55 m focal length. The region of spectrum to be taken was from λ 5500 to λ 7000 Å (Notuki in charge).

2. The prism spectrograph used was of E_2-pattern of Adam Hilger, with one Cornu prism of 60° refracting angle and the lenses for the camera and the collimator; each being of 5 cm aperture and 56 cm focal length. The condensing lens for forming the solar image was of 7 cm aperture and 1.30 m focal length. All the lenses are made of quartz. The region of spectrum to be taken was λ 3100-6000 Å and the dispersion was about 12 Å/mm at 3060Å (Fujita in charge).

Both instruments were used with a common coelostat, the second mirror being dispensed with. Of course, the E_2-spectrograph was set in an inclined position to have the slit nearly in the direction of tangent to the sun's limb at the point of contact.

Five exposures made with the grating spectrograph were: (1) for Fraunhofer spectrum of the center of the disk (with a slit), (2) for flash spectrum at the second contact, (3) for corona spectrum at the maximum obscuration, (4) for flash spectrum at the third contact and (5) for Fraunhofer spectrum by the third contact.

Four exposures made with the prism spectrograph were: (1) for flash spectrum at the second contact, (2) for corona spectrum with tangential slit, (3) for Fraunhofer spectrum at the limb immediately after the third contact and (4) for comparison spectra of iron arc.

Being interrupted by clouds, which were almost incessantly passing over the sun during the totality, no measuable lines were obtained except on the last plate of grating spectrograph, which seems to give some results of value. Further details are reserved for a report to be issued later.

Dr. S. Ishii, with others, visually observed contact times; the mean value of observed times came out as $5^h\ 10^m\ 56^s.7$ and $6^h\ 21^m\ 48^s.0$ (U. T.) for the first and second contacts respectively.

Observations of the Total Solar Eclipse of June 19, 1936, made at Monbetsu, Hokkaido. (Japanese) **Kazuo Kubokawa.** [Tokyo Astr. Obs. Report, 4 (1936), 150-152.] In this short report the author describes briefly the instrumental equipment, the method of observation and the summary of the results. The work was limited to the corona photography with a long focus lens. The instrument consisted of a visual doublet of 17 cm aperture and 11.5 m focal length, a coelostat of 17 cm aperture and a camera, all in horizontal mounting.

Owing to the nasty weather, the observations were not made satisfactorily. During the totality only three exposures were made through passing clouds. Some of those plates show structural details of corona although not very distinct, with several prominences. One of the coronal streamers extends over a distance of 0.7 times of the sun's diameter from the limb, and a K-formed prominence reaches a height of 12-13000 km above the limb. He also reports the sesult of observations of the time of the third contact made by Mr. K. Tuzi who has come over to join him from his own site, which was selected for astronomical determination of geographical position. The result is; $6^h\ 22^m\ 7^s.3$ (U. T.); the observation being made visually with a Cooke equatorial of 9 cm aperture and 140 cm focal length.

A Short Report on the Observation of the Total Solar Eclipse of June 19, 1936, made at Shari, Kitami Prefecture, Hokkaido. (Japanese) **Tadahiko Hattori.** [Tokyo Astr. Obs. Report, 4 (1936), 153-154.] The author's intention was to take emission spectra of the solar corona in visual region. He used a prism spectrograph of Littrow type, which was constructed by himself in collecting the following parts from the laboratory of the Tokyo Astronomical Observatory and the Physical Institute of the Imperial University of Tokyo:—

(1) Collimator and camera lenses: Tessar type of 11 cm aperture and 50 cm focal

length.

(2) Three glass prisms of 30° refracting angle from Carl Zeiss, all having the length 17 cm and the height 12 cm.

The sun's image of 5 mm diameter was formed on the slit, through a condensing lens of 50 cm focal length and the aperture ratio 1/4.0, the sun's beam being reflected horizontally from 40 cm coelostat mirror, toward the west.

The sky around the sun after some hours of cloudiness cleared up temporarily by the time of totality. An exposure to the corona was made for 80^s with iron arc comparison before and after it. After development, the plate was found to be very poor, probably owing to some disturbance in the adjustment of the instrument. Only two emission lines were recognized: λ 5303 and λ 6374, probably of coronal origin.

Monochromatic Images of Solar Corona taken with a Slitless Spectrograph at Nisshin Camp near Memanbetsu Village, in Hokkaido on June 19, 1936. (Japanese) **Rikichi Sekiguchi.** [Tokyo Astr. Obs. Report, 4 (1936), 155–156.] The author briefly describes the scheme of observations and some particulars of the equipment, giving general summary of the results. The spectrograph consisted of a Tessar camera lens of 5.5 cm aperture and 25 cm focal length and the following train of glass prisms:

(1) 45° refracting angle and minimum deviation of 25° 37′ for λ 5900.

(2) 60° refracting angle and minimum deviation of 48° 28′ for λ 5900.

(3) 62°.5 refracting angle and minimum deviation of 55° for λ 5900.

(4) Rutherfurd compound prism of minimum deviation 46° 08′ for λ 5900.

The lens was used with reduced aperture of 28 mm, since the prisms are not large enough to cover the whole bundle of rays from full aperture. The whole instrument was constructed by the author himself with the help of mechanicians of the Central Meteorological Observatory of Japan at Tokyo. The observations and testings of the instruments were made by Mr. M. Koiwai under the author's supervision. The dispersion of the spectrograph was about 50 Å/mm in the mean for the region between F and C lines.

The instrument was mounted horizontally to meet the rays from a coelostat mirror of 8 cm aperture, and three exposures were made as follows: (1) 5^s for the first flash, (2) 50^s for the corona and (3) 5^s for the last flash. In spite of very poor sky condition, a few monochromatic images of corona were recognized on those plates, together with a number of chromospheric arcs, among which λ 5303 ring on the second plate was of rather pronounced strength. Although the definition of those corona images was not satisfactory, owing to the effect of clouds which were passing over the sun during the exposure, they may not be without use in drawing some conclusion about the distribution of λ 5303 light around the disk. Reports on some quantitative results will be reserved for a latter occasion.

Special Wireless Time Signals for the Use of the Eclipse Observation, June 19, 1936. (Japanese) **Masashi Miyaji.** [Tokyo Astr. Obs. Report, 4, (1936), 165–167.] The author describes the system of code of wireless time signals issued by the Tokyo Astronomical Observatory, through Hunabashi and Kemigawa wireless stations, for the benefits of the observers of the total solar eclipse on June 19. Two different systems were issued. The one is nothing other than the ordinary rhythmic system for daily use in Japan and was issued at the beginning of each hour from 1h p.m. to 5h p.m. of 135° meridian. In the other system, each second of mean solar time was sent by a short dot during 10 minutes commencing from a little before the second contact. The former was to facilitate the accurate determinations of corrections of time keepers, while the latter was mainly for direct controls of the proper time of the photographic exposures.

Spectrum of Corona observed during the Total Solar Eclipse of June 19, 1936, at Nisshin of Memanbetsu Village in Hokkaido. (Japanese) **Rikichi Sekiguchi.** [Special Report on the Works by the Central Meteorological Observatory of Japan concerning the Total Solar Eclipse of June 19, 1936, 5–13.] The observation was originally so planned that the intensity variation of some telluric line which is suspected to occur during the course of the eclipse (ozone and water vapour) may be detected, the observation of the corona spectrum being appended in the program as a secondary work. Thus a spectrograph has been specially designed and so adjusted to meet the above purpose. It was constructed in the workshop of the Observatory with the following optical parts:—

(1) Two 55° prisms of heavy flint glass, with the dimension of 105 by 60 mm, made by Nippon Kogaku Kogyo Kaisha.

(2) Collimator lens of 50 mm aperture and 40 cm focal length, Zeiss Uvial triplet;

(3) Camera lens of Tessar type having and aperture 55 mm and focal length 25 cm, made by Nippon Kogaku Kogyo Kaisha.

The spectrograph is of an ordinary laboratory use and was set horizontally together with a coelostat of 80 mm aperture and a light gathering lens of ordinary

doublet with an aperture 70 mm and the focal length 30 cm, optical axis being in the direction of about N55°E.

Very poor sky condition made it almost hopeless to secure good plate suitable for the meteorological investigation in our mind. Only three successive exposures of the corona have been made through passing clouds, on an Ilford Astra III plate, with the slit nearly tangential to the eastern limb of the moon and slightly inside the latter. The third exposure has been a failure due to the interruption of the photospheric light, owing to prolonged exposure. The first and second exposures of 57^{s} and 30^{s} respectively, gave a number of chromospheric and other emission lines. The chromospheric lines are evidently due to the scattering of light of the prominences by clouds. Green corona line, λ 5303, appeared extremely strong. Also Hα, Hβ, Hδ, D3 came out very strong.

Lacking any comparison spectrum, the wave lengths have only to be roughly estimated by referring to those of prominent chromospheric lines. Unidentified lines are as follows:—

4312.5	r. w.	*	5979.6	r. s.	
4445.4	a.		6171.3	r. w.	
5115.5	w.	*	6206.8	v. w.	
5302.8	v. st.	*	6227.2	w.	
5538.5	w.		6272.0	r. w.	
5621.6	r. w.		6377.5	r. w.	*
5681.4	v. w. a.		6541.1	r. w.	
5718.1	v. w. a.		6612.1	w.	
5734.6	w.		6701.7	w.	*
5790.3	v. w.		6776.1	v. w.	*
5905.6	r. w.		6812.8	v. w.	

v. s.=very strong, s.=strong, w.=weak, r.w.=rather weak, a.=ambiguous.

Those marked with stars may probably be attributed to the coronal emission.

Beside them several Fraunhofer lines could be recognized as follows:— 5123.7 (w.), 5949.8 (r. s.), 6281.1 (r. s.), 6344.6 (r. s.), 6475.9 (s.), 6867.4 (v. s., B-band of water vapour).

Solar Corona observed during the Total Solar Eclipse of June 19, 1936, at Nisshin of Memanbetsu Village in Hokkaido. (Japanese) **Kunio Yoshinari** [Special Report on the Work by the Central Meteorological Observatory of Japan concerning the Total Solar Eclipse of June 19, 1936.] The author's works were limited to the direct photography of the sun and corona in the partial and total phases respectively. He used an equatorial refractor with an apochromatic objective of 10 cm aperture and 150 cm focal length, which was made by Nippon Kogaku Kogyo Kaisha. The telescope was driven by a clock-work made in the observatory workshop. For the partial phases a magnifying devise was used, which gave a solar image of 5 cm diameter, whereas for the total phase no such device was used.

For the partial phase the exposures were made three times near the first contact and twice near the fourth contact. The times of contact came out as 5^{h} 10^{m} 53^{s} (U. T.) in the mean from three plates, being calculated by extrapolation of the varying degrees of obscuration corresponding to each time of exposure. The time keeper used was a pendulum clock kept in an underground room, whose correction and rate were accurately determined by comparison with the rhythmic wireless time signals.

The exposures for the corona were:

(1)	for	0^{s}.1	from	6^{h}	21^{m}	53^{s}
(2)	„	1.0	„	22	11	
(3)	„	0.1	„	22	28	
(4)	„	5.0	„	22	43	
(5)	„	0.5	„	22	57	
(6)	„	16.0	„	23	15	

For (1) and (2), Ilford Astra plates, and for (3), (4) and (5) Eastman panchromatic plates were used. The exposure (6) was made with Eastman infra red plate, 850 Hart, through an orange filter.

The plates (1), (2), (3) and (5) were much disturbed by clouds, whereas (4) and (6) were found almost free from any serious disturbance. On the former we perceive the following streamers or rays.

East limb
S 60°: sharp and long,
N 40°: sharp but broad,
Near equator: weak and fairly long.

West limb
S 60°: sharp and long.
N 40° and 30°: „ „ ,
Equator: small but distinct.

In the south of the equator the form of the corona was fairly symmetrical. The above features well correspond to the distribution of frequency of prominences observed at Kakioka in the corresponding period, i.e. primary maximum at 60° and secondary maximum at 30°.

On the same plate eight remarkable prominences were recognized as follows:—

Angle	Position Breadth	Height km
	°	
32°	2.4	29000
87	0.9	19000
144	0.7	16000
204	3.1	47000
232	0.5	13000
266	0.6	20000
276	0.4	13000
317	8.9	73000

Geology and Geography

The Meisen Miocene of North Korea

By Jiro Makiyama

[Mem. Coll. Sci. Kyoto Imp. Univ. Ser. B, 11, No. 4, Art. 8 (1936), pp. 193–228, 2 pls.]. The Meisen series is divisible in descending order as follows :—

6.	Upper Banko sandstone	200–400 m.
5.	Middle Banko sandstone	60–100 m.
4.	Lower Banko sandstone	70–100 m.
3.	Kantin shale	80–200 m.
2.	Inan sandstone	50–300 m.
1.	Heiroku conglomerate	200–300 m.

Heiroku conglomerate is false-bedded and composed chiefly of the dark coloured basaltic material supplied from the underlying Ryudo alkaline basalt. It is thick in the west, but thins out eastwardly. Batillaria, Arca, Cyclina, Ostrea gravitesta and Vicarya callosa are very common. The aspect of this fauna alludes to its intimate relation with the Uetuki Miocene in Chugoku as well as the lower Kadonosawa in northern Kitakami mountain. The writer has proposed a stage name "Uetukian" which probably represents the Burdigarian stage of Japan and its contained fauna distributed in the main island of Japan and Korean peninsula indicates that the water of the Uetukian time was warm.

At the base of the Inan sandstone is observed some undulated surface indicating the erosion interval between the Heiroku and Inan. With a marked contrast with the Heiroku conglomarate the sandstone is light coloured, arkose and unfossiliferous. Its material is believed to be derived from the granitic rocks. The sandstone overlaps the Heiroku southward and rests directly on the granite and dolomite.

Kantin shale shows the mud belt at the high tide of the Meisen transgression and yields a number of fossil animals and plant leaves. The floral list has already been provided by Tateiwa ; 12 species of the Molluscan fauna aside from bones of whales are collected from the sandstone. The Molluscan assemblage point the cold water condition.

Lower Bankodo sandstone was deposited in the belt of variables. Its base is sharply marked from the Kantin not only by the difference of lithic aspect, but by a sign of erosion at some places. The sandstone represents the beginning of the regression and it contains brackish water fauna including Ostrea, Anadara, Trapezium, Corbicula, Protothaca, Batillaria, and so forth.

The lower Banko consists of medium grained sands and sandstones while the middle Banko of sandstones and mudstones with intercalations of thin lignite seams. The mudstone yields the plant remains and fresh water shells, such as Unio, Planorbis, Viviparus and Lymnaea.

Upper Banko is made up almost completely of flase bedded coarse sands with small grained conglomerates in part. Sands are frequently ferruginous, This is the last stage of the sedimentation cycle, and almost barran of fossils. Fortunately, however, a mastodon close to Trilophodon angustidens was procured from the lower part of the bed from which it may be guessed that the age of the upper Banko may be not younger than the middle Miocene.

Along the eastern edge of this Tertiary field develops Entoku conglomerate which is an unfossilifeous thick one. It probably corresponds to the fossiliferous Tertiary beds in the west, but is certainly different from them in facies.

The writer distinguishes the Tertiary series into two groups, the lower Heiroku and upper Kantin. The former is brackish in the lower and fluviatile in the upper part. The latter on the other hand represents a complete cycle of sedimentation initiated with the littoral Inan and closed with the fluviatil upper Banko.

In the systematic description it is pointed out that 1) Anadara is suggested to be a subgenus of Arca and Arca antiquata L. pointed out for its type ; 2) Arca amicula and A. ogawai the Japanese species belonging to Anadara trilineata group; 3) Yoldia thraclaeformis group equal to Megayoldia Verril and Bush ; 4) Yoldia scapha and Y. gratiosa probably synonyms of Y. thraciaeformis; 5) O. gravitesta, when young, similar to O. gigas, but in the adult stage its thick shell and outline distinguish gravitesta from gigas ; Diplodonta usta group equal to the section of Felaniella Dall ; 6) M. donaciformis Kuroda synonymized with M. cuneiformis ; 7) Melania lineolata Griffith & Pidgeon, the type of Cerithidea, not much different from Cerithidea decollatus ; 8) distinction between Natica and Polinices by means of the material of operculum not convinient for the taxonomy of paleontologists and hence it may be better to recognize Polinices, Euspira, Neverita

and Tectonatica as subgenera of Natica ; 9) Pterorhytis Conran 1868 is a valid name, because Cerostoma Conrad 1837 is a homonym of an insect genus.

The followings are new genera, subgenera, species and subspecies :—

Joannisiella meisensis.
Lucina meisensis
Dosinia sirakii
Kaneharaia (subgenus of Dosinia ; type :—Dosinia kaneharai Yokoyama).
Meisenia (type : — Meisenia tateiwai, nov.).
Meisenia tateiwai.
Tateiwaia (subgenus of Batillaria ; type :—Batillaria tateiwai Makiyama).
Proclava (subgenus of Cerithium ; type :—Vertagus pfefferi Dunker).
Cerithium (Proclava) meisense.
Cerithidea (Cerithideospilla) sirakii.
Searlesia kurodai.
Searlesia kurodai kinseiensis.
Coraeophos (subgenus of Phos ; type : —Phos (Coraeophos) meisensis, nov.)
Phos (Coraeophos) meisensis.

T. Kobayashi.

Oceanography

Classification and Distribution of Islands of Japan

By Taro Tsujimura and Sadao Yamaguchi

(Geographical Institute, Tokyo Imperial University, Records of Oceanographic Works in Japan, Vol. IX No. 2, March, 1937)

The total number of small islands that make up Japan amounts to about 5529, excluding 623 in the mandated territory of the South Sea and 108 of the Kwantung leased territory.

In this paper, only islands smaller than Etorohu (3220 km²) of the Kuriles are considered, the large islands of Honshu, Shikoku, Kyushu and Hokkaido forming Japan proper, and Formosa being treated as mainlands.

Number of islands

	Circumference above 1 km	Circumference under 1 km
Japan proper	1080	2989
Honshu	382	1027
Shikoku	167	304
Kyushu	373	1046
Hokkaido	69	228
Ryukyu	89	384
Korea	1164	2315
Formosa	76	223
Saghalin	2	2
Sum	2324	5529

At first we can classify the islands into continental and oceanic simply in reference to their distance from the mainland.

Islands of either group are generally in groups.

The following classification of islands is made on geomorphic basis. First of all volcanic-, coral- and non-volcanic islands are genetically distinguished. Types intermediate between these three are the reef-encircled volcanic islands, reef-encircled non-volcanic islands and partially volcanic islands (ordinary islands but with one or more volcanoes on part of the island).

1) Volcanic Islands. Most of the oceanic islands can be said to be volcanic, and they have always a linear arrangement, viz. in arc or chain. Each volcanic islands in an arc, it seems, are separated from each other in a certain distance. In form they are generally conical and in stage of erosion very young. "Tholoide" islands are rare, the only examples being Unisiru North Is., and Tirihoi South Is., both in the Tisima arc, and Uthuryo-to in Korea.

"Aspite" islands are lacking in Japan proper, but one (Saisyu-to) in its dependent isles, Hiyo-to. On the contrary, several "pedionite" islands are in the Hoko group. Shikine-jima of the Izu chain is also of this type. The limit may exist in the size of one cone, but not in the compound ones as Etorohu or Kunashiri in the Chishima arc. Some of them have many volcanoes, as Paromushiru in the same arc, which is composed of a young conide, an "aspite," ten "tholoide" and a maturely dissected "conide".

Abrasion and erosion begins with the naissance of the volcanic island, and if the island body is small, the sea cliff may grow very rapidly and only the rock chimney may remain as Smith, Lot's Wife, Bayonnaise Rocks as in the Zunan arc. Oftenly volcanic island suffer upheaval or submergence or even both alternately. Three large islands near Hokkaido, Etorohu, Kunashiri, Uruppu, and Rebun, Rishiri on the western sea of Hokkaido, have marine terraces ; while the middle island of the Sulphur group, and Aguni and Kume in the Ryukyu arc are capped or fringed by elevated reefs.

Volcanic islands in the coral sea are ordinarily fringed by living coral reefs, but the highly cliffed islands are reefless, in contrast to those with embayed coast. There are ancient volcanoes of submarine origin, as the Bonin group or four islands along the east coast of Formosa. The Oki islands are also the same, but bear new tholoides on them.

2) Coral Islands. Atoll or table reef does not exist in the Japanese seas, while the barrier or fringing reefs are developed as far north as Suwanose in the Ryukyu arc on the west, and the Bonin chain on the east. Elevated reefs, barrier or fringing, are found on every island of the Ryukyu arc, except the Osumi subgroup near Kyusyu, and on the Bonin islands, while the Daito islands are sometimes stated to be elevated atolls.

3) Non-volcanic Islands. Most of them are only the highest portions of the depressed land. They occur generally in groups, but where the submergence was too great, only the eminent summits remain as isolated islands. When the original mountain was maturely dissected and rich in articulations, a later depression in a fairly large amount will produce the so-called skeleton island. Heguri island in Setouti is a good example. And where the depression is followed by faulting as in Setouchi, the island pattern is controlled by the trends of the respective fault scarp submerged. There are also many islands showing traces of recent upheaval; Awaji-shima in Setouchi is such a terraced island. A few islands of small size are due to mere abrasion, without participation of crustal movements, while many other islands are land-tied by sand bars, as in the north or northwest coast of Kyushu.

Non-volcanic island are mostly continental in origin and only a few, such as the Suisho group in the Chishima arc, the Osumi group in the Ryukyu arc and the Koshiki group, are oceanic. Thus the non-volcanic islands capped by volcano are few, exception being the three large ones in the Chishima arc and Rebun island.

We will now describe the topographical features of each island groups.

Oceanic Island A) Chishima arc. This arc has about fifty islands, stretching from Nemuro of Hokkaido to Kamchatka.

According to Tokuda's view, this arc is composed of many small island chains en échelon, and the larger the distance from Hokkaido, the greater is the interval between them. But here we classify them into three chains, based on morphological characters. The innermost islands are simple volcanic cones and are in a very young stage of erosion, except Makkaru. Araito and Raikokei volcanoes are still active. Islands at the middle form the main chain, and most of them have two or three volcanoes. The southernmost three are surrounded by several terraces of marine origin, cut into the Tertiary formation. Volcanoes are subject to slight dissection and still retain their conical form. Calderas are found on Onnekotan, Shimshiru, Etorohu, and only the former two and Uruppu are tholoides. The outermost Suisho islands near Nemuro peninsula are small non-volcanic islands and they have complex coast-lines due to the recent submergence.

B) Islands along the Japan Sea coast. Here this name is used for these islands in an arc beginning from Kaiba island in the western side of Saghalin, passing Sado, Oki, Iki, and Tsushima, ending at Goto and Ome islands. This arc is divided into three chains, B_1 in the northern part of Japan, B_2 in the southern part and Tsushima islands.

In the B_1 chain, Rishiri, Oshima, and Koshima are considered to be new volcanic islands and Rebun is the young tholoide on the Tertiary base. Most of the islands in this chain may be said to be upheaved islands, and the terrace height attains 1100m in Sado and 580m in Okuziri. But a recent small submergence occurred in Sado and Aoshima; the present outline of the former consisting of two blocks linked together is largely due to this process.

The islands of the B_2 chain have basement of sedimentary rocks and covered with basaltic lava, and are plateau-like in their forms. This is the case of Iki, Mishima, and Goto Islands. Only the Oki group has overlying lava domes. The submergence topography is general in these islands of the B_2 group and the length of embayments sometimes reach to 6 km in Tsushima and Iki, and 5 km in Oki and Goto.

C) Zunan Arc. This arc is composed of Izu, Bonin and Sulphur Ids. and is the southern extension of the Fuji volcanic zone. The islands of the Izu chain are all young volcanoes, but abrasion progressed so greatly that some are highly cliffed (Toshima, Mikura-shima). In this chain we can distinguish Oshima group of andesitic cones from Nii-jima group of liparitic domes.

The islands of Oshima group are simple in structure, except the twin volcanoes of Hachijo. They are all

young, and Oshima, Miyakejima, Aogashima and Tori-shima are all now active. In the islands of Nii-jima group, there are two domes underlaid by tuff cones.

The Bonin chain includes old volcanic islands of submarine origin, and there we can see the elevated abrasion platforms (Haha-jima, Muko-jima) and elevated coral reefs of Tertiary age (Chichi-jima). Since they have suffered from the later submergence, shorelines are intricate and now fringed by living coral-reefs.

The Sulphur or Volcanic islands are three conides, viz. north, middle and south, and the middle one has besides a cone, a tuff dome, on which an elevated reef exists at the height of 110 m.

D) Koshiki group. This group is the prolonged part of the Kyushu mountains and includes Koshiki islands of the Mesozoic formation and Uji islands and others of geological formations of unknown ages.

E) Ryukyu arc. This arc was divided into three chains on the view of tectonic, but geographically it can be separated into two, namely inner zone of volcanic cones and the outer row of large islands. The former is the southern extension of Kirishima volcanic zone in Kyushu. Except a few, they are mostly fresh cones, but in detail, we can distinguish three phases of volcanic activity among them, active (Kutino-erabu, Suwanose), extinct (Aguni, Kume) and ancinet (Pinnacle Ids.).

The main chain comprises Osumi-, Amami-, Okinawa- and Sakishima groups, and these groups are composed of several subgroups. The structure and form of the islands are very complex; there are Tertiary, Mesozoic and Paleozoic formations, and benches of elevated reefs occur side by side with embayments of recent date. Moreover, the islands are surrounded by fringing or barrier reefs.

The Daito group which crosses obliquely the above mentioned two chains has three small islands; these are all elevated atolls and have living barrier reefs.

F) Islands along the east coast of Formosa. These volcanic islands have been elaborately carved by erosion and upheaved afterwards.

G) Hoko group. This group has 54 islands in five subgroups, excluding those smaller than 100 m in length. These are mesas of successive basalt flows; the uppermost bed is 5 or 6 m thick, having fine columnar joints, the middle one is porous and the lowest lies below sea level.

H) Saishu-to group. The giantic shield volcano of Saishu-to and its dependant small isles (26) make up this group. The main island has many parasitic cones, numbering 360 or more.

Apart from the oceanic islands in groups, there are a few isolated islands. Okino-erabu (136°E, 205°N) and South Tori-shima (145° E, 24°14′ N) are small coral islands and Utsuryo-to (130°50′E, 37°30′N) is a volcanic island.

Continental Islands a) Around Ojika Peninsula. The submerged southern part of the Kitakami mountainland has small islands as granitic Kinkazan and others of Mesozoic formations with the bench corresponding to the terrace of 60 m height of the adjacent land.

b) In Matsushima Bay hundreds of small islands are enclosed in the depressed rectangular water area governed by two fault systems of NE-SW and NW-SE. These islands are divided into two groups, Matsushima and Eboishi group.

c) In Atsumi Bay. Scattered small islands in the bay heart are submerged granitic hills. Larger islands at the bay mouth are the extension of Chita peninsula.

d) Around Shima peninsula.

e) In Kii channel.

f) In Bungo channel.

These islands of Mesozoic or Paleozoic formation are formed by the down-warping of the outer zone of southeast Japan, and arranged parallel to the mountain system.

g) Nagato dependent islands.

h) In the north coast of Kyushu. Several islands of granite, Paleozoic- and Tertiary rocks have abrasion surfaces (60–70 m), covered with basalt flow. A few of them are land-tied as Shiga-shima, Keyazaki and Kane-no-misaki.

i) In the northwest coast of Kyushu. Innumerable isles scattered in the sea near Nagasaki, were born as the result of submergence diminishing inclination of the former land surface.

j) Setouchi island group. These islands were produced by submergence followed by faulting, in the north of the median line of southwest Japan. This group may be divided into many subgroups (eight or more), and their boundary lines have a definite liner strike of NE-SW or NW-SE, and most of them are belived to be submerged fault scarps. The degree of submergence is different in each subgroup. Greater the sinking fewer the islands, and there occur even vacant areas, so-called nada. Except the largest island of this group, Awaji, is no traces of upheaval. Most of them is non-vol-

canic, but there are mesa (Te-shima, Yashima) and several butte islands (Ozuchi, Kozuchi).

k) Amakusa group. This island group lies in the sea once continued to the Setouchi, but now separated from it by the eruption of Also and other volcanoes, and may thus be called the islands of the Setouchi type. The recent upheaval is known in this group.

In addition to the above mentioned islands, there are many continental ones along the coast, but they do not form distinct groups. The details about them and two thousands islands dependent of Korea are put aside from the present consideration.

Engineering

Destructive power of earthquakes and resistance of structures

By R. Tanabashi

[J. I. J. A. Vol. 49, No. 598 (1935).] —The present assumption regarding the destructive power of earthquakes and resistance of structures to them does not satisfactorily explain the destructive intensity of earthquakes and its damage to structures. The author proposes a new assumption showing more clearly the relation between the destructive intensity of an earthquake and its damage to structures.

The present assumption is that the destructive force of earthquakes depends on the maximum acceleration of the earth's motion, and that the resistance of structures is the safely applicable horizontal force staticaly to the structure.

As to the former, not only does the maximum acceleration of a severe earthquake almost always reach such large values as 0.4 g–0.5 g, in which g represents the acceleration of gravity, but also in quite harmless earthquakes, a maximum acceleration of as much as 0.3 g has recently been recorded. So long as our calculations are based on the foregoing assumption, our present construction designs to resist a maximum acceleration of 0.1 g cannot be regarded as reasonable despite the fact that the safety-factor for strength of material is about 3. It should be noted however that the large acceleration thus observed cannot continue for any length of time, acting on the structure instantaneously. One must therefore regard the destructive power of an earthquake as the integrated value of acceleration by time, which means maximum velocity.

The energy transmitted to the structure is roughly proportional to the square of the max. velocity of the earth's motion, which assumption somewhat satifactorily explains the relation between past earthquakes as recorded by the seismograph and their damage to houses.

Since the destructive force of earthquakes is regarded as kinetic energy transmitted to the structure, the resistance of a structure must be the potential energy that can be stored in the structure up to its collapse. The earthquake-proof quality of a structure therefore depends not only on the type of construction, but largely on the physical properties of the constructive material. Steel, the most ductile material, is the best, followed by wood and reinforced concrete, while brittle materials, such as brick and stone, are the worst.

Should the structure collapse through excess of stress in the construction material, the earthquake-proof quality can be improved by raising the flexibility of the material, while should the structure overturn through excess of deformation which renders the structure unstable, the earthquake-proof quality can be improved by increasing the rigidity of the material used.

The Ikegai Diesel Engine

By Takeo Imai

[Trans. Soc. Mech. Eng., Japan, Vol.1, No. 4, 1935, 317–322, with 10 figs. and 3 tables.]—The Ikegai Iron Works, in 1930, announced the addition to their line of Diesel engines of a 4 Cycle, 4 Cylinder, automotive Diesel engine that developed 50H.P. Continuous studies of the performance of the engine since then resulted in the construction in 1934, of a new ideal engine, the outstanding feature of which was a special combustion chamber designed for smokeless, perfect combustion, and of the solid injection vertical type. There are two types, 4 HSD 10 and 6 HSD 10.

The specification of the engine is given in the paper.

The special combustion chamber in the cylinder head is so shaped that the air flows with violent turbulence, and owing to the heat accumulating device, perfect combustion, high fuel economy, and higher output are obtained.

The fuel pump is of the Ikegai type, protected by patent No. 181716.

To overcome the starting difficulty, an effective device arranged on the nozzle sprays the oil under higher injection pressure when starting, so that the engine can be easily started cold, it actually doing so easily from—25°C.

As the fuel pump is regulated through the special governor, the engine does not stop nor overrun under any circumstances, thus enabling smooth running throughout the speed range.

This automotive Diesel engine is serviceable not only for busses, trucks, and trailers, but also for small switching lccomotives and Diesel cars.

Ishida's Ball Grinder

By Michio Ishida

[J. Japan. Precision Machinery Asso, II., 2(1935), 45–49, with fig.]—A ball grinder to make crystal balls that has been designed by the author is described.

The essential part of this grinder is two horizontal parallel circular discs of cast iron rotating on two fixed vertial axes at different positions. Many semispherical concavities are drilled on the upper side of the lower disc and pieces of material for making crystal balls are inserted into these holes one by one. A rubber plate fixed to the lower side of the upper disc is brought into contact with the balls in the lower disc, when the two discs are rotated in the same direction with equal angular velocities.

Now, let n=number of revolutions per minute of the two discs, S = distance between the two axes in cm., v = relative velocity of any point on the lower disc to the corresponding point on the upper disc in cm. per minute,

We then have

$$v = 2\pi S n$$

.and the direction of v is always perpendicular to the plane containing the two axes on which these two discs rotate.

On this principle, all the balls between the two discs are rubbed in all possible orientations, so that if the rubbing action be continued and emery and water poured on the material, regular balls of uniform size are easily obtained.

The Development of Acoustical Researches by Means of Talking Films

By Ryuzaburo Taguchi

[J. Japan. Precision Machinery Asso. II., 3(1935), 71–79, with fig.]—It seems almost permissible to say that there has been no exact research on acoustics since those of Helmholtz and Lord Rayleigh. The author, who has been studying sound since 1933, has published a number of reports.

In this paper he advocates the adoption of his methods of studying with the aid of the talking film, and explains the subject in a rather popular manner.

The method consists in

1. Recording sound on a talking film and studying the relation between the sound waves on it and the sounds heard from it, being a good method for eliminating errors of the microphone,
2. Reproducing the films in a reverse direction,
3. Cutting off or lengthening a certain part of the film and reproducing it,
4. Adding to the given wave form any desired wave, or wiping off any desired waves from the film, and reproducing it,
5. Analyzing harmonically the transcient wave by a special method.

The results :

1. The Japanese spoken language consists of consonants and vowels. The former classified into 5 clear consonants (*k, s, t, h, p*), 4 turbid (soft) consonants (*g, z, d, b*), 2 nasal consonants (*n, m*) and liquid consonants (*r*, etc.). The vowels are generally "*i, e, a, o, u*".

2. A consonant wave is caused to precede a vowel and controls the sensation of the vowel, and a vowel acts to amplify the sensation of the consonant. This phenomenon can be detected when the interval between the consonant and the vowel does not exceed 0.3 sec. This time is a constant of the sensation of the consonants to the ear. In the limit of 0.3 sec., the clearness of a consonant to the ear is generally increased as the time is shortened.

3. The loudness in the auditory sensation of a pure sine wave is zero at the first cycle of the wave, and very distinct at the second cycle, but it reaches to saturation at about the 10th cycle.

4. Sounds of striking instruments consist of

a transcient wave + a continuous wave

and each of these waves acts as a consonant and a vowel of the spoken sounds. The author points out that one is able to know the materials that form the source of a sound by the transcient wave, the shape of the source by the continuous wave, and the boundary conditions by logarithmic damping of the continuous wave. These facts are very convenient for humans who live as sort of animals having ears.

5. According to the Japanese rule of

spelling words, sound [Dʒa] (English ja) [ʃa] (sha), and [tʃa] (cha) are spelt as "dya", "sya", and "tya", respectively. In these sounds the author discovered that the waves are arranged exactly as in the Japanese rule. This formula is shown as

the consonant wave + y + vowel.

It can therefore be said that the Japanese rule is the most physical system of spelling in the world.

Long Distance Telephone System by means of Frequency Inversion

By N. Shinohara and M.Konomi

[J. I. T. T. E. Japan, 147(1935), 531–540, with fig.]—It is pointed out both theoretically and experimentally in this paper, that by applying the frequency inversion method to the non-loaded submarine telegraph cable, the attenuation characteristics of the entire line can be kept relatively uniform and smooth with ease, making it possible to construct a good telephone channel.

Since a submarine cable for telegraphy differs greatly from that for telephony in both construction and transmission characters, technical difficulties arise when telephony is used on the former, because of its wide band in frequency. The chief difficulties are large attenuation distortions, the designing of an attenuation equalizer possessing large attenuation, through protection from cross talk, and prevention of the singing phenomena.

When these difficulties have been satisfactory solved, submarine telegraphs throughout the world will be used extensively for telephony, resulting in great economy, efficiency, and convenience.

The author, in this paper, attempts to present a satisfactory solution of these difficult problems.

By providing a repeater station at midpoint of the submarine telegraph cable, the voice signal in normal frequency distribution is transmitted over the first half section of the cable. At the intermediate repeater station this frequency spectrum is inverted with respect to a certain frequency by means of frequency inversion. The voice signal in inverted frequency distribution is then transmitted over the second half distribution and retransformed to normal frequency distribution by the same principle.

In this process, the equalization of distortion due to large attenuation is relatively simple and the resultant transmission character becomes smooth. Complication in designing and the number of necessary attenuation equalizers are reduced.

The same principle may be adapted also for land cables.

Physics

Change of Thermal Energy due to Magnetization in Ferromagnetic Substances

By Toshihiko Okamura

[Sci. Rep. Tohoku Imp. Univ., 24(1936), 745–807, with 28 fig.] The measurement of absorption or evolution of heat in the course of magnetization was carried out on iron, nickel, cobalt, steel, K. S. magnet steel, nickel-iron alloy and single crystals of iron. The change of temperature in these metals by magnetization was measured by means of 31–47 thermo-couples connected in series and by a high sensitive D'Arsonval galvanometer; its sensibility was such that a change of 10^{-6}°C can be detected. The testspecimen was composed of ferromagnetic and German silver bars, 32–48 in number, each 6 cm in length and 2 mm in diameter and distributed alternately in concentric cylinders. Two such sets of bars were made and fixed one upon another so as to form bars of 12 cm. in length, but they were electrically insulated from each other by a thin mica plate.

The heat change consists of two kinds, reversible and irreversible changes; the former is usually known as the magnetocaloric effect and the latter is due to magnetic hysteresis. From the heat changes observed, the present writer succeeded in differentiating these two kinds of heat from each other.

In the initial magnetization, irreversible heat curves are all similar to each other and have a form similar to the curve of magnetization. The reversible heat curves plotted against magnetic field for iron, steels, nickel, nickel-iron alloy and K.S. magnet steel are all similar. In weak fields, the heat is absorbed; its magnitude increases at first, reaches a maximum and afterwards decreases, changing at last from absorption to evolution. In the case of cobalt, the heat absorption only is observed.

In the case of cyclic magnetization starting from a maximum fields, ir-

reversible thermal effect does not at first appear, as the magnetic field is diminished, but it makes its appearance in approaching to zero field; when the field is decreased to the negative side, the heat evolution becomes conspicuous and then approaches to a saturation value. Armco iron, steels, nickel and K. S. steel has one maximum and two minima symmetrically distributed with respect to the ordinate axis. In cobalt, the middle maximum only can be observed, while in nickel-iron alloy, this maximum disappears.

According to Honda-Okubo's theory of ferromagnetic substances, the irreversible heat is the kinetic energy acquired molecules during their abrupt rotations, and therefore it can be calculated from the magnetic data. The reversible thermal effect can be satisfactorily explained by the principles of thermodynamics.

Radio

A Study in High-Frequency Radio Wave Propagation

By Shogo Namba, Kenichi Maeda and Taro Tsukada

(Electrotechnical Laboratory, Ministry of Communications, Tokyo). [J. I. E. E. Japan, No. 578, pp. 946–959, September, 1936.]—Perhaps the most important problem in short-wave radio communication is the quantitative determination of the extent to which the received field intensity is affected by the frequency of the waves, time of the day, path of propagation, etc. When this fundamental problem has been solved, comes next the study of the effect which various phenomena of the upper atmosphere have upon short-wave communication. In other words, the dependability of short-wave communication with respect to various cosmic phenomena must be determined.

The authors, who first began reserch on the problem of predicting short-wave field strengths, about seven years ago, reported in 1932 on the general work accomplished up to that time (Researches of the Electrotechnical Laboratory, No. 336, July, 1932: Proc. I. R. E., July, 1933). In view, however, of the great strides made in the study of wave propagation since then, the authors have issued another general report with certain revisions on the old report.

The revisions given here are based mainly on experimental data, and from the theoretical standpoint there is nothing particularly new compared to what has been given in the previous report, except that within the limits of our present concept of wave propagation, the material presented here is in better agreement with measured results.

The main points of revision are that attenuation in the daytime is regarded as varying continuously with distance, and the fact that night-time attenuation has been taken into consideration. Daytime attenuation is first computed by determining, as before, the apices of the path of propagation, but the values thus obtained are averaged and the attenuation per unit distance of propagation is determined. This is then multiplied by the distance of propagation and the result taken as total attenuation. This type of attenuation, which is assumed to be proportional to distance, is here called "class A attenuation."

Next, in night transmission the multiple ray effect at the receiving point is taken into consideration as well as "attenuation of the second kind" in the F layer. These two effects are combined and represented as an attenuation called "class B attenuation." Class B attenuation is important only during the night. Its particular characteristic is that the attenuation is not proportional to distance as in the case of class A. The calculation is not made for each apex of the path of propagation; the attenuation being determined only at the apex in the darkest region producing the greatest amount of attenuation.

The given examples of this new methed of calculation agree much better with actual results than those given in the previous report.

On the Periodicity of General Fading

By Isamu Ozaki

(Nagoya Regional Direction of Communications, Nagoya). [J. I. T. T. E., No. 163, pp. 814–817, October, 1936.]—The general fading of signal strength on short wave propagation, which has been pointed out Dr. J. H. Dellinger as a new radio transmission phenomenon, has happened very often lately. As the foregoing writer has said, this phenomenon has been looked upon generally as more or less of a vagary. The report here made of investigations on the phenomenon are from our records of radio

communications between Nagoya and Europe and between Tokyo and America since October, 1933.

By charting the days on which general fading occurred, several curves were obtained showing a tendency to general fading. These curves, which were always similar in type, indicated that the phenomenon has a tendency to occur at intervals of 27 days or less, which gradually lengthens to 28 days or slightly longer, after which it ceases.

For convenience of discussion, we shall assume that some special action, such as an explosion on the solar surface causes this general fading. We shall now examine this point of explosion.

From the fact that the period of solar rotation varies with its latitude, we can calculate as follows :

The explosion on the sun generates from a point near the equator, where the speed of rotation is higher than elsewhere. This point gradually moves towards higher latitudes, bursting from time to time, until, notwithstanding the explosion, general fading ceases for the reason that the direction of the explosion does not face the earth, which will readily be understood from the curves now to be referred to. The ends of the curves always fall on a day near that on which the axis of solar rotation inclines to the limit toward N or S, and on which days the point of explosion is farthest from the axis since this explosive point came into existence, at a distance of nearly 40° from the apparent center of the solar disc. It is possible to determine whether the direction of movement of the point of explosion is N or S by ascertaining the inclination of the axis of solar rotation on the day that the last general fading occured.

It was also found that general fading nearly always occurs only within 3 days before or after the day that seems to be the middle of the period of this phenomenon according to the curve, whence it may be said that the general fading occurs only when the point of explosion is within about 40° east or west of the center of the solar disc. This fact is in agreement with the case of latitude already referred to.

The periodicity of general fading may be summarised as follows :

A number of these fadings can be grouped into classes having the tendency to occur with periods as just described. The one that occurred on March 20, May 20, etc., 1935, as reported by Dr. J. H. Dellinger, is now repeating itself at intervals of 28 days, which, however, will appear no more. The group that affected strongly communications with the Far East on February 8, April 2, etc., 1936, is a different one although it appears to belong to the same group.

There seem to be two other groups which are repeating themselves lately.

If general fading is the result of some explosive phenomenon on the solar surface, its frequency will bear a relation to solar activity, while should the time during which observations were made be short, the period of the phenomenon may erroneously seem to be of 54 days interval, as Dr. Dellinger has reported.

A Noiseless Super-regenerative Receiver for Ultra-Short-Waves

By Tatuo Hayashi

(Department of Physics, Faculty of Science, Osaka Imperial University, Osaka). [Rep. Radio Res. Japan, Vol. 6, No. 1, pp. 13–22, May, 1936.]—By means of a new quenching method called by the author "Anti-phase Quenching," nearly all the drawbacks to super-regenerative receivers, such as generation of characteristic noises, poor selectivity, and the masking effect, may be eliminated without losing its characteristic advantages.

The detector consists of two oscillators of nearly the same frequency to which quenching voltages 180° out of phase are impressed. The tail of the decaying oscillation of one valve is utilized as a shock for initiating the oscillation of the other oscillator. The amplitude of the E. M. F. induced from the decaying tail of oscillation must be slightly larger than the irregular impulses that originate in the oscillator, which is believed to be the ultimate source of the noise. At the same time, in order that its high sensitivity shall not suffer, it must be small compared with the incoming signal voltage.

The effectiveness of the antenna coupling, which is of a special type, has been verified by outdoor experiments. This new method of quenching is suitable not only for meter waves, but also for decimeter waves. A test with a receiver of 72 cm waves using Acorn tubes gave very promising results.

In determining the optimum quenching frequency, the damping of the circuit must be taken into consideration. Experiment shows that a higher quenching frequency should be used when the circuit Q is high. This result agrees well with the author's conclusion derived from a consideration of the building-up process of oscillation.

CHAPTER XXXIV

PRESS AND PUBLICATIONS

Press

Early History

Yomiuri Even in Old Japan some form of public announcement was issued from time to time, like the Acta Diurna of the era of the Roman Empire, but perhaps the present subject may appropriately be begun with the Yomiuri, the oldest semblance of the newspaper, which name can be literally translated "reading aloud and selling." The Yomiuri sheets were so named because the venders read aloud the contents of the newspaper on the street while soliciting buyers. The Yomiuri sheets were essentially the Flugblatt of the Middle Ages of Europe. They consisted of single printed sheets, or pamphlets of several pages, recording the latest events of the period. Even in those days the progress of wood-block prints permitted the appearance of illustrations in the sheets. In many cases the illustrations were the outstanding feature, and the descriptive matter was of secondary importance. In this respect the Yomiuri differed from the Flugblatt of Europe.

Its Publishers Old records are lacking to identify the publishers of the Yomiuri, but it appears that the publishers of newspapers, or rather equivalents to newspapers, in the earlier part of the Tokugawa period (about 250 years before the Restoration of Meiji, 1868) were men of little fame and honour. Even at the end of the Tokugawa period it appears that the publishers of the Yomiuri were men of so lowly positions that they were not permitted to enter the society of even woodblock printers. It is, however, considered likely that his early form of the newspaper failed to make any progress owing to government pressure. The Yomiuri carried contents that were often inflammatory and distasteful to the government. Suspension of publication was ordered so frequently that no decent publishers dared to take it up as an enterprise. Only men of low repute engaged in the business often against the law.

Printing of the Yomiuri sheets was done by wood-block prints. The contents of the Yomiuri sheets can generally be divided into two, prose and poetry. This distinction, it appears, existed from the early part of the Tokugawa period. In the era of Genroku (1688–1704) the hawkers sold their sheets on the street either calling the attention of prospective buyers by singing, with or without the accompaniment of the samisen, or merely reading aloud the contents. At the end of the Tokugawa period sheets were sold with the sellers singing popular ballads.

Its Contents A perusal of those Yomiuri sheets still extant shows that at the outset of the development the chief interest of the sheets lay in the illustrations. What are believed to be the oldest Yomiuri have illustrations of the Battle of the Osaka Natsu-no-jin in May in the first year of the era of Genna (1615), accompanied by descriptive matter. Judging from the frequent issuance of suppression or suspension orders, Yomiuri sheets appear to have been published and sold in abundance during the eras of Empo (1673–81), Jokyo (1684–88) and Genroku (1688–1704). In Western Japan, with Osaka as the centre, there is evidence of the popularity of erotic contents in Yomiuri sheets, featuring such stuff as stories of double suicides. Since the vendetta of the famous Forty-seven Ronin vendetta stories formed the chief subject of interest and after the era of Genroku subjects of natural calamities were featured. In the eras of Bunka (1804–18) and Bunsei (1818–30) the enforcement of justice and morality undertaken by the Shogunate government, stressing the protection of right and chastisement of wrong, was reflected in the stories featured in the Yomiuri sheets of those days, even in the accounts of natural calamities and those of sex relations. Because the stories were written by men of low repute, the contents of the Yomiuri sheets in many cases were repellent in tone. Immediately before and after the Restoration of Meiji accounts of the civil disturbances were written, but by this time the number of Yomiuri sheets had considerably decreased owing to the appearance of

newspapers in the more correct sense of the term.

Fusetsugaki Another equivalent of the modern newspaper, in addition to the Yomiuri, was a periodical named "Fusetsugaki" or Book of Reports, which carried foreign intelligence. These books were of two kinds, one with Dutch and one with Chinese reports. After the third Tokugawa Shogun adopted the policy of seclusion, it was only China and the Netherlands which had intercourse with Japan. Captain "Yanyos" (Jan Josten) of Holland, after Japan's adoption of the seclusion policy, presented annually a book descriptive of foreign affairs to the Shogunate government. It was the Oranda Fusetsugaki, or Book of Dutch Reports. The Chinese government in those days presented to the Shogunate government of Japan Chinese intelligence after the manner of the Dutchmen. Information obtained thus was placed in the hands of the Prime Minister and kept confidential, but after the American "black ships" came to knock at the door of Japan, permission was granted to make copies of those books for public circulation. The presentation of Dutch documents continued until the era of Ansei (1854–60), but as the country was opened to foreign intercourse this custom was discontinued at the request of the Dutch government, which instead of the customary annual volume presented Dutch newspapers to the Japanese government. It is considered certain that the newspapers thus presented to Japan were copies of the Javasche Courant, orgain of the Government of Batavia.

Precursor of Modern Paper When the provincial clans requested that the Dutch Book of Reports be made public, the Shogunate government's Yosho Shirabesho, or Bureau for the Study of Western Learning, agreed and planned to publish it. This plan did not materialize, as the Dutch government then replaced the book with newspapers, but instead, the bureau translated the newspapers into Japanese and published them for general circulation. This was the precursor of the modern newspaper in Japan. Not content with this Dutch newspaper, the Shogunate government continued to translate and publish other newspapers from Holland and imported Chinese-language newspapers published by white Christian evangelists in Hong Kong, Shanghai and other places, and had them not only translated and annotated but printed and bound into books and entrusted Hyoshiro Yorodzuya, a book purveyor to the Shogunate government, with the public sale of these books. In general printing wooden types were used. For printing these Chinese newspapers imposition was adopted and for this purpose the Shogunate government had to establish a special department for type foundry. This enterprise was a reflection of the out-and-out principle the Shogunate government adopted for opening the country to foreign intercourse. Those books were chiefly published during the era of Bunkyu (1861–64). Hence they were popularly called Bunkyu Shimbun (newspaper).

Papers in Yokohama In the meantime, anti-foreign sentiment was gaining force in this country and after the era of Bunkyu this interfered with the translation and publication of foreign newspapers. Foreign residents of Yokohama, however, translated foreign-language newspapers and published then in Japanese and they were patronized by those who favoured opening the country to foreign intercourse. Men on the staff of the Bureau for the Study of Foreign Learning had an eye on foreign affairs and established a new institution for the purpose of translating into Japanese articles dealing with Japan which appeared in the English-language newspapers in Yokohama, such as the Japan Commercial News and Japan Times. Those translations were not printed but written by scribes and circulated among interested persons. The years during which this was done extended from 1863 to 1865. Foreign residents of Yokohama also published three Japanese-language newspapers, Kaigai Shimbun (Foreign Newspaper), Bankoku Shimbun (International Newspaper) and Rondon Shimbun (London Newspaper). Of these three, the Bankoku Shimbun had in its contents not only foreign intelligence but news of Yokohama and comment on the English-language newspapers of Yokohama; it introduced ideas of British civilization and carried many advertisements. This journal was edited ably in a characteristic style and published monthly. From this time general progress in newspaper-making was noticeable.

Foreign Language Papers The first foreign-language newspaper published in Japan was the Nagasaki Shipping List and Advertiser issued for the first time in the year 1861 by a resident Britisher, Mr. Hanseard. It was a weekly. The publisher soon moved to Yokohama, where he continued his publication under the name of The Japan Herald, the first issue of which was brought out in December of the same year. He

employed Mr. Black, another Britisher, then a resident of the port city, as editor-in-chief. The example set by the Japan Herald was soon followed by the appearance of the Japan Commercial News in 1863, a weekly published by a Portuguese. In October of the same year, the Japan Herald, in addition to the weekly, started a daily newspaper which featured advertisements. In the year 1865 the Commercial News was discontinued and Mr. Rickerby, a banker, bought the newspaper equipment and started the Japan Times in September of the year. In 1867 Mr. Black had a dispute with the new owner of the Japan Herald, and, leaving the paper, he issued the Japan Gazette, an evening paper. The popularity of the Japan Gazette overwhelmed the Japan Times and the latter lost much patronage and finally had to discontinue publication. The disappearance of the Japan Times, however, was followed by the launching of the Japan Mail. In addition to these newspapers, there was another English-language newspaper, having the name of the Japan Express, published by an American, whose first issue appeared in 1866. The copies of this newspaper were hand-written, carved in wood blocks, and printed. While the name of the publisher and the period of publication are unknown, it is recorded in a diplomatic document in the possession of the French government that this journal represented the American interests. In addition to these papers, there were also a French newspaper, L'Echo du Japon, in the era of Keio (1865–68), an English magazine of caricature, the Japan Punch, which was published continuously for 20 years from the era of Bunkyu (1861–64), and a French magazine of caricature entitled Tobayé. These publications stimulated directly or indirectly the birth of the Japanese modern newspapers.

The Restoration Demand for foreign intelligence was the principal factor in the birth of newspapers in the East as in the West. In Japan, too, newspapers of the earlier periods carried much foreign news, but when there were big developments like civil disturbances they played up internal affairs. The Restoration of Meiji in 1868 afforded the press of Japan much scope for development. Newspaper editors in Yedo, the present Tokyo, were excellent scholars and their papers were much superior to those edited in the provinces. One of the papers in Yedo already advocated parliamentary politics as early as this period, Newspapers published by those holding the "Emperor-centric" policy were filled with articles which merely reflected on the intelligence of the editors themselves. They only advocated the "Emperor-centric" policy and did not propose any advanced ideas about reforms. Newspapers affiliated with the Shogunate government enjoyed much larger circulation than their competitors and it is stated that one of them had a circulation of 3,000.

The Press Law

The press law in Japan was enforced by the Government for the first time in February, 1869. This was the signal for several new newspapers to spring up. The Government, however, interfered so much with the press that sales of newspapers were much hindered and the healthy progress of the press was checked. While the business side of the press was dull, editing itself attained notable progress. Political news had become unusually constructive and efforts were made to establish a new civilization and propagate new and advanced ideas among the people.

Modern Papers

The Yokohama Mainichi The first true Japanese daily newspaper appeared in December, 1870, with the publication of the Yokohama Mainichi Shimbun. Not only was this newspaper a daily but it consisted of a single foreign-style paper sheet with printing done with lead types. In outside appearance it had the semblance of the modern newspaper. Although its contents were much inferior to those of the newspapers that were founded later in Tokyo, it resembled English-language newspapers in that it carried many advertisements.

More Papers Born The year 1872 saw several more dailies born, newspapers which were more perfect in appearance and reading matter than their predecessors. Those newspapers included the Tokyo Nichi Nichi Shimbun, Yubin Hochi Shimbun, and the Nisshin Shinjishi, the last being edited under the supervision of Mr. Black, formerly editor of the Japan Herald. The Nichi Nichi and Hochi remain to this day but the Shinjishi had to change hands in 1875 when the Government, in an effort to bring pressure to bear upon democratic newspapers, controlled the activities of foreigners in newspapers. The change of ownership brought decadance to the journal and the paper was discontinued shortly afterward.

Government and Press

Era of Terrorism An era of terrorism dawned upon Japan's journalism in 1875 when the government, dissatisfied with the way in which the press in general stirred up the discontented elements of the people, revised the press law with the avowed purpose of curbing the influence of the newspapers. Severe punishment was provided for violation of the press law. Journalists writing articles censuring the government were fined or imprisoned. Indeed, this was the first time journalists in Japan were exposed to punishment. Not content with this cruel legislation, the government in July, 1877, invested the Home Minister with power to suppress newspapers or delay their publication, and he was thus free to bring pressure to bear upon them as he saw fit. This objectionable law worked havoc with the press, whose progress was much hampered thereby.

The era in which newspapers served as political party organs began in 1881. Two years before that time the movement in favour of instituting the Diet was launched by the late Taisuké Itagaki and others.

Revised Press Law The government's desperate policy of oppression toward the liberals of the period, which resulted in the prohibition of the formation of political associations and the oppression of newspapers and magazines, came to a definite halt on December 26, 1887, with the enforcement of a new government decree. Two days later a revised press law was issued, considerably modifying the strict control of the press, which had had the effect of almost exterminating all the free political organs of the country. The new press law was drafted on the basis of the principle of "freedom of the press," recognized in the Japanese Constitution which was to be promulgated shortly. The new press law was received by journalistic circles with much satisfaction. Indeed, the modified press law marks a turning point in the history of the development of the modern newspaper in this country.

Whereas under the old law a prospective publisher had to apply for a permit to start a newspaper, by the new regulations he had only to notify the authorities of his intention to issue a journal. The prefectural governor was robbed of his power to suppress newspapers or confiscate the newspaper plants and only the Home Minister was given such power. Unreserved criticism for public good was admitted, and compared with the despotic rule that had prevailed before, newspaper management under the new law became markedly free.

Emergence of Independent Dailies

The approaching promulgation of the Constitution, coupled with the removal of the ban on the formation of political associations and the growing political enthusiasm among the people, revived political newspapers. In the meantime, the Diet was instituted and the majority of the best-known editors of influential newspapers were elected to the legislature. As a natural consequence, the newspapers of these editors became their political tools and alienated public sympathy. Their popularity showed a decided tendency to wane.

The Kokumin and Yorozu While the political organs were thus losing influence, a strictly politically-independent newspaper which refused to cater for the popular taste of the people but which assumed an attitude to instruct the public was founded and caught the fancy of the intellectuals of the day. Its editing, however, was on the old lines and this newspaper never became popular. In the year 1890 Mr. Iichiro Tokutomi founded the Kokumin Shimbun, a popular newspaper. This journal enjoyed the support of the masses and soon other papers more or less imitated the style of editing inaugurated by the Kokumin. In 1892 the late Mr. Shuroku Kuroiwa founded the Yorozu Choho, which added to the Kokumin's style of editing a strong spice of sensationalism, devoting much of its space to the publication of detective and love stories. The Yorozu invaded the fields of the Miyako Shimbun, Yamato Shimbun and other newspapers then having the largest circulation. Thus, the promulgation of the Constitution served to bring about marked progress in the development of the modern newspaper in this country.

Chinese War and the Press The Sino-Japanese War (1894–5) caused severe competition in news reporting. The Osaka Asahi Shimbun, by introducing new features in covering war news, greatly increased the number of its subscribers. In Tokyo the Chuo Shimbun, closely affiliated with the military, was conspicuous for its activities in the issuance of extras and consequently gained an enlarged circulation. Other papers also sent war correspondents and featured news from the front. The Yorozu then was the most popular newspaper, having a circulation of 50,000. In point of circulation the newspapers of that time were in the follow-

ng order: The Yorozu Choho, Kokumin Shimbun, Tokyo Asahi Shimbun, Miyako Shimbun, Nihon Shimbun, Chuo Shimbun, Tokyo Nichi Nichi Shimbun, Jiji Shimpo, Mainichi Shimbun, Yubin Hochi Shimbun and Yamato Shimbun. The war was also responsible for the appearance of influential provincial newspapers, including the Fukuoka Nichi Nichi Shimbun in Kyushu, the Shin Aichi in Nagoya, the Kahoku Shimpo in Sendai and the Hokkai Times in Hokkaido.

After the Russian War

Catering to the Public Following the Sino-Japanese War the majority of the newspapers in Tokyo adopted an impartial attitude toward politics and concentrated their efforts in popularizing pages. To advance their sales they resorted to means which often savoured of vulgarism and received public criticism. The city of Osaka witnessed a duel between the Asahi and the Mainichi not only in business but in news gathering. In the meantime, the Russo-Japanese War (1904–5) occurred to start keen competition in war coverage. The Asahi both in Tokyo and Osaka, the Osaka Mainichi and the Jiji Shimpo competed severely in the matter of extras and increased their circulation. At the end of the war the peace treaty was signed at Portsmouth, but the peace terms were found unsatisfactory and stoutly opposed by all the newspapers of Tokyo and Osaka, with the exception of the Kokumin and the Chuo, both of Tokyo, the political organs of the then Government. Anti-peace mass meetings were held in Tokyo and Osaka, and in Tokyo the participants in the mass meeting, incited by inflammatory articles in one or two newspapers, turned into a mob and attacked the building of the Kokumin Shimbun. To suppress the mob the government had to proclaim martial law. The government simultaneously issued an urgent Imperial Ordinance and suspended the publication for certain periods of the newspapers which incited the public to violence. During one month shortly after the enforcement of the Imperial Ordinance the Yorozu, the Niroku, the Miyako, the Nihon, the Jimmin, the Asahi of Tokyo and Osaka, and other papers were suspended. Of these papers, the Niroku and the Osaka Asahi suffered suspension twice in a month.

Equilibrium of Influence The panic in the newspaper world thus brought about upset the equilibrium of influence. The Kokumin was robbed of much circulation; so was the Chuo. The Yorozu, with a special appeal to the youth of Japan, increased its circulation markedly. In Osaka the Mainichi took advantage of the suspension of publication which the Asahi suffered and invaded its unfortunate yet heretofore superior competitor's field, with the result that finally their influence in business and other respects became about even.

Motion Picture Utilized Several changes for the better were effected following the Russo-Japanese War, and it is noteworthy that the changes effected all concerned with newspaper enterprises. The Kokumin, which had suffered a dwindling popularity since the paper became the object of public censure by supporting the government that signed a "humiliating peace treaty," issued provincial editions, an example which was soon followed by other newspapers. Shortly afterward the Hochi attained success by issuing an evening edition. This ambitious enterprise was also followed by several other competitors. As regards the contents of newspapers, the Yorodzu reported all sorts of sports and amusements; the Asahi bringhtened its pages with articles from the pen of famous men of letters like the late Soseki Natsumé, and the Hochi established a precedent by carrying a novel in serial form that suited home reading. On the business side, the Hochi took the initiative in establishing provincial branches. The Yamato promoted an exhibition and began a motion picture demonstration show throughout the country.

That these enterprises attained favourable results soon showed in the increased number of circulation. According to reports considered reliable, the Osaka Asahi topped the list with 350,000. The Osaka Mainichi came next with 300,000, and the other papers came in the following order: the Hochi, 200,000; the Yorodzu, the Kokumin and the Yamato each 150,000; the Tokyo Asahi, 80,000, and the others 30,000 or 40,000 each.

In the Taisho Era

Expansion of the Business One notable advance made by the press of Japan during the Taisho Era was the remarkable expansion of newspaper business. All first-class journals erected imposing structures for their offices and installed expensive high-speed presses. By the end of the era all the leading newspapers in Tokyo and Osaka had become public corporations wih their capitalizations above the ¥1,000,000 mark. The earthquake and fire of 1923 reduced

to ashes the majority of the newspapers in Tokyo, except the Hochi, Nichi Nichi and Miyako. Of the unfortunate sufferers, those financially well off got to a good start and soon recovered their former positions, but those less financially favoured failed to raise their heads again and had to be content with insignificant showings. At present the Osaka Asahi and Osaka Mainichi possess more than 1,000,000 subscribers each, and big papers in Tokyo have subscribers approaching the above figure. It is not an exaggeration to say that the achievements made by the press of Japan after the dawn of the era of Showa (1926–) are a high-water mark of Japan's modern culture.

Present-Day Newspapers

Of numerous papers, the Asahi and the Mainichi are the most widely circulated and the most popular with our intellectuals. Both of these papers have their main offices in Osaka. They also have a large office each in Tokyo, one being called the Tokyo Asahi and the other the Tokyo Nichi Nichi. Recently the Yomiuri has come to run a close second in the race for press leadership. Not only are these papers widely read in the larger cities, but they also vie with one another in outrivalling the minor local press in provincial cities and towns by issuing their own local editions which possess the features of the local press in addition to the features essentially their own.

Thus they can be said to have a vast circulation throughout the land. Exactly what this circulation is, it is next to impossible to ascertain. The exact number of copies printed is sedulously kept dark. The custom is to exaggerate. It is thought disadvantageous and therefore unwise to tell the truth in this respect at least, because the chances are that by so doing a newspaper will suffer some loss of subscribers and a decrease of income from advertisements. The differences between the real circulation and the one given out vary with different newspapers. At all events, we have no choice but to be content with guess-work based on the amount of paper consumed and on the weight of newspapers taken at railway stations from which they are dispatched to various districts.

This incidentally brings us to a consideration of the amount of paper used by Japanese newspapers. The average monthly consumption is estimated at about 50,000,000 lbs. As nearly 80 per cent of Japan's total paper production comes from the Oji Paper Manufacturing Company, Ltd., the company is at liberty to threaten the newspaper proprietors, now warning them to restrict the use of paper and now giving them a bombshell notification of a rise in the price of nearly 30 per cent. This is of course a result of the recent rapid rise of commodity prices. This increase in the price of paper used for newspapers will, in Japan as elsewhere, have to be made good by a corresponding increase of subscription fees and some adjustment of the labour of the petty employees in newspaper offices.

The more influential dailies in Tokyo and Osaka pay special attention to international news, that is, to cables from abroad. They are eager to get foreign news as speedily as possible. Japan's larget news agency, the Domei Tsushin Sha, has been and is obtaining a great deal of news from abroad in concert with the world's influential news agencies. Not to be behind, the Asahi, the Mainichi, the Yomiuri and other large papers all have their own special correspondents stationed in the principal cities of the world. So complete is its network of communications that our press, coupled with the spread of radio and periodicals, has done much to augment knowledge of international affairs on the part of the nation at large.

The following table shows the 1936 figures on the proportion of foreign news inserted in five large Tokyo dailies.

Name of newspaper	Total Number of lines covering all articles	Total Number of lines covering foreign news
The Tokyo Asahi	6,571,425	666,863
The Tokyo Nichi Nichi	6,142,514	568,683
The Yomiuri	6,466,648	508,000
The Hochi	6,671,043	459,078
The Jiji	6,561,236	500,178
Total	32,412,866	2,702,802

N.B. The figure for the Jiji is as of December 25, 1937, the day on which this paper became defunct.

It must be noted that the comparatively small proportion of foreign news indicated in the above table is due to the fact that of late years news and articles regarding amusements, household hints, literature, sports, etc., have come to occupy, as we shall see presently, more space than those on politics and economics. None the less, a glance at figures for each year will show a steady increase of space allotted to for-

eign news.

The reason why the Asahi and the Mainichi have attained the present prosperity may be found in their critical attitude towards the successive powers that be, as well as in the speed and accuracy with which they furnish news to the readers. This has been particularly so with the Asahi, with the result that it has received strong support from the nation's intellectuals. Since the Manchurian incident, however, there has been much change in the attitude of editorial writers of our dailies. Just as the press in other countries has lately been compelled to alter its functions, so in recent years our influential dailies, the Asahi, the Mainichi, the Yomiuri, etc., have come to find it necessary to modify their tone owing to the great change that has taken place in the political situation. In the main, the tendency is now for the press to support the Government's policy. It must not be supposed that the Japanese press is controlled by law. Still, one can easily imagine that a considerable change has been made in the functions of the Japanese press, whose duty it is to guide public opinion aright, simply as a result of editorial appraisal of the limits within which freedom can be exercised safely and profitably.

Reference has already been made to the fact that of late years the Japanese press has come to consider it expedient, if not necessary, to give more space to news and articles concerning household hints, literature, art, sports, radio, etc., in order to curry favour with the masses. One example will suffice. In most of our dailies nearly one full page is devoted to the daily radio programme. Whether or not this is the right path for the press to tread leaves much room for discussion. But it is perhaps unavoidable that our large dailies should resort to these practices, because they have to struggle for leadership not only in the large cities, but also in the provincial towns.

An event in 1936 was the amalgamation of the Jiji Shimbun with the Tokyo Nichi-Nichi. The Jiji Shimbun left a great footprint in the world of newspapers in Japan as one of the oldest and most influencial papers in Tokyo for over half a century.

Number of Newspapers

The number of daily newspapers in Japan proper at the end of 1935 was 1,222, showing a gain of 2 over the end of 1934, according to government statistics. In addition, there were on the same day 506 newspapers issued 4 times or more a month and 5,452 newspapers issued 3 times or less a month. All these 7,180 papers come under the category of "newspapers" and are so treated by the Government. The newspapers classified according to prefectures follow :

Prefecture	Daily Papers	Issued 4 times or More a Month	Others and Total
Tokyo	234	129	1,691
Kyoto	38	9	322
Osaka	89	52	691
Kanagawa	17	13	110
Hyogo	51	24	289
Nagasaki	13	9	70
Niigata	21	22	128
Saitama	11	2	69
Gumma	15	2	66
Chiba	14	4	79
Ibaraki	9	0	101
Tochigi	15	4	65

Kagoshima	4	3	49
Okinawa	5	6	17
Hokkaido	80	20	357
Total	1,222	506	7,180

Mainly in Tokyo and Osaka The majority of leading newspapers are pub-

lished in Tokyo and Osaka. This is because Tokyo is the capital of the Empire and Osaka is the centre of social and economic life in West Japan. The combined number of daily newspapers in the two largest cities is 30 per cent of all and their combined circulation covers almost all parts of this country. Large daily papers have their own provincial editions of more than 20 kinds. The spheres of provincial editions are divided between the large papers of Tokyo and Osaka. Tokyo papers publish provincial editions for Eastern Japan, Hokkaido and Saghalien, while Osaka papers issue those for Western Japan, Shikoku, Kyushu, Korea and Formosa. These provincial editions eat into the business spheres of country papers. Recently, Tokyo and Osaka papers have been issuing Manchurian editions. Next to these cities in the number of their papers come Aichi (Nagoya), Hokkaido, Kyoto, Hyogo (Kobé), Fukuoka and Nagano prefectures, reflecting the extent of cultural development of those localities. Okinawa prefecture (Loochoos) issues only 16, the smallest number of all, and 19 are issued in Tokushima prefecture in Shikoku.

Increase or Decrease The following table gives the number of newspapers which increased or decreased each year, from 1926 to 1935 :

		With Guarantee Money				With Guarantee Money			
	Sum Total	Total	Daily	4 Times or more Monthly	3 Times or Less Monthly	Total	Daily	4 Times or More Monthly	3 Times or Less Monthly
1926	7,600	5,089	861	344	3,884	2,511	174	165	2,172
1927	8,350	5,438	916	380	4,142	2,912	177	170	2,565
1928	8,445	5,482	966	399	4,117	2,963	184	178	2,601
1929	9,191	5,917	1,020	417	4,480	3,274	201	193	2,880
1930	10,130	5,995	1,031	428	4,536	4,135	184	221	3,730
1931	10,666	6,290	1,083	476	4,731	4,376	197	247	3,932
1932	11,118	6,301	1,124	463	4,714	4,317	206	241	4,370
1933	11,860	6,678	1,179	461	5,038	5,182	210	261	4,711
1934	12,166	7,081	1,219	470	5,392	5,084	215	258	4,611
1935	12,101	7,180	1,222	506	5,452	4,921	219	295	4,407

Circulation

Circulation Unpublished The circulation of daily newspapers in Japan ranges from about 4,000 to about 1,500,000. Japanese newspapers never make public their exact circulation. For this reason, it is impossible to get the exact figures of circulation of each or any. What is believed to be comparatively correct of the daily circulation of more than 1,100 newspapers is an estimate of about 19,000,000. The number of households in Japan is over 17,500,000. Newspapers are far more widely read in cities than in provinces and they are read more in commercial and industrial districts than in agricultural districts. Tokyo has the largest number of daily newspapers, and the more powerful ones are a well-defined force in society. Among them are the Tokyo Asahi Shimbun, the Yomiuri Shimbun, the Hochi Shimbun, the Jiji Shimpo, the Miyako Shimbun, the Kokumin Shimbun and the Chugai Shogyo Shimpo. The first-mentioned two papers are predominant, having an overwhelming influence in newspaper circles. As organizations for news reporting these two giant papers rank among the world's largest newspapers.

Osaka City has a relatively small number of daily papers, 86 in all, but, as regards circulation, the Osaka Asahi Shimbun, which is the head office of the Tokyo Asahi Shimbun, and the Osaka Mainichi Shimbun, which controls the Tokyo Nichi Nichi Shimbun, predominate all, and their circulation is said to be nearly the same. The two papers have practically the whole of Western Japan under their control, and their influence is felt stronger in Kyushu districts by the publication of the "Kyushu Asahi" and the "Western Mainichi" commenced in February, 1935.

Estimated Circulation Estimated circulation of leading dailies in Japan at the end of 1933 was as follows :

Tokyo	
Tokyo Asahi Shimbun	1,100,000
Tokyo Nichi Nichi Shimbun	1,000,000
Yomiuri Shimbun	1,000,000
Jiji Shimpo	200,000
Chugai Shogyo Shimpo	150,000
Kokumin Shimbun	150,000
Hochi Shimbun	300,000

Osaka	
Osaka Asahi Shimbun	1,300,000
Osaka Mainichi Shimbun	1,200,000
Leading Provincial Paper	
Shin-aichi, Nagoya	200,000
Fukuoka Nichi Nichi, Fukuoka	180,000
Hokkai Times, Sapporo	100,000
Kahoku Shimpo, Sendai	100,000

Subscriptions Subscription fees of Japanese daily papers in large cities range from ¥1.00 to ¥1.50. Airplanes are used for transportation between Osaka and Fukuoka, but in most cases it is done by trains and electric cars.

English-Language Papers English-language daily papers in Japan proper and colonies are as follows : The Japan Advertiser (American), The Japan Times (Japanese owned), both in Tokyo ; the Osaka Mainichi English Edition (controlled by the Osaka Mainichi Shimbun); the Japan Chronicle (British), in Kobé ; the Seoul Press (Japanese), in Keijo ; and the Manchuria Daily News (Japanese), Dairen.

News Agencies

The long contemplated merger of the Shimbun Rengo Tsushin Sha (later Domei Tsushin Sha) and the Nippon Dempo Tsushin Sha has been finally realized on June 1, 1936, the new agency assuming the name of the Dōmei Tsushin Sha. The Dōmei Tsushin Sha consists of over 200 Japanese daily newspapers as members and its directorate is organized by representatives of larger dailies and the Broadcasting Corporation of Japan. It maintains close relations with the Tass, A. P., U. P., Stefani, Reuter, D. N. B., and Havas, which have their branch offices in Japan in the Domei Building. Branch offices are located in Washington, New York, San Francisco, Los Angeles, London, Berlin, Paris, Moskow, Bangkok, Manila, Batavia, Singapore, Shanghai, Nanking, Hong Kong, and other important cities in China. The Nippon Dempo remains as a purely advertizing service agent after the merger.

LEADING NEWSPAPERS AND THEIR PRESIDENTS

	Capitalization	Presidents or Representatives
Tokyo		
Tokyo Nichi Nichi Shimbun	¥10,000,000	Minoru Oka

Newspaper Organizations

The Japan Newspaper Association (Nippon Shimbun Kyokai) This consists of daily newspapers, news agencies and advertising agencies under Japanese management; it was founded in 1913. His Imperial Highness Prince Naruhiko Higashikuni has been honorary president of this association since 1926. Count Keigo Kiyoura, former Premier, is president and Mr. Hoshio Mitsunaga, president of Nippon Dempo, is director-in-chief. It has among its honorary members noted persons such as Mr. Iichiro Tokutomi, Mr. Yukio Ozaki, Mr. Seiichi Uyéno, Dr. Yujiro Miyaké, Dr. Minoru Oka, Mr. Ukichi Oshima and Mr. Takeshi Azuma. The association membership includes almost all the Japanese daily newspapers. The Shunjukai is a social club of newspaper editors, magazine writers and correspondents. It was organized in 1908 and has among its members leading newspapermen and magazine writers of Tokyo. The Nijuichinichikai is composed of high editorial staff members of daily newspapers. It was established in 1926. Its members are editorial directors, managers, news editors and other men of important positions in the editorial service of influential papers. The Shimbunkisha Club (Newspapermen's Association) consists of newspapermen and news agency reporters mostly connected with the business of the Imperial Diet. The Federation of Newspapermen and News Agency Reporters was organized in 1931. It consists of 46 newspapermen and news agency reporters' clubs which are connected with various governmental institutions and economic and financial bodies. Leading newspaper and news agency reporters' clubs are as follows:

Naikaku Kisha Kai	Connected with the Cabinet
Kasumi Club	Foreign Office
Yamashita Club	Seiyukai
Sakurada Club	Minseito
Shinto Kisha Kai	Kokumindomei
Rōdō Kisha Kai	Proletarian Parties
Kunai Kisha Kai	Imperial Household Department

Kokuchokai	Navy Ministry
Shinyu Club	Army Ministry
Naisei Kenkyu Kai	Home Office
Hitotsubashi Club	Ministry of Education
Zaisei Kenkyu Kai	Ministry of Finance
Kinyu Doshi Kai	Bank of Japan
Nosei Kisha Kai	Ministry of Agriculture and Forestry
Unéme Kai	Ministry of Commerce and Industry
Tokiwa Club	Ministry of Communications
Kabuto Club	Stock Exchange
Tetsudo Issin Kai	State Railways
Hosei Kenkyu Kai	Ministry of Justice
Tokumu Club	Ministry of Overseas Affairs
Tokyo Undo Kisha Club	Modern Sports

Newspaper Courses in Universities The Meiji University and Jochi University, Tokyo, opened their newspaper courses in April, 1932. The Newspaper School (Shimbun Gakuin), founded by Mr. Shinjiro Yamané, of the Kokumin Shimbun, sent out its first graduates numbering 40 in December, 1932. The Tokyo Imperial University Journalism Course, established as a section of the Department of Literature was opened in April, 1932. Mr. Hideo Ono is in charge of the course. Lecturers include noted newspapermen and magazine proprietors having many years' journalistic experience. The Newspaper Course of the Jochi University was opened in April, 1932. Mr. Ono is in charge of this course also.

Students' Newspapers At the end of 1932 there were 51 so-called students' newspapers in Japan. These papers are published by universities and schools once a week or once or twice a month. The Teikoku Daigaku Shimbun, issued by the Tokyo Imperial University, is one of the largest of its kind and is issued every Monday. It is an eight-page paper, which was founded in 1920. The Kyoto Imperial University also issues a newspaper of the kind. The Mita Shimbun is issued by the Keio University and is one of the oldest and most influential of those published by private universities. It was founded in 1917.

Publications

A Historical Summary

The number of books published in Japan prior to 1881 is not accurately known. But judged from the records and catalogues of books now existing, they may be roughly taken as follows :

About 1,800 between the time of founding the country and one year before the time when the Shogunate Government was established at Kamakura.

About 5,000 since the establishment of the Shogunate Government at Kamakura until one year before the time when the Tokugawa Shogunate was established.

About 60,000 between the establishment of the Tokugawa Shogunate and the Meiji Restoration.

About 130,000 between the 1st and the 10th year of Meiji, 33,819 between the 10th and the 13th year of Meiji, and 679,368 between 1881 and 1924. Statistics for latest years follow :

1927	19,967
1928	19,880
1929	21,111
1930	22,476
1931	23,110
1932	22,104
1933	24,025
1934	26,331
1935	30,347
1936	28,737

Publications in 1936

Publications in 1936 were specially characterized by a great increase of books on social science. According to the statistics of the Home Department for 1936 (from January to November), the increase and decrease of publications, according to subjects, are as follows :—Publications on politics made a gain of 68 over 951 of 1935 ; those on law, 113 over 709 of the previous year ; economics gained by 509 over 1319 of 1935 ; books on sociology increased by 355 over 690 of 1935. Each of these categories showed a considerable increase during the year, due perhaps to an unstableness in social conditions since February 26th incident. Books on Shintoism increased by 133 over 191 of

1935 ; in philosophy there was an increase of 61 over 1077 of 1935 ; educational books increased by the large number of 529 over 1895 of the year before. On the contrary, books on other religions showed a decrease of 77 from 1440 of 1935. A noteworthy feature of the year is the great increase of books on technical subjects, as follows :— Publications on engineering increased by 35 over 734 of the year before ; those on medicine showed a gain of 177 over 744 of 1935 ; books on industries increased by 343 over 1315 of 1935. The fact that there was a large increase of books on industries and engineering is perhaps due to the expansion of war industries in recent years. Publications on literature showed a gain of 560 over 2325 of 1935 ; those on languages increased by 213 over 908 of 1935. The increase and decrease of books on other subjects are as follows :—The increases are 144 in geography ; 236 in mathematics ; 82 in transportation ; 176 in fine arts ; 165 in amusements ; 59 in technical arts. The decreases are 60 in military affairs ; 89 in statistics ; 687 in textbooks ; 56 in history ; 55 in biography ; 35 in travel ; 64 in science ; 183 in music ; 410 in home life ; 1 in dictionaries, 934 in miscellaneous books. In respect of book-form, books of the size of pamphlets have increased by 3446, and those of ordinary size have decreased by 1788, indicating a rapid production in books of pamphlet size.

Classification The total number of publications in 1936 from January to November was 28,737, including books, pamphlets, leaflets, handbills, maps, drawings, musical notes, printed pictures and toys. They are classified as follows :—

Kinds	No.	Kinds	No.
Shintoism	324	Transportation	215
Religion	1,363	Fine arts	1,014
Philosophy	1,138	Music	1,102
Education	2,424	Amusements	676
Text-books	1,375	Home life	1,209
Literature	2,885	Handicrafts	186
Language	1,121	Politics	1,019
History	429	Law	822
Biography	434	Economics	1,828
Geography	1,238	Sociology	1,048
Travel	63	Military Affairs	294
Mathematics	558	Statistics	147
Science	541	Dictionaries	94
Engineering	769	Series	351
Medicine	921	Miscellaneous	1,405
Industry	1,694	Total	28,737

Following is the classification of the publications according to their form :—

In the form of	Number
Books	13,332
Pamphlets & leaflets	12,545
Handbills	1,226
Maps, drawings, musical notes, photographs, & toys	1,634
Total	28,737

Imports and Exports During the Meiji and Taisho eras the imports of publications far exceeded the exports. The balance, however, gradually decreased because of a steady increase in exports. In 1935 the total value of imports amounted to ¥2,066,000 against ¥2,255,000 of exports. The destinations of the exports were mainly the countries where the Japanese are residing in great numbers, such as the Kwantung Province, Manchoukuo, the U. S. A. the Hawaii Islands and China. The countries from which books are exported to this country are, in the order of importance, England, Germany, the U. S. A. and France. Details follow :

EXPORTS AND IMPORTS OF BOOKS AND PERIODICALS

(In yen)

	Exports		Imports	
	1934	1935	1934	1935
Manchoukuo	412,755	512,046	9,456	13,531

Public Libraries Public libraries both official and private are to be found in all parts of Japan. During 1933 there were 4,686 public libraries throughout Japan.

The largest public library in Japan is the Imperial Library situated in Uéno Park, Tokyo. There are 500,000 volumes of old and new books stored for public perusal. The Tokyo Imperial University Library, rebuilt following the earthquake and fire of 1923, is another large library in Japan.

The following table gives detailed figures regarding the number of public libraries, both official and private, and the number of visitors, and the number of books collected :

Table Showing No. of Libraries, Visitors and Collection of Books

Year	No. of Libraries	No. of Collection of Books	No. of Visitors
1929	4,490	8,592,000	22,847,000
1930	4,553	9,276,000	22,835,000
1931	4,609	9,636,000	23,355,000
1932	4,609	10,138,000	24,980,000
1933	4,686	10,563,000	24,766,000
1934	4,881	10,993,394	26,383,674

Magazines

Historical One of the oldest magazines in Japan was the "Meirokuzasshi" which was published in 1873. But this magazine was full of heavy material only suitable for scholars. It was four years later that a number of magazines to cater to popular interest came into existence. The magazine named "Marumaru-chimbun", for instance, was one of these and was full of sarcastic verses, popular lyrics and also of many laughter-provoking cartoons. Short stories were also favourable reading matters in it. For novels principally appeared the "Hodan-zasshi". For pleasure-reading the "Robun-chimpo." There also appeared a magazine named "Tokyo-shinshi" written chiefly in Chinese, but decidedly erotical. There were also such ones as the "Homei-shinshi," "Moon and Snapping Turtle" and "Kwagetsu-shinshi," and "Shimbunshi."

The "Homei-shinshi" was a more or less imitation of the "Tokyo-shinshi." The "Tsuki-to-Suppon" (Moon and Snapping Turtle) was largely a cartoon paper. The "Kwagetsu-shinshi" (Flower and Moon Magazine) was a pure literary paper under the editorship of Ryuhoku Narishima and lasted about five years from 1879. The "Shimbunshi" (New Proses and Verses) was under the editorship of Shunto Mori. Political magazines also were not slow to arise. The "Ohmei-shinshi" was a private organ of democratic politicians such as Saburo Shimada, Ikuzo Ohoka and Ryo Koyezuka and was full of fervent articles of democratic principles. The "Fuso-shinshi" was also another of this type of magazines, and there were many others of this sort of

papers. No one, however, lasted long, because they all evoked official ban soon. Among these political magazines there was one "Dekinei-sodan" which is remembered by the imprisonment of Eitaro Komatsubara, later Education Minister, on account of his anti-Government articles. It was not, however, Mr. Komatsubara alone who was sent to jail on account of outspoken expression of political views in letters. Many were imprisoned on account of similar offences. Ryuhoku Narishima of the "Kwagetsu-shinshi" was once forced to spend months in jail. As the day of the first opening of Parliament drew nearer, the number of political magazines increased. In 1886 the "Chuo Koron" (Central Review) was first published. The year 1887 was an epoch-making one in the history of magazines in Japan as it was in February of that year that Mr. Iichiro (Soho) Tokutomi started a publishing society named "Minyusha" with the "Kokumin-no-tomo" as its organ which surpassed all other periodicals of the day in the amount of circulation. A few months later the Kokumin Shimbun, a daily paper, was published by the same society headed by Soho Tokutomi. In June the Hakubun-kwan was brought into existence which soon published the "Nippon Taika Ronshu" (Essays by Great Scholars). This resulted in a big success. The "Jogaku-zasshi" (Ladies' Magazine) of Zenji Iwamoto, the "Kyoiku-hochi" (Educational News) of Sannosuké Kusakabé and the "Tetsugakukwai Zasshi" (Philosophical Association Magazine) of Yenryo Inouyé, were published almost simultaneously. The circulation of the aforesaid "Nippon Taika Ronshu" was indeed epoch-making in the sales of all published matters in those days. In 1889 the Hakubun-kwan published the "Nippon no Shonen" (Children of Japan) which surpassed the "Nippon Taika Ronshu" in the amount of circulation. Even that, however, counted only ten thousand, a fact quite uncomparable to the modern colossal number of successful publishing matters. The business condition of the Hakubun-kwan went on successfully and in January, 1895, they published the "Taiyo" (Sun) which soon secured 50,000 readers. In 1904 another hit was made by the issue of the "Nichi-Ro Senso Shashin Gaho" (Graphic News of the Russo-Japanese War) which was published alongside the "Nichi Ro Senso Jikki" (True Stories of the Russo-Japanese War), with 150,000 copies published. Some months later such magazines as the "Jitsugyo no Nippon" (Japan of Business), "Fujin-sekai" (World of Women), "Nippon Shonen" (Youths of Japan) etc. were published by Mr. Giichi Masuda which caused a great sensation among the magazine people. Another noted publisher of those days was a certain Mr. Shimada who published a number of periodicals for youths and children and also for artists which was an equally big surprise to other publishers. It is of interest to note that both Mr. Masuda and Mr. Shimada as well as Mr. O-hashi of the Hakubun-kwan were men from Niigata prefecture. In 1919 the "Kaizo" was published and became a good rival of the "Chuo Koron" which had attained leading position in the magazine world of Japan by this time. Years later came another big magazine man and he was Mr. Seiji Noma, now president of the Dai Nippon Yubenkai (Eloquence Society of Great Nippon) and also president of the Hochi, one of the leading dailies in Tokyo. His first periodical enterprise was the "Yuben" (Eloquence) which was followed by the "Kodan (Heroic Story) Club", "King", "Fujin(Women) Club" and "Gendai" (Present Day). It is a matter of surprise, indeed, that the circulation of the "King" numbers one million copies monthly. In the meantime, the "Taiyo" of the Hakubun-kwan which lasted 36 years disappeared from the magazine world. Soon a rival of the "King" in the bigness of circulation appeared and that was the "Shufu-no Tomo" (Friend of Household Wives) by Mr. Takeyoshi Ishikawa.

Present State Surprisingly many and varied are the periodicals, mostly monthlies, published in this country. A casual visit to a book-stall or the book section of any of our department stores, will give one some indications of the amount of mental pabulum provided to the masses by this type of publication. Statistics show that in 1936 Japan had 8,578 monthly magazines in all. Add to this those published semi-monthly or quarterly, and the number reaches more than 13,700.

What purport to be periodicals of a serious nature intended primarily for intellectuals deal with a wide range of subjects including social problems, science, literature, sports, as well as political and economic subjects. Representative of such magazines are the Chuo Koron, the Kaizo, the Nippon Hyoron, and the Bungei Shunju. Apart from its rich contents, the remarkable thing about any of these "big four" is the tremendous number of pages it has. Every one of them has the thickness of a fairly big volume, containing

from 500 to 600 pages in octavo. What is more, these magazines become stouter still at least four times a year when special numbers are issued. So far as the number of pages is concerned, these monthlies most probably stand in a class by themselves in the whole world.

The contents of any of these so-called reviews include, among other things, detailed reports of news relating to political and economic problems, and frank comments by experts on such problems. Besides, every one of these journals contains, as a rule, a treatise or two of topical interest, usually examinations, from all sorts of standpoints, political, philosophical, religious, literary and what not, of some of the heritages of Japan's past which remained ignored while the country was busy transplanting Western civilization to her soil. It may be stated in this connection that the view often held by Western journals that the tendency is for Japan to turn Fascist and become imbued with a bellicose spirit at the expense of liberalism, is not a sound one, if credence is to be given to the opinion reflected in these high-class reviews which are enjoying wide popularity among the country's intelligentzia.

Needless to say, journals in Japan, as in other countries, have to be censored. And it is a fact that of late years censorship has become very strict, but freedom of speech, though thus circumscribed, is far from dead. What there is of freedom of speech in this country is quite different from that crippled freedom which prevails in other countries. Certainly it is many degrees removed from that which one sees in Russia where speech is entirely monopolized by the Government.

Another feature of the aforementioned reviews of Japan is that a large number of contributors write for each issue. The number averages about forty-five, of which from one-third to one-half are generally considered as first-rate pens of the day. Among them are—to mention only a few at random—Nyozekan Hasegawa, Tsunego Baba, Hitoshi Yamagawa, Yoshitaro Ohmori, Masanori Ito, Hakucho Masamuné, Kiyoshi Miki and Itsuro Sakizaka. The writings of these men, excellent both in substance and style, make good reading, when they enrich the pages of Japanese periodicals, and are always warmly received by Japan's intellectuals.

Yet another feature of these reviews is the large space devoted to short stories and dramas by coming writers. Each issue contains as a rule three or four such pieces of work, and in the case of a special number anything from five to seven. Short-story writing has been and still is occupying an important place in the literary field in this country. One of the cogent reasons for the healthy growth of this branch of literature in this country may be sought in the great favour shown by magazine editors to young writers able but unknown to fame. It has been the custom ever since the Meiji era for almost all literary efforts by writers, who have since found niches in the temple of fame, to be introduced to the public first through the pages of magazines of a serious type.

As these serious magazines are intended for readers of the highest level of intellect, they naturally have a limited circulation of from 30,000 to 70,000 each. Magazines which have a larger circle of readers are those catering to the tastes of the masses, young and old, and those edited primarily for the fair sex.

Most of our popular magazines intended for amusement are published by the Dai Nippon Yubenkai Kodan Sha, the president of which is Mr. Seiji Noma, known both at home and abroad as a magazine king. This publisher owns nine magazines, all enjoyed with avidity by the millions. Of these the more popular are the King, the Kodan Club, and the Fuji, the first-named being literally the king of Japan's popular magazines. These journals are said to have a circulation of from 300,000 to 400,000. Then there are two or three other magazines, such as the Hinodé and the Hanashi, which, though they are not published by Mr. Noma, boast nearly as many readers. These popular magazines have from 500 to 600 pages each. As might be expected, editors of such magazines are out to put in stories calculated to move the reader to tears or tickle his or her sense of humour. Here is a vast scope for popular writers of tales replete with those deeds of derring-do which reflet the ethos of the feudal days. Sentimental love stories by popular novelists are hailed with great delight. The Edgar Wallaces and Wodehouses of Japan find in these journals a great demand for their thrilling and side-splitting stories.

Keeping pace with these journals in point of popularity are women's magazines. The more popular of these are the Fujin Koron, the Fujin Club, and the Shufu-no-Tomo. They contain, among other things, articles on social problems previously touched upon in newspapers,

such as the love affairs concerning film stars, cases of double suicide, scandals of noted ladies and many other sensational topics. Space is not allotted to sensationalism alone. A great deal of space is also devoted to articles on conventional things, such as hints on cookery, sewing and the care of babies—rehashed and repeated year in and year out—as well as romances by popular writers.

Another remarkable thing about all these popular journals is that whenever special numbers are issued, generally three times a year, two or three extra volumes, running up to 200 pages each, are thrown in as a token of gratitude to the reader. This idea of showing generosity was originally hit on by Mr. Noma. The extra volumes thus given into the bargain generally contain articles on the ABC of manual art, or else articles meant purely for amusement. All this goes to show, if nothing else, that publishers of such journals are great consumers of paper.

Of the monthly magazines described above, those of a serious nature generally see the issues of the following month out on or about the 19th of each month, popular magazines much earlier, that is, at the beginning of each month. As soon as they are out a half-page advertisement, showing the contents with subjects and names of writers of feature articles printed in large type, is inserted in turn for two or three days on end in the principal newspapers. There can be no doubt that this sort of advertisement serves as a powerful magnet.

As already stated, there are at present more than 8,500 varieties of monthly journals in Japan. Of these about 800 are on sale in Tokyo. Below are given figures representing some of the principal magazines :

Magazines of a serious nature	250
Magazines for amusements	58
Women's magazines	25
Young men's magazines	95
Juvenile magazines	30

There are practically no weekly periodicals of any importance in Japan. The Asahi, one of the most important daily newspapers in this country, once started publishing a weekly of a serious nature, giving news of the previous week lumped together and comments made on the principal international problems, mainly political and economic. The result of this enterprise was not so satisfactory as expected, and the weekly in question degenerated in less than a year into a periodical catering for the amusement of the public. Much the same fate was shared by the weekly undertaken by the Osaka Mainichi, another influential daily. It may be that the very fact that here in Japan the unit of the economic life of the people is the month, and not the week, stands between weeklies and their success.

LIST OF PRINCIPAL PERIODICALS

Politics and literature:
- Chuo Koron (Central Review)
- Kaizo (Reconstruction)

Politics and law
- Sekai Chishiki (World Knowledge)
- Shakaiseisaku Jiho (Social Policy Review)
- Kokusai Chishiki and Hyoron (International Knowledge)
- Gaiko Jiho (Diplomatic Review)
- Hogaku Shimpo (Science of Law)

Finance and Economic Magazines:
- Toyo Keizai Shimpo (Oriental Economic Review)
- Economist
- Diamond
- Nippon Hyoron (Japanese Review)
- Keizai Chishiki (Economic Knowledge)
- Keizai (Economy)

Popular Magazines:
- King
- Hinodé (Rising Sun)
- Kodan Kurabu (Kodan Story Magazine)
- Gendai (Present Generation)
- All Yomimono (all Stories)
- Hanashi (Story)
- Shinseinen (New Young Generation)

Literary Magazines:
- Bungei Shunju (Literary Review)
- Bungei (Literary arts)
- Bungaku (Literature)
- Bungaku Hyoron (Literary Review)
- Shincho (New Tide)
- Araragi, a waka magazine
- Hototogisu, a haiku magazine
- Butai (Stage)

Woman's Magazines:
- Fujin Koron (Woman's Review)
- Fujin Kurabu (Woman's Club)
- Shufu-no Tomo (Friend of Ladies)
- Fujin-no Tomo (Woman's Friend)

CHAPTER XXXV

LITERATURE, ARTS AND MUSIC

Literature

History

Yamato Period The history of Japanese literature may be divided, in accordance with the political development of the country, into 6 periods : the Yamato, Heian, Kamakura, Muromachi, Yedo and Tokyo periods. The Yamato period comprises the Kodai (archaic period) and the Nara age that followed. The term, Yamato, is derived from the district of Yamato, Nara prefecture, wherein was the seat of the Imperial capital throughout that age. This nascent age of Japanese literature ended in 781 A. D., with the removal of the Imperial capital to Kyoto, then called Heian, by the Emperor Kammu. It may seem improper to include so long a period under one section, but this early stage of Japanese literary growth can thus conveniently be considered as one concrete age, and be studied as such.

(1) Literary Works. The literary works which reveal the mind of the Yamato period and which are still extant, are : the Kojiki, Nihonshoki, Fudoki, Norito, Senmyo, Mannyoshu, Kaifuso, and Nihonraiki. The principal writers are : Ohno-Yasumaro, Tonerishinno, Yamabé-no-Akahito, Kakinomotono-Hitomaro, Yamanoeno-Okura, Otomono-Yakamochi, Ohmino-Mifuné, besides certain sages of the prehistoric age. The last mentioned, Ohmino-Mifuné, was proficient in Chinese classics and poetry.

(2) Development and Classification. Narrative prose and lyric verse assumed concrete form in this period. From a literary point of view the writings of the period can be divided into two sections : works in descriptive style, of which the Kojiki is the main representative ; and poetry that followed, with the Mannyoshu[1] anthology as the typical poetic composition.

Individual self-consciousness realized meagre general development ; instead, a collective sense controlled society. But ample evidence of a pure national spirit is seen. In the latter part of this period alien ideas were introduced from China and India, but could not find their way deeply into the minds of the people. It is not to be wondered at, therefore, that the literary achievements of this awakening period are instinct with the noble national spirit of loyalty and ancestor-worship, permeated with the national traits of optimism, frankness, and genuine simplicity.

Heian Period The Heian period starts from the year in which the Emperor Kammu removed the Imperial palace to Kyoto, then called Heian, and ends in 1186 when the Shogunate government was established by Yoritomo Minamoto at Kamakura. This second literary period, covering nearly 400 years, following the period of dawn, saw Japanese prose and poetry reach full bloom.

Generally speaking, the literature of the period emerged from a style of clear-cut simplicity to one of elegance and delicacy, all literary productions assuming a mood of refined sentiment. In presentment likewise there appeared the graceful kana syllabary, in keeping with current ideas. This harmonization of content and form in the literature of the Heian period set an example to succeeding generations. The Heian period is thus the golden age of Japanese literary achievement. The

1 Mannyoshu (or Manyoshu). The anthology is considered to be one of the greatest poetical attainments of the nation not only in this period, but all through the history of Japanese literature. Its compiler is unknown. The period in which the poets of the book lived covers 450 years from 313 to 764 A. D., and the range of the social standard of the poets extends to all classes from the Emperor down to the farmer or the hermit. The book contains 4,496 poems, which consist of 262 long poems, 4,172 waka and 62 others. Their themes are taken from human relations, love, lamentation, the four seasons, and natural scenery. They are written in the Yamato dialect with Chinese characters. The eminent anthologists in it are Kakinomotono-Hitomaro of the epic long poems; Yamanouéno-okura of the long lyrics who took his themes from social and economic problems of his day; Yamabeno-akahito, the only nature poet among the group; Ohtomonoyakamochi who is believed by many critics to be the compiler of the book and Nukatano-ohogimi and Sakanoé-iratsumé, who distinctly tower above many poetesses who left beautiful love songs with the anthology to their posterity.

period may further be subdivided into the following four sections :

Early Heian period (781–884)
Middle Heian period (885–980)
Mature Heian period (981–1064)
Last Heian period (1065–1182)

(1) Early Heian Period. During this period, imported Chinese culture exercised no small influence on the literary circles of the country, resulting in the popularity of Chinese classics and poetry. Among the poetical works are the Ryounshu, Bunkashureishu, Keikokushu, while among the authors were the Emperor Saga, Kukai, Onono-Takamura, Miyakono-Yoshika, Oyeno-Otondo, Sugawarano-Koreyoshi, Tachibanano-Hirosuké, Sugawarano-Michizané, Fujiwarano-Sukeyo and Miyoshi-Kiyoyuki. With the overwhelming influence wielded by these imitators in the domain of the newly imported Chinese literature, the Japanese waka (31-syllabled poem) was threatened at one time with relegation to obscurity. But the situation was saved through realization of a proposal from Sugawarano-Michizané to discontinue the customary visits of Government envoys to China. In consequence, Chinese literature gradually lost its former influence, and the eminent position once occupied by this alien form of belles-lettres was taken by Japanese poetry. The forerunner of the revived waka verse was the Rokkasen, a collaboration of six representative poets, namely, Ariwarano-Narihira, Ononо-Komachi, Bunyano-Yasuhidé, Kisenhoshi and Otomono-Kuronushi. A further literary achievement of the period is the appearance of works in the Japanese kana syllabary, such as the Taketori-monogatari and the Isé-monogatari.

(2) Middle Heian Period. This is the age of national consciousness when the waka poetry triumphed over Chinese forms, pushing itself forward like a tidal wave. In poetry, works like the Kokin-wakashu and Gosen-wakashu are prominent, while in fiction such works as the Utsubo and Ochikubo and Tosanikki, in Japanese kana syllabary, are representative products.

(3) Mature Heian Period. This is the period in which the literary development of the Heian era attained the highest perfection, creating a golden age of prose. In the field of waka we have such poets as Izumi-shikibu, Akazome-Emon, Fujiwarano-Kinto, Fujiwara-Sanekata and Noin-hoshi, while in the realm of prose there appeared women novelists, like Murasaki-shikibu and Seisho-nagon. the former being the authoress of the Genji - monogatari,[1] while the latter composed the Makurano-soshi, opening up a literary régime of women, as if flowers of innumerable variety and colours blossomed all at one time.

(4) Last Heian Period. A general survey of the period gives the impression of its being politically transitional from Imperial rule to Shogunate administration. Along with the decline of the Fujiwara family in power, literature also hastened towards decline. And in consequence, in the early part of the period the literary cult turned from novels to historical works, producing the Eiga-monogatari and Okagami. In the realm of poetry also a new tendency was apparent, which gave birth to such noted poets as Toshinari Fujiwara and Saigyo-hoshi ; and at the same time a scientific criticism of poetry was initiated and prevailed under students like Mototoshi Fujiwara, Toshiyori Minamoto, and Kiyosuké Fujiwara.

(5) General Development. The most characteristic feature of the period lies in the movement from impromptu and lyrical poetry to stories and narration which require plots and objectification of things. The instinctive or primitive sentiment of the Mannyoshu precedes the more intellectual Kokinshu ; and the Shikashu that followed is pervaded by more meditative and philosophical reflections. With reference to prose, the myths and legends appearing in the Mannyoshu and Kiki (short for Kojiki and Nihonshoki) underwent mutation and took the form of narrative tales in the Taketori-monogatari and the Isémonogatari. This realistic tendency

1 Genji-monogatari. The author Murasaki-shikibu (975-1031) was born a daughter of Tametoki Fujiwara, a family of the illustrious Fujiwara clan, and served at Court for some years as lady-in-waiting to the Empress Akiko. She is known as Lady Murasaki, but her personal name is not known. The book is a large one (nearly 1,900 pages in Arthur Waley's English translation), written in pure old Japanese, extremely refined and pregnant, with Japanese character, or kana. sentences, and literary critics agree in the opinion that it belongs to the greatest masterpieces of the novels of the world.

Genji-monogatari means the Tale of Genji, mainly a love story between the hero Genji and several heroines. It is also a most vivid picture of a civilization, nine hundred years ago, probably as refined, though in the central city only, and certainly as colourful, as any the world has ever known. The most striking thing about the book is the impression it creates upon us of its modernity and universality of feeling. It reflects the Oriental characteristics in every line and still shows human nature very much the same as the Occidental.

was further augmented by the Utsubo-monogatari, and later produced the famous Genji-monogatari, turning its direction thenceforward toward historical compositions, such as the Eiga-monogatari and the Okagami. To enhance this realistic tendency of the time, legends and fairy tales, mingling with current realism, regained their former influence, producing the Konjaku-monogatari, a fairy tale dealing with supernatural and supersensuous things. Furthermore, amid this abundance of literary composition there are others with characteristic features common to meditative, lyrical literature, namely the Tosa-nikki, Murasaki-shikibu-nikki, Makurano-soshi, Izumi-shikibu-nikki, Tombo-nikki, Tonominé-shosho-monogatari and Sarashina-nikki.

Kamakura Period The period of about 150 years, beginning with the Minamoto-no-Yoritomo Shogunate government at Kamakura in 1182 and ending in the Kemmu Era of 1334, is called the Kamakura period, in the history of our literature. For the first 50 years literature was under the influence of the preceding Heian period ; but the one hundred years that followed saw two literary currents sweeping against each other, one at Kyoto, the cultural centre, and the other at Kamakura, the pivot of political authority. Although, during the period, there was no literary movement worthy of special mention, yet it created its own literary atmosphere which resulted in the production of numerous so-called war-tales and religious literature.

(1) Kamakura Literature. The fact that the emotional and sentimental tendency of earlier ages gradually turned to philosophical meditation during this period explains why the works of the time are generally void of individual touch while being true to type. Buddhist pessimism then dominated social thought. The popularization of the Buddhist religion in this period was the result of the natural growth of that religion on the one hand, and of the reaction of public sentiment against the ceaseless civil wars, on the other.

(2) Representative Works. War literature, like the Hogen-monogatari, Heiji-monogatari, Heiké-monogatari and the Gempei-seisuiki, is the most outstanding production of the age. Just as in the preceding period, when literary themes were gathered from historical facts, so in the Kamakura period subjects were sought for from the social conditions of the times when bloodshed, existing side by side with the simple, artless life of the samurai, completely saddened and subdued public sentiment. With reference to waka, inspired by the advent of well-known poetical works like the Shin-chokusenshu, were born the Zoku-gojuishu and Kinkaishu. The Shin-kokinshu, another anthology of poetry, shows the highest point that Japanese poetry had so far reached. The Kinkaishu suggests a return to the Mannyoshu, while the Shin-chokusenshu gives an impression of having reached the acme of poetical refinement, retracing its way back to the beauty of simplicity. It is a pity, however, that rival influences between groups of literary men and critics holding different theories of literary values left the healthy development of literature very much handicapped. Ranking as principal poets of the period were Gotoba-joko, Tsuchimikado-joko, Juntoku-joko, Yoshitsuné, Sadaié, Iyetaka, Jakuran and Sanetomo.

Muromachi Period The Muromachi period is the term applied to the 270 years sandwiched in between the Kamakura and Tokugawa periods, beginning in 1335 when Takauji Ashikaga rebelled against the Emperor Godaigo and terminating in 1603 when Iyeyasu Tokugawa removed the Shogunate government to Yedo.

(1) Muromachi Literature. In consequence of civil disturbance in the preceding age, the literary movement of the period was rather stagnant : the Court nobles were deprived of their positions, while the militarists, taking advantage of the disorderly administration of the central government, exercised an unfavourable influence on the natural development of literary talent generally. Nevertheless, even in such helpless social conditions, the period had the literature peculiar to such an age. Despite the troublesome yoke of historical events, there emerged a certain free and simple literary style ; hence, instead of the waka, tales, and diaries, that flourished down to the close of the last period, such descriptions of war and historical tales as the Masukagami, Jinnoshotoki, Taiheiki, Yoshitsuneki and Soga-monogatari were born, besides rambling notes like the Tsurezuregusa, with their own characteristic attractions.

(2) New Forms of Literature. It is worthy of special mention that in this chaotic period originated such new literary forms as the renka, yokyoku (utai), kyogen and otogisoshi, which saw full development in the following period. Tanka (or waka) verse developed and gave birth to a more diminutive mode, the haikai (or haiku) ; kyogen evolved into joruri and drama ; while otogisoshi reappeared in the form of novels and plays, all in the period that

followed. Herein we notice the beginnings of modern thought, the product of classicism evolving into modernism, and aristocracy into plebeianism. The Muromachi period thus occupies an important position in our literary history, functioning as a bridge that connects the preceding periods with the more illustrious Yedo literature. Another thing worthy of note in this connection is the creation at this time of the Kanazawa Bunko, the Ashikaga-gakko and the Gozen-bungaku, the first two being seats of learning and the last a branch of literature.

Yedo Period The Yedo period begins in 1603 when the Tokugawa Shogunate took up the task of civil government in Yedo, and ends, after 265 years, in 1868, when the Meiji Restoration was accomplished. This forms the most important section in the history of Japanese literature. The Yedo literature succeeded the decadent Muromachi literature and handed on its wealth of achievement to the Meiji period. The remarkable fecundity of this era is to be attributed to various factors, but to none more fundamental than the good government of Iyeyasu Tokugawa, the first Shogun of that line. Realizing the importance of the diffusion of learning for good government, he engaged Confucian scholars, published books, started schools and collected rare literary works. The example thus set by the first Shogun was emulated by the succeeding Shoguns, each striving to open up the way for easier access to knowledge and culture both in town and country, until in the Genroku Era under the rule of the fourth Shogun, Tsunayoshi, national culture reached its highest stage of development. The Yedo period may be divided into the following four sections : centered around Osaka and Kyoto,

1. Period of enlightenment (1603–1680)
2. Period of development (1681–1741) Yedo as the centre,
3. The period of eastward advance of literature (1741–1791)
4. Period of maturity (1791–1868)

(1) Period of Enlightenment. True to its name, this period, following the establishment of the Tokugawa Shogunate in Yedo, saw the collection and publication of ancient books, and annotations thereof, as well as translations of Chinese literature. It is but natural that during this period nothing worthy of note was produced save as foundation work in preparation for what was to come. From another viewpoint this is the age when our traditionally mystic view of art, and our undue belief in tradition, greatly wanes in influence.

(2) Period of Development. A bird's-eye view of the period gives the impression of a rapid development in popular literature, with Osaka and Kyoto as the centre and the Genroku Era as its climax. The origin of this literary movement is traceable to the Mitogaku, which later led to a renaissance of the classics ; we see a revival of haikai verse under Basho, the poet ; and then the appearance of Chikamatsu's joruri. Each made unfettered development within its own sphere of influence. Towards the close of the period, however, these branches of literature lost popularity, until eventually they could scarcely enjoy public recollection.

(3) Eastward Advance of Literature. This is the period when the so-called Kamigata literature of Kyoto and Osaka, began its movement eastward to establish a new literary movement in the city of Yedo, the seat of the Shogun's government. By this time the popular literature founded by Chikamatsu and Saikaku had declined. Buson became the representative haikai poet of the time. Besides haikai, there came into vogue in Yedo various kinds of short poetry, namely, senryu, witty epigrammatic verse ; kyoka, comic verse ; and kyobun, nonsense notes. Also in this period the so-called literature for men of the world cropped up, following the publication of the kibyoshi and sharébon.

(4) Period of Maturity. It was in this period that the construction of the main body of Yedo literature was completed. As a result of the encouragement of learning by the Shogun's highest official, Sadanobu Matsudaira, both art and learning made a remarkable advance, producing a number of artists, and authorities on Japanese and Chinese classics. Parallel with this phenomenal development of classics, popular literature resumed its firm grip on the public. Inasmuch, however, as during the latter half of the period the country was completely upset by troubles both from within and without, most of the literary progress was confined to the early part of the period. Nevertheless, this is known as the period when Yedo literature was crowned with full maturity.

What most characterize Yedo literature are its fecundity in kinds, volume of production and sphere of influence. Not only was it prolific but, all branches of art and learning, from the aristocratic classics down to kyoka, senryu, haikai, joruri (gidayu) and popular novels, showed systematic advancement. The social structure in those days could

not but react on the taste and sentiment of the people, as is evidenced by the two different literary currents that prevailed throughout the period. Whereas the so-called aristocratic literature, which dominated those days, stood on a foundation of Bushido and Confucianism, the popular literature strove to create the epicurian's world. Each of these tendencies went on cultivating its own field of influence in its own respective class, yet what most aptly represents the characteristic features of Yedo literature is the stronger public appeal of popular literary works. These intellectual diversions of the common people, unlike the traditional, conservative and retrogressive taste of classical literature, are optimistic, and charged with the spirit of uplift and mirth. But the negative policy of the Tokugawa government proved an impeding factor in the healthful growth of popular literature, resulting in a gradual loss of individuality. In this way authorship gradually kept aloof from essential requirements of progressive art; the most glaring example of this deplorable tendency is clearly noticeable in Bakin's works.

Tokyo Period The Tokyo period of Japanese literature begins with the Meiji Restoration of 1868 and still happily continues in our present Showa Era. In this short period of sixty-five years the volume of national literature surpasses any other period in Japanese history. The same can be said of its quality.

(1) A general survey of the literary movements of this period reveals the enormous influence exercised by Western literature; all works have thus been enriched in quality and enabled to rank among the most advanced literatures of the West. The present period can conveniently be subdivided into four sections in the following way, chronological figures being given for form's sake :

1. Period of transition (1868–1886)
2. Period of new literary movement (1887–1901)
3. Period of naturalism (1902–1910)
4. Period of neo-romanticism (1911–)

..(1) Period of Transition. During this time the new and old forms and types of literature maintained coexistence, beginning with the earliest years of the Meiji Era and terminating about the 12th year, when the Shosetsu-shinzui by Shoyo Tsubouchi was published. In the early part of the period, still under the influence of the reserve energy of the preceding Yedo period, the novels of Kanagaki-Robun, the plays of Kawataké-Mokuami, the Sosho style haiku all made their influence felt; but the tendency to inertia could not cope with the destructive invasion of European thought and principles; namely, the utilitarianism of Britain and America, the universal love and altruism of Christianity, French liberalism and German nationalism. To be more concrete, in the realm of fiction there appeared, through the influence of such English writers as Lytton and Scott, the Keikoku-bidan by Ryukei Yano, the Kajinno-kigu by Shiba-Tokaisanshi, Setchubai by Tetcho Suehiro, Ryokusuidan by Suto Nansui, and Bunmeitozenshi by Meikaku Fujita, which were brought out one after another. All these are political novels. Following these came the Shosetsu-shinzui and Tosei-shoseikatagi, written by Shoyo Tsubouchi, sign-posts pointing to the new-born movement in national literature. Coincident with the rise of the new literary movement appeared a new form of poetry with the publication of the Shintaishisho. Mingled with these new renaissance phenomena the cultural and literary aesthetics of France and Britain were being introduced through translations.

(2) New Literary Movement. The most outstanding characteristic of the literature of this period is that it completely relinquished Yedo influence and established its own assimilation of the romantic thought then sweeping over Europe and America. Realism, especially psychological delineation, came to be demonstrated by novelists like Shoyo Tsubouchi and Futabatei Hasegawa. They were soon followed by Koyo Osaki, Rohan Koda, Bizan Kawakami, Kyoka Izumi, Ryuro Hirotsu, Chugai Goto, and Ichiyo Higuchi, a woman novelist. These fiction writers dealt with either idealistic, pungent or psychological materials. Especially noteworthy for phenomenal activity in poetry were Toson Shimazaki and Bansui Tsuchii, composers of long poems; and Tekkan Yosano, Saishu Onoé and Kunen Kaneko in the sphere of tanka verse. Furthermore, there was the Negishi school initiated by Shiki Masaoka, and the Araragi school by Sachio Ito. As to haiku verse, under Shiki Masaoka were composers affiliated with the Nihon school; under Koyo Osaki was founded the Shiginsha school, and with the combined efforts of Seisetsu Sassa, Shiei Fujii and Shachiku Ōno was formulated the Tsukubakai.

(3) Period of Naturalism. The trend of literary movement during the last quarter of the Meiji Era was toward

the domination of naturalism. In this sudden rise of naturalism, much influence was exercised by the works of French, German and Russian novelists. Representative Japanese novels indicative of this new movement include works by Doppo Kunikida, Toson Shimasaki, Katai Tayama, Hakucho Masamuné, Shusei Tokuda, Seika Mayama, Homei Iwano, Seiko Nakamura and Shuko Chikamatsu. Against this realistic trend there appeared in the literary arena Soseki Natsumé, Kyoshi Takahama and Ogai Mori, upholding the transcendent school, commonly called the Kotoha. In the realm of literary criticism Hogetsu Shimamura. Tenkei Hasegawa, Tengen Katakami and Gyofu Soma wielded their pens under the banner of art for life's sake. In the domain of drama, plays depicting social thought came into existence under Ibsen's influence. A similar trend was apparent in general poetry and short verse, represented by Yumei Kamowara's and Kyukin Susukida's symbolic poems, Gyofu Soma's poems in colloquial style, Rofu Miki's free verse and Hakushu Kitahara's prose-poems. In the sphere of short poems, came Bokusui Wakayama, Aika Doki, Takuboku Ishikawa and Yuguré Maeda, exploiting new fields, just as Hekigodo Kato and Seisensui Ogiwara did in the realm of haiku. Literature created in the atmosphere of naturalism is generally too much involved in representation of the ugly side of human life, failing thereby to see the whole of life. It is not unnatural, therefore, that the naturalistic trend of the period did not long enjoy public support and was obliged to effect a change towards the close of the Meiji Era.

(4) Period of Neo-romanticism. We may be doing injustice to modern literary movements by crowding all their complex currents under the one category of neo-romanticism . Yet, it is a fact that after the predominant sway of naturalism, every new branch of literary activity obviously based itself on the reactions of the naturalism of the preceding period. Contrary to the negative, sceptical and pessimistic view of life as evinced by naturalism, neo-romanticism attempts to draw from life with the eye upon reality and humanity, in a positive attitude and a spirit of optimism. At the back of this new movement were the pragmatism of William James, Bergsonian philosophy, Tagore's mysticism, Tolstoy's humanism, and the ideas of several other influential Occidental writers. Neo-romanticism was, in its early days, supported by Rinsen Nakazawa, Yohei Ishizaka, Jiro Abé, Saneatsu Mushakoji and other youthful thinkers. It was at that time that the European War broke out. This greatly stimulated the literary movement, pushing it further into the actual life of the people ; eventually it built up such intimate human relations that a drastic renovation was considered unavoidable. This welcomed the rise of many new novelists and playwrights ; among whom were Saneatsu Mushakoji, Takeo Arishima, Yoshio Nagayo, all holding fast to their principles ; Toyohiko Kagawa and Koyata Ebara initiated the vogue of religious fiction and literature ; Naoya Shiga, Ton Satomi, Ryunosuké Akutagawa, Yoshio Toyoshima, Masao Kumé, Haruo Sato and Kan Kikuchi cultivated their own field, in a characteristic style of description. In addition to these fiction writers there arrived on the scene, Seikichi Fujimori, Mimei Ogawa, Kan Eguchi and Hiroichiro Maedako, as representative socialistic writers ; and no small number of novelists producing popular literature. Similarly, in the circle of drama quite a number of new playwriters appeared : of these, Kichizo Nakamura, Yuzo Yamamoto and Junichiro Tanizaki were the most noted. Shoyo Tsubouchi, aforementioned, opened up a new field in pageant and juvenile plays. Another novel phenomenon worthy of note is the powerful growth of scenario writing. With reference to poetry, the long form gradually developed into prose, while folksongs came to the fore, in Yaso Saijo, Shogo Shiratori, Sakutaro Hagiwara and Ujo Noguchi. The overwhelming vitality of the ever-growing literary movement also lent stimulation to the composition of short poems which, following the revival of Mannyoshu study, tried to assimilate nature while giving birth to new verse composed in colloquial style. As to haiku, there is nothing which requires special mention, save the tendency to re-establish itself in couplet form. Summing up all these facts, we arrive at the conclusion that Japanese literature has made wonderful strides and built up a nation-wide sphere of influence that qualifies it to rank with world literary attainment, without forgetting to maintain its own traditions and thereby to create a new and distinct literature of its own.

Contemporary Tendencies

Some of the more prominent movements in modern Japanese literature passed through so many critical phases after the middle of the Taisho (circa

1916), that they began to suffer decline at the close of the period ; and then new movements began to appear.

The First Stage First there is the movement towards proletarian literature, Ohmi Komaki, Yobun Kaneko. Hirabayashi, Aono and Maedako made the first systematic attempt to create literary movement for the proletarian classes, and it was in this circle that such promising writers as Hayama, Kuroshima, and Taiko Hirabayashi were brought up.

The Second Stage Launched by a few younger writers who gathered around Kan Kikuchi, eminent novelist and dramatist, this group promoted new ideas of sensual beauty by abandoning the old conventions and aesthetic notions. Riichi Yokomitsu, disclosed a new realm of style in fiction, being much influenced by the French novelist, Paul Morand.

The Third Stage The third stage in our present-day literature is marked by a powerful appeal from the "Literature for Majority." Kan Kikuchi changed over to this new movement in fiction. In the tenth year of Taisho (1920), "Madam Pearl" was brought out, and this incited the emulation of many other writers.

There are two aspects indicated in the "Literature for Majority." One of these tends mostly to depict modern life struggles in an attractive way ; Kikuchi, Kumé, and Kato are included in this circle. Shirai, Maki, Naoki, and Osaragi are mostly concerned in producing historical and biographical fiction, full of fantastic descriptions.

To the Proletarian groups already mentioned can be added another group of novelists like Nakano, Murayama, Kobayashi, Hayashi, Tokunaga, Fujimori, Ineko Kubokawa ; and critics like Kurahara and Miyamoto. On the other hand, a type-setter, Choku Tokunaga, produced a clever work, "The Street without the Sun," which was translated into German. The labourmen, Sui and Kanechika, are also beginning to produce able and promising works.

The prominent phenomenon of the literary world in 1933 was the decline of proletarian literature. The leading periodicals began to keep the young communistic writers at a respectful distance from the January number of the year and the old writers who had their days in the Meiji Era were reinstated in their place. The tendency of the year was decidedly reactionary in literature, especially in novels.

In the world of drama almost no original work was published, except some translations of Western dramas.

In 1934 religious literature began to flourish, as waves of the so-called Renaissance of religion swept through Japan, while magazines of poetry witnessed a greater cirulation.

Introduction of French literature represented by Valéry and André Gide, and a fresh study of Russian literature, which once was most influential in the literary circles of Japan, has given a new mode of thought to young writers.

Literature in 1936

Trend of Thought The social conditions in the latter half of 1935 and the beginning of 1936 had been comparatively calm, until the sudden outbreak of the February 26th incident threw society into great consternation and uneasiness, exercising not a little influence upon the trend of thought in the country. For nearly four months after the occurrence of the event, the general public was bound to a policy of non-expression of views, and the periodicals were forbidden to give out any criticisms on the Incident. With the easing of tension, after the lapse of some months, however, the Incident became the topic of much severe criticism among the journals, and the seriousness of the situation was sufficiently borne in upon the people. The general opinion was against the violent measures employed by the young leaders of the revolt, who sought to realize their fascist ideals by those means. The Incident gave rise to two distinct and opposite groups of thought, the nationalistic group and the socialistic or liberalistic one. Almost all papers and periodicals were in support of the latter group, and very little appeared in the press in favor of the former. Among the leading contributors of liberalistic thought were the following :—G. Omori, H. Hasegawa, H. Yamakawa, T. Baba, T. Morito, T. Miyazawa, K. Arahata, M.Royama, K. Tanaka, E. Kawai, T. Yanaibara, S. Sasaki, H. Arisawa, K. Miki, K. Abe, K. Kiyozawa. The nationalist or fascist thought found few champions among the leading writers, with the exception of the following :—S. Tokutomi, R. Kita, S. Nakano, M. Kanokogi, K. Chihara, and H. Kurata. Even these writers were not all agreed in their interpretation of the fascist ideals.

During this critical period of political unrest, yet another movement, the "Front Populaire", was introduced from France and Spain and stimulated the Marxist and radical elements in labour groups, though it achieved no tangible results. During its active period in November, G. Omori, a leading com-

munist thinker contributed an article to the "Chuokoron" (The Central Review), wherein he pointed out that the political thought of the world was divided into two conflicting groups, the fascist group and the communist one, and that every individual was obliged to take sides with one or the other of the two.

The need for a humanistic mode of thought was advocated by K. Miki who has been endeavouring to make his ideas the guiding principles of the nation, in order to counteract the feudalistic conceptions still prevalent in Japan.

Towards the end of 1936, the leaders of the various groups of thought, radical as well as moderate, paused to consider how far their concepts were in harmony with the traditional characteristics of the Japanese people. This gave an incentive to historical studies of the peculiarities of Japanese national characteristics. The indiscriminate introduction and admiration of Western culture became the object of severe criticism by leading writers. N. Hasegawa contributed a significant article on the "Characteristics of the Japanese Concept of Culture" (The Nippon Hyoron, August), wherein he maintained that the standards of Japanese culture differred fundamentally from those of the West, as, for instance, the ideal of beauty which expresses to the Japanese in the incomplete and the unsymmetrical, as opposed to the complete and the symmetrical which is the standard of beauty to the Westerner.

K. Miki, in his article "Japanese Fascism" (The Central Review, November) pointed out that what was popularly known as Nipponism was only another form of Fascism imported from the West, but that the true Japanese psychology was incompatible with the Fascist ideals and behaviour.

Literary Events In April, 1936, a new association for the protection of the rights of translators of Western literature was organized at the proposal of D. Horiguchi, Y. Yamanouchi, K. Miki, and other translators. The need for this Association arose from the fact that the original authors in foreign countries demanded heavy payments for infringement of translation rights, which the translators were unable to pay, because of the low payment they receive from publishers.

In May, the Bungeika Kyokai (Literary Men's Association) installed Kan Kikuchi in the chair, and made a plan to establish a Literary Men's Club for the propagation and development of literature, and held its first meeting to make preparations for the collection of building funds.

In July, Toson Shimazaki, the chairman of the Japanese Pen Club, left for Argentine to attend the International Conference of the Pen Club held at Buenos Aires on the 5th September.

A monument in memory of Ichiyo Higuchi, a famous woman novelist of the Meiji Era, was erected in Ryusenji Temple at Shitaya, Tokyo, on the 26th July, under the initiative of the famous Waka poet Nobutsuna Sasaki, and other writers. Another monument was erected in memory of Doppo Kunikida, a well-known novelist of the Meiji Era, at Yugawara, Kanagawa prefecture.

The year 1936 was marked by the visits of famous Japanese literary men to foreign countries. Yone Noguchi, a poet of international fame, visited India, at the invitation of the Calcutta University to deliver a series of lectures on Japanese culture; Kyoshi Takahama, the famous Haiku poet went on a trip to the West and the famous novelist, Saneatsu Mushakoji visited Germany and France.

The literary world of the country suffered great losses in the deaths of the following eminent men of letters:— Choko Ikuta, who translated the complete works of Nietzsche and wrote a historical novel of the life of Buddha; Chisetsu Omori, a versatile writer of Kabuki plays; Miyekichi Suzuki, a prolific writer of stories for children; and Shinkichi Makino, a promising young novelist.

Novels and Stories Literary activities in the realm of novels and short stories proceeded without interruption by political events. The output of literature in this branch during the year showed a considerable increase as compared to that of the year before. A special feature of the year was the large addition of young writers among the ranks of novelists, indicating that literary talent was active among the young, and promising a bright future for the literary world.

Among leading novelists of established fame, such as Shusei Tokuta, Ton Satomi, Shuko Chikamatsu, Haruo Sato, Hakucho Masamune, Junichiro Tanizaki, Saisei Murow, and others, the most prolific during the period were Satomi and Murow, but the works that were much acclaimed among literary circles came from the pen of Tanizaki and Shusei, They were "Shozo, a Cat and a Woman" by the former, and "Kaso Jinbutsu" (Disguised Persons) by the latter.

Shiro Ozaki, a powerful writer of the middle class life, completed his long

story "Jinsei Gekijo" (Theatre of Life) which appeared as a serial in the columns of the "Miyako". The story is written, partially as an autobiography of the author, but dealing chiefly with the people of the lower stratum of society with whom he frequently comes in contact. Riichi Yokomitsu, completed his long novel "Kazoku Kaigi" (Family Conference) which was published serially in the columns of the "Nichi Nichi", and had attracted much attention, "A Great Eagle" by Mitsujiro Serizawa is a remarkable story of petit-bourgeois society, a subject which the author has dealt with in all his novels.

Among proletarian novelists, Kensaku Shimagi was most distinguished in his work "Sanjudai Ichimen" (An Aspect of a Man of Thirty), in which he depicts the distresses and aspirations of the younger generation chafing under the political and social burdens of the age.

As a writer of psychological love-stories, Fumio Niwa contributed frequently to the pages of literary journals during the year. Yojiro Ishizaki's "Mugi Shinazu" (A Grain of Wheat Never Dies) was a much criticized work dealing with the love affairs of intellectual people.

Among longer stories dealing with present-day themes, the following were the most noteworthy: "Gekai no Nagame" (Scenaries of the Underworld) by Rintaro Takeda; "Shusen" (An Autumn Letter) by Mitsujiro Serizawa; "Somenshin" (The Double-faced God) by Kunio Kishida; "Nadare" (An Avalanche) by Jiro Osaragi.

Among the works of younger authors, the following stories, classed under pure literature, were the most outstanding and were awarded the Akutagawa prize: "Koshamain Ki" (Story of Koshamain) by Tomoya Tsuruta, a tragic story describing the life of a chief of the perishing Ainu tribe in Hokkaido; "Jogai" (Out of the City Wall) by Takeo Oda, a record of the author's experiences as a diplomat in Hanchow; and "Kento Sen" (A Messenger Ship to China) by Taku Takagi, an adventurous life-story of Nakamaro Abe, a scholar of the Nara period, who was sent to the Tang Court as a student of Chinese learning.

Among popular stories by leading authors, the most noteworthy work in 1936 was "Miyamoto Musashi" by Eiji Yoshikawa, which appeared serially in the "Asahi". The story describes the life of Musashi Miyamoto, a great swordsman of the Tokugawa Period, to whom the author gives an entirely original interpretation from a modern standpoint. Otokichi Mikami's "Nichiren", a biographical story of the famous founder of the Nichiren sect of Buddhism, was another widely read and much appreciated work of the year. Among writers who regularly contributed historical stories to newspapers and periodicals during the year, the most conspicuous were the following: Shin Hasegawa, Kyoji Shirai, Kodo Nomura, Shiro Kunieda, Matsutaro Kawaguchi.

The following were awarded the Naoki prize which is instituted for the recognition of young authors writing on historical themes:—"Yoshinocho Taiheiki" (Taiheiki of Yoshino Period) by Uko Washio and "Tensho Onna Kassen" (Women's Struggles in the Tensho Era) by Chogoro Kaionji.

A writer of detective stories, Dr. Hayashi, who writes under the pseudonym of Takataro Kigi, contributed several stories to journals which were read with much interest.

Plays Among prominent play-wrights, Seikichi Fujimori, Juro Miyoshi and Yobun Kaneko were the most active during the year. Fujimori's plays, "Watanabe Kazan" and "Takano Choei" were received with much approbation. These plays dealt with the lives of two powerful revolutionary characters who lived at the close of the Tokugawa period, the days preceding the Meiji Restoration. Watanabe Kazan, a distinguished painter and scholar of Dutch learning who carried on his studies in secret because of the ban on foreign studies imposed by Tokugawa Shogunate, and after being caught and imprisoned, ends his life by committing suicide. Choei Takano is another progressive scholar, a contemporary and friend of Kazan, and ends his life under similar tragic circumstances. Among plays dealing with modern life Kaneko's "Furusato" (Native Country) and Miyoshi's "Hikoroku Laughs Heartily" were the most popular, and were accorded very good reception in their cinema version.

The two progressive groups of players, the Shinkyo Gekidan and Shin Tsukiji Gekidan became keenly alive to the need of presenting plays in a purely realistic way, so as to depict the true conditions of society on the stage with the object of bringing out its defects as well as good points. Shinkyo Gekidan group presented Goethe's "Faust", Toson's "Yoakemaye", Fujimori's "Takano Choei" and other plays. The Shin Tsukiji players' group produced "Watanabe Kazan", "Jinsei Gekijo", a dramatic adoption of the story by Shiro Ozaki, Fujimori's "Yo-

gaku Nendaiki" and other plays, including translations of foreign ones.

Poetry Poems in Western style continued to gain in favour, in spite of the opposition to new forms of verse by the followers of the classical styles. Among poets of the Western style, two schools of poetical theory vied with each other for prominence, the one insisting on musical effect as the most important factor in a poem and the other contending that picturesqueness of thought must be held as of vital importance. The dispute ended in a success for the former opinion and musical effect began to be aimed at in a poem.

Ryuko Kawaji, a well-known poet of the Western group, advocated the desirability of introducing poetical recitations into radio programmes.

The following were the most promiment works published during the year by poets of the Western school: "Ichijitsu Shu" (Poems of a Day) by Kaoru Maruyama; "Bogan" (Country Rock) by Shimpei Kusano; "Iyarashii Kami" (The Disagreeable God) by Fuyuhiko Kitagawa.

Tanka Tanka (waka), the thirty-one syllabic poem, continues to be the most favourite verse-form with the Japanese poets. The following were the most prominent among the Tanka poets: Hakushu Kitahara, Isamu Yoshii, Bummei Tsuchiya, Eiichi Matsumura, Fumoto Oka, Nobutsuna Sasaki, Utsubo Kubota, Mokichi Saito, Kunen Kaneko, Yugure Mayeda, and Jun Ishihara. The leading tanka poets publish journals of their own in which their poems appeared. Among the tanka journals, Saito's "Araragi" (Araragi Plant), and Sasaki's "Kokorono Hana" (Flower of the Heart) were the most widely read. Though there exist various schools of poetic expression among tanka poets, the "Mannyo-cho" (the Mannyo style) is generally followed by all as the accepted standard of style. Some variations in tanka verse-form, tending to greater freedom from metrical restrictions were tried successfully, during the year, by such poets as Kubota, Mayeda and Ishihara.

Haiku Haiku, briefer form of verse, composed of seventeen syllables, continued to enjoy steady popularity. During the period under review, two distinct schools of haiku came into conflict with each other. The one, known as "Hototogisu" (Nightingale) school, under the leadership of Kyoshi Takahama, maintained that the representation of the objective world was the chief purpose of the haiku, and the other, led by Shuoshi Mizuhara. insisted on the description of inner reactions to outer things, or the emotional response as the chief theme of a haiku poet. The latter view was strongly supported by young haiku writers, though no decision was arrived at in the controversy. Another movement was introduced for discarding the convention of "Ki", which is an implied rule that no haiku poem is worth its name unless its theme is suggestive of season in which it is composed.

Notable among the books of haiku poems, published in 1936, were Yoshi Kosugi's "A Collection of Haiku", and Suiha Watanabe's "Hakujitsu" (A Bright Day).

Fine Arts

History

Pre-Asuka Period This period, corresponding to what is called the dark age of art, has nothing specially to describe, although it is perhaps the longest period, extending, as it does, from the age of myths down to about the 7th century, A.D.

According to archaeology the ancient Japanese worked in stone, artifacts such as stone images being used in ancestor worship. These are rough hewn sculptures, representing persons clad in armour, wearing a sword, or other arms, all having been used in burial as guardians of the tomb. It was customary, too, in ancient times to have a similar primitive engraving, in the form of a ladder or a wheel, made on the coffin; the plain, artless impression thus conveyed is expressive of the simple mode of living in that remote age.

The dwellings were also in very simple style, constructed of barked but unhewn timber. Even in this simplest type of building there were two styles, known as the Izumo and the Isé; which implies that the ancient culture of Japan was dual, derived either from Izumo or Isé. The former style of structure is represented by the Izumo Shrine, Izumo province, present Shimané prefecture; and the latter by the great shrine of Ise, although these now give no more than a vague idea of what must have been the prehistoric architecture of the country.

In addition to the above, there are

earthen figures called haniwa which arrest the attention not only of archaeologists but also of artists. According to historical records, the Emperor Suinin, who abdicated in 2 B.C., abhorred the cruel old custom of burying people alive around the grave of a high personage, certain individuals being selected from among those persons who were under patronage of the deceased in life. At the instance of a retainer, Nomino-Sukuné, he caused earthen figures to be interred in place of living persons, when the Empress Hihasuhimé died; and this was the origin of haniwa. It is believable, however, that the haniwa existed before Suinin's time. The haniwa is, from an artistic point of view, by no means of high value. It is, nevertheless, the only art product of Japan before the importation of Buddhism. Moreover, its value rests on the fact that it is a work produced solely by the Japanese before they had been influenced by Chinese art. Besides, it is invaluable in that it gives some idea of the life of the people of its day. The variety of haniwa may be roughly classified into human figures, birds and animals, architectural structures, household articles and arms.

Asuka Period As has been stated in the preceding section, for sometime after the foundation of the Empire by the Emperor Jimmu, there was nothing worthy of mention in the realm of art. The Asuka period covers the reign of the Empress Suiko (592–629), when the Imperial palace was in the province of Yamato, Nara prefecture. Already, as early as the time of the Emperor Yuryaku, in the middle of the 5th century, a painter named Isura came over from Chosen, with which country Japan then had frequent intercourse, and through which Chinese civilization had been introduced. Later, during the reign of the Emperor Sushun, towards the end of the 6th century, another painter called Hakka came with carpenters to build temples. But it was not until Shibatatto came over from China, in the reign of the Emperor Keitai (507–531), that Buddhism was introduced into Japan, despite the fact that communication had long before continued with Chosen, then called Kudara.

Shibatatto must have been an expert in the art of sculpture, for he was the grandfather of Kuratsu-kurinotori who cast the large image of Buddha now in the Horyuji temple, in the Empress Suiko's time. Nevertheless, it is evident that the country which contributed most toward founding Japan's fine art technique was Kudara.

The development of art in the Suiko régime was really wonderful. Prince Shotoku, a man of wide learning and an enthusiastic devotee of Buddha, spurred on the ever increasing devotion to art. The leading structures of the period were the Horyuji and Tennoji temples; but those parts of them that have best withstood the wear and tear of time are the two-storied kondo, gate, the five-storied pagoda of the Horyuji temple and the three-storied pagodas of the Horyuji and Horinji temples. No doubt the creative design of the Prince must have been woven into them, but it is nevertheless true that they were modelled after Kudara architecture. It is only from these structures that one can form any idea of what Chinese architecture in those days might have been. The Tamamushi-no-zushi, (a miniature temple) in the Horyuji temple, is valuable not only as a model of ancient architecture but as an example of the structural art and craft of the Suiko régime. The honeysuckle design on the metal fittings of the miniature temple bears close resemblance to similar art motives of Greece. The sculptures of the Suiko period are not all from one source, some coming from China or Chosen, while others are home creations, either from the hands of Chinese sculptors, or the combined efforts of Japanese and naturalized aliens.

The fine art of the Suiko period has thus great depth and width, and at the same time affords invaluable reference for study.

Hakuho Period In the history of Japanese fine art, following the Suiko Era comes the Hakuho period which starts in the reign of the Emperor Jomei, terminating in that of the Emperor Mommu, 629–697. In the 15th year of the reign of the Empress Suiko the custom of sending a government envoy to China, then called Sui, was established, followed by increased intercourse between the two countries. Later, in the 2nd year of the Emperor Jomei's administration, the first envoy was despatched to the T'ang Court in China. By the establishment of this custom art products of China came direct to Japan instead of through the Korean Peninsula, as they had done up to that time. Moreover, the Taika Reformation, by which the political system of China came to be closely followed from the time of the Emperor Kotoku, contributed much toward developing Hakuho art.

(1) Painting. One of the most outstanding facts in the art of this period is that paintings were imported from the Continent, and Buddhist pictures were

painted by priests from China and India. The mural paintings of the kondo of the Horyuji temple testify to this; Its fresco work is further advanced in technique than that of India, and is prized as the leading example of mural painting in any extant wooden building. This and other examples of imported pictorial art technique during the period eloquently speak of the inflow from Indian sources into Oriental countries.

(2) Bronze. The most representative work of the period consists in the big bronze images of Buddha and the two disciples at the Yakushiji temple at Nara. Upon their pedestals are engraved a hoshokumon design in lieu of honeysuckle which by that time had ceased to command preference. The hoshokumon design is the art of inlaying or setting jewels in necklaces, armlets, pedestals, and halos around the heads of images. In connection with the Yakushiji temple's three images, it is interesting to notice that, side by side with the hoshokumon, there is an engraving of arabesque design in grapes. This grape pattern also has its origin in the west of India, whence it came to China during the Han dynasty and prospered in the age of Tang.

(3) Architecture. The only model of architecture constructed in this period and still extant is the three-storied pagoda of the Yakushiji temple at Nara. Another example of the best architectural technique of the period is to be seen at the Nara Imperial Museum where models of five-storied pagodas of the time are preserved.

Tempyo Period The Nara period (707–780) is called the Tempyo Era in the history of Japanese fine art. Through the zealous efforts of the Emperor Shomu and Empress Komyo, who were unrivalled in piety, Buddhist doctrine was thoroughly demonstrated in the capital of Nara, with a consequent development of Buddhist fine art. It was the veritable golden age of fine art in religion. The casting of the Daibutsu (great image of Buddha) at the Todaiji temple and the construction of he temple itself may be pointed out as the greatest examples of art within the period. The Daibutsu has several times suffered from fire, which made it necessary to repair the image; and, in consequence, only the petals of the lotus blossom upon which the image sits retain traces of contemporary art motives. On the surface of these petals are engraved scenes from the sacred world of Buddha, which, from the view point of technique in painting are decidedly excellent. In front of the building occupied by the colossal statue of Buddha there is a bronze-lantern which minutely exemplifies the characteristics of the Tempyo period. Other remains representing the sculptures of the period include several images in the same temple.

(1) Shoso-in Museum.[1] After the

1 The Shōsō-in is located in the precinct of the Tōdaji temple at Nara. The building is a typical wooden storehouse of old Japanese Aze-kura style. No metal nails are used and no walls of earth. The whole building consists of three separate sections which have no windows but one entrance door for each. In the interior each section is two storied with an attic. The dimensions of the building are approximately 108 feet by 30 feet, the height from the ground to the roof top being 39 feet.

Formerly the treasures were kept out from light, and untouched for a long period of years. Since 1872 the doors are being opened annually for airing for two weeks, from November 1st to 14th. All the precious objects are kept in glass cases. In the northern section are kept treasures of the Imperial House before and at the time of the Emperor Shōmu, mirrors, desks, musical instruments, screens, medicine, etc. The middle section contains arms and armour, cases, glass and lacquer wares. The southern section largely contains religious antiques of the Tōdaiji temple.

The Shōsō-in apparently existed in the precinct of the Tōdaiji temple before 756 A.D. when the Empress Kōmyō, widow of the Emperor Shomu, dedicated to the Vairocana Buddha or Daibutsu the Imperial treasures as a memorial of the deceased. Weather has beaten it of course. Battles went on around the sacred ground and the Shōsō-in itself was once stricken by a thunderbolt. But the wooden storehouse has been mysteriously preserved through 1,179 years, with partial repairs. Most of its contents listed in the "Tōdaiji Kemmotsu Chō" (catalogue of donation), dated June 21, 8th year of Tempyō-shōhō (756 A.D.), have been kept unharmed solely due to the loyalty of the officials and people to the Imperial House to whom the Shōsō-in belongs.

The most important treasures are the "Kemmotsu Chō" (catalogue of donation), letters of the Emperor Shōmu, essays written by the Empress Kōmyō, slung sword of the Emperor Shōmu, Kin-gin Hyomon Kin (gold and silver ornamented Oriental harp), Shitan Genkwan (a stringed instrument), Gogen Biwa (a five stringed lute) Mokuga Shitan Kikyoku (a sandalwood checker board ornamented with wooden mosaic), Toriké Tachionna Byobu (a screen with a female figure who wears feathered garments), Urushi Ko Hei (a lacquered carafe), Yōraku or diadems and fragments of the crowns of the Emperor Shōmu and Empress Kōmyō, Gingaku Men (masks used in an old performance "gigaku"), bronze mirrors, swords and other arms and armour; Imperial edict engraved on a bronze plate, glass cup, lacquered chest painted with gold and silver dust, gold and

demise of the Emperor Shomu all the objects of art and craft he possessed were donated to the Todaiji temple by the Empress Komyo. Nearly all were treasured in the Shoso-in Art Museum of Nara, and have safely been handed down to the present. Perfect preservation of art products from so remote an age could be expected only in such a country as Japan. The national treasures of the Shoso-in not only abound in rare paintings but also in many objects of industrial art, such as textiles, lacquer-ware as well as gold and silver ware, porcelain and writing utensils. Especially noteworthy are the T'ang masterpieces from the Imperial household of China. In addition to those of Japanese and Chinese production, examples from the East Roman Empire, Persia, India and countries west of China are found in the museum. Thus the Shoso-in Art Museum is representative of the art products covering both East and West from even before the 7th century.

(2) Ganjinwajo. A priest known as Ganjinwajo in Japan with a number of disciples, visited Nara, then capital of the country, not long after the completion of the Daibutsu. He and his followers had drifted ashore in the southern part of Kyushu. These foreigners left an indelible impression on the history of Japanese art, because they belonged to a group of leading artists of the Tang period of China. Their skill in art was woven into the art of the Tempyo period, not only in the fields of painting and sculpture, but also in architecture. That art products from their hands must have been as great in number as in variety is evidenced by the art treasures of the Toshodaiji temple in Yamato province, Nara prefecture. The image of Buddha enshrined in that temple exhaustively represents the characteristics of the art of the Tang dynasty. Besides these there are several wood-engravings in which, it is surmised, the sculptures of the succeeding period had its origin. Among the foreigners were persons of other than Chinese nationality. Gumporiki, as he was called in Japan, was an expert sculptor, from the country of Kunlunkuo the exact location of which is still a question. Judging by the fact that the Gajinwajo party included people from the west of China, it is but a matter of course that the engravings at the Toshodaiji temple resemble the fresco art of countries west of China. From what remains, there is sufficient reason to believe that some of the descendants of the Persians driven out of the country by the Mohammedans, arrived in Japan with the party.

All kinds of cultural forms and products were imported during this period. These the Japanese could digest and work with a skill not inferior to that of the foreigners. A general impression of the Tempyo period, however, is that there was too much copying of Chinese art and so, too little originality. This one-sided trend of evolution gave rise to a movement in following periods for a revival of art genuinely Japanese in origin.

Konin Period The Konin period (782–888) begins about the time that the Emperor Kammu transferred the capital from Nara to Kyoto, lasting till the reign of the Emperor Koko. The outstanding characteristic of the Konin period lie in the phenomenal rise of native art at the hands of noted priests. Kobodaishi and Chisho-daishi were priest sages of refined artistic endowment. Quite a number of pictures and sculptures of the period are from their hands. The Toji, Koyasan and Miidera temples treasure works of theirs. As one of the prominent painters of the time we may name Kudara Kawanari on whom there are a number of books, but none giving reliable historical information about him. He must have been among those artists summoned by the Emperor Saga to paint the pictures of landscape and rough seas seen on the walls and paper sliding-screens of the Seiryoden Hall of the palace. The custom of painting landscapes and characters on screens of the Imperial palace was thereafter developed setting a fashion in drawings which please the eye. In those days screens were popular, and this helped to popularize landscape painting.

The typical sculptures of the period are such sacred images as are seen at the Shingoji temple, Kyoto, known as

silver ornamented leather box, hangings with figures of Buddhas, Mitta Ebon (a painted tray), silver bottle, and censer with a handle.

Priceless documents of the Tempyō period are stored in Shōsō-in, 779 in all. They include census registers, maps, official documents, I. O. U. and books, and present indispensable materials for the study of official and civil life 11 centuries ago.

For protection, inspection of the treasures of the Shōsō-in is not permitted to the general public, but the pictures of all treasures are published in book form named "Tōyei Zuko," and all the documents may be found in the "Dai Nippon Ko Mon Jo" (Japan's old documents),

the Shingoji style sculpture, and others at the Murofuji temple in Nara prefecture, known as the Murofu style. The rise of the art of engraving images of Japanese gods may be mentioned as a memorable event of the age.

As regards architecture the period shows very few examples that now remain, the representative structures being the main hall and five-storied pagoda of the Murofuji temple. The Heian Shrine constructed in Kyoto, closely modelled after the structures of the age under review, offers excellent material for the study of Konin architecture.

Fujiwara Period The Fujiwara period (889–1186) covers the three hundred years between the reign of the Emperor Uda and that of the Emperor Antoku. At the beginning of the period the Emperor Uda, at the suggestion of Michizané Sugawara, discontinued the custom of despatching envoys to China, thereby cutting off facility of communications with the continent. During the consequent isolation Japanese art was afforded a chance to cultivate its native genius and its own field of influence. The continental art that had been freely absorbed and adopted up to that time commenced to produce national characteristics as is demonstrated by yamatoyé work in the sphere of painting.

(1) Painting. Koseno-Kanaoka was probably the most skilled landscape painter of the period. His reputation was such that the horse he painted on a paper sliding-door was credited with getting out of the screen at night to feed on bush clover in the yard. Koseno-Hirotaka, a well-known painter, was one of his descendants. As skilled painters of that age we may mention also Motomitsu Fujiwara, Mitsunaga Fujiwara, Takayoshi Fujiwara and his son Takachika, besides Toba-sojo and Kakuyu, all of whom specialized in painting yamatoyé or native style, which had developed from a school in the T'ang period of China, called Karayé. Japanese paper-doors and folding screens were what they selected to paint on.

Besides yematoyé many other schools of Japanese style paintings were started, as the kamiyé, utayé, ashideyé, and okoyé. The last mentioned was a school of comic genius whose premier artist was Toba-sojo, a noted priest of the day. Three albums of comic pictures from his brush are treasured at the Kozanji temple. Another important arrival was the yemakimono (paper-scroll) which later developed until reaching its golden age in the Kamakura period. The aforementioned three artists were the most popular masters of the age. Some of their work still survives.

Consequent upon the ever inculcated Buddhist precepts, Buddhist paintings flourished, so much so that specialists in that art were always in evidence. In this religious sphere of painting also national characterization was effected to no meagre extent. The most outstanding of the Japanized Buddhist schools was named the Eshinfu, started by Eshinsodzu, a priest, first affiliated with the Tendai sect of Buddhism, but who later preached the doctrines of the Jodo sect. Probably this school was second to none at that time in Japanization of technique. Tameto, commonly called Great Takuma, who did the fresco work of the Ho-o-do at Uji, Kyoto, belonged to the Takuma family, producing accomplished painters of the time. The most representative Buddhist paintings are treasured at the Hokkeji, Yamashiro Chohoji, Yamato Horinji, Koyasan, the Toji temples and the Imperial Art Museum of Tokyo.

(2) Sculpture. Remarkable advancement in the realm of Buddhist sculpture was revealed in consequence of effective doctrinal propaganda by the Tendai and Shingon sects. Wood-engraving stood unrivalled, but that art, unlike the same mode of the previous age, was mainly in what is called parquetry work. Sculptors collaborated, and in most cases images were constructed in separate parts, each carved by a different artist, under an accomplished specialist. It is interesting to note that even in the carving of hands, feet, head and body there was a division of labour into smaller parts, and each section was put in charge of one sculptor. When completed, the several parts were put together, painted with lacquer and gilded.

Guilds of sculptors, like the shichijobussho, Shichijo-omiya-bussho, Rokujomarikoji-bussho and Sanjo-bussho, established studios one after another. Especially noteworthy in this field was the Shichijo-bussho started by the famous artist Jocho who was practically supreme in the realm of sculpture in the Fujiwara period. The peculiarity of the Jocho school of his creation lies in its soft, mild features with smooth, elegant textile folds or plaits, which characterize the most glorious period of Fujiwara art. The images of Amitabha enshrined at the Ho-o-do, Hokaiji, Saikyoji and Chusonji temples are all representative works of the Fujiwara period.

(3) Architecture. Along with the development of Japanese style painting,

a new Japanese architecture, as seen in what is called the Shinden-zukuri (main building of a peer's residence), prevailed. This style gradually encroached on the domain of sacred structures, as is well exemplified in the Ho-o-do and Konjikido, above cited.

Within three hundred years after the country's adoption of a seclusion policy, an indigenous style characteristic of the Yamato race made the fullest possible development in all branches of art.

Kamakura Period Between the Emperor Gotoba and Emperor Godaigo the Kamakura Shogunate assumed the reins of government. The Kamakura period (1192–1337) of political history is at the same time that of Japanese art. During those 140 years traditional Japanese sentiments and thought developed vigorously against the aristocratic culture which had gained influence in the previous period. Such a turn of cultural development could not but react on art; the anti-traditional spirit of the age began to tell on artistic creation. Not only from within but also from without the country a radical change was introduced, because in those days the Yuan period succeeded the Sung in China; and its highly favoured cultural attainments came flooding into Japan. The two movements, of foreign and domestic origin, combined to lay a foundation for modern fine art which started and developed in and after the Muromachi period.

(1) Painting. Continued civil wars, military administration, and war literature, all contributed to the voluminous production of yemakimono (picture-scrolls) based on themes from battle scenes. Another kind of yemakimono worthy of special mention was painted for the purpose of propagating the doctrines of newly risen sects of Buddhism, such as the Zen and Jodo. This pictorial demonstration of religious doctrines proved quite effective; for, by depicting the life and work of founders, a more direct appeal was made to prospective converts. For the same reason the yemakimono came to serve also as a means to propagate knowledge of the origin and development of shrines. Quite a number of picture-scrolls of the period still remain in perfect condition, those reckoned among the greater works being the History of the Kitano Tenjin Shrine, Murasaki-shikibu-nikki, Sanjurokkasen, Moko-shurai - ekotoba, Honen - shonin - gyojo - edzu. The last mentioned is a yemakimono depicting the personal history of Honen-shonin, the noted priest who founded the Jodo sect of Buddhism. Among scores of yemakimono painters, Nobuzané Fujiwara, Keion Sumiyoshi, En-i, Takakané Takashina and Yoshimitsu Tosa were the most popular. A further noteworthy event of the period was the rise of portrait painting. Generally speaking, until this period there was no other method for reproducing figures except by sculpture. The term for portrait was niseyé. But toward the end of this period a new mode appeared. The technique of portrait painting made rapid advance from the time of Takanobu Fujiwara, Taira-no - Shigemori, Minamoto - no - Yoritomo whose works are treasured at the Shingoji temple, all rare masterplieces.

With reference to Buddhistic painting, the aforementioned Takuma school gradually improved in technique; and with the appearance of Shoga, a descendant of the Takumas, the Takuma school of Buddhist painting was founded, drawing a clear line between the old and the new delineations.

(2) Sculpture. The Kamakura period was also a fecund age in the direction of sculpture. Compared with the work of the preceding period it appeals with more virility. The Shichijo-bussho, the most important sculptors' association or guild, which had been making steady progress, produced a group of consummate artists in Koei, Unkei, Jokaku, Kwaikei, Tankei, Jokei, Koben and Kosho, all contemporaries. Among them the most skilled were Unkei, Tankei and Kwaikei, who are recognized as the best sculptors since the time of Jocho. Whereas Unkei and Tankei excelled in producing the expression of passion, as in statues of nio (Deva kings), Kwaikei specialized in gentle, elegant figures, like those from the chisel of Jocho.

(3) Industrial Art. Lacquer-ware technique, too, made a remarkable advance. The art of engraving also progressed, especially with the appearance of the Kamakura-bori (Kamakura style of engraving). Technique in metal work, also saw much development, inheriting the characteristic virtues of the Fujiwara period. Up to that time the native ceramic art was in so primitive a stage that only unglazed ware could be manufactured. After Kato Shirozaemon-Kagehisa returned from Sung, marked progress was made in this field, and fine chinaware became a home product.

(4) Architecture. The mansions of nobles had been built in the Shinden-zukuri style, but during the Kamakura period the Buké-zukuri style of architecture started and soon dominated.

This is a simple, plain style with an unusual number of sliding-doors to let in light. Though this style of structure has gone out long ago, one can get an idea of it through various yemakimono in which this style of architecture is represented. After the advent of the Zen sect of Buddhism under Eisai-zenshi from China, then called Sung, and the establishment of the Kenninji temple at Kyoto, Zen style of architecture came to attract attention. A good example of this style, still intact, is the Enkakuji temple at Kamakura.

Muromachi Period Succeeding the Kamakura age came the Muromachi period (1337–1573), which, after the two centuries and a half of civil strife, ended with the downfall of the Ashikaga Shogunate. In China the civil disturbances of the late Yuan dynasty had been brought under control by the rise of the Mings, resulting in the advent of the golden age of Ming culture, which exercised some influence on Japan.

(1) Painting. As was customary whenever Chinese culture attained its zenith, communication between the two countries, which had been on the wane, revived again, resulting in the gradual decline of yemakimono, portrait and Buddhist painting, handed down from the preceding Kamakura period, which were unable to cope with the powerful influence of Sung-Yuan style of painting in China. Early in this period there were not a few yemakimono worthy of note such as the Gosannen-gunki by Korehisa Fujiwara and the Yuzu-nembutsu-engi, joint work of Hiroyuki Tosa, Yukihidé Kasuga, Mitsukuni Fujiwara, Ryuko Awataguchi, Jakusai Rokkaku and Eishun Hogan. The latter still remains in the form of a coloured wood-engraving, perhaps the most widely known as our oldest example of this art.

Typical portrait work of the period is that of the Emperor Godaigo in the Daitokuji temple, Kyoto, and of Yoshimochi Ashikaga, at the Shingoji temple. Far more characteristic of the age, however, are the portraits of Zen priests or so-called "Chinso." The most typical chinso is, perhaps, the portrait of Seiichi-kokushi, painted by Mincho, preserved in the Tofukuji temple. Strictly speaking, chinso has more similarity to the Sung-Yuan style than to the Tosa school of portraits.

Buddhist painting of the Muromachi period may roughly be adjudged stationary. Copying of old works seemed to have been the only task attracting artists, among whom a priest named Myotaku-zenshi was known for skill in painting Acala pieces; the principal works of this priest-painter are treasures of the Imperial Art Museum. The most distinguished pictorial artist throughout the period, however, was Mincho. Among his works handed down to the present are the portrait of Seiichi-kokushi, above-mentioned, Gohyakurakan (five hundred disciples of Buddha) in the Tofukuji temple, and Dainehanzu, known as the largest painting in the country. In his brush work are ample traces of the style of the Sung-Yuan period in China; and he was, moreover, the leading painter of the age by whose art the Continental technique, introduced with the Zen sect in the Kamakura period, was digested, assimilated and consummated.

Special mention should be made of the advent of the Sung-Ming style in yamatoyé work, enhancing the traditional style of that art. This new movement was no doubt made possible by the Ashikaga policy of encouraging trade with China, then called Ming. In consequence, numerous Chinese works of art continued to be imported, greatly stimulating the domestic art world. Among various merits and demerits then inherited from the Continent, kakemono (hanging pictures) and a more advanced technique in painting flowers and birds were perhaps the most outstanding. It is also a fact worthy of special mention that the Sung-Yuan style of sumiyé painting (black and white) became popular throughout Japan, under artists like Jasoku Soga, Sotan Oguri, Shinno Nakano, Sesshu and Masanobu Kano. These five sumiyé painters were talented pupils of Shubun who enjoyed the confidence of the Shogun and occupied an important position under the Shogunate government as a painter.

(2) Sculpture. Images of Buddha continued to be supplied by the Shichijobussho of which mention has already been made. But these products gradually lost their artistic value. The aforementioned Shubun was also a good sculptor. It is said of his skill that the great wooden statue, 40 feet high, of Amitabha, enshrined in the Unkyoji temple, was originally the work of a Nara sculptor, but was retouched by Shubun's chisel and improved.

(3) Industrial Art. In this epoch the development shown in industrial art was mainly due to the whimsical enthusiasm of the Shogun. Chanoyu (tea ceremony), a ceremonial etiquette genuinely Japanese, gave rapid rise to various branches of industrial art especially in fine porcelain, the climax of which

was reached during the latter part of the period. This progress was not only in works of manual art like tea-cups, trays and so on, but in kakemono and tokonoma (alcove) furnishings of the tea-room, and the building itself, all of which are required for the full ceremony of tea-serving. Most of the tea-cups used for chanoyu in those days were of Chinese make, or imports from the South Seas.

(4) Architecture. The Zen style of architecture greatly improved. This, combined with the cult of chanoyu lent impetus to the construction of simple but tasteful habitations and temples, with gardens and arbours harmonious to the main building, well represented by the Kinkakuji and Ginkakuji temples in Kyoto.

Momoyama Period The 25 years from 1574 to 1598 is termed the Momoyama period. During this comparatively short interval civil disturbances stirred up the whole country under the governments of Nobunaga Oda and Hideyoshi Toyotomi, acting as military dictators.

(1) Painting. Eitoku Kano was perhaps the greatest painter of the period. Nearly all the mural pictures in the castles of Azuchi and Osaka and the mansion at Shuraku are attributed to the brush of this famous artist. The peculiarity of the painting of the period lies in its grand scale and gorgeous, bright colouring. This is especially true of Eitoku Kano's work. Another noted landscape and ukiyoyé painter was Sanraku Kano; in the Sesshu school of sumiyé were Kogan Unkoku and Tohaku Hasegawa; the Tosa school had Mitsuyoshi who succeeded to the Tosa school which had by that time been reduced to a school only in name.

(2) Sculpture. The most striking feature of the Momoyama sculpture is its clever adaptation to decoration of architecture. Besides Hidari-Jingoro, whose fame as an accomplished sculptor and engraver still enjoys nation-wide popularity, there were skilled artists like Yuzaemon Miyanishi and Matayemon Okabé. As in the Muromachi period, the art carving "No" masks came into vogue.

(3) Industrial Art. Metal work experienced remarkable improvement. The sword-guard artists evolved novel designs. Also in the technique of bronze casting no insignificant progress was made by casters like Yashichiro Nagoya, Dojin Nishimura, Yojiro Tsujido, Yayemon Nagoya and Echizen-no-Shojosansho. The current of the age could not but influence the art of raised lacquer, handed down from previous periods; now works on large scale, fit for the decorative purposes architecture, began to dominate the situation. The Kannon-do of Chikubu-shima inland, Biwa lake, and the Kodaiji temple of Kyoto best represent the technique of this period.

Ceramics also were greatly enhanced in technique. Impelled by the nation-wide use of chinaware, due to the popularization of chanoyu, imported articles grew insufficient. As a natural consequence, home industry in this direction was greatly stimulated, resulting in Nagasuké Chojiro invention of the rakuyaki style and Rokubei Mikazuki's bizenyaki style of ceramic ware. In the realm of textile art, what is to be noted is that in the Tensho Era (1573) a new technique in weaving was introduced from Ming, China, and reached Nishijin, Kyoto, where it appeared in the form of Yamato-nishiki, ito-nishiki, karaori-nishiki, kinran (gold brocade), donsu (satin damask), rinzu, and so on.

In conclusion it may be said of the art of the Momoyama period that, while developing such gorgeous and imposing structures as the Shurakutei and Momoyama Castle, it popularized the exclusive, austere and polite art of chanoyu. Thus two diametrically opposed arts developed all through the Momoyama period.

Yedo Period The Yedo period (1603–1867) started with the Tokugawa Shogunate in Tokyo, then called Yedo, and terminated with the downfall of that government just before the Meiji Restoration. During the 260 years of the Tokugawa Shogunate Yedo flourished, cultivating its own culture as against that of Kyoto, giving the country two centres of culture, one in the east and one in the west.

In the early Yedo period communication with countries beyond the sea opened and foreign trade was thereby greatly stimulated. Whereas hitherto Japan had had little or no dealing with Europeans, save Spaniards and Portuguese, Japan now began to be visited by Hollanders and Britons who came to her shores for commercial purposes. Relations with neighbouring countries also increased in intimacy, due to improved communication facilities. Nevertheless, the people were not satisfied with official passivity but extended their trade with Siam, Cochin, Tonking, Luzon. Furthermore, Iyeyasu Tokugawa, the first Shogun of that line, even attempted to trade with Spain and Mexico, sending envoys for that purpose. By this improved intercourse with foreign countries traditional Japanese art was greatly

influenced. In the Kan-ei Era (1644), Yemosaku Yamada first produced pictures in Western style painting. Fortunately or unfortunately, however, the third Shogun, Iyémitsu, with a view to stamping out Roman Catholicism pursued and imposed an isolation policy by prohibiting the entrance of all foreigners except Hollanders and Chinese. Under this high-handed policy the infiltration of foreign influence was almost completely checked, and domestic genius again came into its own, developing another golden age of fine art.

(1) Painting. The Kanos, who had flourished since the Muromachi period, produced skilled artists like Yasunobu, Naonobu, Tsunenobu and Morinobu, all of whom had the honour of serving the Shogunate as official painters. But this special favour proved a cause of decline in the Kano school later. Among the foregoing four principal members of the Kano school, the last mentioned, Morinobu, was the most excellent, known by the pen-name of Tan-yu. Tsunenobu ranks next in artistic skill. The Tosa school, which had been waning in influence, recovered its laurels in the days of Mitsuoki who was promoted to the Emperor's service. In those days the Sumiyoshi school originated from the Tosa, and became firmly established under Jokei, younger brother of Mitsunori. Toward the close of this period an attempt was made for the revival of yamatoyé, by Totsugon Tanaka, Ikkei Ukita and Tametaka Okada, among whom the latter was pre-eminent. The yamatoyé of the Meiji and Taisho eras started from their work. Yosai Kikuchi is another painter of the group.

One of the greatest painters of the age was Korin Ogata whose art may be traced back to that of Sotatsu school which was originally a style of painting for decorative purposes. Under Korin were Kenzan, Shiko Watanabé and Hoitsu Sakai. Their work suprised foreign eyes as a revelation of the peculiar excellence of Japanese art. Being used for decoration the work of the Koetsu school had close relations with textile, dying, ceramic and other technical industries of the time.

Ukiyoé, which for originality is one of the salient art products of the Yédo period, developed hand in hand with popular drama and popular literature. It is said that the Ukiyoyé or genré style of picture, was started by Iwasa-Matabei-shoi; certainly he and Choshun Miyagawa, Shunsho Katsukawa, Utamaro Kitagawa, Kiyonaga Torii, and Hokusai Katsushika are known as the most accomplished ukiyoyé painters. Of ukiyoyé there are two kinds, namely, hand-painting and colour-print. The latter form was most characteristic of the age. The black and white prints, started by Moronobu Hishikawa, were forerunners of beniyé, which is a coloured print made on coloured wood blocks, an engraved block for each colour. Before this printing process was adopted for mass production, brushes were used for colouring. At first two colours, red and green, were used for printing from engraved blocks, but Harunobu Suzuki later invented an improved process of printing in five colours, starting the nishikiyé which met with popular favour as time went on. Later, in the hands of masters like Utamaro and Hokusai, the process of colour-printing from wood-engravings saw marked improvement, until the finished pieces far surpassed the original hand-painted work in artistic value. Landscape prints in ukiyoyé style were started by the famous Hiroshigé Ando. Some people may look down upon ukiyoyé as vulgar art; but nevertheless it was art most true to the life of the Yédo period. In later years it was not seldom that European collectors of works of fine art were found ready to pay even several thousand yen for a sheet of mere colour-print. This was not without reason.

Special mention should also be made of the arrival of Ifuchieu, a painter of the Ching dynasty in China; for it was through this artist that the Nan-Sung literary school of painting was first introduced into this country. In the early days of the Nan-Sung style of painting, Nankai Gion, Hyakusen Sakaki, Taiga Ikeno and Buson Yosano were its most excellent exponents. Later, with the rise of Chinese classics, the Nan-Sung literary school made great progress and its influence practically dominated the country, producing such noted names as Unsen Kushiro, Daizen Hirosé, Kaiséki Noro, Chikuden Tanomura, Kazan Watanabé, Aigai Takaku, Baikan Sugai, Hanko Okada, Chikudo Nakabayashi and Baiitsu Yamamoto, among whom Chikuden Tanomura was reputed the most excellent. Kazan Watanabé and Baiitsu Yamamoto enjoyed popupar favour next to Chikuden.

Buncho Tani became the most brilliant artist of the age, both in Pei-Sung and Nan-Sung styles of painting; he was a pupil of Kangen Kitayama who learned technique from Fei Hun-yuan and Chu Ko-chin who entered Japan during the Ching dynasty of China. There were some other very important painters, too, namely, Rikyo Yanagisawa, Jakuchu Ito, Sosen Mori

and Ganku. Especially popular were the pictures of domestic fowls by Jakuchu, and monkeys by Sosen.

An important event, moreover, was the appearance of the Maruyama school with Okyo Maruyama as its founder. Okyo's style was derived mainly from Ming and Ching paintings, and developed into what resembled sketches. His pupil, Goshun Matsumura, established the Shijo school, which in later years grew to be as popular as the Maruyama school. By these two styles the Kyoto world of pictorial art was dominated.

(2) Architecture. The Momoyama architecture of the preceding period developed into a far more elaborate style, and with more elegance. This elaborate rococco style of Yedo architecture had less value as fine art than as mere decoration. Examples of the architecture of this period are found in the celebrated buildings at Nikko, which, as everybody can recognize, are more worthy to be called an excellent decoration than an excellent example of fine art.

(3) Sculpture. Although there is not much to be said about the sculpture of this period there are yet two outstanding instances that exemplify the use of Chinese carving; there are the Mampukuji temple at Uji, Kyoto, by a Chinese, Ingenzenshi, and the art of Zenshu-chokoku (Zen architecture), by a Buddhist sculptor, Fan Ton-sheng, from Foochoo, China.

(4) Industrial Art. Both manual and industrial art greatly advanced in technique, and metal, textile, dying, lacquer and ceramic industries flourished like all sorts and varieties of flowers. A Chinese introduced from Ming the process of decorating ceramics with brilliant colours or in gold or silver. And through the efforts of Kakiémon Sakai and others the famous Arita and Imari potteries were founded. In this field of fine art the name of Jinsai Nonomura should be remembered, for he occupied the highest position. Cloisonne ware also experienced a remarkable promotion in technique, along with other branches of industrial art.

The time arrived at last when the people awoke from their age-long sleep, and the doors that had been closed to foreigners were opened. Besides Hollanders, came Russians, Britons, Frenchmen and Americans, in spite of the national agitation to keep the country shut against foreign intercourse. Already from Holland Western learning and art had percolated in through Nagasaki. Oil painting in Western style was attempted by Gennai Hiraga. The new style of painting spread far into the country even to Akita prefecture, and reached consummation under Kokan Shiba later. Thus towards the close of the Yedo period the urge of Western art reached Japanese shores in great force.

Meiji Art The modern age in the history of Japanese fine art started over 60 years ago when the Emperor Meiji established the Imperial government in Tokyo. The Oriental fine art, which first originated in Mesopotamia, made eastward advance blending with Indian and Chinese art until it reached the Far East and established its central influence in Japan.

(1) Architecture. With the Meiji Restoration came a turning point in our history; the country was opened to free foreign intercourse, followed by the inflow of European culture like a flood. Western civilization soon began to exercise an overwhelming influence all over the country, and eventually everything foreign met with enthusiastic popular favour. This phenomenal change in the country directly influenced architecture; and European-style of structures sprang up here and there. Even in the Japanese style of building were mixed Western modes of architecture. These radical changes in the architectural world of Japan had no small influence on other branches of our fine art.

(2) Japanese Painting. In the early part of the period Nan-Sung literary painting still prevailed, supported by Kyou Hoashi, Koseki Nakanishi, Shoka Watanabé, Gokaku Hirano, Rozan Yasuda, Soun Tasaki, Yukoku Noguchi, Aizan Taniguchi, Kwatei Taki, Chokunyu Tanomura, Seiko Okumura, Kampo Araki, Shohin Noguchi and others.

It so happened that in the 11th year of Meiji Prof. Ernest F. Fenollosa, an American professor in the chair of philosophy at Tokyo Imperial University, being charmed with Japanese paintings such as the ukiyoyé and Kano and Tosa work, proposed to start a movement for the preservation of these schools of art. In conformity with his suggestion, the Government, in the 21st year of Meiji, established the Tokyo Academy of Fine Arts. As a result of the movement, the old schools of Japanese style of painting revived and a number of painters regained influence, of whom the more distinguished were Hogai Kano and Gaho Hashimoto of the Kano school; Kangyo Morizumi, Kangi Yamana, Mitaté Kawabé, Fuko Matsumoto of the Tosa school; Zeshin Shibata, Kansai Mori, Bairei Yukino, Gyokusho

Kawabata, Keĭnen Imao of the Maruyama school; Chikudo of the Kishi school; Honen Tsukioka and Gekko Ogata of the ukiyoyé school.

In the 40th year of Meiji the first art exhibition was opened by the Education Office; and since that time it has been held once every year, greatly stimulating the resurrection of traditional Japanese art. The Tokyo circle of Japanese style painters was represented by Taikan Yokoyama, Kanzan Shimomura, Kogyo Terasaki, Gyokudo Kawai, Tomoné Kobori, Jippo Araki, Suiun Komuro, Somei Yuki, Kiyokata Kaburagi, Reika Yoshikawa, Eikyu Matsuoka, Hyakusui Hirafuku and Keigetsu Matsubayashi; while in the Kyoto circle were well-known painters like Kokyo Taniguchi, Hobun Kikuchi, Seiho Takeuchi, Shunkyo Yamamoto, Kako Toji, Keigetsu Kikuchi and Suisho Nishiyama. All of these leaders displayed great activity in nurturing the Japanese style of painting as we see it today.

(3) Western Painting. Towards the end of the Yedo Era the foundation of the Occidental style in painting had already been laid by Kokan Shiba and Denzen Aodo; and now came Togai Kawakami, Yuichi Takahashi, Horyu Goseda, Hosui Yamamoto, Shinkuro Kunisawa, Chu Asai, Shotaro Oyama, Kiyowo Kawamura and Naojiro Harada, for whom the former foundation work became the basis for a new start. In the early Meiji days, English and Italian painters came to give lessons at the fine art department of the Tokyo Imperial University. Later, in the 21st year of Meiji, the Meiji Bijutsukai was founded for the purpose of enhancing the Western style of painting. It was, however, not until Kiyoteru Kuroda returned from France and opened a department for Western style painting in the Tokyo Academy of Fine Arts, that the Occidental mode really became established. Important artists in the new style in those days were Saburosuké Okada, Eisaku Wada, Takeji Fujishima, Kotaro Nagahara, Mankichi Kobayashi, Fusetsu Nakamura, Kunishiro Mitsutani, Sanzo Wada and Kunzo Minami. The models set by these great painters still prevail to-day, but will in future be more subjected to the influence of the Japanese style before reaching consummation, just as the Japanese style will assimilate Western motives and technique as it keeps on its forward march.

(4) Industrial Art. The ceramic industry made rapid advancement after the arrival of Wagner from Germany with a new technique; and with the help of Kozan Miyagawa, Yohei Kiyokazé, Dohachi Takahashi, Rokubei Shimizu and Sobei Kinkozan. In recent years Hazan Itaya, Rokubei Shimizu and Ichiga Numata have won distinction in this sphere of art. During the Meiji Era, fine cloisonne was manufactured and exported in abundance. Metal work also developed to a remarkable extent, producing a number of skilled artists. In the domain of lacquer and dying industries no less improvement brought Japanese industrial art to the verge of its golden age.

The tendency of Western countries to vie with one another in holding Japanese art exhibitions amply endorses the international value of Japanese art.

(5) Sculpture. Upon opening the Tokyo Academy of Fine Arts, Kyuichi Takeuchi and Koun Takamura gave lessons in traditional Japanese wood sculpture. Western style sculpture was also taught, by an Italian instructor in the academy, side by side with lessons from Shukei Naganuma who had returned from Italy, followed by Fumio Asakura, Taimu Tatehata, Seibo Kitamura. From Koun Takamura and Kyuichi Takeuchi we come down to Choun Yamasaki, Unkai Yonehara, Denchu Hirakushi, Shin Naito. In the Meiji Era the rise of ivory carving was also conspicuous, producing engravers like Gyokuzan Asahi and Komyo Ishikawa.

What helped the phenomenal ascendency of all branches of art were the Bunten (Education Office's art exhibition) which later came to be called Teiten (Teikoku Bijutsuin art exhibition), and the Inten (Nihon Bijutsuin art exhibition). Besides, there were and are exhibitions held by many other smaller groups of painters. From the viewpoint of art, it is not too much to say that Japan is to the Orient what France is to Europe.

Present Day Art

The period since the close of the Meiji Era has been no less remarkable in the art history of Japan than the previous period, evincing brilliant activity in every direction. Since 1919, when the Imperial Academy of Fine Arts was established, a systematic movement in the art world of Japan has been promoted. During the Taisho and Showa eras many institutions and organizations have been created, and new schools successively introduced from Western countries, especially from France, Germany, and Italy. Western-style painting, coming first under the sway of French impressionism, and later passing through many stages of European influence, has

produced vigorous and progressive artists who are thinking hard and exploring the furthest reaches of European pictorial thought. They have already reached the level of their Occidental benefactors, in technique. At a time when all the visual arts, if not all others as well, seem to be aspiring towards Occidental ideals of art, it must yet be noticed that our native art traditions are still retained, and characterize all works of purely Japanese fine art, with its classical rhythm and beauty.

Japanese-style Painting There are now in this country various exhibitions of Japanese-style paintings held by many institutes, wherein members are always seeking to achieve a more perfect expression of their ideals through traditional form and long-fostered technique. In the earliest stages of modern Japanese art, Kakuzo Okakura and other leaders, entertained this ideal, along with a number of artists and art societies, as well as such pioneers as Hogai Kano or Gyokusho Kawabata; and they joined efforts in the development of this school. Western realism, however, instead of the old traditional method, is gaining gradual influence among painters.

The "Teiten" or Imperial Fine Art Academy Exhibition, which includes various Sections of Fine Art, in 1931 celebrated the 25th anniversary of its establishment. As the only art exhibition under management of the Government, it has, since its foundation, been exerting a profound effect upon this sphere of art, along with the Institute of Japanese Art (Nihon Bijutsuin), which is a private institution established specially for Japanese-style paintings. This was organized in 1898 under the direction of Kakuzo Okakura and Gaho Hashimoto. These two institutes have continued to hold an exhibition every year. They have given birth to works of admirable achievement and merit, under such masters as Seiho Takeuchi, Taikan Yokoyama, Eikyu Matsuoka, and Hyakusui Hirafuku, all of whom are contributors to the native school.

On the other hand, there are other painters who also produce extremely creditable work, bringing out the profundity of the Oriental spirit and rising high above the conflict between Japanese traditionalism and Western realism. They are all grouped in organizations. Seison Maeda, Yukihiko Yasuda, Usen Ogawa, Sofu Nagano and Reimei Mamichi belong to the Nihon Bijutsuin; and Somei Yuki, Eikyu Matsuoka, Tsusen Ogiu, Ren Yamada, Shokin Katsuta, Nanyo Inui, Katsuji Koizumi, Ryuko Tsutaya, Gengetsu Yazawa and Saiten Tamura comprise the Japanese Painting Society (Nihon Gakai).

In the Kansai district, the Free Painting Society of Japan (Nihon-Jiyugadan) was organized by certain artists grouped in Kyoto, which has in itself special significance for lovers of genuine Japanese art. The members were Keisen Ikeda, Bunto Hayashi, Keigaku Nishi, Kokan Watanabé, Shunki Tayama, Manshu Ueda and other painters.

Western-style Painting It is not too much to say that the striking progress of Western-style painting is chiefly owing to the efforts of the Nikakai members, who, dissatisfied with the purely academic tendency of the Imperial Academy of Fine Arts, freed themselves from its restraint, and organized a society of their own. The Nikakai was organized in 1913 by an active group of rising painters of fresh and advanced ideas, the members being Ikuma Arishima, Yuzo Fujikawa, Hakutei Ishii, Moriichi Kumagai, Jutaro Kuroda, Tokusaburo Masamuné, Katsuyuki Nabei, Kigen Nakagawa, Hanjiro Sakamoto, Shintaro Yamashita, Sotaro Yasui, Haruyé Koga, Seifu Tsuda, Seiji Togo, and foreign painters, André L'Hôte and Zadikine. In 1922 was founded the Shunyokai by Misei Kosugi and other artists who had formerly been associated with the Western-style painting Section of the Institute of Japanese Art, but who had seceded from it, together with Ryuzaburo Umehara. The other members were Hakuyo Kurata, Noboru Hasegawa, Kanaé Yamamoto, Gen-ichiro Adachi, Shohachi Kimura, Tsuruzo Ishii and Ippei Okamoto. The Pacific Art Society, the oldest Western-art organization of the Meiji Era, was established in 1905, and with them instruction in Western-style painting was first begun. Toraji Ishikawa, Banka Maruyama, and Kunishiro Mitsutani were conspicuous collaborators.

The Kaijusha was formed in 1924, supported by such able painters as Juji Kanazawa, Itaru Tanabé, Soshichi Takama, Sakujiro Okubo, Yoshihiko Kumaoka, Yori Saito and other artists.

In 1930 the Independent Art Association was founded by certain extremists in the art-world, like Katsuzo Satomi, Zenzaburo Kojima, and nine other members of the Nikakai, who had been dissatisfied with the mannerism of that society and left it. The new body consisted of 13 congenial artists, who aimed at working for a new art movement, by opening up a fresh course for students of Western-style. The painters

of note in this group were Moriichi Kumagai, Kinzo Kuniyeda, Haruyé Koga, Tokusaburo Masamuné, Katsuyuki Nabei, Kigen Nakagawa, Hanjiro Sakamoto, Seifu Tsuda, Reiichi Yokoi, Giken Kinoshita, Kanemitsu Hamada, Shogo Taguchi, Genichiro Adachi, Noboru Hasegawa, Shohachi Kimura, Misei Kosugi, Hakuyo Kurata, Issei Nakagawa, Ippei Okamoto, Zennosuké Tanaka, shozo Yamazaki, Kanayé Yamamoto, Kotaro Takamura, Sadao Tsubaki and Tsusei Kono.

In addition to these societies, there are some minor organizations such as the Hakujitsu-Kai, the Japanese Painting Society (Nihongakai), the Creative Print Association of Japan, and the National Art Association, all of them no less remarkable than the Societies previously mentioned.

Sculpture For the promotion of plastic art, there are many organizations which contain, each of them, sculptors of distinction. Besides the "Teiten" and the "Nikakai" which have also Sculpture Sections, there is the "Kozosha", organized in 1926, for study in the various branches of plastic art. At the time of organization, it was supported by Sogan Saito, Jitsuzo Hinako, Saburo Hamada, Miézo Shimizu, Kanji Yo, Taménari Hirai, Minato Kozu, Takézo Sato and other artists.

Applied Art Our applied arts have developed in their own way, giving birth to many works of really admirable craftsmanship, some being of more artistic merit than those of Europe. At every exhibition, various branches of applied art are represented. Many artists, some using all their traditional technique, or others creating wholly new forms, are striving to satisfy the demands of present-day life. The Fine Art Association of Japan is a leading organization, having Hozuma Katori, Keigi Nakata, Choun Yamazaki, Shunzan Yagioka, Hiromi Minakami, as directors.

Architecture After the earthquake and fire of 1923, Tokyo and other cities witnessed the erection of many new buildings; and almost all these structures reveal a lively modernism under the influence of European styles, though some are more or less marked by national-classical characteristics. At present, Japan has acquired the modern mentality for steel and reinforced concrete; and many buildings in Japanese cities are as large and expensive as those in America. On the other hand a dozen or more able architects are thinking out greater possibilities in the adoption of newer European styles of architecture Already in the new Mitsui Bank and the Mitsubishi Bank, as well as in many other new buildings, Japan can show imposing examples of architecture unsurpassed for art and utility by any other country.

The 1935–36 Exhibitions

The 10th and 11th exhibitions of the National Painter's Society was opened on April 28, 1935 and April 3, 1936 in the Tokyo-fu Art Gallery. The number of works sent in for examination reached 1,726 for the 10th and 1,841 for the 11th exhibition. Details follow:

	1935		1936	
	Works Submitted	Works Accepted	Works Submitted	Works Accepted
Western painting	1,182	140	1,251	140
Sculpture	199	38	211	26
Block colour-print	169	26	197	38
Industrial art	176	80	182	80

The submitted works to the Shunyo-kai Art Exhibition which was opened on April 28, 1935, in the Tokyo-fu Art Gallery in Ueno Park numbered 2,455 of which 263 were accepted. New painters numbered 38. The number of paintings submitted to their exhibition which was opened on April 3, 1936, was 2,653 of which 124 (7 new) were accepted.

The 22nd Nika-kai exhibition was opened on September 3, 1935, in the Tokyo-fu Art Gallery at Ueno. The number of works submitted was 4,105 (3,927 Western paintings and 178 sculptures). The number of Western paintings accepted was 369 and that of sculptures 49. Among new admissions there was Harberd Wagner, while a foreign number of the society Mr. Aslan of France sent his works to the exhibition.

The 22nd Nihon Bijutsuin Exhibition (Inten) was opened on September 7, 1935, in the same building with the Nika-kai. As the result of amalgamation with the Teiten mentioned below, the exhibition was changed to a private one, works being submitted by the members and their pupils only.

A new organization of the Imperial Academy of Fine Arts was initiated by the Education Ministry in May, 1935, and the new Academy was organized on May 29, increasing the number of members from 30 to 50, so as to take in all representative artists who had been divided into three groups, i.e. the Imperial Academy of Fine Arts, the Nihon Bijutsuin and the Nika-kai, and certain improvements were effected in the way

of examining the works submitted.

The new Teiten (Imperial Academy of Fine Arts) Exhibition was opened on February 25, 1936, and closed on March 25, the résumé was as follows :

	Works Submitted	Works Accepted
Japanese painting	1,731	191 (70 new)
Western painting	(Omitted for this time only)	
Sculpture	194	17 (13 new)
Industrial art	797	214 (66 „)

The 1936–37 Exhibitions

Tokyo art lovers were fortunate to have exhibitions of art productions by foreign geniuses such as the French painter Emil Belneral or the German sculptor Georg Kopel in the spring of 1936, besides over 70 exhibitions of Japanese productions which gained press comments during the 12 months, from April, 1936 to March, 1937.

The 23rd Nihon Bijutsuin Exhibition (Inten) was held in the Tokyo-fu Art Gallery in Ueno Park, for a month beginning with September 2, 1936, to which 520 Japanese paintings were submitted for examination and 53 were accepted including 12 works by new painters, while the number of sculptures submitted was 185 of which 50 were accepted including 10 new names.

The 8th Seiryusha Exhibition was held in the same building with the Inten for four weeks from September 1 to 28, and out of the 124 Japanese paintings submitted to this Exhibition, 49 were accepted.

The 23rd Nika-kai exhibition was held in the same building with the other two in September, to which 4,224 Western style paintings were submitted, of which 358 were accepted including 92 works by new young painters, while the number of sculptures submitted was 235 of which 59 were accepted, including 16 new names.

The Imperial Academy of Fine Arts adopted a new policy in 1936 and put an end to the former Teiten exhibition and decided to hold two kinds of exhibitions in the name of the Education Ministry, one for the works accepted after examination and the other for works accepted without examination and those of the members of the Academy. The First Exhibition of the Education Ministry (Bunten) was held in the Tokyo-fu Art Gallery from October 16 to November 3, the exhibits were as follows :

	Works Submitted	works Accepted	Works by New Artists
Japanese paintings	1,561	367	106
Sculptures	415	124	35
Industrial art	769	194	46
Western paintings	3,006	374	174

The first exhibition of the other kind which was called Shodai (invitation) Exhibition was held for about a month beginning with November 6, in which 97 Japanese paintings, 119 Western paintings and 88 sculptures by representative artists of Japan were exhibited.

Art Museums

A list of the more important art museums follows :

1. Tokyo Imperial Household Museum: Ueno Park, Tokyo; open daily from 9 a.m. to 4 p.m.
   Departments: Art and History.
   Officials. President: Eisaburo Sugi; Manager: Masaaki Yajima.
2. Imperial Household Museum at Nara: In Nara Park; open daily from 9 a.m. to 4 p.m.: closed from Dec. 25 to Jan. 5.
   Departments: History and Art. Director: Gunichi Wada.
3. Kyoto Onshi Museum: In Shichijo, Kyoto; open daily from 9 a.m. to 4 p.m.; closed from Dec. 25 to Jan. 5. Departments: Art and History.
   Officials. Director: Fujio Wada; Advisers: Torajiro Naito and Yasunosuké Seki.
4. Chokokan: In Uji Yamada, Mié. Director: Kotaro Sakamoto.
5. Reihokan: At Koya-san, Wakayama. Director: Chito Izumi.
6. Treasure house, Kanshin-ji: In Kanshin-ji-mura, Minami-Kawachi-gun, Osaka.
7. Treasure house, Koryuji: At Uzumasa-mura, Kadono-gun, Kyoto.
8. Reihokan, Ninnaji: At Omoro, Kadono-gun, Kyoto.
9. Museum of the Faculty of Letters, Imperial University, in Kyoto.
10. Kankokan: in Hiroshima.
11. Treasure house of the Itsukushima shrine: At Miyajima, Hiroshima.
12. Kokuhokan: at Kamakura.
13. Sanda Museum: at Sanda, Arima-gun, Hyogo.

14. Governmental Museum: at Seoul, Chosen. Manager: Ryosaku Fujita.
15. Keishu Museum: in Keishu-gun, Keisho-hokudo, Chosen. Manager: Hideo Moroshika.
16. Prince Li's Museum: in Seoul, Chosen.
17. Kanto-cho Museum: at Port Arthur, Kwantung Province. Director: Naomiki Hirose.

Music

The First Period

Primitive Music The development of Japanese music may be divided into four periods. The first period originates in prehistoric times and ends about the reign of the Empress Suiko (592–629 A.D.). This is the music of the ancient Japanese (Yamato), and is here named, for convenience, primitive music. To regard the music of this stage as primitive may seem inappropriate, because towards the close of the 6th century Yamato civilization had advanced quite beyond primitive culture. The word primitive is applied here because, although music should show some development of artistic form, no such form was known in the music of this period.

The Second Period

Introduction of Foreign Music The second period started about the end of the Suiko régime in the 7th century, and continued till about the end of the Heian period, at the close of the 12th century. The characteristic feature of this period lies in the building up of Japanese music upon a foundation of Chinese, Korean and Indian music, which possessed a markedly advanced form and was then being freely introduced into Japan.

(1) The First Half. In the first half of this period imported music was imitated. Music was first introduced from Korea (Chosen), then from India and lastly from China. Of the three, only that from China continued to come freely thereafter. The Chosen music then imported was widely different from the music introduced from China and India, especially in the degree of its evolution. But even such undeveloped music as that of Chosen (then called Sankan), was far more advanced than Japanese music. It is, therefore, but natural that there was a great gulf of difference between the standard of the Japanese music of the early period and that later imported from China and India. Moreover the early models were monopolized by the nobles; the masses could not share the privilege of enjoying the advanced art but had to be content with the same old primitive music. For two to three hundred years this state of things continued, until the reigns of Emperors Saga and Nimmyo when genuine Japanese Court music, called gagaku, came into vogue. But even this gagaku was of foreign origin too.

(2) The Second Half. During the second half of the second period, foreign and domestic music became harmonized, producing a new Japanese style in vocal music. Founded on the imported music staff, the vocal music of this period cannot be compared with the purely national music that prevailed in a later period. The varieties then developed were kagura, saibara, roei and imayo, all of which can be included in the following two groups:

(a) One group was modelled after foreign music but set to the key of Japanese music of the primitive age; and hence the reconstruction thus effected in ancient Japanese music was only in form. The most conspicuous examples are the kagura, Azuma-asobi, Kumé-uta and Yamato-uta. No doubt the kagura existed in the prehistoric age, as may be inferred from Japanese history, but not until past the middle of the Heian period did it appear in the regular form of music. The kagura is a sacred dance with music, practised on the stage of a shrine at village festivals. The kagura now observed, however, is fundamentally different from that staged in those days; it saw marked development in the Heian period. In the early days of the sacred Kagura dance it adopted so primitive a form of vulgar indecency that it could not be performed today.

During this latter part of the second period all the other three branches of music, namely, Azuma-asobi, Kumé-uta and Yamato-uta, were also practised at shrine festivals. Originally they had no relation with shrines, the first two having developed from folk-songs, and the third from a war-song sung during the triumphant expedition into Yamato under the Emperor Jimmu. The adoption of those folk-songs in the rites of sacred festivals was made possible by the advanced music of foreign origin employed at

Buddhist temples; better music also became indispensable at Shinto shrines in order to rival the advanced Buddhist music. Unlike Buddhist temples, the Shinto shrines hesitated to make use of the imported variety; and so they had no alternative in those days but to improve their music on the ancient models of the country. The principal instruments employed for this purpose were the six-stringed Japanese koto and the six-holed kagura flute, remodelled.

(b) Those modes that come under the category of the other group are the saibara, roei and imayo, which were combinations of imported and Japanese music then in vogue. As regards saibara, it is believed that it was a sort of folk-song that prevailed in the Nara period, but the sihara, a folk melody of the Nara period, can not be compared with the saibara which was an artistic vocal song of the Heian period; in form they are widely apart. The saibara in the Heian period was in fact an artistic product. These branches of music served for the amusement and diversion of nobles, and had nothing to do with religious services. They were exclusively of foreign origin in form.

The Third Period

Seclusion of Domestic Music The third period begins with the Kamakura Era and terminates towards the close of the Tokugawa Shogunate, or from the beginning of the 13th century to the middle of the 19th century. A characteristic of the period was its seclusive tendency in music. By the term seclusive music, however, is not meant national seclusion, but that music, like other arts, throughout the period, was driven into seclusion in consequence of incessant civil war in Chosen and China, which prevented its development in Japan. Save for the material brought back by priests from China no foreign culture entered Japan during that age; and it is for this reason that the term seclusive represents the third period. Characteristic features of the third period are seen in the relations of music with literature.

(1) Music and Literature. As a natural result of the interruption of intercourse with continental civilization, the influence of the Japanese language made itself felt on music, so much so that in form music seemed to belong to language, both evolving together; in fact, story and song became the essential requirements of music.

(2) The Range of Influence. Next, the range of influence of each school was narrowed, until such forms as kiyomoto, joruri, shinnai and itchubushi became representative during the third period, but each of them was cultivated in a limited locality and time. In this connection joruri was most conspicuous, because, based entirely on the national literature, it appealed only to the people who understand the language used. Kiyomoto music thrived in Yedo, joruri prospered in Osaka, and itchubushi flourished in Kyoto. Thus none of the music that was born and popularized in the third period was of national, far less of international, character, having been limited to a certain locality. This, however, is by no means a proof of retrogressive tendency in music; for the harmony thus realized between Japanese literature and music was of no meagre advantage. It was natural too, for, in the evolution of art, song is older than speech, poetry than prose.

(3) Music and the Military. Then there was the relation of music to military administration. The government was in the hands of feudal lords. In the preceding period music was regarded as a means of culture, and treated as such by the leisured class, because, among the nobles, proficiency in this art constituted an essential element in anyone aspiring to be a man of character. Under the feudal lords, however, asceticism rose to influence among the samurai class, and music was looked down on as no more than a mere luxury which military men should despise as effeminate. This trend of the times gradually transferred music from the control of the nobles down to the lower orders of the community. This is why samisen music did not develop among the upper class but the lower stratum of society, where it thrived. The exclusion of samisen music by the intelligentsia was a glaring defect of the military administration. Naturally all branches of music in those days had to develop on the basis of popular knowledge and common sense.

Although civil strife is a great deterrent to the art of music, this was not so true in Japan as in China, for in Japan the Imperial household, whose existence and dignity suffered practically no change on account of the new military government, music was encouraged in Court circles. Then again it was protected and cultivated by priests; new music was fostered especially by Kamakura priests. The Heiké Biwa originated and developed under priestly auspices; and the shakuhachi (a kind of bamboo flute) music was introduced from China and popularized in the Buddhist domain, and

through its efforts. The shakuhachi music now in vogue had its origin in this period.

The Muromachi Era The Muromachi Era, sandwiched in between the Kamakura and Tokugawa eras, corresponds to a middle third period in the history of music. Between the Kamakura and Muromachi Shogunates a striking difference is noticeable in that, while a military administration was possible under the former, it was denied to the latter. Beginning with the Muromachi Era the Ashikagas removed the Shogunate from Kamakura to Kyoto. Since Kyoto was the seat of the Imperial household, the officials who were military men could not do without etiquette in their association with Court officials of the Imperial household. They had to be familiar with the art of flower arrangement, the tea ceremony and the yokyoku music of the lyrical drama, or Noh dance. Thus from the necessity of studying these arts of social etiquette, military men had to approve and promote them. The introducers of the sarugaku dance were priests who returned from China, and used this sort of drama for moral or religious purposes, like the miracle and morality plays in England. The Noh dance was probably derived from primitive forms of sarugaku and other musical dances.

Early Yedo Era The last period begins and ends in the early Yedo Era. All through this period popular music prevailed; the samisen, a popular musical instrument introduced into the country at the end of the Ashikaga Era, rose to great influence. Naturally, therefore, such popular music as the joruri, nagauta, kouta and hauta developed rapidly; they were especially popular among merchants and artisans.

The samisen was not only a representative musical instrument throughout the Yedo Era but also occupies a most important position in Japanese music today. This three-stringed Japanese guitar has now come to enjoy worldwide recognition as an advanced musical instrument. Nearly 400 years ago, toward the end of the Muromachi period, it arrived in the country through the Ryukyu islands and is supposed to be of Spanish or Chinese origin. Compared with the sho and biwa, imported in the 5th or 6th century, the samisen is a thing of but yesterday. Yet it is found everywhere in Japan as an accompaniment to vocal music.

The Fourth Period

Internationalization of Japanese Music The fourth period covers the Meiji and Taisho eras (1868–1926) when domestic music rose to join the world current of music. The people awoke from their long slumber throughout the isolated Yedo Era, and exchanged anti-foreignism for free intercourse with the outside world. With this epochal open-door movement came the Meiji Restoration which eliminated the Shogunate and restored the old Imperial régime. In obedience to the august wish of the Emperor Meiji all welcomed the introduction of the supposedly more advanced European civilization. Music was no exception. European music then imported was enthusiastically imitated all through the period. Production of imitative art was not the only task assigned to that age, for side by side with the movement the reconstruction of native music occupied the serious attention of musicians. A similar tendency is noticeable in and about the Nara period in the 8th century, when advanced ideas, imported from the continent, afforded models on which the ancient music of the country was reconstructed. Yet, a great difference is evident between that and the movement now under review; because, whereas in that day home music still lingered in the primitive stage and imitation of alien models was effected only with extreme difficulty, improvement in the native music of the Meiji Era was so easy a matter that reconstruction could be carried out by mere importation of new staves. This fourth period, which corresponds to the Meiji and Taisho eras, can be studied from three points of view, with reference to the development of the art.

(1) Innovations in Traditional Music and Revival of Ancient Music. In the Yedo period the development of music in form was insignificant, because importance was placed on expression of sentiment. People who realized this defect in the traditional Japanese music, agreed on the necessity of introducing radical innovations in this direction. This new movement was responsible for the stimulus given by the extensive introduction of European music, which in form was far superior to Japanese. Up to about the 16th year of Meiji considerable effort was expended towards eliminating this defect. As a practical attempt to attain this object, a movement was created for reconstruction work on the form of sho music which had deplorably degenerated in the Yedo Era, due to the influence of samisen music then at the height of popularity. The rise of the Yamada

school in Tokyo is an example. Shakuhachi music likewise could not escape being influenced by the reconstruction current of the times.

For revival of ancient Japanese music the Gagaku Bureau was created in the Imperial Household Office in the 3rd year of Meiji. A large number of authorities on gagaku became officials of the bureau and strove to effect reorganization of the ancient music of Japanese parentage. These Court musicians set about composing new music out of gagaku, for use in elementary schools. The national anthem, Kimigayo, is a product of that bureau. Precisely speaking, Kimigayo ought to be played in gagaku, but, instead, it has come to be rendered with European instruments; for in those days they were the only musical instruments in educational institutions. Kibigaku, which is still popular in the Kansai district, is a form of gagaku somewhat vulgarized, at the time, by Hoshu Kishimoto, an Okayama musician.

(2) Diffusion of European Music. One of the outstanding features of musical development in the Meiji and Taisho eras is that Japanese musical education was placed on the foundation of European music. The introduction of European music into Japan can be traced as far back as the entrance into Japan of Christianity. This, however, had been monopolized by the introducers themselves in their respective localities of influence, until in the 2nd year of Meiji it entered the capital for the first time. In this year Japanese soldiers learned military band music from an English naval band master at Yokohama, which is perhaps the first instance of our official use of European music. Soon afterwards, in the 5th year of Meiji, both army and navy bands were inaugurated. Later, in the 12th year of Meiji, an investigation commission on school musical education was established in the Education Office. A commission, headed by Mr. Shuji Izawa, conducted inquiries as to the best method of teaching European music in Japanese schools. In the following year, the Education Department invited an expert from America, and, under his superintendence, made music a part of elementary school education. Three years after, the Tokyo Academy of Music was established. This is but a brief outline of the growth of European music in Japan during the Meiji Era. It was mainly due to Government encouragement that European music was popularized in Japan much earlier than generally expected. But, for sounder and more thorough instruction in European music we must look to the era of Taisho. Rapid progress of music in the Taisho Era was made possible principally in the following ways:

(a) Propagation by Gramophone. This invention enabled inhabitants of even the remotest corners of the island Empire to appreciate the great foreign music masters.

(b) European War and Visiting Musicians. At the outbreak of the European War many well-known musicians of the West went to America and Oriental countries in order to avoid being involved in the turmoil, and to find appreciation of their music in more peaceful environment. These world-famous musicians gave a number of concerts in Japan, and thus afforded us an opportunity to hear the best music the world can produce. So fortunate an event contributed much toward cultivating a taste for music in this country. Not long afterwards came radio, also from the West; and, like the gramophone, radio also greatly helped the public towards a more intelligent appreciation of European music. Radio, however, should be regarded as more properly belonging to the present era of Showa.

(3) Internationalization of Japanese Music. The diffusion of the knowledge of European music demonstrated to us its international qualities, systematized form and aesthetic structure. The vast difference between this international music of the West and Japanese music which is but national, served to spur on the reconstruction movement among the Japanese interested in music. The movement originally started in the middle of the Meiji Era, but at that time it had no fixed goal at which to aim. Now, however, renewed ambition moved in three definite directions:

(a) The attempt to harmonize European instruments with the rhythm of Japanese music was laudable, but this seems to have been confined only too largely to Japanese students of European music.

(b) The movement to produce European rhythm with Japanese musical instruments, such as the samisen, sho and shakuhachi, was the task of those musicians who specialized in domestic music and who were yet familiar with modern ideas.

(c) A scheme to create a grand symphony orchestra of mixed foreign and domestic instruments was studied and tried by a few accomplished musicians, but the success or failure of the attempt is a question of the future.

Latest Developments

European Music (1) Schools. The Tokyo Academy of Music, established in the early Meiji Era, is the only government institution of the kind. Most of the teachers are now Japanese. Leo Sirota is an instructor of piano, and Maria Toll is in charge of vocal music. The school has an orchestra and mixed chorus, organized by students, graduates and teachers, and conducted by Mr. C. Pringsheim. They give public concerts several times a year. Generally speaking, the Tokyo Academy of Music attaches much importance to German classical music, and the orchestra plays, among other masterpieces, symphonies and overtures by Beethoven, Bach and Mozart, although modern French works, such as the Nocturne by Debussy, have occasionally been attempted. The latest performances were the Fifth Symphony by G. Mahler, 1932, and the Ninth Symphony by Beethoven in the spring of 1933. In addition to this government academy, there are several private music schools.

(2) Orchestras. Outside the schools there were also several orchestral groups, but all, except the New Symphony Orchestra conducted by Viscount Hidemaro Konoé, have dissolved. The surviving symphony orchestra separated from Konoé and is under the auspices of JOAK. A mandolin orchestra, known as the Sinfonia Mandolini Orchestra, was created in the early Taisho Era, the conductor of which is Mr. Morishigé Takei of the Bureau of Court Music of the Imperial Household Department; it gives concerts twice a year, in spring and autumn. Among foreign musicians of note who visited Japan are Mischa Elman, Efrem Zimbalist, Fritz Kreisler, Jascha Heifetz, Jacques Thibaud, John McCormack, Ernestine Schumann-Heink, Amelita Galli-Curci, Toti Dal Monte, Mischa Levitzki, Benno Moiseivitch and Leopold Godowsky.

(3) Choruses. Besides those attached to schools there are several amateur chorus companies under the leadership of professional musicians. As there are no good chorus pieces in the Japanese language, no appreciable success has yet been attained. In most ordinary educational institutions, such as universities and colleges, there are music clubs, each with its male chorus.

(4) Opera. In the early Taisho Era there was created in the Imperial Theatre an opera company under the leadership of Professor Rossi. Miss Tamaki Miura, who was regarded a prima donna at this nascent stage of Japanese opera, became a member of the company and finally won world-wide notice as an opera singer. The company later dissolved and the members organized an operetta troupe, which, after a brief period of obscure existence, met the same fate. In more recent years, stimulated by the visit of Russian and Italian opera companies a movement to revive opera was started, but no tangible success has been attained. Opera scenes have been sometimes broadcast by the radio broadcasting stations, but no native opera company has yet reappeared. Inasmuch, however, as the Tokyo Academy of Music is directing some of its talent towards this line of music, genuine Japanese opera may be expected to materialize in the near future.

(5) Religious Music. The music of the churches does not show the development that one might expect. This is, perhaps, because the members are not favoured with much musical endowment. However, recently there came into existence, outside the Church, groups which investigate religious music. At the Tokyo Academy of Music choral and cantata pieces have often been rendered by chorus and orchestra, giving Mozart's "Requiem" and the "Missa Solemnis" by Beethoven.

(6) Exhibitions. It is but recently that musical competitions have come to be held. The first trial of the kind was attempted by mandolin orchestras at the close of the Taisho Era, while chorus exhibitions were not given until the Showa Era. In 1932, under the auspices of the Jiji Shimpo, a contest of piano, violin and vocal music was arranged to be held annually, the judges to award the prizes being leading musicians of the capital. Furthermore, it was so arranged that the three most talented among those taking prizes were to be sent to Europe. A young pianist, Miss Miwako Kai, won the highest honour at the first exhibition.

(7) Composers. In the realm of musical composition Japan still lingers in the stage of research.

Messrs. K. Yamada and Kosuké Komatsu—all leading Japanese composers—have almost entirely ceased to wield influence, but seeing that there are a number of young musicians who are devoted to the study of the wake left by German music, or the harmonies of French music, it is hoped that the basis of a new Japanese music will be laid. As regards the general public, they have grown somewhat tired of German classical music and turned their attention to the lighter airs of southern Europe, of even the jazz now in vogue

in the United States. In urban centres social dances prevail to such an extent that folk-songs are set mostly to dance music. In the field of genuine Japanese music, songs akin to kouta are now in vogue. Not only folk-songs but war songs have revived, since the Manchurian incident. The old war ditties sung at the time of the Sino-Japanese and Russo-Japanese Wars have come again into vogue, together with a new and thrilling ballad with the "Three Heroic Warriors" who made bombs of themselves at Shanghai, as its theme.

(8) Vocal Soloists. The most noted vocal soloists are Tamaki Miura, Yoshié Fujiwara, Toshiko Sekiya and Yoshiko Miyagawa. But among instrumental musicians there is no name specially worthy of notice; Mrs. Koko Ando, formerly professor at the Tokyo Academy of Music, has won distinction as a violinist under the tuition of Joseph Joachim, but she has seen her best days, and is now settled down as a successful teacher. At the Bureau of Court Music in the Imperial Household Office each musician performs on his own favourite European instrument; and there is an orchestra which at one time was quite influential. In the orchestra there are some good violinists and cellists but few who have been on the stage as soloists. There is, however, a string quartet, organized by some of the members of the orchestra, called the Haydn Quartet. Long established, it is now regarded as the only superior quartet in Japan, though occasional changes occur in its membership. As a violinist, Miss Nejiko Suwa is regarded as having the brightest future. She is now in Europe to develop her talent.

(9) The Piano. The piano is the most popular musical instrument in Japanese homes at present. Even among amateur girl pianists there are many who display fair attainment. Formerly Japanese girls used to start their musical education with the koto (Japanese harp), which, having proved too primitive and monotonous, has gradually fallen into decline, being replaced by the piano. In this way the younger daughters of the upper middle class in towns have begun to receive training on the piano. Western music in Japan is still in transition. The Japanese have become good listeners, but have not yet become good players. But there is really no good reason why in the future Japan will not turn out world-famous musicians. Encouraging signs are already evident among young musicians, especially women. For instance, Miss Chieko Hara won the first prize in the 1932 concours in Paris when she was 17 years of age.

1933–1936 Music Friedmann of Poland visited Japan in September, 1933, and his piano recital lasted for five evenings, October 2–6, in the Hibiya Auditorium.

The Tokyo Academy of Music held a special concert in the presence of the Empress on March 17, 1934 in celebration of the birth of the Crown Prince. The programme consisted of the No "Takasago", by Umekawa, Kanzé and Hosho; the nagauta "Tsuru-kamé", by Yoshizumi; the koto music, by Michiko Miyagi; Mozart's Coronation symphony, conducted by Pringsheim; Wagner's Imperial March and Bach's Prelude in E Major, by Sueko Ogura.

Leo Sirota gave a piano recital in the Nippon Young Men's Hall at Aoyama on April 23. His programme included Busoni's piece, Chopin's Ballade, Dvorák's Humoresque, Smetana's Polka and Stravinsky's third movement of Petrouchka.

Leonid Kreutzer and Nicolai Tcherepnin visited Japan in 1934 and the former gave concerts on the works of Schumann and Chopin while the latter introduced his own compositions.

Foreign musicians and dancers visited Japan during 1935 and early in 1936, and made valuable contributions to the country's music. Among them were Mr. Chaliapin who caused a sensation among Japanese lovers of music by his brilliant recitations at the Hibiya Public Hall in January and May, 1936. Other important visitors were as follows: Efrem Zimbalist, Leonid Kreutzer, Siamese dancers, Amelita Galli-Curci, Lili Kraus, Simon Goldberg, Jacque Thibaud, Mischa Elman, etc.

1936–37 Music Paul Winegarten of Vienna who is to give instructions on piano at the Tokyo Academy of Music for two years, arrived in Tokyo in April, 1936, and Joseph Rosenstock who was called by the Broadcasting Corporation of Japan as the conductor of the JOAK orchestra reached the capital in August, 1936. Other musicians who visited Japan between April, 1936, and March, 1937, were the German pianist, Wilhelm Kemp, and cellist, Emmanuel Feuermann in April, 1936; the French violinist Jacque Thibaud, and Russian vocalist Chaliapin, in October; violinist Mischa Elman in January, and French cellist Maurice Marchal in February, 1937.

On May 4, 1936, Tamaki Miura and others held a concert at Hibiya Hall in memory and honour of the late Adolfo Sarcoli, their tutor. On May 28 the

first public concert was given by the Pro Arte Band conducted by Professor Moguilewsky. The concert held at Hibiya on June 20 by the Tokyo Academy of Music, which rendered Hector Berlioz's " Damnation of Faust," was a great success. On June 27 " Madam Butterfly " was performed at the Kabuki-za by Tamaki Miura and other vocalists. An exhibition concert in honour of the new conductor Rosenstock of JOAK was held at Hibiya Hall on the 21st September 1936.

The 5th concours of Japan was held at Hibiya on October 14 and 15, and the first prize winners were as follows : Violin, Hiroshi Hatoyama ; Vocal music, Miss Tsuma Yokota ; Piano, Miss Toshi Koseki ; and Composition, Yasuyoshi Hirai.

Native Music (1) The Koto. The koto has long been popular in Japan as a domestic musical instrument. It still retains friends among all classes, although it has lost some of its former popularity. Improvements have been attempted by specialists in recent years. An authority on koto music, Michio Miyagi, organized an orchestra with koto, shakuhachi and samisen. Like most koto musicians, he showed more talent than insight on traditional Japanese instrumental piece he composed in European style, but has already attained a fair success. The " Spring Sea ", a duet for koto and violin was composed by him and rendered by Madame Renée Chemet, a violinist who visited Japan in 1932.

(2) Nagauta. This is samisen music, developed in the Yedo period, and still serves widely as an accompaniment to dances at theatres, and social entertainment in homes. But it has never been able to rise superior to its early development in the gay quarters. Through the efforts of a singer, Kosaburo Yoshidzumi, and a samisen player, Rokushiro Kineya, the nagauta texts are now being revised to suit family taste, new compositions for children being produced and new rhythms introduced. Another pioneer in this field is Sakichi Kineya, himself a noted samisen player. He once attempted the composition of a concerto for the samisen as a solo instrument with a view to cultivating a new sphere for the samisen. The success or failure of the new attempt remains to be seen. Other noted musicians of nagauta are Ijuro Yoshimura, Wafu Matsunaga ; and samisenists, Kangyoku Kineya, Eizo Kineya, Isaburo Kashiwa.

(3) Joruri. The joruri music is made up of tokiwazu and kiyomoto, besides gidayu. Kiyomoto is mostly a lyric melody for a tenor voice ; while tokiwazu demands a high baritone and is therefore rich in dramatic element. The joruri music is now employed merely as an accompaniment to stage dance and ballets ; it scarcely goes beyond preserving the old tradition. It is interesting to note in this respect that Enjudayu, a descendant of the Kiyomoto family, by which the school was founded, is a splendid lyric tenor whose art overshadows even Japanese vocalists of the Western style. The gidayu music is indispensable to the kabuki (Japanese classical play) and ningyo shibai (puppet-theatre) in their stage performances, but this music contains not only ordinary airs but has also plenty of musical recitation.

Noted joruri musicians are : kiyomoto —Enju-dayu, Kiku-tayu, Umekichi (samisenist); tokiwazu—Matsuo-dayu, Mojibeë (samisenist) ; gidayu—Shikoro-dayu Takemoto, Tsu-dayu Takemoto, Tosatayu Takemoto, Kotsubo-dayu Toyotaké and Iwao-dayu Toyotaké.

CHAPTER XXXVI

SPORTS

Japan in the World Olympics

Stockholm and Antwerp Japan participated in the World Olympic Games for the first time in 1912, at Stockholm, when only two athletes represented the country. They were Shizo Kanaguri, marathon runner, and Yahiko Mishima, short-distance runner, both of whom were miserably defeated. In the following Olympiad, which was held in Antwerp in 1920, 15 Japanese took part. Of these, 11 were track and field men, and the others were two swimmers and two tennis players. Neither the track and field men nor the swimmers placed. The tennis entrants won second place.

The Paris Olympiad Japan made its real debut in the Eighth Olympic Games in Paris in 1924, with 14 men participating. A third place in wrestling was the only official score, but Mikio Oda won sixth place in the hop, step and jump; the swimming team placed fourth in the 800-metre relay; Katsuo Takaishi came in fourth in both the 100-metre and 1,500-metre free style, and Kenkichi Saito took sixth place in the backstroke event.

At Amsterdam The year 1928 found 63 Japanese competing in the Ninth Olympic Games at Amsterdam. The late Miss Kinué Hitomi was the only girl in the Japanese delegation and the first Japanese woman to take part in the Olympics, made impressive performances. She won a 100-metre heat in 12.8 seconds and took second place in the 800-metre finals by negotiating the distance in 2 minutes 17.7 seconds. Mikio Oda not only scored for the first time but won Japan's first Olympic championship by taking the hop, step and jump event. In the swimming competition, an equally bright success was attained by Yoshiyuki Tsuruta, who took first place and the championship in the 200-metre breast-stroke. Kazuo Kimura placed sixth in the running high jump; Yonétaro Nakazawa placed sixth in the pole vault; Kanésaku Yamada placed fourth and Séiichiro Tsuda placed sixth, respectively, in the marathon; Katsuo Takaishi won third place in the 100-metre free style swim; Toshio Iriyé came in fourth in the 100-metre backstroke; the 800-metre relay team placed second. The swimmers won second place in competition with the United States, the championship winner. Japanese took part in the boxing, regatta and equestrian contests for the first time but lost.

At Los Angeles The results achieved at Los Angeles by 131 athletes were satisfactory. The delegation took seven championships, seven second places and four third places.

(1) Aquatic Meet Japan dominated the 1932 aquatic meet as no other nation had done in the past. Of 150 official points scored in the six races, 86 went to Japan and only 46 to all other nations together. The result is Japan 86 and America 33, with the rest outdistanced. Only one race was by a non-Japanese champion, the 400-metre free style, in which Clarence Crabbe, of the United States, and Jean Taris, of France, upset expectations and finished ahead of the Japanese trio in new record time. The only team race, the 800-metre relay, went to Japan by a wide margin in almost incredible time, 8 min. 58.4 sec.

The Japanese swimmers produced both world and Olympic records in the Los Angeles meet. The Japanese 800-metre relay team produced a new world record with a time of 8 min. 58.4 sec. Shozo Makino set a new world mark when he swam the first 1,000 metres in the 1,500-metre free style, broke the Olympic record, 58.6 sec., set by the great American swimmer, Johnnie Weismuller, by negotiating the distance in 58 sec. flat. Others who broke Olympic records were Reizo Koiké, who won the 200-metre brest stroke in 2 min. 44.9 sec., and Katsuo Kitamura, 15-year-old boy, who won the 1,500-metre free style in 19 min. 13.4 sec.

(2) Track and Field Events In the track and field events, the Japanese did not show up so brilliantly as did their team mates in the aquatic events. Thanks to Chuhéi Nambu, however, Japan was able to defend the hop, step and jump championship which Mikio Oda had won at Amsterdam in 1924. With a mark of 15.72 metres, Nambu not only won the championship but established a new world record. Another outstanding performance was turned by Baron Takéichi Nishi, of the Japanese Army,

who won the difficult equestrian contest, the Prix des Nations. By winning this steeplechase, Baron Nishi put Japan's horsemanship on a high plane in the eyes of the world.

The principal performances of the Japanese athletes of both sexes and their records are given below :

TRACK AND FIELD

100-metre run—Ryutoku Yoshioka won sixth place in the finals. Time, 10.8s.

400-metre relay—Japan's team placed fifth.

1,600-metre relay—Japan's team placed fifth.

Marathon—Seiichiro Tsuda placed fifth and Onbai Kin sixth. Time, 2h.35m.42s. and 2h. 37m.28s. respectively.

Running high jump—Kazuo Kimura placed sixth with 1.90 metres and Misao Ono seventh.

Running broad jump—Chuhei Nambu placed third with 7.45 metres, and Naoto Tajima sixth with 7.15 metres.

Pole vault—Shuhei Nishida barely missed the championship by losing to Bill Miller of the United States, placing second with 2.28 metres.

Hop, step and jump—Chuhei Nambu won and defended successfully the title which Mikio Oda had captured at the Amsterdam meet. Nambu's record, 15.72 metres, set a new world mark.

SWIMMING

100-metre free style—Yasuji Miyazaki won. Time, 58.2 seconds, breaking the Olympic record set by Johnnie Weismuller but Miyazaki had turned in a better record, 58 seconds, in the semi-finals.

400-metre free style—Tsutomu Oyokota placed third with 4 minutes 52.3 seconds.

1,500-metre free style—Kusuo Kitamura won. Time, 19 minutes 12.4 seconds, which broke the Olympic record set by Arne Borg.

100-metre back stroke—Masaji Kiyokawa won. Time, 1 minute 8.6 seconds.

200-metre breast stroke—Yoshiyuki Tsuruta won. Time, 2 minutes 45.4 seconds, which broke the Olympic record.

800-metre relay—Japan's team won. Time 8 minutes 58.4 seconds, which set a new world record.

WOMEN'S TRACK AND FIELD

400-metre relay—Japan's team placed fifth. Time. 50.2 seconds, which broke Japan's record.

Javelin—Miss Masako Jimbo placed fourth with 39.06 metres.

WOMEN'S SWIMMING

100-metre back stroke—Miss Misao Yokota placed fifth in the semi-finals.

200-metre breast stroke—Miss Hireko Maehata placed second, only four-fifths of a second behind the winner. Time, 3 minutes 6.4 seconds, which broke the existing Olympic and world records.

400-metre relay—Japan's team (Kojima, Yokota, Morioka and Arata) placed fifth. Time, 5 minutes 6.7 seconds.

HOCKEY

Japan's team placed second.

EQUESTRIAN COMPETITION

Lieutenant Baron Takeichi Nishi won the Prix des Nations.

Japan participated in the Fourth Olympic Winter Games held at Garmisch-Partenkirchen, Germany, for 11 days, beginning February 6, 1936. The Japanese delegation was composed of a skiing team of 11 men, speed skating team of 8, figure skating team of 5 including Miss Etsuko Inada, and ice-hockey team of 14. It was the biggest winter sports delegation sent by Japan so far. Japan, however, finished 14th place, tied with Italy and Belgium, scoring only 3 points. Shozo Ishihara of Waseda University was the only point getter for Japan, winning fourth place in the 500-metre speed skating race.

Details of the Japanese performances at the Games were :

Skiing

18-kilometre run : Kan Tadano finished 33rd with a time of 1:25.26 hour ; Shinzo Yamada, 50th ; Tsutomu Sekido, 56th ; among 75 entrants.

50-kilometre run : Kan Tadano finished 28th in 4:10.23 hours ; Tadao Okayama, 34th ; among 36 entrants.

40-kilometre relay : Japanese team (G. Yamada, Sekido, S. Yamada and Tadano) finished 12th in 3:10.59 hours among 16 entrants.

Jumping : Shoji Iguro finished 7th with 218.2 points (74.5 metres and 72.5 metres) among 28 entrants.

Combined event : Isamu Sekiguchi finished 28th with 305.9 ponits among 45 entrants.

Slalom : Isamu Sekiguchi finished 39th in 6:48.6 minutes ; Tsutomu Sekido, 44th ; Kan Tadano, 47th ; among 56 entrants.

Skating

500-metre race : Shozo Ishihara finished 4th in 44,1 seconds ; Reikichi Na-

kamura, 11th : Seitoku Ri, 16th ; among 36 entrants.

1,500-metre race : Seien Kin finished 15th in 2:25.0 minutes ; Ishihara, 19th ; Ri, 23rd ; Nakamura, 28th ; among 37 entrants.

5,000-metre race : Seien Kin finished 21st in 8:55.9 minutes ; Ri and Yushoku Cho, 27th ; among 32 entrants.

10,000-metre race : Seien Kin finished 13th in 18:02.7 minutes ; Ri, 25th ; Cho, 26th ; among 33 entrants.

Men's figure skating : Toshiichi Katayama finished 15th with 347.4 points ; Kazukichi Oimatsu, 20th ; Zenjiro Watanabe, 21st ; Tsugio Hasegawa, 23rd ; among 25 entrants.

Women's figure skating : Miss Etsuko Inada finished 10th with 368.1 points among 23 entrants.

Ice-hockey

The Japanese team was eliminated in the first-round contest, losing its matches to Sweden and England with a score of 2 goals to 0 each.

Japan took part in the Sixth International University Games held in Budapest in August, 1935, sending its all-star student track and field team of Keio University. After one week of competition among the athletic representatives of 29 countries, Japan took third place in the track and field events and second place in the gymnastics. Germany won the track and field contest with 125 points and Hungary was second with 92. Japan was third with 74 and England fourth 47.

In gymnastics, Hungary won first place with 509 points and Japan was runner-up with 478 points. Third place went to Germany which scored 475 points. Ichiro Nozaka was the best in individual scoring for Japan, being placed 8th with 97 points.

Those who won points in various events for the Japanese track team were.

100-metre dash : Monta Suzuki (Keio U.), 2nd, 10.8 seconds.

200-metre dash : Monta Suzuki (Keio U.), 3rd, 21.9 seconds.

1,500-metre run : Hideo Tanaka (Chuo U.), 4th, 4:0.58 minutes.

5,000-metre run : Hideo Tanaka (Chuo U.), 2nd, 15:24.4 minutes.

110-metre high hurdles : Tadashi Murakami (Waseda U.), 3rd 15.3 seconds ; Masao Harada (Kyoto Imperial U.), 4th.

400-metre relay : Japanese team, 4th, 42.8 seconds.

1,600-metre relay : Japanese team, 6th, 3:27.2 minutes.

Olympic relay : Jpanese team, 4th, 3:35.6 minutes.

High Jump : Hiroshi Tanaka (Waseda U.), 3rd, 1.94 metre ; Tadashi Murakami (Waseda U.), 5th.

Broad Jump : Naondo Tajima (Kyoto Imperial U.), 1st, 7.52 metres ; Masao Harada (Kyoto Imperial U.).

Pole vault : Shunhei Nishida (Waseda U.), 1st, 4.30 metres ; 2nd, Sueo Oyé (Keio U.).

Javelin throw : Saburo Nagao (Kwansai U.), 4th 57.70 metres.

At Berlin Japan spent a delegation of 248 athletes and officials, including 19 women athletes, to the 11th Olimpic Games held at the Reich Sports Field, Berlin, for 16 days started on August 1, 1936. The delegation was the biggest Japan ever sent to the Olympics, and was an increase of more than 50 athletes compared with the number it despatched to the Los Angels Olympiad.

The Japanese contingent participated in 13 events ; men's track and field, men's swimming, soccer, hockey, rowing, gymnastics, basketball, yachting, wrestling, equestrian, boxing, women's track and field and women's swimming. Japan won six championships, four second places and eight third places, and finished 8th in an unofficial standing which was far better than its performance in the Los Angels meet.

1 Track and Field. Of the most outstanding success for Japan was the triumph in the marathon race by Son Kitei. Son, a young Korean runner who set an unofficial world marathon record in Tokyo the previous year, won the event with a time of 2 hours, 29 minutes and 19.2 seconds, a new Olympic record. It was the first victory by a Japanese in this event. Naota Tajima, a Kwansai student, also lived up to his fame by winning the hop, step and jump for the third consecutive time for Japan in the Olympic Games. Tajima's winning leap, 16 metres, was a new world record. Other brilliant performers for Japan were Kohei Murakoso who won fourth place both in the 5,000-metre and 10,000-metre runs, and Shunhei Nishida and Sueo Oye who tied for second place in the pole vault event, after giving hard resistance to Earl Meadows of the United States, the winner. It was the second time Nishida placed second in the Olympic pole vault.

2 Swimming Japan successfully defended its world superemacy gained in the Los Angeles meet by winning three championships, two second places, and five third places. Three events won by Japanese were the 1,500-metre free style, the 200-metre breast stroke and the 800-metre relay. Tetsuo Hamuro, com-

peting in the Olympic Games for the first time, caused a sensation by winning the 200-metre breast stroke in a new Olympic record of 2 minutes and 42.5 seconds. Miss Hideko Maehata was the first Japanese woman to win in the Olympic aquatic event. She won the 200-metre breast stroke for women and set a new Olympic record of 3 minutes and 3.6 seconds.

After the Games, the International Olympic Committee met and awarded Japan the right to sponsor the 12th Olympic Games in Tokyo in 1940.

The Tokyo Olympic Games The Olympic Organizing Committee of the 12th Olympic Games to be held in Tokyo in 1940, was formed on December 21, 1936, with the following members.

Three members of the International Olympic Committee for Japan, Prince Iyesato Tokugawa, Mr. Jigoro Kano and Count Michimasa Soyeshima.

The Mayor of Tokyo, Mr. Ichita Kobashi.

The President of the Japan Amateur Athletic Association, Lieutenant-General Matahiko Oshima.

The Vice-Minister of Foreign Affairs, Mr. Kensuke Horinouchi.

The Vice-Minister of Home Affairs, Mr. Hisatada Hirose.

The Vice-Minister of Finance, Mr. Sotaro Ishiwatari.

The Vice-Minister of War, Lieutenant-General Yoshijiro Umezu.

The Vice-Minister of Navy, Vice-Admiral Isoroku Yamamoto.

The Vice-Minister of Education, Mr. Enkichi Ito.

The Vice-Minister of Communication, Mr. Kaname Hirasawa.

The Vice-Minister of Railways, Mr. Kenjiro Kiyasu.

The Chairman of the Municipal Assembly of Tokyo, Mr. Azuma Matsunaga.

The President of the Japan Chamber of Commerce and Industry, Mr. Chokyuro Kadono.

The Vice-President of the Japan Amateur Athletic Association, Mr. Ryozo Hiranuma.

Prince Iyesato Tokugawa was elected president of the Olympic Organizing Committee, and Mr. Kobashi and Lieutenant-General Matahiko Oshima were chosen vice-president of the Committee. Mr. Matsuzo Nagai, former Japanese Ambassador to Berlin, is appointed secretary general of the Olympic Organizing Committee, and is assisted by Dr. Taku Iwahara, chief of the section of physical education of the Ministry of Education, Mr. Fumio Takahashi, director of the Japan Amateur Athletic Association, and Mr. Tokimitsu Kusama, chief secretary of the Tokyo Municipal Office, all of them being members of the committee of general affairs of the O. O. C.

Two other departments of the O. O. C., game and publicity, are headed by Dr. Takashi Go, honorary director of the J. A. A. A., and Mr. Kuraji Takahashi of the Board of Tourist Industry of the Railway Ministry.

Games to be played are track and field, swimming, weight-lifting, wrestling (free style and greco-roman), boxing, fencing (foil, epee and saber), shooting (pistol and rifle), gymnastics, riding, cycling, rowing (scull, four-oared and eight-oared shells), canoeing, yachting, skiing, skating and bobsleigh.

The Main Stadium : The site of the main stadium and swimming pool will be in the outer garden of the Meiji Shrine in the heart of Tokyo, its area being 125 acres. All scientific and modern devices will be installed to insure accuracy of judging the contests, and for the comfort of the contestants as well as of the spectators. The chief events to be held at the stadium are the opening and closing ceremonies, track and field events, different games, etc. The stadium field will be laid out with track at the centre, its outer portion being devoted to racing and the inside to throwing events and different games. The track is 400 metres in length with a straight way of 140 metres on the side of the main stand. The stadium will have a seating capacity for 100,000 spectators.

The Swimming Pool : The present Meiji Shrine pool, 50 metres in length with a separate diving pool, will be used, with the seating capacity of 12,000 persons, expanded to 20,000. Other plans for grounds are as follows :

Ball-game ground : The grounds for the ball games will be laid out at Shiba Park and several others as required. These grounds will be used also for preliminary contests.

Indoor stadium : Besides the one just built in Hitotsubashi, Kanda ward, one more to be called 'Olympic Memorial Gymnasium,' will be constructed in Surugadai in the same ward, about three miles from the main stadium. The new gymnasium is to be built over 3,200 square tsubo with a cost of ¥2,000,000, and will have a stadium, gymnasium and indoor swimming pool.

Equestrian events : A new riding ground will be made at Setagaya, six miles from the main stadium, by the Japan Riding Association for Olympic contest.

Rowing course : Toda in Saitama prefecture, just outside Tokyo, is the site for the rowing course, which is to run parallel to the north bank of the canal just above the Toda bridge. This project is a tremendous undertaking, involving the excavating of a large area of agricultural land adjacent to the present canal and an expenditure of some ¥2,800,000. The work started in May, 1937, and is expected to finish by the summer of 1939. The course will be 2,500 metres long and 80 metres wide, enabling three eight-oared shell rowed at one time. A road seven metres wide, will run parallel on either side of the course. A space of 56 acres will be used for grass lawns, a grandstand to accomodate 10,000 spectators and parking room.

Yacht course : A yacht course will be constructed at Kominato, off the Yokohama harbour, with the city of Yokohama taking responsibility for the project. The work will cost ¥700,000.

Shooting grounds : The grounds 50 m. x 60 m. will be located at Higashi-Murayama, in the outskirt of the city, about six miles from the main stadium. The Tsurumi shooting grounds will be used for the American style clay target shooting.

Cycling course : The cycling course will be built at Shibaura near the heart of the city. It will be a 50-metre circular course, equipped for evening races, with accomodation for 10,000 spectators.

Marathon course ; The paved course extends from the main stadium to Tsurumi, connecting the new Tokyo-Yokohama highway which is now under construction. The course will be well shaded by trees and will not be disturbed by surface traffic.

Fine arts exhibition : The Ueno Fine Arts Gallery will be devoted to the arts, and the Hibiya Public Hall for musical performances.

Olympic Village : The village will be located at Kinuta, along the Tama River, about six miles from the main stadium. The grounds will cover 800 acres, and wooden cottages will be assigned to the participating countries. Facilities available at the village will be : 20 fields for track and field ; 10 swimming pools ; 13 football fields ; 8 hockey fields ; 10 basketball courts ; 10 gymnastic courts ; 10 boxing rings, 10 wrestling mats, 10 fencing courts ; and 10 places for weight-lifting practice.

Time of Events : At the International Olympic Committee meeting held in Warsaw in June, 1937, it was decided that the games should be started from the last week of the August, 1940. But this may be changed according to later developments. Japan prefers to hold the games during August since there is less rain in this month than in September.

Winter Games : The 5th Olympic Winter Games are also awarded to Japan, being recently decided at the International Olympic Committee conference held at Warsaw. The site of the games will be Sapporo in the Hokkaido in the northern extreme end of Japan, where an abundance of the finest snow is obtainable and national open and collegiate skiing and skating championship meets are being held every year.

Government subsidy : The 70th session of the Japanese Diet, held in early 1937, appropriated ¥4,300,000 to subsidize the 12th Olympic Games.

Details of the Japanese performances at the Berlin Olympiad were :

TRACK AND FIELD

5,000-metre run—Kohei Murakoso won 4th place.

10,000-metre run—Kohei Murakoso won 4th place.

Marathon—Son Kitei won for the first time for Japan with a time of 2 hours 29 minutes 19.5 seconds, and Nan Shoryu placed third.

Running high jump—Kimio Yada placed 5th with 1.97 metres.

Running broad jump—Naota Tajima won third place with 7.74 metres.

Hop, step and jump—Naoto Tajima won and defended successfully the title for the third time in row since the Amsterdam meet. Tajima's leap was 16 metres, a new world record.

Pole vault—Shuhei Nishida and Sueo Oye tied for second place with 4.25 metres respectively.

Women's Track and Field

Discus throw—Miss Ko Nakamura and Miss Hide Minejima won fourth and fifth places respectively.

Javelin throw—Miss Sadako Yamamoto placed fifth.

Swimming

100-metre free style—Masanori Yusa won second place, followed by Shigeo Arai and Shoji Taguchi in third and fourth places. Yusa's time was 57.9 seconds.

400-metre free style—Three Japanese mermen finished in first five, namely, Shumpei Udo in second place, Shozo Udo was timed in 4 minutes 45.6 seconds.

1,500-metre free style—Noboru Terada won with a time of 19 minutes 13.7 seconds. Two other place winners were

Shumpei Udo who came in third and Sunao Ishiwarada who finished fourth.

800-metre relay—Japan's team won, members being Yusa, Sugiura, Taguchi and Arai. Time, 8 minutes 51.5 second.

100-metre back stroke—Shoichi Kiyokawa won third place with a time of 1 minutes 6.4 seconds. Kiichi Yoshida placed 5th and Yasuhiko Kojima 6th.

200-metre breast stroke—Tetsuo Hamuro won. Time, 2 minutes 42.5 seconds. Two others who placed were Reizo Koike, third, and Saburo Ito, fifth.

High diving—Tsuneo Shibahara placed sixth.

Spring board diving—Tsuneo Shibahara took fourth place.

Women's Swimming

400-metre free style—Miss Kazue Kojima placed sixth.

200-metre breast stroke—Miss Hideko Maehata won. Time, 3 minutes 3.6 seconds.

High diving—Miss Reiko Osawa won 4th place and Miss Fusako Kono finished 6th.

Spring board diving—Miss Masayo Osawa placed sixth.

Wrestling

Free style

Featherweight—Kozo Mizutani ranked 6th.

Lightweight—Eiichi Kazama ranked 5th.

Boxing

Bantamweight — Shumpei Hashioka ranked 5th.

Equestrian competition

Steeplechase—Japanese team, composed of Captain Baron Takeichi Nishi, Lieutenant Hiroji Inaba and Lieutenant Manabu Iwabashi, placed 6th with 75 penalties.

The Tenth Far Eastern Olympiad

The Tenth Far Eastern Championship Games were held in Manila between May 12 and 21, 1934. Much trouble was created in Japan before the Japan Amateur Athletic Federation finally decided to participate in the event. The Japanese side proposed to the headquarters of the Championship Games that Manchoukuo, represented by the Manchoukuo Amateur Athletic Federation, should be allowed to participate in the event. A protest was raised by both China and the Philippines that the matter had to be submitted to a general conference of the participating countries and the Constitution of the Games be revised for admittance of Manchoukuo. This attitude angered those supporting the Manchoukuo side and caused them to advise the Japan Amateur Athletic Federation to withdraw from the event, unless the matter was accepted. The matter was telegraphed to the Manila headquarters, but the reply was that it had to be submitted to a general meeting for approval. In the midst of a vigorous opposition, the Japanese Federation submitted to its general meeting a plan whether it had to attend the games in Manila or renounce its right to participate, leaving the Manchoukuo Federation, and finally it was decided the Federation would attend it with a determination to discuss matters regarding the Manchoukuo participation in the next event and to withdraw from the Games, if Constitution could not be revised so as to let the Manchoukuo participation possible. In course of the games in Manila, the matter was discussed, but failed to be adopted by unanimous consent. In consequence, the Japanese Federation made up its mind to depart from the Games and to organize a new athletic federation with the object of promoting physical culture. Japan, however, participated in the Tenth Games throughout. On June 12, after the return of the Japanese sports delegation to Japan, it was resolved by the delegation that the Japanese Amateur Athletic Federation withdraw from the Far Eastern Championship Games and organize the Amateur Athletic Association of the Orient. Japan, Manchoukuo and the Philippines have decided to join the new Federation, but China will not join it. Thus the Far Eastern Championship Games have been forced to break up.

Results of the Tenth Far Eastern Championship Games follow:

BASEBALL

Philippines	25	to	China	1

Boxing

Philippines 3–2 All Kwansai (Osaka); Philippines 4–1 All Kwanto (Tokyo); Kwanto Student Champions 4–1 Philippines (Tokyo); Pilippines 3–2 Middle Japan (Nagoya).

Development of Western Sports

The History Young When a Japanese refers to "sports," he usually means Western athletic sports, not the traditional sports of Japan, The tremendous interest of the Japanese in Western sports and the remarkable development that they have made in them have relegated Japan's own sports to the background. One may pay tribute to the athletic prowess of the Japanese and their adaptability and capacity for as-

similation, but one strong reason for the great popularity of the sports from the West may be sought in the fact that most Western sports are played collectively, instead of individually as in the case of Japanese fencing and judo, and they appear to suit the race in their modern mode of life. Western sports, moreover, offer the Japanese an opportunity to compete with other athletic nations and demonstrate their ability. This gives more incentive for their enthusiasm for foreign sports.

Despite their remarkable growth, Western sports in Japan are very young, and their history is a matter of only half a century. Sixty years ago, no Western sport worth the name existed in Japan. The fact that Japan could send only two athletes to the World Olympic Games for the first time as late as 20 years ago and suffered a miserable defeat is indicative of the slight athletic progress the conutry had attained up to that time. Except for baseball, which was played zealously even in the earlier years, it is no exaggeration to say that Japan's participation in the World Olympics provided the real incentive for the growth of Western sports in general.

The Far Eastern Olympiad It should be added in this connection that, one year after Japan's first participation in the World Olympics, the Far Eastern Olympic Games were organized, with Japan, China and the Philippines as the participants. There is little doubt that this minor Olympics had a great deal to do with athletic development in Japan. As in the case of the World Olympics, Japan had an insignificant beginning as far as points go, but in 1930 the country so completely defeated the Philippines and China that one who was acquainted with the remarkable athletic progress in Japan doubted the usefulness of further competition in the Far Eastern Olympic Games. The first meet of this junior Olympics was held at Manila in 1913, and since then successive Far Eastern Olympic Games have been held every other year. In 1930, when the last meet was held in Tokyo, it was agreed to hold the meet every four years so that it would not clash with the World Olympics. The last Far Eastern Olympic Games took place in Manila in May, 1934. In addition to the World and Far Eastern Olympic Games, there have been from time to time frequent exchanges of visits between Japanese athletic teams and those of foreign countries, which not only offered the Japanese opportunities to learn valuable lessons but proved good for a closer international friendship.

The Re-organization of the Japan Amateur Association The Japan Amateur Athletic Association was reorganized as the highest regulating body for sports in Japan, on May 19, 1936. The Association was able to perfect its organization with the affiliation of sixteen other athletic bodies and became the most important sports governing body in Japan. The important work for the Association in 1935 was the sending of the delegation to the 11th Olympiad in Berlin and exerting its best efforts to invite the 12th Olympiad to Tokyo.

As regards the sending of the delegation the Association succeeded in obtaining the fund. A subsidy of ¥300,000 was granted by the Government and public donations amounting to ¥400,000 were obtained these two making a total fund of ¥700,000 for the despatch of the delegation. It was thus possible to send 47 athletes to the 4th Winter Sports Games and also a large and imposing delegation composed of 68 officials and 246 athletes representing 13 events to the 11th Olympiad in Berlin.

Traditional Sports Of Japan's traditional sports, those which have remained from ancient times and which still hold the interest of the people include jujitsu (judo), known as the art of self-defence; kenjutsu (kendo), or fencing; sumo, or wrestling, and swimming (native styles). All these major sports are still being practised throughout the country. Probably the most popular is wrestling. At the Kokugikan amphitheatre at Ryogoku, on the bank of the Sumida River, which flows through Tokyo, a professional wrestling tournament is held twice a year, in January and May. H. I. M. the Emperor invites almost each year not only professional wrestlers but jujitsu and fencing masters of the land to the palace for matches in His Majesty's presence. In addition to these Japanese sports, there are others, such as archery and horsemanship of ancient origin, but they have suffered more or less decadence since the overthrow of feudalism.

Under Education Minister All sports in Japan are controlled either by the Ministry of Education or the Home Office. All students' sports are under the jurisdiction of the Education Ministry, and such non-student affairs as Japanese professional wrestling and professional boxing are under the control of the Home Office. Matters such as the maintenance of peace and order in and around the wrestling amphitheatre

or boxing ring are in the hands of the local police.

The leading athletic organization in Japan is the Japan Amateur Athletic Association, mentioned above, with Ryozo Hiranuma as acting president. This is the organization which controls track and field games in Japan and selects athletes for international meets. There are other similar organizations, such as the Japan Amateur Swimming Federation and the Japan Lawn Tennis Association.

Records Various statistics of records made by Japanese athletes follow :

JAPAN'S AND WORLD'S TRACK AND FIELD RECORDS

Running

Event	Japan's Record	World's Record
100-meter	10.3s. Ryutoku Yoshioka (1935)	10.3s. Ralph Metcalfe, U.S.A. (1934)

Baseball

Baseball is the most popular and most widely played game in Japan. Sumo, the Japanese style of wrestling, had been known for many years as the national game, but baseball came from the United States and caught popular fancy. The American pastime is now recognized as the de facto national game of this country. The Japanese are agile by nature and gifted with quick headwork and therefore are fitted to play baseball, although their weakness in batting is admitted. American professional players who have been to Japan and played with the Japanese have said that the Japanese are good pitchers and good fielders, but poor hitters and have recommended that efforts be made to improve batting.

Its Inception Like track and field sports, baseball was brought to Japan in the early years of Meiji. It is recorded that baseball was introduced by two American teachers in 1872. Not much progress was made until after 1890. The First Higher School is known as the first school which organized a strong team. Keio University and Waseda University also organized teams. Games began to be played between those schools with much zeal. In 1905, Waseda University sent its team to the United States. It played 27 games and won seven, but the team brought to Japan new tricks, such as winding and bunting, which had been unknown here until that time. Organized cheering was begun about the same time. From then on, American university teams, such as those of St. Louis, Wisconsin, Washington and Chicago Universities, came to Japan. At first, the American invaders were sure to win. As years went by, baseball in Japan developed greatly, however, and now it is admitted that Japanese university teams are on a par with American 'varsity nines. Hence the almost semi-annual exchange of university baseball teams between Japan and the United States.

Its Development The development of baseball in Japan owes much to the visits of American professional players. In 1913, Japan invited the leading players of the New York Giants and the Chicago White Sox to play with the Japanese and coach them. In 1931, a picked American professional team came under the management of Mr. Herb Hunter. Those Big League players not only impressed the Japanese with spectacular playing but also opened their eyes to the possibilities of further improvement in technique. In 1932, Mr. Hunter brought here Frank (Lefty) O'Doul and a few other Big League players for the purpose of coaching Japanese university players.

The University League The game was laid on a firm foundation in 1925 when

the present Six-University Baseball League of Tokyo was organized among Waseda, Keio, Meiji, Hosei, Rikkyo and Imperial Universities. Of the semi-annual league series, the most popular is the Waseda-Keio, series, the interest in which is high, as in the Cambridge-Oxford regatta, because of the historical background. Before the present league was formed, Waseda and Keio had such keen rivalry that blood shed was caused at one of the games and the series had to be abandoned for 20 years. The creation of the league revived the series, and they are now the World Series of Japan. Each Waseda-Keio game is usually attended by a capacity crowd of 60,000 at the Meiji Jingu (Shrine) grounds, Tokyo.

In the semi-annual league seasons, each university plays a two-game series with the others. The championship winners were formerly decided on the basis of the number of series won, but now the number of games won.

The following tables show the final standing of the autumn season of 1936 and the spring season of 1937 :

1936 Autumn

	Waseda	Meiji	Hosei	Rikkyo	Keio	Imp.	Won	Draw	%
Waseda	×	2	1	2	1	1	7	1	.750
Meiji	0	×	1	1	2	2	6	0	.600
Hosei	1	1	×	1	0	2	5	2	.600
Rikkyo	0	1	1	×	1	1	4	1	.450
Keio	1	0	0	0	×	1	2	3	.350
Imp.	0	0	0	1	1	×	2	1	.250
Lost	2	4	3	5	5	7			

Waseda won the pennant.

1937 Spring

	Meiji	Waseda	Keio	Hosei	Rikkyo	Imp.	Won	Draw	%
Meiji	×	2	1	2	2	2	9	0	.900
Waseda	0	×	2	1	1	2	6	0	.600
Keio	1	0	×	1.5	1	2	5	1	.556
Hosei	0	1	0.5	×	1.5	2	4	2	.500
Rikkyo	0	1	1	0.5	×	2	4	1	.444
Imp.	0	0	0	0	0	×	0	0	.000
Lost	1	4	4	4	5	10			

Meiji won the pennant.

At the invitation of the Waseda University, members of the baseball team of the Yale University, star nine of the Eastern Collegiate League of the United States, arrived in Tokyo on August 17, 1935, for a series of games against the members of the Tokyo University League. Their performance here was poor as they lost seven games out of 11 played and drew one. They sailed back on the Asama Maru on September 11.

The results of the games :

August 18 Waseda 8–5 Yale 7–0 Waseda ; August 20 Keio 10–0 Yale ; August 22 Yale 7–5 Tokyo Club ; August 24 Waseda 8–8 Yale ; August 25 Meiji 5–0 Yale ; August 28 Rikkyo 4–1 Yale ; September 3 Yale 7–3 Waseda ; September 3 Waseda 14–0 Yale ; September 8 Waseda 9–3 Yale ; and September 9 Waseda 7–3 Yale. The last three games were played in Osaka.

Next, the American Champion Amateur Baseball squad, selected by the Amateur Baseball Congress of America, visited Tokyo in early November, 1935, right after the closing of the fall season of the Tokyo University Baseball League, and opened a series of games with members of the former league.

The American champion nine, however, failed to live up to its fame, dropping the first two games to both the freshman teams of Meiji and Rikkyo in one-sided games respectively. The Americans played eight games in Tokyo and managed to win five of them. The losing Japanese teams, however, did not use their regulars since their colleagues smothered the visitors easily with their second string. The Americans, consequently, failed to draw a large crowd at the Meiji Shrine grounds and suffered loss on their travelling expenses.

The results of the games :

November 7, lost to Meiji, 5–4; November 8, lost to Rikkyo, 7–1; November 9, won over the Yokohama Commercial College, 9–0; November 10, won over Waseda, 7–0; November 12, lost to Hosei, 5–4; November 14, won over the Tokyo Railway Bureau, 6–4; November 16, won over Keio, 5–4; and November 20, won over the Tokyo Club, 6–0.

Members of the team were :

Pitchers : George Adams (Fort Collins, Colorado) ; Joseph Copp (Springfield, Illinois) ; Lou Briganti (New York) ; George Simmons (Philadelphia); Hayes Pierce (Nashville, Tennessee) ; A. Gonzales (University of Southern California).

Catchers : Fred Herringer (Stanford University) ; Fred Waters (Laurel, Minnesota) ; Dick Offringa (Wyckoff, New Jersey).

Infielders : Bob Chiado (Spring Valley, Illinois) ; Leslie Mc Neese (Fort Lauderdale, Florida); Alex Metti (Cleveland, Ohio) ; R. Goldsmith (Bloomington) ; Frank Scalza (Alabama) ; T.D. Wicklund (Kansas City).

Outfielders ; Jess Heath (Seattle) ; Ron Hibbard (Battle Creek, Michigan) ; Emmertt Fore Houston, Texas) ; Max Carey (Brooklyn).

The Waseda University team, winner of the 1935 fall season of the Tokyo University Baseball League, made a month-and-a-half tour to the United States, returning to Tokyo on July 15, 1936. The team brought back an excellent record of 15 victories out of 22 games played on American soil. The players benefited from the tour, according to Kenji Oshita who captained the nine. Not only did they learn something of the technique of the game, but they enjoyed themselves to the utmost. Everywhere they went they were widely entertained, not only by local Japanese but by Americans as well.

The majority of the team's opponents were college or university nines, although a number of Japanese clubs were included on the schedule. The full result of Waseda's six-week tour was as follows :

Date	Oppositon	Score
May 16	Stanford	1-8
May 16	Stanford	1-8
May 17	Asahi Japanese	9-4
May 18	Stadford	14-6
May 19	San Diego Marines	4-16
May 19	San Diego State College	3-2
May 23	Los Angeles Nippon	11-2
May 29	Chicago University	16-17
May 30	Chicago University	10-5
June 4	Boston College	2-4
June 7	Providence College	6-8
June 8	Yale	6-0
June10	Princeton	5-4
June12	Harvard	5-0
June13	Boston University	4-0
June17	Chicago University	3-13
June21	Taiyo, Seattle	11-1
June22	Washington	7-8
June23	Washington	11-1
June26	Mikado, Sacramento	8-10
June27	Yamato, Stockton	13-8
June28	Fresno, Japanese	11-7
June30	Alameda, Japanese	17-1

Professional .Baseball Japan now boasts of eight professional baseball teams, four in Tokyo and two each in Nagoya and Osaka. They are Tokyo Giants, Eagles, Tokyo senators and Lions in Tokyo ; Nagoya and Golden Dolphines in Nagoya ; Hankyu and Osaka Tigers in Osaka. The teams were formed during 1934 and early 1936, all possesing former leading baseball players from colleges and middle schools.

The Japan Professional Baseball League, a governing body for these professional teams, was founded in 1936, with leading men of each team in its official board. The league is headed by Marquis Nobutsuné Okuma, president of the Tokyo Giants. Each team is operated as sister companies of leading newspaper or railway companies, and some of them are financed by a group of business men. The Tokyo Giants is the oldest among them, founded in late 1934, and is backed by the Yomiuri Shimbun, leading Tokyo newspaper. The team made a tour of the United States twice already in 1935 and 1936, each time their trip extending for three months. Most of the professional teams are stronger than those of the Tokyo University League and their future is very promising .

The three championship series among the professional teams were held in Tokyo, Osaka and Nagoya during July, 1936, and resulted as follows :

The First Championship Series (Totsuka grounds, Tokyo, July 1–7)

Semi-finals

Nagoya beat Hankyu, 13 to 3 ; Tokyo Senators beat Osaka Tigers, 9 to 8.

Finals

Nagoya beat Tokyo Senators, 1 to 0. Batteries—Matsuura and Haris ; Noguchi and Kitaura.

The Second Championship Series (Koshien grounds, near Osaka, July 12–14)

Semi-finals

Tokyo Senators beat Golden Dolphines, 9 to 1; Hankyu beat Nagoya, 7 to 5.

Finals

Hankyu beat Tokyo Senators, 2 to 1. Batteries—Kitai and Kuramoto; Noguchi and Kitaura.

The Third Championship Series (Yamamoto grounds, Nagoya, July 15–19).

Semi-finals

Osaka Tigers beat Tokyo Senators, 9 to 7; Hankyu beat Golden Dolphines, 13 to 8.

Finals

Osaka Tigers beat Hankyu 11 to 7. Batteries —Wakabayashi and Monzen; Kitai, Yamada, Maruo and Kuramoto.

1936 Autumn (played at Osaka)

	Tigers	Giants	Dolphines	Hankyu	Senators	Nagoya	Tokyo	Won	%
Tigers	×	0	1	1	1	1	1	5	.833
Giants	1	×	0	1	1	1	1	5	.833
Dolphines	0	1	×	1	1	0	1	4	.667
Hankyu	0	0	0	×	1	1	1	3	.500
Senators	0	0	0	0	×	1	1	2	.333
Nagoya	0	0	1	0	0	×	1	2	.333
Tokyo	0	0	0	0	0	0	×	0	.000
Lost	1	1	2	3	4	4	6		

Tigers and Giants tied for first place, and Giants beat Tigers by 2 games to 1 in the deciding games, thus winning the championship.

Marking as one of the biggest events in the history of the Japanese baseball, 15 star baseball players of the American major leagues, made a barnstorming tour to Japan in the fall of 1934 at the invitation of the Yomiuri Shimbun. They arrived in Yokohama on November 2 and stayed for a month during which they made a clean sweep of winning 18 games against the All Japan nine in the leading cities of this country. Mr. Connie Mack, the veteran baseball coach and manager of the Philadelphia Athletics Club, was the leader of the team.

The American team, including such famous players as Babe Ruth, homerun King, Lou Gehrig, Jimmy Foxx and Charles Gehringer, were given a tremendous welcome by the Japanese baseball fans in every city they visited. Every baseball ground where they played, were filled to more than its capacity with the enthusiastic fans, who were, in return, treated with amazing and excellent play by the visitors, both in batting and fielding. Especially Babe Ruth was the centre of attraction, his play being observed keenly by the Japanese. He was also chased around heavily by a large number of autograph hunters wherever he appeared, just in the same way as in his home country.

The All Japan team which was specially formed to meet the American stars with the former star players in the Japanese college leagues, the strongest nine Japan could offer then, was beaten by a lopsided score by the visitors in almost every game they played. A total of 47 home runs was recorded by the American players during their sojourn, with Ruth leading with 13. A name of "home run team," was given by the Japanese fans for their heavy and amazing batting works by Ruth, Gehrig, Foxx, Averill and Gehringer, who all hit home run more than four each.

The American team was composed of the following players :

Eric McNair (Philadelphia Athletics), shortstop.

Charles I. Gehringer (Tigers), second base.

Babe Ruth (Yankees), left field and first base.

Lou Gehrig (Yankees), first base.

James Foxx (Athletics), third base.

Earl Averill (Cleveland), centre field.

E.J. Miller (Athletics), right field.

Morris Berg (Cleveland), catcher.

Frank Hayes (Athletics), catcher.

Vernon Gomez (Yankees), pitcher.

Earl Whitehill (Washington), pitcher.

Clinton H. Brown (Cleveland), pitcher.

Edward Cascarella (Athletics), pitcher.

Hal Warstler (Athletics), substitute for infielder.

Frank O'Doul (Giants), outfielder.

Mr. John A. Quinn, the noted Southern League umpire, acted as chief umpire.

Results of the games follow :

Americans 17–1 Tokyo Club (Meiji Shrine Grounds, Tokyo, November 4)

Americans 5–1 All Japan (Meiji Shrine

Grounds, Tokyo November 5)
Americans 5–2 All Japan (Yunokawa Grounds, Hakodaté, November 8)
Americans 7–0 All Japan (Yagiyama Grounds Sendai, November 9)
Americans 10–0 All Japan (Meiji Shrine Grounds, Tokyo, November 10)
Ruth team 13–2 Miller team, exhibition (Meiji Shrine Grounds, Tokyo November 11)
Americans 14–0 All Japan (Jintsu Grounds, Toyama, November 13)
Americans 15–6 All Japan (Meiji Shrine Grounds, Tokyo, November 17)
Americans 21–4 All Japan (Yokohama Park Grounds, Yokohama, November 18)
Americans 1–0 All Japan (Shizuoka City Grounds, Shizuoka, November 20)
Americans 6–5 All Japan (Narumi Grounds, Nagoya, November 22)
Americans 6–2 All Japan (Narumi Grounds Nagoya November 23)
Americans 15–3 All Japan (Koshien Grounds, Hyogo, November 24)
Miller team 5–1 Ruth team exhibition (Koshien Grounds, Hyogo, November 25)
Americans 8–1 All Japan (Itatsu Grounds, Kokura, November 26)
Americans 14–1 All Japan (Kyoto City Grounds, Kyoto, November 28)
Americans 23–5 All Japan (Omiya Grounds, Saitama, November 29)
Americans 14–5 All Japan (Utsunomiya Grounds, Tochigi, December 1)

Track and Field

The birth of track and field sports in Japan dates back to the Meiji Restoration in 1868. In the following year, a physical training course was added to the curriculum of middle schools, which consisted of gymnastics introduced by the Dutch. In the meantime, those who returned home to Japan from abroad, much impressed by athletics in foreign countries advocated the introduction of Western athletics. Several foreign teachers were invited to teach athletics as well as English. Running and jumping were taught, but progress was slow. The first Japanese track and field meet was held in Tokyo in 1884, but the first really systematic athletic meet was not held until 1886. At the latter meet, programmes were printed. It was an epoch-making event. Track and field events about 1889 and 1890 were almost the same as they are now. There were the 100, 220, 400, 880 yards, the 100 yard hurdles, cricket ball throw, the three-legged race and so on. As for records, the best was 10.8 seconds for the 100-yard dash and 18 seconds for the 100-yard hurdles. From that time on, progress was gradual until 1912, when Japan took part in the World Olympic Games for the first time. An outline of the progress of Western sports in Japan in subsequent years is given in the first section titled "Japan in the World Olympics."

At the invitation of the Japan Amateur Athletic Federation, the American track and field stars, captained by Glenn Cunningham, the world famous distance runner, visited Japan in September, 1934, for a series of contests against the leading Japanese athletes. They were the first and strongest athletic force ever came to Japan from the United States, and staged one of the biggest track and field events in this country.

The Americans with 14 members, engaged in two dual meets with the selected Japanese team in Tokyo and Osaka, and appeared in five exhibition contests, visiting Nagoya, Dairen, Seoul and Fukuoka. Their visit was successful, contributing much to Japan's athletic circle and also toward the international friendship between the two countries. The Americans won the first dual contest, held on September 8 and 9 in Tokyo, by a score of 84 points to 75, but lost the second meet to Japan by a close 77½ points to 75½ in Osaka a week later, which was an unexpected victory for the local side. Three world and 13 Japanese records were shattered in these dual contests.

Ralph Metcalfe, the ranking dusky American sprinter, covered the 200-metre course in 20.2 seconds, clipping four tenth of a second from his own world mark, both in Tokyo and later in the Dairen meet. Another world record was bettered by a Japanese, Kenkichi Oshima, former Kwansai University ace, who won the hop, step and jump event with a leap of 15.82 metres in the second dual meet in Osaka. The former world record for this event was 15.72 metres held by Chuhei Nambu of Japan, a sensation in the last Olympic Games in Los Angeles.

Members of the American team were: Glenn Cunningham (Kansas University); John Anderson (Cornell University); Robert Clark (Olympic Club); Frank Crowley (Manhattan College); Gorden Dunn (Stanford University); Donald Favor (University of Maine); Phil Good (Bordoin University); Howard Greene (Abilen Christian College); Charles Hornbostel (Indiana University); Walter Marty (Fresno State University); Ralph Metcalfe (Marquette University); Charles Parsons (University of Southern California); Wirt Thompson (Yale University); and Dudley Wilkins (Louisiana State University). Coach—Mr. John Magee, vice-

president of the American Athletic Union.

Winners of the first dual meet were :

Track Events

100-metre dash, Ralph Metcalfe (United States), 10.5 seconds ; 200-metre dash, Metcalfe (United States), 20.2 seconds (new world record) ; 400-metre run, Charles Hornbostel (United States), 49.2 seconds ; 800-metre run, Hornbostel (United States), 1:54.0 minute ; 1,500-metre run, Glenn Cunningham (United States), 4:8.6 minutes ; 5,000-metre run, Ryu Choshun (Japan), 15:41.8 minutes ; 110-metre high hurdles, Phil Good (United States), 14.6 seconds ; 400-metre relay, American team (Clark, Greene, Parsons and Metcalfe), 41.3 seconds ; and Swedish relay, American team (Metcalfe, Parsons, Greene and Hornbostel), 1:57.6 minutes.

Field Events

High jump, Yoshiro Asakuma (Japan), 1.95 metre ; broad jump, Masao Harada (Japan), hop, step and jump, Keinkichi Oshima (Japan), 15.28 metres pole vault, Suyeo Oyé (Japan), 4 metres ; Shot put, Gorden Dunn (United States), 15.-26 metres ; discus throw, Dunn (United States), 47.42 metres ; hammer throw, Isao Abé (Japan), 48.98 metres ; and javelin throw, Saburo Nagao (Japan), 62.07 metres.

Points scored :

United States		Japan
6	800-metre run	4
4	Broad jump	6
7	Discus throw	3
7	100-metre dash	3
3	High jump	7
4	5,000-metre run	6

Tennis

Lawn tennis is the Western sport through which the Japanese nation won international recognition for the first time. The game was introduced into this country more than half a century ago, but real tennis, by which is meant the game as played in the West, began only 20 years or so ago. Until then the Japanese played the game with the "soft ball." Even now the Japanese have two sorts of tennis, the hard ball and soft ball. Japan distinguished herself in tennis for the first time in 1915, when Ichiya Kumagai and Seiichiro Kashio represented her in the Far Eastern Games held in Shanghai. Kashio dropped one singles match, but the rest were won by Japan.

Prominence at Antwerp Japanese tennis players figured prominently in the international athletic world in 1920, when the Japanese entrants in the World

Olympic Games at Antwerp won second place. In the following year, the country entered the Davis Cup tournament for the first time and surprised the world by reaching the challenge round, in which, however, the Japanese dropped to the Americans and missed the honours. But this served to win for the country a high place in international tennis. Since then, the Japanese entrants have cut a good figure each year.

The Davis Cup Tournament The following tables show how each year the Japanese players advanced in the Davis Cup tournament in their attempt to win the tennis supremacy of the world :

1921 (Challenge Round)
U.S.A. 5, Japan 0

In the singles matches, Johnston beat Kumagai 6-2, 6-4, 6-2 ; Tilden beat Shimizu 5-7, 4-6, 7-5, 6-2, 6-1 ; Tilden beat Kumagai 9-7, 6-4, 6-1 ; Johnston beat Shimizu 6-3, 5-7, 6-2, 6-4. In the doubles, Williams and Washburn beat Kumagai and Shimizu 6-2, 7-5, 4-6, 7-5.

1923 (Finals, American Zone)
Australia 4, Japan 1

In the singles matches, Anderson beat Shimizu 6-0, 6-3, 6-3 ; Hawks beat Fukuda 6-3, 6-4, 6-3 ; Shimizu beat Hawks 6-4, 3-6, 2-6, 6-1, 6-4 ; Anderson beat Fukuda 6-1, 3-6, 6-2, 6-1. In the doubles, Anderson and Hawks beat Shimizu and Kashio 6-1, 6-2, 6-2.

1924 (Finals, American Zone)
Australia 5, Japan 0

In the singles matches Patterson beat Shimizu 7-5, 11-9, 6-4 ; Wood beat Okamoto 6-4, 2-6, 6-4, 2-6 6-1 ; Patterson beat Okamoto 7-5, 6-1, 6-4 ; Wood beat Shimizu 6-4, 6-4, 6-2. In the doubles, Patterson and Wood beat Okamoto and Harada 7-5, 6-2, 6-4.

1925 (Finals, American Zone)
Australia 4, Japan 1

In the singles matches, Patterson beat Shimizu 6-1, 6-4, 6-2 ; Anderson beat Harada 6-4, 3-6, 6-3, 6-1 ; Harada beat Patterson 6-2, 3-6, 6-1, 7-5 ; Hawks beat Fukuda 6-1, 6-3, 6-0. In the doubles, Patterson and Hawks beat Shimizu and Harada 6-1, 6-2, 9-7.

1926 (Finals, European Zone)
France 3, Japan 2

In the singles matches, Cochet beat Tawara 1-6, 4-6. 7-5 6-3, 6-2 ; Harada beat Lacoste 6-4, 4-6, 6-3, 9-7 ; Lacoste beat Tawara 6-1, 6-3, 6-2 ; Harada beat Cochet 6-1, 6-3, 0-6, 6-4. In the doubles, Cochet and Brugnon beat Harada and Tawara 6-0, 6-0, 6-2.

1927 (Finals, European Zone)
France 5, Japan 0

In the singles, Cochet beat Ohta 6-0, 6-3, 6-2 ; Lacoste beat Harada 6-1, 6-1, 6-2 ; Harada and Ohta scratched the other two matches. In the doubles, Cochet and Brugnon beat Toba and Harada 9-7, 6-1, 6-2.

1928 (Finals, American Zone)
U.S.A. 5, Japan 0

In the singles, Tilden beat Abé 6-2, 6-3, 6-0 ; Hennessey beat Ohta 8-6, 6-3, 6-3 : Cohen beat Abé 7-9, 6-2, 6-4, 7-5 : Tilden beat Ohta 6-8, 6-3, 6-1, 6-0. In the doubles. Tilden and Lott beat Toba and Abé 6-1, 10-8, 6-2.

1929 (Second Round, American Zone)
U.S.A. 4, Japan 1

In the singles matches, Hennessey beat Abé 8-6, 6-1, 3-6, 6-1 ; Ohta beat Van Ryn 6-4, 5-7, 2-6, 6-4, 7-5 ; Van Ryn beat Abé 6-2, 4-6, 6-3, 6-2 ; Hennessey beat Ohta 6-2, 6-2, 6-2. In the doubles, Hennessey and Van Ryn beat Abé and Ohta 6-3, 6-4, 6-2.

1930 (Finals, European Zone)
Italy 3, Japan 2

In the singles matches, de Stefani beat Ohta 6-3, 6-4, 4-6, 6-4 ; Harada beat Morpurgo 6-4, 6-3, 7-5 ; Harada beat de Stefani 6-2, 7-5, 7-5 ; Morpurgo beat Ohta 6-0, 6-0, 6-1. In the doubles, Morpurgo and Gaslini beat Harada and Abé 8-6, 9-7, 6-8, 2-6, 6-1.

1931 (Second Round, European Zone)
Great Britain 5, Japan 0

In the singles matches, Perry beat Jiro Sato 6-1, 4-6, 7-5, 7-5 ; Austin beat Hyotaro Sato 0-6, 6-2, 6-4, 6-1 ; Austin beat Kawaji 6-1, 0-6, 8-6, 6-2 ; Perry beat Hyotaro Sato 6-2, 6-3, 4-6, 6-2. In the doubles, Hughes and Perry beat Jiro Sato and Kawaji 6-4, 6-4, 8-6.

1932 (Semi-finals, European Zone)
Italy 3, Japan 2

Kuwabara beat Palmieri 6-0, 6-2, 1-6, 6-3 ; de Stefani beat Jiro Sato 6-3, 6-4, 6-4 ; Palmieri beat Jiro Sato 4-6, 4-6, 6-1, 6-2 ; de Stefani beat Kuwabara 6-2, 6-2, 6-4. In the doubles, Jiro Sato and Miki beat Palmieri and Sertario 6-4, 6-4, 6-3.

1933 (Semi-finals, European Zone)
Australia 3, Japan 2

Jack Crawford beat Ryosuké Nunoi 6-2, 4-6, 6-3, 4-6, 7-5 ; Vivian MacGrath beat Jiro Sato 9-7, 1-6, 4-6, 6-4, 7-5 ; Jiro Sato beat Crawford 3-6, 6-3, 6-1, 1-6, 6-2 ; Nunoi beat MacGrath 6-4,

6-4, 6-8, 7-5. In the doubles Adrian Quist and Crawford beat Sato and Nunoi 7-5, 7-9, 6-3, 3-6 and 6-3.

1934 (Second round of European Zone)
Australia, 4 Japan 1

Jack Crawford beat Jiro Fujikura, 6-3, 6-3, 11-9, Vivian McGrath beat Jiro Yamagishi, 2-6, 7-5, 6-2, 6-4. Fujikura beat McGrath, 6-4, 5-7, 6-2, 8-6. Oswald Turnbull beat Yamagishi, 6-4, 7-5, 9-7.

In the doubles, Crawford and Adrian Quist beat Yamagishi and Hideo Nishimura, 6-1, 6-0, 4-6, 9-7.

1935 (Second round of European Zone)
Czechoslovakia 4, Japan 1

In the singles matches, Roderick Menzel beat Hideo Nishimura, 6-3, 6-2, 8-6; Josef Zaska beat Jiro Yamagishi, 6-1, 8-6, 6-3; Zaska beat Nishimura, 6-2, 6-3, 6-8, 6-2; and Yamagishi beat Ladislau Hecht, 6-4, 6-1, 6-3.

In the doubles, Menzel and Josef Malacek beat Nishimura and Yamagishi, 2-6, 6-2, 6-1, 6-1. All matches were played at Prague on June 6, 7 and 8.

In 1936 Japan did not take part due to poor material and lack of fund for sending players to Europe.

1937(First round of American Zone)
U.S.A. 5, Japan 0

In the singles matches, Donald Budge beat Fumiteru Nakano, 6-1, 6-1, 6-0; Frank Parker beat Jiro Yamagishi, 6-1, 2-6, 8-6, 6-1; Parker beat Nakano, 6-0, 6-3, 6-2; and Budge beat Yamagishi, 6-2, 6-2, 6-4.

In the doubles, Budge and Jene Mako beat Yamagishi and Nakano, 6-0, 6-1, 6-4.

Tennis Ranking in Japan Rankings are decided by a committee of the Japan Lawn Tennis Association on the basis of the results of matches played in Japan. It happens, therefore, that Davis Cup players who have had no chance to play in Japan, are barred from the ranking list. A new list is announced usually each January.

The ranking list for 1936 and 1937 follows :

Men's Singles

1936	1937
1. Jiro Yamagishi (Keio U.)	1. Jiro Yamagishi (Keio U.)
2. Shunsuke Hirai (Keio U.)	2. Akimasa Miura (Waseda U.)
3. Yasumine Kuramitsu (Kwansai U.)	3. Shunsuke Hirai (Keio U.)
4. Jiro Fujikura (Meiji U.)	4. Yasumine Kuramitsu (Kwansai U.)
5. Masatomo Tsukada (Meiji U.)	5. Fumiteru Nakano (Hosei U.)
6. Fumiteru Nakano (Hosei U.)	6. Katsumi Matsuoka (Keio U.)
7. Akimasa Miura (Waseda U.)	7. Sakuzo Hasegawa (Senshu U.)
8. Makio Murakami (Kyoto Imperial U.)	8. Shinroku Hayashi(Tokyo Imperial U.)
9. Katsumi Matsuoka (Keio U.)	9. Junzo Kinoshita (Kwansei Gakuin)
10. Junzo Kinoshita (Kwansei Gakuin)	10. Shojiro Tatsuta (Kwansai Gakuin)
11. Hyotaro Sato (Tokyo L.T.C.)	11. Masatomo Tsukada (Meiji U.)
12. Shiroku Hayashi (Tokyo Imperial U.)	12. Mitsuo Kawamura (Kwansei Gakuin)
13. Shizuo Fujii (Kwansai U.)	13. Tamio Abe (Tomon Club)
14. Reizo Murakami (Keio U.)	14. Shizuo Fujii (Kwansai U.)
15. Hajime Ebisu (Kajimaya)	15. Yasuji Kiyosu (Kwansei Gakuin)
16. Koichiro Niiya(Kobe Commercial U.)	16. Reizo Murakami (Keio U.)
17. Masayuki Iyoda (Rikkyo U.)	17. Tatsuo Hisano(Eighth Higher School)
18. Masao Tanaka (Kyoto Imperial U.)	18. Masutaro Nakamura (Keio U.)
19. Reishiro Hattori (Waseda U.)	19. Taisuke Yokota (Tokyo Imperial U.)
20. Tatsuo Hisano (Eighth Higher School)	20. Tomigoro Fujita (Waseda U.)

Men's Doubles

1. Jiro Yamagishi-Reizo Murakimi (Keio U.)	1. Jiro Yamagishi-Reizo Murakami (Keio U.)
2. Tamio Abe-Minoru Kawaji (Tomon Club)	2. Masuo Uehora-Haruo Horigoshi (Kwansai U.)
3. Jiro Fujikura-Masatomo Tsukuda (Meiji U.)	3. Shunsaku Hirai-Reizo Murakami (Keio U.)
4. Jin Tsuda-Akimasa Miura (Waseda U.)	4. Junzo Kinoshita-Yasuji Kiyosu (Kwansai Gakuin)
5. Shizuo Fujii-Yasumine Kuramitsu (Kwansai U.)	5. Shizuo Fuji-Yasumine Kuramitsu (Kwansai U.)

1936	1937
6. Masayoshi Takahashi-Reizo Murakami (Keio U.)	6. Shinroku Hayashi-Yoshio Takahashi (Tokyo Imperial U.)
7. Shinroku Hayashi-Naosuku Okubo (Tokyo Imperial U.)	7. Keiji Tanako-Tomigoro Fujita (Waseda U.)
8. Mitsuo Kawamura-Yasuji Kiyosu (Kwansai Gakuin)	8. Mitsuo Kawamura-Shunji Ikushima (Kwansei Gakuin)
9. Masao Tanaka-Makio Murakami (Kyoto Imperial U.)	9. Masatomo Tsukada-Koyata Nishioka (Meiji U.)
10. Keiji Tanaka-Tomigoro Fujita (Waseda U.)	10. Akimasa Miura-Reijiro Hattori (Waseda U.)

Women's Singles

1. Mrs. Tokuko Nakano (Tokyo L.T.C.)	1. Miss Sadayo Toda (Osaka)
2. Miss Sanae Okada (Denen Club)	2. Miss Toyoko Kimata (Osaka)
3. Miss Reiko Takiguchi (Poplar Club)	3. Miss Hisako Yamagishi (Denen Club)
4. Miss Toyoko Kimata (Osaka)	4. Miss Kumiko Sasakura (Poplar Club)
5. Miss Hisako Yamagishi (Denen Club)	5. Miss Hisako Takiguchi (Osaka)
6. Miss Michiko Harada (M.L.)	6. Miss Shizuyo Narukawa (Nagoya)
7. Mrs. Naoko Matsudaira (Green Club)	7. Miss Michiko Harada (M.L.)
8. Miss Kumi Sasakura (Poplar Club)	8. Miss Kiyoko Enotani (Osaka)
9. Miss Hisako Ikeguchi (Osaka)	9. Mrs. Naoko Matsudaira (Green Club)
10. Miss Mitsuko Iida (Osaka)	10. Miss Mitsuko Iida (Osaka)

Women's Doubles

1. Miss Sanae Okada-Miss Hisako Yamagishi	1. Miss Kumiko Sasakura-Miss Michiko Harada
2. Mrs. Naoko Matsudaira-Miss Michiko Harada.	2. Mrs. Naoko Matsudaira-Miss Hisako Yamagishi
3. Miss Mikiko Kamiyama-Miss Hisako Takeuchi.	3. Miss Shizuyo Takigawa-Miss Mikiko Nakamura
4. Miss Sadayo Toguchi-Miss Katsuko Tomikawa.	4. Mrs. Ewing-Miss Kiyoko Enotani
5. Miss Reiko Takiguchi-Miss Kumi Sasakura.	5. Miss Hisako Takiguchi-Miss Mitsuko Iida

The following are the results of the important tennis matches played in 1936 :

15th annual national open championships (Waseda courts, Tokyo, October 28—November 8)

Singles : semi-finals

Jiro Yamagishi (Keio) beat Fumiteru Nakano (Hosei), 6-2, 7-5, 6-3.

Akimasa Miura (Waseda) beat Yasumine Kuramitsu (Kwansai U.), 7-5, 6-2, 3-6, 6-2.

Finals

Yamagishi beat Miura, 6-4, 3-6, 6-0, 4-6, 7-5.

Doubles : semi-finals

Yamagishi and Murakami (Keio) beat Tanaka and Fujita (Waseda), 6-3, 6-4, 7-5.

Abé and Kawaji (Tomon Club) beat Uehara and Horigoshi (Kwansai), 6-1, 4-6, 6-3, 6-3.

Finals

Yamagishi and Murakami beat Abé and Kawaji, 14-12, 6-2, 6-2.

8th annual national student championships (Koshien courts, Osaka, August 24—September 2)

Singles : semi-finals

Sakuzo Hasegawa(Senshu) beat Junzo Kinoshita (Kwansei Gakuin), 0-6, 3-6, 6-0, 6-2, 7-5.

Akimasa Miura (Waseda) beat Katsumi Matsuoka (Keio), 6-3, 6-1, 6-3.

Finals

Miura beat Hasegawa, 3-6, 6-2, 6-2, 6-4.

Doubles : semi-finals

Hirai and Murakami (Keio) beat Tanaka and Fujita (Waseda), 6-2, 6-4, 6-1.

Kinoshita and Kiyosu (Kwansei Gakuin) beat Hayashi and Takahashi (Tokyo Imperial), 1-6, 6-2, 6-3, 6-1.

Finals

Hirai and Murakami beat Kinoshita and Kiyosu, 6-2, 1-6, 6-2, 3-6, 7-5.

13th annual national women's championships (Koshien courts, Osaka, November 11—14)

Singles : semi-finals

Miss Toyoko Kimata beat Mrs. Shizuko Narukawa, 6-3, 6-4.

Miss Sadayo Toda beat Mrs. Ewing, 6-2, 5-7, 6-3.

Finals

Miss Toda beat Miss Kimata, 6-1, 6-1.

Doubles : semi-finals

Miss Yamagishi and Mrs. Matsudaira beat Mrs. Ewing and Miss Fictor, 6-3, 5-7, 6-2.

Miss Harada and Miss Sasakura beat Mrs. Narukawa and Miss Nakamura, 6-4, 4-6, 6-1.

Finals

Miss Harada and Miss Sasakura beat Miss Yamagishi and Mrs. Matsudaira, 4-6, 6-4, 6-3.

The following list shows the winners in the annual National Tennis Championship tournament which takes place either in Tokyo or Osaka in November every year :

	Singles	Doubles
1922	Masanosuké Fukuda	Tamio Abé and Ryuzo Kawazuma
1923	Takaichi Harada	Tamio Abé and Ryuzo Kawazuma
1924	Tsumio Tawara	Iwao Aoki and Taku Ukegawa
1925	Tsumio Tawara	Tamio Abé and Kyo Kawajiri
1926	Yoshio Ota	Hisataka Aizawa and Kengo Asoo
1927	Tamio Abé	Tamio Abé and Masanosuké Fukuda
1928	Hajimé Makino	Seiichi Yamagishi and Hikoshichi Shimura
1929	Takeichi Harada	Ichiya Kumagai and Takechi Harada
1930	Jiro Sato	Seiichi Yamagishi and Hikoshichi Shimura
1931	Takao Kuwabara	Seiichi Yamagishi and Yasuo Murakami
1932	Ryosuké Nunoi	Jiro Sato and Minoru Kawaji
1933	Hideo Nishimura	Hideo Nishimura and Jiro Yamagishi
1934	Jiro Yamagishi	Hideo Nishimura and Jiro Yamagishi
1935	Jiro Yamagishi	Hideo Nishimura and Jiro Yamagishi
1936	Jiro Yamagishi	Jiro Yamagishi and Reizo Murakami

Swimming

Swimming is one of Japan's major sports that has been handed down from time immemorial. Surrounded on all sides by the sea, the people of the Island Empire had easy access to water. It was but natural that the people became adept in swimming, and swimming masters turned out several distinct styles of swimming, some of which more or less resembled the Western crawl of the present day. Swimming in ancient Japan was a serious subject of study, especially for the fishermen and warriors, to whom swimming was more a practical necessity than a healthful diversion.

The Western crawl was introduced into Japan about 1910. Since then the Japanese have not only copied but developed it into a more perfect stroke. The result was the remarkable showing made by the Japanese mermen at the Tenth Olympiad in Los Angeles in 1932.

As a partial explanation of the swimming ability of the Japanese, it is said that the race is particularly fitted for prowess in swimming. A modern physician once said that the Japanese show better development than other peoples in the muscles in the upper part of the lower limbs that bind them with the lower part of the trunk. It is noted in this connection that clever use of the lower limbs, which depend on the muscles in the upper limbs, plays an important part in swimming.

The second Japan - American dual swimming meet was held on August 17, 18 and 19, 1935, at the Meiji Shrine pool, Tokyo, ending in the former's victory by a close score of 36 points to 27. Climaxing three days of thrilling competition which held capacity crowds spellbound during the meet, the Japanese aces proved their supremacy and marked themselves as foremost contenders for the Olympic water crown at Berlin next summer.

The meet was close throughout. Before the final day, the score stood 22 to 20 in favour of Japan. All predictions pointed to the final relay as the deciding event. But in the 200-metre back stroke, Taylor Drysdale of the United States who finished first, was

disqualified for what the judges considered an illegal turn at the 100-metre mark, giving Eiichi Yoshida of Japan first place and the meet to Japan before the concluding event. Japan won seven events out of 12 held. Two world and three Japanese records were bettered during the meet.

Winners were :

200-metre breast stroke : Reizo Koike (Japan), 2:42.6 minutes (new Japanese record).

200-metre free style : Masanori Yusa (Japan), 2:13.2.

1,500-metre free style : Sunao Ishiharada (Japan), 19:12.0

300-metre medley relay : American team (Drysdale, Kasley and Fick), 3:20.2.

100-metre back stroke : Taylor Drysdale (U. S.), 1:10.2.

100-metre breast stroke : Reizo Koike (Japan), 1:13.6 (new Japanese record).

400-metre freestyle : Jack Medica (U. S.), 4:45.2 (new world record).

400 - metre relay : American team (Chrostowski, Lindegren, Wolf and Fick), 3:53.8.

800-metre free style : Hiroshi Negami (Japan), 10:02.4.

100-metre free style : Peter Fick (U. S.), 57.2.

200-metre back stroke : Kiichi Yoshida (Japan), 2:35.6 (new Japanese record).

800-metre relay : Japanese team (Yusa, Ishiharada, Makino and Negami), 8:52.2 (new world record)

Points scored :

Japan		U. S.
5	200-metre breast stroke	1
3	200-metre free style	3
6	1,500-metre free style	0
0	300-metre medley relay	3
1	100-metre back stroke	5
4	100-metre breast stroke	2
3	400-metre free style	3
0	400-metre relay	3
4	800-metre free style	2
3	100-metre free style	3
4	200-metre back stroke	2
3	800-metre relay	0
36		27

Members of the American team were : Coach, Robert Kiphuth ; Jack Higging, Russell Branch and Matt Chrostowski of the Olneyville Boys Club, Providence, Rhode Island : Peter Fick of the New York Athletic Club ; Paul Wolf and Art Lindegren of the Los Angeles Athletic Club ; Dan Zehr of Northwestern University, Illinois ; Jack Kesley, of Michigan ; John Macionis of Yale University ; Jack Medica of the Washington Athletic Club ; Ralph Flanagan of the Greater Miami Athletic Club ; and James Gilhula, Taylor Drysdale, Ray Kaye of the Detroit Athletic Club.

The combined 1936 national swimming championships and the final Olympic tryout was held on May 29, 30 and 31 at the Meiji Shrine pool, Tokyo. Only one national women's record was bettered during the meet due to poor weather condition, rainy on the last two days.

Winners were :

Men's Events

100-metre free style, Masanori Yusa (Nihon U.), 57.8 seconds.

200-metre free style, Shoji Taguchi (Rikkyo U.), 2:14.0 minutes.

400-metre free style, Shumpei Uto (Rikkyo U.), 4:54.4 minutes.

1,500-metre free style, Shumpei Uto (Rikkyo U.), 19:45.6 minutes.

100-metre back stroke, Yasuhiko Kojima (Keio U.), 1:10.2 minute.

200-metre breast stroke, Tetsuo Hamuro (Nihon U.), 2:43.4 minutes.

Spring-board diving, Tsuneo Shibahara. (Nihon U.), 146.06 points.

High diving, Tsuneo Shibahara (Nihon U.), 101.92 points.

Women's Events

100-metre free style, Miss Tsuneko Furuta (Shizuoka), 1:14.2 minute.

400-metre free style, Miss Hatsuko Morioka (Osaka), 5:58.4 minutes.

100-metre back stroke, Miss Yuriko Izumi (Kyoto), 1:29.0 minute.

200-metre breast stroke, Miss Hideko Maehata (Nagoya), 3:05.4 minutes.

Spring-board diving, Miss Fusako Kono (Tokyo), 74.76 points.

High diving, Miss Reiko Osawa (Tokyo), 35.50 points.

Wrestling (Sumo)

Japan's traditional wrestling, known in Japanese as sumo, is another ancient sport of Japan. It is recorded in ancient history that Nomi-no Sukuné and Taéma-no Kehaya wrestled before the Emperor Suinin. In feudal times each lord had under him the strongest wrestler of the province, and he made it a custom to arrange a match with the wrestler of another lord. Such being the case, the wrestler who was strong and won for his lord many laurels enjoyed warm patronage. Public estimation of wrestlers in those days was unusually high. During the Tokugawa era, which extended for nearly 300 years

before the Meiji Restoration (1868), a wrestling tournament was organized, and in January and May of each year the best wrestlers of the Kwanto district (Eastern Japan) gathered for it at Ryogoku, Yédo (present Tokyo). Rankings were decided on the basis of the showing made at the tournaments, and the wrestlers exhibited great enthusiasm in their matches. This custom remains even to this day.

Until late in the Meiji Era (1868–1912), Japan had two major wrestling organizations, one in Tokyo and the other in Osaka, but later they merged into one organization. At the end of 1931, however, the Japan Wrestling Association had internal trouble. To be more precise, many wrestlers became dissatisfied with the traditional system of distribution of profits because the retired wrestlers, who acted as officials of the association, took the major part, virtually disregarding the wrestlers on the actives list. The trouble divided the wrestlers into three separate groups. In addition to the one which remains in the association, there were the Shinko and Kakushin groups. The latter two groups adopted new rules for wrestling. Of the two the Kakushin group headed by Tenryu and located in Osaka has survived outside of the traditional group in Tokyo.

The semi-annual tournaments of the Japan Wrestling Association are held at the Kokugi-kan amphitheatre at Ryogoku, Tokyo, in January and May. Each tournament lasts for 11 days, The wrestlers are all professionals, and the majority of them have unsually well-developed bodies. Victory in a typical Japanese wrestling match is a matter of a minute or two. Very often it is a matter of a few seconds. The wrestler who forces his opponent to fall or even let any part of the body above the knee touch the ground or to jump out of the ring is declared by the umpire to be the winner. It is said that there are 48 different ways of defeating an opponent. Wrestling is also practised widely in schools, as are jujitsu and fencing.

The list of principal sumo wrestlers, in May, 1937, follows :

In the order of seniority in the East camp, Tamanishiki (Yokozuna or Grand Champion) ; Musashiyama (Haridashi-Yokozuna, or No. 2 Grand Champion) ; Futabayama (Ozeki, or Champion) ; Daikyuzan (Sekiwake, or Champion No. 2) ; Tamanoumi (Komusubi, or Champion No. 3).

In the order of seniority in the West camp, Minanogawa (Yokozuna, or Grand Champion) ; Shimizugawa (Ozeki, or Champion) ; Kagamiiwa (Haridashi-Ozeki, or Champion No. 2) ; Asahigawa (Sekiwake, or Champion No.3).

Jujitsu (Judo)

Jujitsu, more popularly known as judo, is more a military art than a sport. In olden times, this art of self-defence was widely practised among the warriors, to whom it came next to kenjutsu, or fencing, in importance. One essential difference between wrestling and jujitsu is in the use of strength. The wrestler as a rule throws down his opponent by his own strength, but the jujitsu expert uses little of his own strength, rather taking advantage of the weight and strength of his opponent in hurling him to the floor. Action is unusually swift, and a good expert of jujitsu can easily dispose of a dozen non-jujitsumen in a fight.

This manly art of self-defence was developed to its present popularity and prosperity chiefly by Prof. Jigoro Kano, promoter of the Kodokan style of jujitsu and head of the Kodokan, the leading jujitsu training gymnasium in Japan. Since he established the Kodokan in 1886, he has turned out thousands of experts, and these experts in turn have popularized the art throughout the length and breadth of the land. After the Russo-Japanese War, jujitsu became popular in foreign countries, where Japanese instructors were invited to teach it. Some foreign writers became enthusiastic over the art, which they said embodied the sprit of the Japanese race, and even went the length of declaring that to it the Japanese owed in large measure their brilliant victory in the Russo-Japanese War, the first war in which an Oriental nation defeated a major Western Power.

At present jujitsu is practised in all middle schools and other higher schools in Japan for its value in physical and mental culture. Many schools have teams, and as with baseball and tennis these teams have seasonal clashes. Private clubs and training halls are found in all cities of Japan. Experts receive degrees from the Kodokan.

The list of Japan's outstanding jujitsu experts of the Kodokan includes Nagaoka and Isogai, both holders of Kudan, the highest rank Iizuka, Samura, Tabata and Mifuné, all holders of hachidan, a rank next to the highest.

Kendo (Japanese Fencing)

Together with Judo, the study of Kendo was carried on among the Samurai and several hundred forms of fencing

were propagated throughout the country. At the present time, there are about 30,000 people who are taking up this sport, if we include those in the middle schools, colleges, universities, and in private life. This sport is to hold the sword with both hands and to stike the face, forearm, or torso of the adversary.

Boxing

Boxing is a Western sport which has earned phenomenal popularity in Japan during the past few years. Earlier, interest was quite negligible. The rapidity with which boxing has become popular in this country owes much to American motion pictures, which introduced it. The hero who gives the villain a black eye and finally knocks him down caught the fancy of the Japanese people, and films recording the major bouts of the past decade, including the famous Dempsy-Tunney fight, also went a long way toward creating interest in boxing here.

Boxing clubs are to be found in all leading cities of Japan. In Tokyo there are about 20 professional clubs which from time to time arrange bouts for the public. There are, of course, champions, both professional and amateur. Foreign boxers are invited to fight Japanese pugilists. Intercollegiate boxing bouts are as popular as professional bouts and draw a heavy attendance, often several thousand men and women. It is only during the past few years, however, that boxing has paid its way.

Records show that boxing was first introduced to Japan by foreign sailors in the early years of the Meiji Era (1868–1912) at Yokohama, where they landed and held a few bouts among themselves. It is also recorded that a foreign sailor had a dispute with a Japanese samurai on the street and knocked him down in the clash which followed. The first boxing club in Japan was organized in 1910 by Mr. Kenji Kano. In about 1920, American motion pictures introduced to Japan many scenes in which boxing was employed. In the meantime, Mr. Yujiro Watanabé, trained by the noted negro fighter, Turner, returned to Japan and established a club of his own to train many youths in the pugilistic game.

Japanese boxers participated in the World Olympic Games for the first time in 1928 at Amsterdam. Of the two entrants, one lost the first tussle, but Kintaro Usuda, a welterweight, won two bouts before losing in the quarter-finals. In the Tenth Olympiad, held at Los Angeles, the Japanese boxers made an insignificant showing, not one winning a single bout. In 1931, the All-Japan Professional Boxing Association was organized to control professional boxing.

The second national boxing championship tournament was held for eight days, beginning December 20, 1935, under the joint auspices of the Japan Professional Boxing Federation and the Tokyo Nichi-Nichi Shimbun. The final bouts were staged at the Kokugikan wrestling bowl, Ryogoku, on January 6, 1936, resulting in only two champions defending their title successfully.

More than 150 boxers, mostly from Tokyo, Nagoya, Kobé, Osaka and Seoul, took part. The championships were contested in five different divisions—flyweight, bantamweight, lightweight and welterweight. The participants were divided into two classes, A and B. 30 leading fighters who appeared as favourites for championship honours were seeded in A class, and all others were included in B class. The New York Commission rules were applied to the tournament.

Results of the final round, a 10-round bout each, were as follows :

Flyweight : Yoichiro Hanada (Imperial Club) defeated Isamu Ito (Imperial Club) on points.

Bantamweight : Umio Gen (Imperial Club) defeated Shoichi Otsu (Kyokuto Club) on points.

Featherweight : Sanekatsu Koike (Dai-Nippon) Knoked out Goro Takatsu (Olympic Club) in the ninth round.

Lightweight : Ichiro Mitsuyama (Imperial) won a technical Knockout over Kotaro Suzuki (Imperial), in the seventh.

Welterweight : Yoshio Natori (Tokyo) defeated Riichi Sato (Toho) on points.

Challenge bouts for three championships, flyweight, bantamweight and featherweight, over 12 rounds each, were held on September 14, 1936, and March 7, 1937, in Tokyo, and were resulted as follows :

Bantamweight—Shoichi Otsu (Kyokuto Club), 116 pounds, challenger, captured the title by outpointing Umio Gen (Imperial Club), 118 pounds, the champion.

Flyweight—Handa (Imperial Club), 111 pounds, defended his title by winning a decision over Hajime Sakamoto (Tokyo Club), 108 pounds.

Featherweight—Umio Gen (Imperial Club), 124 pounds, won the title by outpointing the defender Sanekatsu Koike (Dai-Nihon Club), 126 pounds.

The final tryout to select five members of the Japanese Olympic boxing team was held on April 8 at the Hibiya Public Hall, participated by those who

were qualified in the four districts eliminations, Kwanto, Kwansai, Chubu and Korea.

Winners were :

Flyweight : Chiyondo Nakano (Senshu U., Kwanto) defeated Teichu Kin (Korea) on points.

Bantamweight : Shumpei Hashioka (Kwanto) defeated Hikomasa Tajima (Kwansai) on points.

Featherweight : Sajiro Miyama (Chubu) defeated Katsuo Kameoka (Kwanto) on points.

Lightweight: Eikichi Nagamatsu (Meiji U., Kwanto) defeated Ryutoku Sai (Korea) on points.

Welterweight : Keikan Ri (Korea) knocked out Yasuo Nakada (Kwansai) in the second round.

Football

Rugby Imported from England, this winter sport has gained much popularity during the past decade. The leading universities in Tokyo have a league, and their matches draw large crowds. Japan and Canada have exchanged teams during the last few years. The all-Japan team which invaded Canada left a very impressive record, winning several matches and losing none.

Soccer Soccer is also fast gaining popularity here. The Football Association was organized in September, 1921, in Tokyo, and since then an annual national championship game has been held.

Results of the Kwanto Inter-Vasity Rugby League, 1936 were as follows :

	Waseda	Meiji	Keio	Rikkyo	Hosei	Shodai	Imperial	Won
Waseda	×	1	1	1	1	1	1	6
Meiji	0	×	1	1	1	1	1	5
Keio	0	0	×	1	1	1	1	4
Rikkyo	0	0	0	×	1	1	1	3
Hosei	0	0	0	0	×	1	1	2
Shodai	0	0	0	0	0	×	1	1
Imperial	0	0	0	0	0	0	×	0
Lost	0	1	2	3	4	5	6	

Waseda won the championship

The deciding match for the national collegiate title between Waseda, the Kwanto champion, and Doshisha, winner of the Kwansai League, ended in a victory of the former by a close score of 9 points to 8. Waseda scored three tries while Doshisha made one try and a goal. The match was played at the Hanazono stadium, Kyoto, on January 4, 1937.

The 1936 season was fortunate with the visit of the New Zealand universities team which gave execellent performance both in Osaka and Tokyo, winning six matches and drawing one. This was the first time the Japanese college team met such a strong team as New Zealanders and learned much of tactics and kicking. Their matches were witnessed by a large crowd everywhere they played, averaging 10,000 spectators.

The results of the matches were :

Jan. 26, won over the All-Kwansai, 31 points to 3 ; Jan. 30, won over Keio, 23 to 6 ; Feb. 2, won over Meiji, 13 to 11 ; Feb. 6, won over Waseda, 22 to 17 ; Feb. 9, won over the Japanese all-star students, 16 to 9 ; Feb. 11, won over the All-Kwansai students, 23 to 8 ; and Feb. 16, drew with the Japanese all-star students, 9 to 9.

Members of the team :

Mr. P. Martin-Smith, manager and coach ; G. A. Parsons (captain), R. G. Bush, G. G. Rae, C. C. Gillies, E. Grant, F. J. Wilson, W. R. Laney, H. R. C. Wilde, H. H. Fookes, J. D. Lewis, D. O. Hudson, R. J. Thomas, W. Tricklebank, J. M. Watt, S. G. Eade, O. W. Chapman, J. P. McVeagh, J. J. McAuliffe, B. U. A. Jones, R. B. Burke, S. W. Simmers, L. S. Drake, I. O. Stance and E. K. Chesterman.

The team arrived in Kobe on January 23, 1936, at the invitation of the Japan Rugby Football Union and left for home on February 17, sailing from Nagasaki on the Kitano Maru.

The Tokyo Collegiate Soccer League, formed in 1923, now boasts of 33 members which are divided into six divisions. Results of the first class matches of the League in 1936 were as follows :

	Waseda	Keio	Bunri	Imperial	Shodai	Nodai	Won	draw
Waseda	×	1	1	1	0	1	4	0
Keio	0	×	d	1	1	1	3	1
Bunri	0	d	×	0	1	1	2	1
Imperial	0	0	1	×	1	0	2	0
Shodai	1	0	0	0	×	1	2	0
Nodai	0	0	0	1	0	×	1	0
Lost	1	1	2	3	3	4		

d indicates draw
Waseda won the pennant

Waseda defeated the Kobe Shodai, the Kwansai champion, by 3 goals to 2, to win the national collegiate title for the fifth consecutive times. The match took place at the Koshien stadium, Osaka, on December 13, 1936.

Rowing

This is one of the Western sports introduced to Japan early in the Meiji Era. The Tokyo Imperial University took it up first. Japan's rowing team did not fare well at the Tenth Olympic Games at Los Angeles. Lack of training and poor physical power were blamed for the defeat. The leading universities have races on the Sumida River each year.

The 16th annual Kwanto inter-college rowing championship meet was held on the Ogu course on River Ara, Tokyo, on September 12 and 13, with 16 entrants. Results were :

Four-oared shell championship (2,000 metres)—Won by the Nihon University crew in 6 minutes 56.4 seconds, beating the Tokyo University of Commerce team by 17 seconds.

Eight-oared shell championship (2000 metres)—Won by the Tokyo University of Commerce team in 6 minutes 31 seconds, beating the Meiji University eight by one length and a quarter.

The 9th annual Japan open rowing championships were held on River Seta, Otsu, Shiga prefecture, near Kyoto, on September 23, 1936. Resuts were :

Four-oared shell championship (2,000 metres)—Won by the Nihon University in 6 minutes, 33 seconds, beating the Osaka Imperial University crew by 16 seconds.

Eight-oared shell championship (2,000 metres)—Won by the Tokyo University of Commerce eight in 5 minutes, 24 seconds, beating the Third Higher School of Kyoto by 15 seconds.

Prior to its participation in the Berlin Olympic regatta, the Japanese Olympic crew, Tokyo Imperial University eight, caused a sensation in England when it defeated the Thames Rowing Club by a length and half in the finals of the Marlow Grand Challenge Cup race, held on the 1,540-yard course on River Thames on June 20, 1936. The Japanese crew's winning time was 4 minutes 9 seconds, a new course record. It eliminated the Cambridge Varsity crew by three-quarters of a length in the semi-finals on the same day. It was the first rowing victory by Japanese oarsmen abroad.

Later, the Tokyo Imperial University crew took part in the Henley Regatta, started on July 1, and lost to the Zurich crew in the semi-finals on July 3. The Japanese eight lose to Zurich by 6 lengths. Members of the Tokyo Imperial crew were :

Position	Names	Age	Height	Weight
Cox	Tadashi Kirishima	23	5.1 feet	96 pounds
Stroke	Tadashi Negishi	23	5.6	129
7	Katsu Kashiwabara	21	5.6	137
6	Mondo Sekigawa	22	5.9	160
5	Isamu Mita	22	5.9	140
4	Osamu Kitamura	23	5.6	143
3	Haruyoshi Nakagawa	23	5.7	143
2	Takeo Hori	22	5.6	132
Bow	Yoshiteru Suzuki	24	5.5	130

Average height	5.6 feet
Average weight	134 pounds
Coach	Mr. Shuhei Seta

Horsemanship

Japan's horsemanship won international recognition at the Tenth Olympiad at Los Angeles when Lieutenant Baron Takeichi Nishi, of the Japanese Army, won the Prix des Nations and had the flag of the Rising Sun hoisted. Horsemanship was widely practised by the warriors of the feudal period as a military art. The Japanese army attaches importance to horsemanship and takes great pains in training officers and men. Horsemanship is also gaining popularity among college students and even women. There are at present about 15 clubs in large cities, and many universities and colleges have their own riding societies. Horse racing regained popularity with the use of pari-mutual tickets under strict restrictions in 1923. The Government encourages racing by granting aids. There are more than a score of race clubs throughout the country, most of the races being held semi-annually, that is in the spring and autumn.

Golf

Once a pastime of the wealthy, golf is beginning to become popular with the opening of public courses. Clubs are to be found in practically all large cities and their environs. A group of Japanese golfers visited the United States in 1932 and participated in national and State tournaments. Although they failed to win any title, they made impressive records. The list of golf links follow :

Name	System	Number of Courses	Prefecture
Tama	Club	18	Tokyo

The following list shows the winners in the annual National Open Golf Championship tournament :

1927	Rokuro Akaboshi
1928	Rokuzo Asami
1929	Tomekichi Miyamoto
1930	Tomekichi Miyamoto
1931	Rokuzo Asami
1932	Tomekichi Miyamoto
1933	Kamekichi Nakamura
1934	Abandoned by storm
1935	Tomekichi Miyamoto

National Amateur Championship tournament

1921	Zenzaburo Tanaka
1922	Komei Otani
1923	Abandoned by the great earthquake
1924	Hajime Kawasaki
1925	Hajime Kawasaki
1926	Shiro Akaboshi
1927	Shunkichi Nomura
1928	Shiro Akaboshi
1929	Brown
1930	Rokuro Akaboshi
1931	Kyoichi Nitta
1932	Kihei Narimiya
1933	Naoyasu Nabeshima
1934	Naoyasu Nabeshima
1935	Naoyasu Nabeshima
1936	Giichi Sato
1936	Tomekichi Miyamoto
1927	Seisui Chin

Chin (Musashino Country Club, Tokyo) defeated Rokuzo Asami (Hodogaya Country Club, Kanagawa) by seven strokes in the 1937 tournament which was played on the Sagami course, Kanagawa prefecture, for three days beginning June 3. Chin's aggregate score was 284 (69, 77, 68, 70). 84 players took part in the contest.

(National Amateur)
1927 Giichi Sato

The 30th national amateur championship tournament was held for three days, commencing on May 12, on the Hirono course, near Kobe.

Semi-finals

Naoyasu Nabeshima beat Kihei Narimiya, 5 and 4.

Giichi Sato beat Tamajiro Matsuyama, 4 and 3.

Finals

Sato beat Nabeshima, 6 and 4, thus defending his title successfully.

National Professional Championship tournament

1931	Rokuzo Asami
1932	Montess
1933	Montess
1934	Tomekichi Miyamoto
1935	Toichiro Toda
(National professional)	
1936	Tomekichi Miyamoto

Miyamoto beat Jiro Morioka (Naruo Country Club, Osaka) in the final by 4 and 3 on the Wago course near Nagoya on September 17.

Skiing and Skating

Introduced here only a decade or so ago, skiing has become extremely popular. Japan abounds in good grounds in the northern districts, which accounts for the rapid strides skiing has made. Numerous women are taking to it of recent years. In 1929, Hannes Schneider, prominent Austrian skiier, visited Japan and exhibited his technique at various skiing slopes at Akakura, Myoko, etc., making a great impression among Japan's ski lovers.

Skating is an older game than skiing in this country. As a sport for the general public, an exhibition was first given about 1907 on Lake Suwa, in Nagano prefecture. The All-Japan Skating Championship Meet for speed skating, figure skating and ice hockey is held there yearly. At Nikko, a rink of tremendous size was laid in the winter of 1932 to permit the public to enjoy the pastime. In 1934, Japan invited Miss Bruger, the figure skater and the Canadian Ice Hockey Team. She sent 11 skiiers, 7 speed skaters, 3 figure skaters, 15 ice hockey players, and 13 officials who all participated actively in the 11th Olympiad at Gürmisch. A list of important ski grounds follows :

Name	Prefecture

ALPINE SKII GROUNDS

Shirouma	Nagano
Norikura	,,
Kamikochi	,,

Most of skii grounds have shanze, and such grounds as have complete equipments are as follows:

Akagi, Sankakuyama, Nozawa, Iiyama, Numajiri and Toyohara

Other Sports

Basketball Basketball is very popular not only among boys but girls in secondary and higher schools. The Meiji University basketball team invaded the United States in the winter of 1932 and 1933, but it made an insignificant showing.

At the joint invitation of the Japan Basketball Association and the Hochi Shimbun, an American all-star basketball squad of eight men headed by Mr. Clarence Anderson, assistant basketball coach of the University of Southern California, arrived in Yokohama May 5, 1935. The Americans stayed in this country for a month during which they played eight games and one exhibition match with the leading Japanese teams, winning all. Their visit benefited the basketball cirle of Japan a great deal, mastering American's excellent tactics in both defence and charge.

Results of the games were :

Americans 33-25 Tokyo Imperial University team (Tokyo) ; Americans 38-23 Japan's pick-up student team (Tokyo) ; Americans 34-14 All Japan (Tokyo) ; Americans 36-23 All Japan (Osaka) ; Americans 64-32 Kyoto Imperial University team (Kyoto) ; Americans 22-15 All Japan (Tokyo) ; Americans 52-24 All Japan (Tokyo) ; and Americans 74-29 All Niigata (Niigata).

Members of the American team were :

William Pierce (U.S.C.), Richard Linthicum (University of California), Donald Piper (U.C.), George Brotlemarkle (U.C.), Kenneth Fagans (Oregon State College), George Curtner (University of Pittsburgh), Duane Swanson (University of Iowa) and Victor Larkin (U.C.).

Volley-ball This sport came to Japan with basketball and is now quite popular among school girls. National championship games are held annually.

Hockey Hockey is more or less a novelty in Japan. It was in November, 1920, that the first national tournament was held, when the Waseda University team captured the honours. At the Tenth Olympiad at Los Angeles, the Japanese team beat the United States squad and finished second behind the Indians.

American Football The American football game was introduced by the picked Japanese student team (formed mostly with the American-born Japanese boys, studying in Tokyo) and the Y. C. and A. C. eleven (foreigners' athletic club in Yokohama) on the Thanksgiving Day, November 29, 1934, at the Meiji Shrine stadium. The game ended in a victory of the Japanese students who shut out the foreigners 26 to 0. The Tokyo Collegiate American Football League was formed among Meiji, Waseda, Rikkyo, Hosei and Keio in December of the some year.

In March, 1935, the Asahi Shimbun invited 35 leading football players from the United States, selected from several universities in the Pacific Coast, who gave a series of exhibition games in Tokyo, Osaka, Nagoya and Fukuoka. The American football players were led by Mr. Albert L. Maloney star quarterback of the University of Southern California eleven.

Tokyo Collegiate American Football League

1934	Waseda
1935	Meiji
1936	Waseda

Waseda and Meiji tied for first place with three wins and one defeat, and the former defeated Meiji in the pennant deciding game by 7 to 0.

Twenty selected players from the Waseda and Meiji teams, toured Hawaii and the United States for a short period in December, 1936, and January, 1937. They played only two games and resulted as follows :

Southern California all-star high school squad beat the Japanese team by 19 to 6.

Japanese team drew with the Roosevelt High School of Honolulu, 0-0.

Wrestling Wrestling in Japan has not shown sufficient progress but this country has sent representatives to both the Olympiad in Paris and Los Angeles and they have left excellent records. In 1934, with the establishment of the Japan Amateur Wrestling Association, this sport has been taken up by many universities and Japan sent 2 wrestlers in the bantam weight, 3 in the feather weight, 2 in the light weight, 1 in the welter weight, and one substitute each for the bantam and the welter weight respectively to the 12th Olympiad in Berlin.

Fencing This sport is still in the elementary stage in Japan. With Hosei University taking the lead, teams have been formed in other universities and women fencers are increasing in number.

CHAPTER XXXVII

AMUSEMENTS AND CALENDAR OF ANNUAL EVENTS

Amusements

The Drama

Japan has a drama all her own. The popular stage is the "kabuki", essentially a product of past ages, which, with its enchanting beauty and gorgeous colour, often captivates the fancy of foreign visitors. The kabuki drama is not old as age goes in Japan. It sprang spontaneously from the people, the tradesmen, the artisans and others who were excluded from the pleasures enjoyed by the aristocrats and samurai in olden days; but its forbears may be recognized in the stage art of Japan prior to its birth.

The Origin The religious dance that was the precursor of drama goes back through centuries to the mythological age of the gods, when the great Sun Goddess, offended by her brother, retired to a deep cavern, casting the world into darkness. After trying in vain to entice her from her retreat, the other gods finally hit upon the scheme of flashing a metal mirror into the cave and of jumping and shrieking before its mouth, whereupon the Sun Goddess came forth, the mouth of the cave was sealed, light was restored to the world and the dance was added to civilization.

For centuries the dance remained, as in other countries, a religious rite, being performed in Shinto shrines by virgins. With the incoming of Chinese culture Chinese music came into favour and was introduced into the Imperial Court. At the time of the establishment of the first Shogunate, that at Kamakura in the 13th century, the Buddhist semi-dances and semi-drama made a great appeal to the warrior class, and from them was evolved the "no" drama, in which both actor and playwright are subservient to interpretation. The No is a combination of music, posturing and dialogue, severely bound by conventions, with but little action, appealing to the ear and intellect rather than to the eye. The No found warm patronage among the warriors and feudal lords, continuing to hold its own with them until the Meiji Restoration, when it was identified with the then unpopular Shogunate and suffered a decline which has only recently been mitigated.

But the common people had no part in either the religious or the No dances, not even appearing as spectators. These were the exclusive prerogative of the upper classes.

Popular Stage Appears It was during the early part of the long Tokugawa Shogunate that the popular stage in Japan came to birth, flowered and bore fruit. An era of peace was ushered in, and the Empire began to prosper in a material way. Not only the kabuki, but the ukiyoyé, or woodblock colour print, and other genre date from this period. The people had leisure, money and the inclination for pleasure. It was but natural that forms for providing that pleasure should follow.

The germs of the popular drama may be found in society prior to this period, but they had not attained much development. About 370 years before, one of the Shinto shrine dancers, O-Kuni, performed on a public street in the capital city of Kyoto, after which she wandered from place to place for the entertainment of the people. Others followed her lead, until the government decreed that thereafter only men might give public entertainments, owing to the moral laxity which had ensued. The name kabuki was first applied to this pioneer form of dancing. Although the Chinese ideographs forming the word mean literally "singing and dancing art," Japanese scholars say that its true derivation is from an obsolete Japanese verb meaning "to be playful."

The Kabuki The early kabuki actors were social outcasts, or kawara-mono (river-bed folks), but as the aristocracy learned of the new art and its charms they secretly slipped away from their palaces and homes to enjoy it. Gradually, as in other nations, the moral and social level of the stage was raised, until today there is no more social prejudice against the actor in Japan than in America or Europe. The late Emperor Meiji's attendance of a performance by a troupe of kabuki actors at the home of the late Marquis K. Inouyé improved

their status immeasurably.

The introduction of the samisen, or three-stringed guitar, into Japan from the Loochoo Islands constitutes another high-water mark for the drama, for in time the musical compositions for the No were adapted to this instrument of the streets, and there followed the puppet show, which has survived to this day. These marionette theatres called to their aid some of the best talent in the country, musicians, playwrights and puppet manipulators collaborating in the work. The kabuki emerged from the street dancing and the puppet show and yet as a separate and distinct art of a high order.

The kabuki is found to embrace four general classifications : historical dramas, plays of everyday life, fantastic, imaginative improvisations, and music-posture plays or dances. It is often difficult, however, to assign any particular drama to one of these four classifications, for the play with historical characters may also be a play dealing with their very human emotions.

The Technique The drama is primarily a picture for the eye, although dialogue is carried on and an orchestra-chorus seated on the stage plays very much the same rôle as was played by the chorus in classical Greek drama, aiding the action with explanations to the audience. The life and thought, costumes and manners of all classes of feudal society are well illustrated on the kabuki stage, while skilful colour combinations in costumes, stage architecture and furniture tend to carry the spectators into a land of imagination and romance. In dramatic ability it takes rank with that of any country. In stage settings and mechanics it has much to teach the rest of the world. Its gorgeousness of costuming and pageantry finds no equal. One of the features of the Japanese theatre is the hana michi, or flowery way, which usually consists of two long narrow platforms on the same level which stretch through the audience from the stage to the rear of the auditorium. They are chosen by the actors for their best entrances and exists and are extremely effective when processions are used.

The Kabuki Actors The profession of kabuki actors is in most cases hereditary. Sons of actors succeed their fathers in the profession, and actors without sons usually adopt the sons of other actors or their best disciples and give them the stage names of their families. Kikugoro Onoyé, one of the most accomplished actors, is the sixth Kikugoro Onoyé, while the late Danjuro Ichikawa represented the ninth generation of the Ichikawa family. Kabuki actors are trained from childhood and because of the difficult conventions to which they must conform few men can become actors after the age of 20.

In kabuki proper, all rôles are taken by men. The onnagata, or woman impersonators, devote years of study to femininity, and in most cases they are more consistently feminine than women.

In comparison with screen actors, kabuki actors are very well paid. Though the matter of salaries is kept a strict secret, it is well known that a high-class kabuki actor is given more than ¥10,000 a month, but in cinema circles very few actors obtain as much as ¥1,000. Stage actors are also held in much higher esteem by the general public than screen actors. They still live and work according to the family system. A high-class actor has a troupe, all the members of which are his disciples. Only the head of the troupe receives wages directly from the theatre, and he in turn divides the money among his disciples. Other feudal customs also survive among them.

Tokyo is the dramatic centre of the country. Practically all first-class kabuki actors live here, though there are a few in Osaka. They travel all over the country from time to time. The more noted ones in Tokyo are Utayemon Nakamura, Uzayemon Ichimura, Kikugora Onoyé, Sadanji Ichikawa, Koshiro Matsumoto, Kichiyemon Nakamura, Sojuro Sawamura, Ennosuké Ichikawa and Mitsugoro Bando. The noted Osaka actors include Enjaku Jitsukawa, Fukusuké Nakamura and Kaisha Nakamura.

On the business side, kabuki is controlled entirely by a single commercial organization, the Shochiku Theatrical Company. This company not only has all the first-class actors under contract but owns or leases all of the principal playhouses throughout the country. The largest and most famous theatre is the Kabuki Theatre, commonly known as the Kabuki-za, situated back of the Ginza, Tokyo. Other well-known theatres in the capital are the Tokyo Theatre, Meiji-za, Shin Kabuki-za and Shimbashi Embujo. The Imperial Theatre, which once earned fame as a modern playhouse, has been converted into a cinema house. Osaka has the Naka-za and Naniwa-za, where Kabuki programmes are given practically throughout the year. The theatres change programmes once a month, and very sel-

dom, if ever, are long runs given, no matter how popular a particular programme may prove, although the pieces which prove popular are repeated from time to time as long as they hold public interest.

The Typical Programme A typical kabuki programme has three to five offerings of different types and lasts six hours, beginning at 4 o'clock in the afternoon and ending at 10 o'clock. The majority of the spectators take dinner in restaurants in the theatre during intervals. Tickets cost from 50 sen to as much as ¥7 or ¥8 a seat. All the playhouses are of Western style, at least inside, with chairs provided. Seats may be reserved 10 days in advance.

It is wrong to assume that Japanese actors specialize in producing classics alone. From time to time they insert modern plays between those of bygone generations on the programmes. In the past they have even staged plays from Shakespeare with marked success. Some actors specialize in modern plays, such as Masao Inouyé, Takeo Kawai, Rokuro Kitamura and they appear with actresses, such as Yayeko Mizutani, as the latter are essential for the realistic type of plays, plays which are true to life and without the incongruity and exaggeration which characterize the kabuki.

A "little theatre" movement in Japan was started about 15 years ago, led by the late Kaoru Osanai, prominent dramatist and stage director. The group which performed at the Tsukiji Little Theatre, Tokyo, produced hundreds of Western plays in Japanese translation, but their performances aroused the interest of only a limited section of the intellectuals. The unexpected death of Mr. Osanai and the business depression that followed dealt a crushing blow to the movement and the company split up into small and unimportant groups.

The Revue The revue, a product of the West, is quite in vogue at present in Japan. Imported only a few years ago, it appealed to modern-minded youth, and several revue organizations sprang up. The largest troupe is that of the Shochiku Theatrical Company, with several hundred girls. Another influential organization is the Takarazuka Girls' Opera Troupe, with headquarters at Takarazuka, a hot-spring resort between Osaka and Kobé. It enjoys the distinction of being the oldest in Japan, having been organized nearly two decades ago. The performances of the latter group include operas and revues and are generally more refined than those of the Shochiku Troupe, and they find warm patronage among young girls. Costumes and scenery in the revues are both Japanese and foreign. The Shochiku group gives occasional performances in Tokyo and Osaka, and the Takarazuka organization set up a new Tokyo Takarazuka Theatre in 1933 at Hibiya, Tokyo.

The Odori Differing entirely from this type of foreign-style performances is the "odori", or Japanese dance, as given by the geisha, the native dancing girls. Kyoto, the ancient capital, boasts the best organization, which gives the "Miyako Odori" each April, better known to foreigners as the Cherry Dance of Kyoto. In Tokyo, the "Azuma Odori" (dance of eastern capital) is given at cherry-blossom time by the geisha of the Shimbashi district of the city, who also perform in the autumn, always in their own theatre, the Shimbashi Embujo, which is of Western style. Geisha dances can be enjoyed at private parties at any time of the year.

No Drama

The No drama was as aristocratic as the kabuki drama was plebeian, and even now its performance and enjoyment are practically restricted to the upper classes. There are very few theatres or private houses, if any, where strangers are allowed to view No upon payment of admission. Most No enthusiasts form clubs, and members and their friends see the productions. In feudal Japan, the No was the principal form of entertainment among the aristocrats and the warrior class. It was often given in the presence of the Emperor, and at one time it was the custom to invite the common people to performances given in commemoration of some happy event by the Tokugawa Shoguns, who used the No on all ceremonial occasions.

The Origin and Stage The origin of the No dates back to the early part of the 15th century. Two men, Kiyotsugu Kan-nami and his son, Motokiyo Séami, revolutionized the "Saru-gaku", an ancient form of dance, consisting of juggling feats and comic remarks with actions to suit, with the result that the No in its present form was developed. Not only did these two men build on what was best in their own saru-gaku, but they drew freely from the "dengaku", ancient music, which had much in common with the saru-gaku. What was graceful in them was ennobled to profundity in the No, while their comic elements developed into the "kyogen", comic performances, usually given on the same programme with No pieces.

Unlike any other form of drama, the No is performed on a wooden stage of regulation size, built above the ground, 18 feet square, open on three sides, with a narrow extension on one side for the singers and another at the back of the stage for the musicians and attendants. To that rear extension is attached aslant a passage called a bridge. The players appear from under the curtain, to one end of which the passage slightly slopes down. The stage, too, is very slightly tilted to the front.

The No pieces, numbering more than 250, are repeated over and over again, but the interest of the spectators apparently never wanes. The pieces are classified into five groups for convenience: (1) "wakino", which generally deal with Shinto or Buddhist deities; (2) "shuramono", which commonly deal with ghosts of warriors; (3) "kazuramono", with noble ladies acting the main parts; (4) "genzaimono", or present-day pieces, dealing with various manifestations of human nature; (5) pieces dealing with demons or goblins as subjects, or those of congratulatory nature with gay and joyous elements.

For each programme of the No, which generally lasts a good part of a day, one from each of the above five classes is given in the order mentioned, with a "kyogen" between each and generally a dance in ordinary dress in addition. The whole programme is preceded by a piece called "okina", which is held in special reverence; the person acting its chief character is the okina, an old man.

The Construction The construction of the No piece is by no means uniform, but very often it is as follows: A "waki," who plays the secondary rôle, generally a monk or a Minister of State, first appears and tells who he is. Then he walks about the stage a while, singing, to suggest that he is travelling. Coming to a standstill, he announces his arrival at a certain famous spot and takes his place by the post at the front righthand corner facing the stage. Then the "mayé jité" (shité), the principal character in the first appearance, comes in the form of a farmer, fisherman or priest, describing the scenery of the place and telling of heroes connected with it, or relating the origin of the temple or shrine as the case may require, thus furnishing the audience with a necessary background to the play. The "mayé jité" then suddenly retires from view. He was in reality a Shinto or Buddhist deity, or the ghost of a warrior, in disguise. While the "waki" is startled by this sudden disappearance, there come on the stage common farmers or wood-choppers who give in plain language, spoken more or less in the ordinary way, all detailed information concerning the place, generally reiterating what has alreary been chanted or intoned by the "mayé jité," and then retire. This allows necessary time for the principal character to change for his reappearance, While waiting, the "waki sings," indicating a lapse of time. The song ended, the "nochi jité," the principal character in the latter appearance, in proper form and attire as a Shinto or Buddhist deity or the spirit of a hero, comes to the stage and dances as though wandering at night, revealing some spiritual attributes. In words and in action he recounts his bravery, his death struggle, or his suffering in the underworld, asking for the prayer of the "waki" for the peaceful repose of his soul. The "shité" tells his story as he performs, or he merely dances without any chanting. Generally there is a chorus who intone some verses either alone or with the performers. In the No drama, the action is symbolic, stately and ennobling.

Generally several persons sitting on the side extension sing either in chorus, by themselves, or together with the performer. On the rear extension there are usually four musicians who play on the "fué" or flute, the tsuzumi, which is a small drum struck with the tips of the fingers and resting on the shoulder, the ohkawa, a slightly larger drum struck on the knee also with the tips of the fingers, and the drum beaten with two sticks.

The accessories used on the stage in connection with the play are very simple. A fan is much in evidence in the dance, the studied use of which is very effective with the manipulation of the dancer's big sleeves. The costumes used in the No are marvels of textile fabrics, refined taste being revealed in bold yet harmonious designs and colours. Above all, the mask to be worn by the principal character and the assistant is a very important part of the No performance. There have been great masters among carvers of No masks in his feudal Japan many of whose works still remain.

Six Schools. Ever since the great reformation at the beginning of the 15th century, the No has had four main acknowledged schools or houses: Kwanzé, Komparu, Hosho and Kongo, all of which are still thriving. Later, another school, Kita, won official recognition, while still another, Umekawa, also has

many followers, the variation practiced by each school being but slight. On the whole, the No performance may well be compared to a masterful Oriental picture in monochrome, both being guided by highly idealistic aims and artistic aspirations with many points in common, possessing alike great impelling qualities that thrill the devotee but sometimes weary the uninitiated.

The Doll Theatre and Joruri

Japan's doll theatre, the precursor of the kabuki drama, has suffered so much decadence that now the Bunraku-za in Osaka is the only doll troupe of its kind in the country. The plays are kabuki in miniature. Each doll, slightly smaller than life-size, is held by a manipulator on the stage and made to act. The manipulators, who appear in ceremonial robes, put life and spirit into the wooden figures, and they have world fame for their dexterity.

The "joruri (Gidayu)", a dramatic recitation, is not only inseparable from the doll show, but enhances its effect. The joruri reciter usually sits on a raised platform at the right corner of the stage and there sings and recites to the accompaniment of the samisen, the player of which sits beside him. Not seldom several reciters and samisen players perform in unison, the reciters speaking their lines for the dolls. Both manipulators and singers are trained from childhood. The joruri recital often accompanies the kabuki performance. The joruri or Gidayu is also sometimes recited independently of the doll show or the kabuki.

Yosé, or Story-Telling

Professional story-telling is a distinct Japanese art, which, defying the advent of the movies, still survives in Tokyo and elsewhere. When there were no movies, story-telling was one of the few common forms of amusement. The houses where the story-tellers perform are called yosé, and are a sort of variety hall, where singing, juggling, dancing and other entertainments are offered in addition to story-telling.

Today a score of story-tellers' halls can still be found in Tokyo. Unlike theatres for the drama and the cinema, they are usually Japanese-style frame houses, with quite modest advertisements covering their fronts. Inside, a yosé consists of one large mat-floored room, with a small mat-floored stage attached. All the guests sit on cushions spread on the matting, and the performers sit on the matting of the stage. Usually the house has a balcony with more expensive seats.

The majority of the story-tellers, who are called hanashika, specialize in comic monologue. Those who specialize in stories of heroism and adventure are called koshakushi, or romance readers, and regarded as of a different class. The hanashika use a lot of punning, irony and sarcasm, and each story has a twist at the end. Translated into English, their talk loses almost all meaning, for it is the manner of telling that is important.

Cha-no-Yu

Japanese people drink tea during and after each meal and it is customary to serve a cup of tea to callers at any time of the day. Cha-no-yu or tea-ceremony is, however, a peculiarly artistic way of serving tea as an entertainment for guests according to strictly-formulated rules of etiquette. A fine powder of choice green tea is used for it. The powdered tea is put in a bowl much larger than an ordinary tea cup and hot water is poured over it, and the mixture is beaten by means of a bamboo whisk. A party of guests are invited to enjoy this drink. They assemble in the "yoritsuki," a special waiting room for the tea party. The host appears and conducts them to the tea-room. They walk along a garden path to the tea-room, which is about 20 feet away. At a basin filled with fresh water they wash their hands before entering the tea-room. This is usually four and a half mats in area, about three metres square, and is provided with a stationary hearth or portable firebrazier for the kettle. The entrance to the tea-room is so small that the guests have to stoop to enter.

On entering the room each guest kneels in front of the tokonoma or alcove, and admires the kakemono or hanging picture or inscription on the wall of the alcove, and the tiny incense-holder on a side shelf. Then a meal is served as soon as the guests are properly seated. It is called "kaiseki" and is of the simplest dishes. The host waits on them himself not eating with the guests. After the "kaiseki" sweets are served, the first part of the ceremony is concluded.

Then at the host's suggestion the guests retire to the waiting-room or to another place where a bench is provided. A gong announces that the host is ready to serve the tea above mentioned. The formality of purification at the basin is repeated and the guests enter the room. The hanging scroll is gone and a flower arranged in a

vase is in the alcove. The receptacles for fresh water and the tea-caddy are placed in position before the host enters with the tea-bowl. The tea-whisk, tea-cloth and teaspoon are also brought in. The host retires once more to the adjoining room but soon reappears, this time with the receptacle for waste water, the dipper and a stand for the cover of the kettle or the dipper. All these articles are valued treasures which the host is proud of, and the guests are supposed to pass compliments on them in a proper way.

The host puts three spoonfuls of powdered tea in the bowl, then he puts the dipper deep into the kettle and takes it out brimful of hot water. About one-third of the hot water is poured over the tea-powder in the bowl, two-thirds being returned to the kettle. The mixture is vigorously stirred or beaten with the bamboo whisk until it becomes frothy. The host places the bowl of tea thus prepared in front of the principal guest. The guest makes a bow to his fellow-guest and puts the bowl on the palm of his left hand. Supporting one side of the bowl with the right hand he takes one sip, complimenting the host on the excellent flavour, right consistency and so on. After he has taken two or more sips the bowl is passed on to the second guest, thence to the third, and so on until all have partaken. When the bowl comes to the last one, he takes it to the principal guest who then returns it to the host. Then the chief articles of cha-no-yu, the bowl, caddy and spoon, are inspected and their workmanship admired by the guests, and when they are finally returned to the host in the prescribed fashion the cha-no-yu entertainment is over. When the party breaks up and the guests are gone the serious-minded host returns to the tea-room and sits alone in front of the kettle which is now his sole companion and listens to the sound of the boiling water. The whole procedure will take about four hours.

In Japan, tea had been used for centuries, the tea plant growing wild in the western islands. The earliest written record of tea drinking, which is called "Okugi-sho", tells of a tea-party given by the Emperor Shōmu in 729 A.D. to one hundred Buddhist monks. At that time an Imperial gift of tea was made, as a precious drug, to the monks. The use of tea as a common drink seems to have begun with the Age of the Emperor Kammu, when, in 805, the monk Saicho brought seeds of the tea-plant back from China, where he had spent some years in the study of Buddhism; and the cultivation of tea-plants gradually spread over the provinces west of Shizuoka.

Cha-no-yu or tea-ceremony began with Shukō in 1483. In the north-eastern end of Kyoto there is the famous villa where Yoshimasa, 8th Shogun of the Ashikaga line, indulged in æsthetic pursuits. The historic tea-room built as specified by Shukō, father of the tea ceremony, is still preserved in sound condition in the villa which is called Ginkakuji, better known to foreign tourists as the Silver Pavilion.

The principles of tea-ceremony taught by Shukō were more concretely set forth by Jōwō (1503–1555), and then his mantle fell on Sen-no-Soyeki (1521–1591) who is better known by his court name, Rikyū, granted through the influence of his patron Hideyoshi Toyotomi. The formula and etiquette instituted by Rikyū still remain the basic practices as taught by the various schools of cha-no-yu that have sprung up since his death in 1591. Many utensils bearing the stamp of his genius have come down to the present day, and those who lay out tea-rooms and gardens still adhere to the canons left by him. There are many schools of tea-ceremony represented by various tea-masters, but one is little different from another in their essentials. Harmony prevails, therefore, when persons of different schools meet at a cha-no-yu party.

Cha-no-yu was a pastime for warlords, monks and courtiers, but now it is enjoyed by all classes of people and taught to young ladies in schools and by private tutors as one of the best means for training them in Japanese etiquette, because it enables them to cultivate poise, grace, tranquillity and urbanity, all qualities making for refinement in manners.

The power to find true beauty in simplicity and enjoy peace and satisfaction of mind in a life of small means may be considered a racial trait of the Japanese as it is seen in the Japanese cult of Shintoism. Social conditions in Japan in the 15th century and Buddhist philosophy, especially that of the Zen sect, which had been introduced from the neighbouring continental countries, prepared the Japanese mind for instituting such a ceremony as cha-no-yu in unison with this racial trait. The love of chaste and refined simplicity which is the keynote of the Japanese cult of ceremonial tea has exercised a wholesome influence upon architecture, pottery, and landscape gardening. Especially the ceramic art of Japan is great-

ly indebted to tea-masters and devotees for its high taste.

Flower Arrangement

Japanese flower arrangement is the art of arranging flowers and leaves in different kinds of vases so as to meet the requirements of Japanese taste in decorating their sitting rooms and parlours. The raison d'être of this Japanese floral art is the satisfaction of their instinctive love of naure by a scheme of decoration best fitted for Japanese interval architecture. The beginning and development of Japanese flower arrangement, therefore naturally corresponds to the history of Japanese architecture and way of living.

The Japanese style of architecture which had completely emerged from the Chinese influence in the 14th century, and the comparatively peaceful life of the people in the 14th century under the Ashikaga régime, prepared favourable conditions for the development of flower arrangement which played an important part in enriching the tasteful life of the upper classes of people such as Court nobles, warrior lords and monks.

The Ginkakuji Temple or Silver Pavilion, which was built in the latter half of the 15th century, in the outskirts of Kyoto, is said to have been the birthplace of Japanese flower arrangement as an art, as well as that of the tea ceremony. The Ashikaga Shogun Yoshimasa who lived at the Ginkakuji had several attendants, "chabōzu" or "tea-priests" who looked after the tea ceremony and flower arrangement for him. Among these attendants of Yoshimasa the one who was best versed in the art of flower arrangement was Sōami. One of the oldest documents on the floral art "Gojō Shikimoku" is attributed to his authorship, and it is most likely that the primitive flower arrangement which had been already in vogue took a definite shape with Sōami and schools of the art began to be established. After Sōami came Ikenobō priest of a temple called Rokkakudo, also located in Kyoto, who later so distinguished himself as priest and master of flower arrangement that he became the founder of the priesthood at Rokkakudō and the school of floral art, both bearing his name. The Ikenobō school of floral art has existed for more than four hundred years and is proud of having the longest tradition and probably the largest number of students throughout the country.

During the 17th century the Emperor Gomizunowo took great interest in the floral art and courtiers, nobles and high officials gathered together at court for the study and occasional exhibitions of flower arrangement. A hall was provided in the court for the tea ceremony to which guests were invited and an exhibition of flowers arranged in vases by different hands was often held for them in a building which was temporarily built for that purpose in the palace garden. Such exhibitions of flower arrangement were held frequently during the following centuries.

There have developed many schools of flower arrangement in Japan during the past four centuries, but they may be roughly grouped into two; one is the "rikkwa" group which is more formal in style and the other is the "nageiré" group which is more natural. The former was in the past regarded as the orthodox style whereas the latter was considered heretic or auxiliary. But to-day both styles have equal standing among the students of the art, each having characteristic merits and uses of its own.

In Japan girls are taught the floral art in schools and under private tutors as one of the accomplishments for ladies and carefully keep their certificates of the art in the "tansu" or Japanese chest-of-drawers for keeping kimono, one of the indispensable pieces of furniture which they take to their new home at their wedding. Japanese ladies find occasions for escaping from their household duties and chatting with their friends in attending flower arrangement parties, for as a rule they rarely go out for picnics or to dances. Men, young and old, occasionally take up the study of the floral art, and though they are much fewer in number than the other sex they occupy the position of leadership in almost all schools of the art. It is no longer a monopoly of the aristocracy, and visitors to Japanese homes are charmed with the sight of flowers and leaves artificially yet most naturally arranged in vases put on the "tokonoma" or alcove shelves. On festival days passers-by are entertained by exhibitions of flowers most skilfully arranged and set in rows in the front rooms of houses facing the street. Modern department stores attract customers with special flower arrangement exhibitions.

The Cinema

Cinema theatres are to be found in all parts of Japan, both in cities or hamlets, accommodating from 400 to 3,000 persons. In 1934, there were 1,458 permanent cinema houses and 78,497

temporary ones. In 1933 the total attendance at these movie houses was 225,266,000, including 54,901,000 children. They are equipped and managed very much after the manner of theatres in the West, and in architecture, especially in the large cities, they follow the American style. The pictures shown in them are Japanese, American and European.

Home and Imported Films According to the report of the Police Bureau, Home Ministry, the number of new films inspected by the Bureau in 1934 was 4,385 with an aggregate length of 4,005,736 metres.

HOME AND IMPORTED FILMS INSPECTED in 1934

	No. of New films	Aggregate Length (In metres)	Length of Cuts
Japanese films	3,247	2,821,438	6,351
American films	937	947,897	10,128
European films	201	236,401	3,118
Total	4,385	4,005,736	19,598

The largest and most influential motion picture producing and distributing companies in Japan are the Shochiku Cinematograph Company, Ltd., Shinko Eiga Company, Ltd., and Japan Motion Picture Company, Ltd., the last being better known as Nikkatsu for short. Shochiku manages or supplies with pictures about 600 theatres, or nearly half of the total in Japan, and all the rest are either managed or supplied with pictures by the other two and by foreign, especially American, companies. Japanese pictures in general are produced by distributing companies.

Characteristics of Japanese Pictures The substance of Japanese pictures is varied. The recent tendency favours a serious view of life, and audiences are more impressed by what is implied than by what is expressed. The Japanese people are fond of tragedy. With few exceptions, pictures without tears cannot be expected to prove financial successes. Especially the women, who constitute 50 per cent of the spectators, feel disappointed if they have not shed tears over a tragic scene. Influenced by American pictures, comedies have come to be appreciated, but to satisfy the audience they must have at least 30 per cent of tragic elements.

Talkies In talking pictures, Japan is much behind Western countries. Shochiku produces two a month, but the other companies combined turn out only one or two a year.

Practically all imported films are talkies. Their introduction presented language difficulties, for few Japanese understand English when spoken. As a solution, most of the American pictures now exhibited are so-called super-imposed prints, which flash a Japanese translation of the English dialogue in a corner of each scene. This has proved highly satisfactory to native audiences and has rendered unnecessary the benshi, or interpreters, who are required for silent films, in the theatres which specialize in foreign talking pictures.

Radio

Introduced in 1925, the radio has become one of the two most popular means of amusement in Japan, the other being the cinema. In August, 1936 more than 2,643,000 families in Japan proper had already become radio subscribers which means that one home in every 5 has a receiving set. Programmes broadcasted by the 25 broadcasting stations scattered throughout the country are diverse, including weather reports, market reports, news and lectures. Entertainment is naturally the most popular.

Complex Programmes. It is said that Japanese radio programmes are more complex than those anywhere else in the world. Japan does not have a single and uniform culture; the old and the modern exist side by side, the indigenous and the foreign. Programmes, in consequence, must be arranged to meet divergent tastes, though ingenuity is sometimes taxed to satisfy everyone daily. The principal cleavage is in music. Japanese music, both instrumental and vocal, has developed in many varieties through many centuries. Just as in foreign countries different listeners have preferences for classical songs, or violin solos, or orchestral music, or popular songs, or dance music, or chamber music, so in Japan there are preferences for particular kinds of Japanese music. On the other hand, the music introduced from Europe and America is fast becoming popular. Young people who understand it generally prefer Western music, and old people, who do not understand it, would rather hear the music they have known since childhood. The ideal programme, therefore, must combine them. If 30 minutes are given to music by the New Symphony Orchestra of Tokyo, 30 minutes must also be given to music that is purely Japanese. Statistics show that station JOAK in Tokyo broadcast a total of 227 items from April to December, 1933, classified as: orchestral music,

56; vocal solos and chorus, 50; brass music, 30; chamber music, 13; violin solos, 9; piano solos, 20; jazz music, 9; foreign and Japanese music combined, 15; 'cello music, 3; flute solos, 3; pipe organ music, 2; guitar solos, 1; trumpet solo, 1; trombone solo, 1; xylophone solo, 1; and opera, 5.

Japanese Entertainment Purely Japanese entertainment is very varied. It includes singing of all kinds, from the nagauta, kiyomoto, naniwa-bushi and tokiwazu to all sorts of folk-songs, radio drama, story-telling, romance reading and descriptive accounts of athletic events.

Very little amusement is given in the daytime. The first radio entertainment of the day starts at 12:05 o'clock in the afternoon. It is usually in a lighter vein and may be Japanese or foreign music or a drama. If there is a major athletic event in the afternoon, a descriptive account usually goes on the air. After this there will be no entertainment of any kind, except on Sundays, until 8 o'clock, when the principal amusement programme begins. Frequently, however, the children's programme, given at 6:30 o'clock for 30 minutes, has fairly good entertainment. From 8 to 9:30 o'clock entertainment of all sorts is offered. Very rarely does the programme extend beyond 10 o'clock.

Programme and Listeners The Japan Radio Broadcasting Association distributed 1,233,908 sheets of enquiries to its subscribers all over Japan in 1932, out of which 358,039 answers came, and a résumé of the investigation was given out in April, 1934. In the questionnaire there was a column in which the listeners were requested to state what item or items of the programme they most liked and the answers given in percentage were as follows:

Item of Programme	Percentage of Listeners
News and reports	
General news	91.2
Time signal	77.5
Weather forecast	75.8
Radio gymnastics	48.0
Public announcements	42.3
Daily menues	31.0
Industrial news	30.8
Commodity prices	27.8
Stock-market news	23.2
Employment agency	11.0
New cocoon price	8.2
Exposition of current topics	29.4
Educational	
General and moral	28.1
Literature, arts, etc.	22.3
Physical education and hygiene	22.0
The home and women	20.7
Science	13.0
Foreign languages	9.9
Amusements	
Comic stories	57.6
Naniwa-bushi (mostly tragic stories)	57.5
Radio dramas	51.2
Movie picture dramas and stories	49.3
Samurai stories	48.0
Kabuki	43.4
Biwa (Story chanted with biwa music)	39.6
Gidayu	33.4
Foreign and Japanese music combined	33.4
Japanese harp, bamboo flute, and samisen	30.0
Nagauta (long chanting)	28.3
Modern Japanese music	24.4
Opera	24.2
Brass music	22.6
Orchestra	22.6
Vocal solos	22.0
Short songs (utazawa and kouta)	22.0
Shinnai (a kind of joruri)	20.2
Kiyomoto	19.0
Piano, violin solos and duets	18.7
Tokiwazu (a branch of joruri)	18.6
Chorus	17.6
Jazz	17.3
Yokyoku, kyogen (the No)	14.5
Old Yedo music	8.5
Young folk's hours	
Nursery rhymes	60.1
Short songs	57.0
Dramas for the young folks	52.5
Music	51.5
Stories	49.0

Horse Racing

It was after the Russo-Japanese War that the import of thoroughbred studhorses and horse racing began to be encouraged for the improvement of horses in Japan. As the result a craze for horse racing suddenly set in. At that time pari-mutuel tickets were sold at ¥5, and unlimited dividends and sweeps were allowed. The result was that many people became bankrupt and abuses were too apparent, so that in 1909 horse races at which pari-mutuel tickets were sold were prohibited. But

it soon became evident again that the decline of horse racing had an adverse effect on the improvement and propagation of horses in the country. Ten years later, the Horse Race Bill passed through Parliament and became law in 1923. The law fixed the price of pari-mutuel ticket at ¥20 a sheet, payment being made on wins only, not on places. The number of pari-mutuel tickets a person may buy was limited to one sheet. The dividend was also limited to ten times the cost of the ticket. The race courses permitted under the law are eleven in all, the names and locations of which are as follows :

Name	Location
Sapporo Race Club	Sapporo, Hokkaido
Hakodate „ „	Suburb of Hakodate, Hokkaido
Fukushima „ „	Fukushima City, Fukushima Prefecture
Niigata „ „	Niigata City, Niigata Prefecture
Nakayama „ „	Katsushika-machi, Chiba Prefecture
Tokyo „ „	Fuchu-machi, Tokyo Prefecture
Nippon „ „	Yokohama City, Kanagawa Prefecture
Hanshin „ „	Naruo-mura, Hyogo Prefecture
Kyoto „ „	Yodo-machi, Kyoto Prefecture
Kokura „ „	Suburb of Kokura City, Fukuoka Prefecture
Miyazaki „ „	Miyazaki City, Miyazaki Prefecture

All of these clubs are corporate judicial persons. These eleven race clubs hold race-meetings twice a year, in spring and autumn, each of which lasts from six to eight days. The money paid to the Government, the commission on sales, and the surplus of money are all used for the improvement and propagation of horses in the country as well as for the importation of the thoroughbred, Anglo-Norman and Arab horses. Since the losses of the betters were large with "win" alone, "place" payments were allowed by a change in the Horse Race Law, and horse-racing has been carried on now on that basis since 1931. In all horse races in Japan, clubs themselves undertake the sales of pari-mutuel tickets by the totalizator and do not allow bookmakers. Horse-racing is operated under the complete control of the Department of Agriculture and Forestry.

The above are the so-called officially-recognized horse-races, or horse-races operated under the Horse Race Law. In addition to these, there are local horse-races operated under the local horse-race regulations.

There are 113 local horse-races permitted in the country. A pari-mutuel ticket costs ¥1. per sheet. Some of these are being operated on the combined basis of "win" and "place". Each person is permitted to purchase one each of "Win" and "place" tickets

The number of horses that ran in the officially-recognized horse-races in 1934 was 1,733.

The Derby in Japan The Great Tokyo Derby, which was established in 1932 by the Tokyo Race Club, is modelled after the Derby in Great Britain. The time set for it is the latter part of April. The race course covers 2,400 metres, the horses entered being both males and females of four years old. The prizes offered are the highest in Japan. The regular prizes are ¥10,000 for the first horse, ¥3,500 for the second, and ¥2,000 for the third. In addition to this there are paid about ¥10,000 for the first, ¥4,000 for the second, and ¥2,500 for the third horse in stakes.

In the horse racing in Japan, flat races, steeple-chases, and trotting-races behind sulkies are held at each meeting. There is a distinction between non-subscription and subscription horses. Subscription horses are those horses which are distributed to those members of the clubs by lot, each member paying comparatively a small fixed sum for it. This was a system established in Japan at the time when the interest of the people in horse racing was not as keen as it is now, with a view to increasing the number of the people who own horses.

As to weights, the system is to fix it according to the amount of the prize. One kilogramme is added to each non-subscription horse in a flat race for every ¥3,000, while for a subscription horse one kilogramme is added for every ¥2,000. In each instance, the horse is withdrawn from the meeting if the weight exceeds 77 kilogrammes.

For a trotter a handicap of from 30 to 40 metres is placed for every ¥1,500.

Other Pastimes

Hyakunin Isshu There is a popular

game of cards, in which stanzas from what are known as the "hundred poems", or hyakunin isshu, take the place of flowers. At this game no gambling is ever indulged in. It is rather an amusement for family parties, who at New Year time often sit up over it all night. Some of these diversions are shared in by the ladies.

Children's Sports The sports of Japanese children include kite-flying, top-spinning, battledoor and shuttlecock, making snow-men, playing with dolls, etc. The large, grotesquely coloured papier-mâché dogs given to babies owe their origin to some idea of the dog as a faithful protector, especially against onslaughts by evil spirits.

Shogi Japanese chess (shogi) was introduced from China centuries ago; and though it has diverged to some extent from its prototype, the two games still have a feature in common distinguishing them from all other varieties. It is this. The rank on which the pawns are usually posted is occupied by only two pieces, called hisha and kaku by the Japanese. Also, on either side of the king are two pieces, called kin in Japanese. These perform the duty imposed on th ferz or visir of the Persian Shatranj, which was the equivalent of the modern queen. Therefore, no queen or piece of similar attributes appears eiher in Japanese or Chinese chess. There are eighty-one squares on the Japanese board, and the game is played with twenty pieces on each side, distinguished, not by shape or colour, but by the ideographs upon them. Though the movements of the pieces resemble in most respects those followed in the European game, there are certain ramifications unknown to the latter. The most important of these are the employment of the pieces captured from the adversary to strengthen one's own game, and the comparative facility with which the minor pieces can attain to higher ranks.

Chess is understood by all classes in Japan. The very coolies at the corners of the streets improvise out of almost anything around them materials with which to play, and thus while away the tedium of waiting for employment. But it is comparatively little patronized by the educated classes, who hold its rival "go" in much higher esteem. O is the king, keima the knight, hisha the rook, and kaku the bishop—or pieces having movements like them. Fu is the pawn. The movements of the yari also resemble those of the rook, but are confined to the single rank on which it stands. Gin (silver) and kin (gold) are not found in Western chess. Gin moves one square diagonally only. The kin, besides having similar movements, has also the power of moving one square on each side of itself, but it cannot return diagonally. The fu advances one square forward, and captures as it moves. When any piece moves into the adversary's third row, it may become a kin. This is indicated by turning the piece over. Every piece so promoted loses its original character, except the hisha and kaku to which the movements of the kin are added. As already indicated, a captured piece may be employed at any time for either attack or defence. To checkmate with the fu is a thing vetoed—or at least considered "bad form"—in this non-democratic game, neither is stalemate permissible in Japanese chess. You wait until the adversary makes a move which admits of a free action on your part. The object of the game is to check-mate the king.

Go Go, often with little appropriateness termed "checkers" by European writers, is the most popular of the indoor pastimes of the Japanese,—a very different affair from the simple game known to Europeans as Goban or Go-bang, properly the name of the board on which the go is played. Clubs and professors of the art are found in all the larger cities, where, too, blind players may occasionally be met with. Go may with justice be considered more difficult than chess, its wider field affording more numerous ramifications. The game was introduced into Japan from China by Kibino-Mabi, commonly known as Kibi Daijin, who lived in the reign of the Emperor Shomu (A.D. 724–756). In the middle of the seventeenth century, a noted player, called Hon-imbo, was summoned from Kyoto to entertain the Chinese ambassador then at the court of the Shogun, from which time forward special go players were always retained by the Shoguns.

Go is played on a square wooden board. Nineteen straight lines lengthwise and the same number of lines cross ways, crossing each other at right angles, make three hundred and sixty-one mé, or crosses, at the point of intersection. These may be occupied by a hundred and eighty white and a hundred and eighty-one black ishi or stones. The object of the game is to obtain possession of the largest number of mé. This is done by securing such positions as can be most easily defended from the adversary's onslaughts. There are nine spots on the board, called seimoku, supposed to represent

the chief celestial bodies, while the white and black stones represent day and night, and the number of crosses the three hundred and sixty degrees of latitude, exclusive of the central one, which is called taikyoku, that is, the primordial principle of the universe. There are nine degrees or classes of proficiency in the game, beginning with number one degree as the lowest, and ending with number nine as the highest point of excellence attainable. In playing, if the combatants are equally matched, they take the white stones alternately; if unequal, the weaker always takes the black, and odds are also given by allowing him to occupy several or all of the nine spots or vantage points on the board,—that is, to place stones upon them at the outset. A description of how the game proceeds would be of little utility here, it being so complicated as to make the personal instruction of a teacher indispensable. The easy Japanese game, called gomoku-narabé, which was introduced into foreign countries, is played on the go board and with the goishi. The object of this game is to be the first in getting five stones in a row in any direction.

Hanagaruta (Japanese Playing Card) The Japanese flower-cards developed from the classical "flower contests" which were originated far back in the 9th or 10th century A.D. by the elegance-loving ladies and gentlemen of the Kyoto Imperial court. At first the game was played by each contestant choosing a spray of some flower and writing a thirty-one syllable poem on a piece of coloured paper in praise of this flower and tying it to the twig. Then the flowers were collected and judged from the artistic, literary and various other points of view of the flower, poem and general colour effect.

These sprays of flowers came later to be represented in pictures, and probably under the influence of the Western card games introduced to Japan by the Portuguese of the 16th century, our flower-cards came into being. They present sprays of various flowers in the simplest but the prettiest design and colouring so characteristic of the art of the Tokugawa period, but at the same time they preserve all the poetic sentiments and associations of the courtly game of the flower contests.

A pack of the flower-cards consists of 48, and every four of them make a set presenting a flower. That is, there are 12 sets of fours presenting 12 different flowers or plants, as follows: young pine, plum blossoms, cherry blossoms, wistaria,iris, tree peony, lespedeza, grass hill, chrysanthemum, maple leaves, willow, and paulownia, one for each month of the year in the order given.

Among the 48 cards, there are 5 'glory cards,', each counting 20 points, and 9 10-point cards. These high-valued ones are at once distinguished by the various objects of classical associations presented together with the flowers. Each set,except the Grass Hill and the Paulownia, has a card with a poem strip on it, either of a red colour with letters written on, or of a red or blue colour in blank. These cards always count 5 points. The rest, 24 in unmber, are simple chips and each counts one point. To sum up, there are 48 cards in a pack and in all these cards count 264 points.

There are several ways of playing games with Hanagaruta : solitaire, hachi-hachi or "Game of Eighty-eight," "Six hundred," Sudaoshi, Mushi, and Kabu. But, the most popular and the most interesting of these is hachi-hachi. As in the case with bridge, the game may be played according to quite simple or elaborate rules.

Theoretically, a party of from two to six can play the game, it is most enjoyable when between three and half a dozen players are at the table.

The winner in the last round shuffles and deals the card. He deals 7 cards to each member and places 6 cards in the 'pool' face up. The remaining cards are placed in the centre of the pool in a pile, face downward. Each player then inspects his hand and declares if he will play or drop out. The hands of those who have dropped out are mixed in the cards in the pile. The player who dealt the cards has the first option to declare and the others in turn. In case three players declare to go, the remaining players are obliged to drop out, for not more than 3 can play each round. In case all but two drop out, the two play against each other, and should all but one drop out, the last remaining is the winner and so he shuffles and deals the cards for the next round.

The leader first plays one of the cards in hand the flower of which matches with that of one of the six cards in the pool, taking care to score the highest count possible. He then takes the topmost card in the pile and turns it over. In case the card so taken does not match with any in the pool he leaves it in the pool, but if the card matches with one in the pool, he scores that pair too. All cards thus matched are kept separate by the player who made the tricks. His next player is the one sitting on his right. Thus, in Japa-

nese card playing, we go "against the sun" always.

Each player plays seven times and then all the cards will have been matched and taken. Then the scores are counted. There being 264 points in all, as explained before, one who scores 88 is at par. Hence the name, the "Game of Eighty-eight."

Besides the scores, honours are awarded according to an arrangement agreed on at the beginning of the game.

First of these is the "Four Glories": namely, the "glory cards" Pine, Cherry, Moon and Paulownia, which in one hand count 144 points. The "Three Good Reds"—the 5-point cards of Pine, Plum and Cherry—in one hand as also the "Three Blues"—the 5 point cards of Peony, Chrysanthemum and Maple—in one hand are another honour of the same value, namely, 84 points. Any seven of the 5-point cards in one hand makes another honour and scores 144 points, and also sixteen or more of single-point cards in one hand is an honour worth 144.

In case there are two cards of the same flower in the pool, the player may take only one of them if matched with a card from his hand or with one turned up. But should there be three such cards, the player either matching it from hand or by the turnup takes the whole batch.

When only two players are in the game, the turnup after playing of the last card from hand ends that game and the cards that remain in the pool and the pile are discarded.

In case a player either plays a card from his hand or turns up a card that matches with any in the pool, it is compulsory for him to take that pair. In case a player who has his turn finds no card in the pool with which he can make a match, he is obliged to play blank. It is also permissible to play blank even where a match is possible.

Twelve rounds complete one set and each round is sometimes referred to by the name of the month following the natural order. Twelve months or one year can be played in twenty minutes or less.

Whenever a player finds a prospect of making an honour, he should make his tricks of the honour cards before anything else. In turn, should any player be noticed to be trying to make an honour, his opponents should do their best to prevent his making the tricks he wants.

The rules described above are those for the simplest possible way of playing this most absorbing and pretty game of Eighty-eight. Those enticed by the lure of Japanese card-playing are recommended to refer to a regular handbook of Eighty-eight and learn about sundry other honours, handicaps and penalties which have not been pointed out in the foregoing brief explanation of the game.

Landscape Gardening Japanese landscape-gardening is one of the fine arts. Ever since the middle of the fifteenth century, generations of artists have been busy perfecting it, elaborating and refining over and over again the principles handed down by their predecessors, until it has come to be a mystery as well as an art, and is furnished—not to say encumbered—with a vocabulary more complicated and recondite than any one who has not persued some of the native treatises on the subject can well imagine. What the Japanese call 'hakoniwa' or 'bonkei' is a whole landscape-garden compressed into the microscopic limits of a single dish or flower-pot,—paths, bridges, mountains, stone lanterns, etc., all complete,—a fanciful little toy.

Cormorant Fishing Cormorant-fishing always takes place at night and by torch-light. The method pursued is as follows: There are four men in each of several boats, one of whom, at the stern, has no duty but that of managing his craft. In the bow stands the master called ujo, distinguished by the peculiar hat of his rank, and handling no fewer than twelve trained birds with the surpassing skill and coolness that have earned for the sportsmen of the Nagara River in Gifu prefecture their unrivalled pre-eminence. Amidships is another fisher, of the second grade, who handles four birds only. Between them is the fourth man, called kako, from the bamboo striking instrument of that name, with which he makes the clatter necessary for keeping the birds up to their work; he also encourages them by shouts and cries, looks after spare apparatus, etc., and is ready to give aid if required. Each cormorant wears at the base of its neck a metal ring, drawn tight enough to prevent marketable fish from passing below it, but at the same time loose enough—for it is never removed—to admit the smaller prey, which serves as food. Round the body is a cord, having attached to it at the middle of the back a short strip of stiffish whale-bone, by which the great awkward bird may be conveniently lowered into the water or lifted out when at work; and to this whalebone is looped a thin rein of spruce fibre, twelve feet long, and so far wanting

in pliancy as to minimize the chance of entanglement. When the fishing-ground is reached, the master lowers his twelve birds one by one into the stream and gathers their reins into his left hand, manipulating the latter thereafter with his right as occasion requires. No. 2 does the same with his four birds; the kako starts in with his volleys of noise; and forthwith the cormorants set to at their work in the heartiest and jolliest way, diving and ducking with wonderful swiftness as the astonished fish come flocking towards the blaze of light. The master must handle his twelve strings so deftly that, let the birds dash hither and thither as they will, there shall be no impediment or fouling. He must have his eyes everywhere and his hands following his eyes Specially must he watch for the moment when any of his flock is gorged,—a fact generally made known by the bird itself, which then swims about in a foolish, helpless way, with its head and swollen neck erect. Thereupon, the master, shortening in on that bird, lifts it aboard, forces its bill open with his left hand, which still holds the rest of the line, squeezes out the fish with his right, and starts the creature off on a fresh foray,—all this with such admirable dexterity and quickness that the eleven birds still bustling about have scarce time to get things into a tangle, and in another moment the whole team is again perfectly in hand.

Calendar of Annual Events

Few countries, if any, possess more ceremonies and more festivities than Japan. Some of these ceremonies at first sight may look absurd to the foreign eye, but familiarity with them and especially their origin will reveal most of them to be delightful. Rural people are more conservative than city folk in adhering to observance of ancient customs. Indeed, modern life has robbed the busy citizens of that quiet and poetical mood in which people of bygone days observed ancient customs, such, for instance, as moon viewing. But none the less it is true that despite the modern garb Japan wears today, the life of the present-day Japan is still associated with many picturesque customs and poetical sentiments of Old Japan, which afford a glimpse into the days of feudalism, and the people continue to observe many of the customs handed down from time immemorial.

Below is given in chronological order a list of annual events in Japan, including ceremonies, festivals and other national customary observances.

January

January 1st New Year's Day—New Year's Day means as much to the Japanese as Christmas means to Western peoples, or probably more. It marks the beginning of new life in an atmosphere of quiet and gaiety, leisure and pleasure. It is a time to forget the cares of the past year and enjoy feasts and indulge in all sorts of amusement in celebration of the coming good and lucky year. The homes are decorated, both inside and outside; the people are clad in their best clothes, and they all look very happy.

The Imperial Household observes a religious ceremony called Shihohai (worshipping in four directions) at the Imperial Sanctuary according to Shinto rites. The Emperor usually officiates in person, offering prayers to the gods for the peace and prosperity of the Empire. New Year's Day is one of the four most important National Holidays of Japan, the others being the Imperial Birthday celebration, the celebration commemorating the anniversary of the accession of the Emperor Jimmu, the first Emperor of Japan, in 660 B. C., and the celebration of the Emperor Meiji's Birthday on November 3.

The time-honoured custom of worshipping the sun-rise at shrine compounds situated in the "lucky direction" of the year is widely observed from the traditional belief that so doing will bring luck. Many, of course, observe this custom without sharing the belief. The compound of the Meiji Shrine in Tokyo, for instance, is always filled with worshippers at dawn on New Year's Day. Ceremonies celebrating the New Year are also observed at all Shinto shrines throughout the country. On this day and the following two days people call on their relatives and friends and exchange New Year greetings.

2nd Beginning of Work—This day is known as 'shigoto hajimé,' or beginning of work and is marked with cremonies for the beginning of all sorts of activities which are to be executed properly and well in the right spirit, in the hope that everything will go on in the same happy way for the rest of the year. Young school children study calligraphy for the first time in the year. Car-

penters begin the day by using their professional tools. Geisha tune up their samisen and practise a piece or two of music. The first delivery of goods is undertaken by all wholesale stores in a spirit of celebration. The last named is called hatsu-ni, or first merchandise. Cars on which goods are to be delivered on this day are fully decorated, and the carriers and delivery men, usually drunk, enter into the spirit of the thing, although this custom is observed in recent years with less ostentation than formerly.

On the night of the second day, people were supposed, in ancient times, to dream the first lucky dream of the year. To inspire such a dream, pictures representing the Seven Gods of Fortune were sold in the streets, to be placed under the pillow so that the sleeper might dream a desired dream.

3rd Genshi-sai, a national holiday, celebrating the auspicious origin of the Imperial Throne at the beginning of the year, is observed on the third day before the Imperial Sanctuary in the Imperial Palace. The ceremony is attended by the Emperor, members of the Imperial family, Princes and Princesses of the Blood, high officials of the Government and members of the peerage. In the morning the front of the Nijubashi, the bridge at the main entrance to the Imperial Palace, presents a glittering scene as the dignitaries of the nation arrive at the palace in their State uniforms to participate in the court function. The New Year holidays come to an end on this day.

4th Beginning of Politics—All normal functions of the State are resumed on this day and government and private offices re-open. The Ministers of State make various important reports to the Emperor, and the Minister of the Imperial Household also gives an account of the ceremonies performed at the Grand Shrine of Isé and the other government-protected shrines on the occasion of the New Year.

5th The Shinnen Enkai, or New Year Party, is held at the Homei Hall of the Imperial Palace, where the Emperor and Empress give a banquet to the Princes and Princesses of the Blood, Ministers of State, foreign diplomatic representatives and a large number of other dignitaries. The people in general also hold New Year parties and many persons are seen till a late hour on their way home from celebrations in a hilarious mood.

One of the most interesting features of Tokyo life on this day is the festival of the Suitengu shrine at Ningyo-cho. Here, right in the heart of the modern capital, a glimpse of old Japan reveals itself.

6th Tokyo fire-brigades assemble in an open space in front of the Nijubashi for the New Year parade and give acrobatic performances on fireladders to show their agility. There was a time in the old days when fires were so frequent in Yedo (Tokyo) as to be called "the flowers of Yedo." The life of the fireman was envied by many as inspiring. The performance of acrobatics was initiated in those days to reassure the public by demonstrating the efficiency of firemen when confronted with danger.

Cold Season begins—The so-called 'kan,' or cold season, begins its conventional period of four weeks. The cold season is divided into two stages, the period of 'shokan,' or lesser cold, and the period of 'daikan,' or greater cold. During the period many male apprentices and artisans devoted to their work go out thinly clad in the evening to worship at their favourite temples, having the traditional belief that divine power invoked by their enthusiasm will make them proficient in their callings. They go to the well in the temple compounds and pour cold water over their bodies to purify themselves before worshipping at the temples. The rite is practised for the whole period every evening without a break, irrespective of weather conditions. Such enthusiasts, dressed in white clothes and usually with tinkling bells hanging over their loins, can be seen in the streets during the cold season, running from temple to temple.

Decorations removed—All New Year decorations should be removed from the house fronts before nightfall, as the main New Year celebrations come to an end.

7th The Seven Herbs—On this day, known as 'nanakusa' (seven herbs), people eat rice gruel mixed with seven kinds of herb. This custom originated in the days of the threatened Mongolian invasions under Kublai Khan. The herbs were deemed to give strength to the Japanese soldiers, and they are now supposed to give strength to all consumers against the nation's enemies.

8th Military Review—The Emperor reviews the troops of the Imperial Bodyguard at the Yoyogi parade ground. The public can witness the review.

10th The Kompira Shrine holds its festival on this day. The shrine is located at Toranomon in Shiba, Tokyo. A feature of the festival is a fair at which many talismans are sold.

11th The Kodokwan, the celebrated

judo training institution in Koishikawa, observes the ceremony of beginning judo practice for the year. The greatest experts in the art of self-defence participate in the ceremony, at which the finest matches of the year are seen.

12th Sumo (Japanese wrestling)—The semi-annual tournaments of the Japan Wresting Association are held at the Kokugi-kwan amphitheatre at Ryogoku, Tokyo, in January and May. Each tournament lasts for 13 days. (See Chapter XXXVI.)

15th and 16th Extra holidays for apprentices and servants—in old days apprentices and servants were given only two day's holidays a year, January 15 or 16 and July 15 or 16. Nowadays they are given at least one holiday a month in many cases, but in addition the old holiday-dates are still adhered to.

February

February 1st Country people, who still go by the lunar calendar, celebrate the New Year on this day.

3rd or 4th The Bean-throwing ceremony—This day is called 'Setsubun,' or change of season, on which winter comes to an official end and spring begins according to the lunar calendar. 'Mamemaki,' or the bean-throwing ceremony, is widely practised throughout the country. People scatter beans in an attempt to drive out all the evil spirits in the house and call in good luck. The priests of leading shrines and temples observe this custom in the presence of thousands of worshippers. Usually popular actors and wrestlers are employed as bean-throwers.

11th Commemoration of the Accession of the Emperor Jimmu—This national holiday, Kigensetsu, commemorating the accession in 660 B.C. of the first Emperor of Japan to the Throne, is one of the most important in the Japanese calendar. The Emperor observes elaborate ceremonies in front of the Imperial Sanctuary, attended by the Empress, Princes and Princesses of the Blood, court functionaries and high officials of the Government, and peers. An Imperial luncheon is given at the Homei Hall of the Palace, to which are invited the Princes and Princesses of the Blood, State Ministers, members of the foreign diplomatic corps, etc.

March

March 3rd Girls' Doll Festival—This is sometimes known as the peach festival, because it is associated with the peach blossoms which begin to open about this time. This day is a great day for the girls of Japan. All families, except the poorest, place decorated doll shelves in the guest rooms or alcoves with a set of dolls and accessories on them. Very often the dolls are taken out from the closets and displayed for the enjoyment of the young girls of the family. The set of dolls is supposed to represent a miniature Court of ancient days with the Emperor, Empress, and their retainers. Some of the sets in wealthy families are very valuable, costing several hundred yen each. Dolls are displayed for sale at department stores and stalls for some weeks before the arrival of this festival. Considerable religious significance was originally attached to the doll festival, but later it became a mere pastime for children. It is said by some that the custom encourages happy family life, and by others that it encourages the spirit of filial piety and loyalty. Scholars declare that the custom originated during the reign of the Emperor Tsuchimikado (1199–1207).

6th The Empress's Birthday—This day is known in Japanese as Chikyu-setsu, and is a holiday for girls' schools.

18th Higan, the Week of the Equinox, is a busy time for Buddhist families. Usually, all members of the family visit the family graveyard during the week, attend to the tombs and offer prayers to the spirits of their ancestors. Higan, literally translated, means "yonder shore," or Nirvana. Various vegetable foods specially prepared for the purpose, are offered to the dead and sent as presents to friends and relatives. All Buddhist temples in th country hold special services during the period. Tokyo old-fashioned Buddhist believers make special pilgrimages to the images of the six-faced Amida Buddha at 18 temples situated in the hilly sections of the city and suburbs.

21st Vernal Equinox Festival—On this national holiday, which is called Shunki Korei-sai, all schools and public buildings are closed. A Shinto festival in memory of the Imperial ancestors and ancestresses is performed at the Imperial Sanctuary.

April

April 3rd Anniversary of the demise of the Emperor Jimmu, national holiday—This day is the anniversary of the demise of the first Emperor Jimmu, who reigned over the country for 76 years. The Emperor performs an appropriate ceremony in front of the Imperial Sanctuary.

8th Birthday of Gautama Buddha—This day, kept as the anniversary of the

birth of Gautama Buddha, is celebrated by all Buddhist temples throughout Japan. Leading temples arrange parades of young girls who are daughters of Buddhist believers, and hold memorial services in honour of the founder of their religion. Amacha, sweet tea, is freely given at the temples to all visitors.

18th Festival of the Tokugawa Shogunate Shrine—a festival is held at the Toshogu Shrines at Ueno park and Shiba park, which are dedicated to the Tokugawa Shoguns.

29th Emperor's Birthday—One of the three greatest national holidays, commemorating the birthday of the Emperor Hirohito, the 124th ruler of Japan. A serviee is held at all elementary and second grade schools in Japan. At the Imperial Court the Emperor and Empress hold special ceremonies in front of the Imperial Sanctuary, offering prayers to the spirits of the Imperial ancestors for the peace and prosperity of the Empire. After the function, the Emperor reviews the army at the Yoyogi Parade-ground. An Imperial banquet is held, to which high officials of the Government and foreign diplomats are invited.

30 Semi-Annual Festival of the Yasukuni Shrine—The semi-annual festival of the Yasukuni Shrine, on Kudan hill, Tokyo, dedicated to the spirits of the officers and men of the army and navy and others who died fighting for their country in the wars since the Meiji Restoration, lasts for 3 days, beginning on April 30.

May

May 1st May Day—This imported festival for labourers is observed usually with a labour mass meeting at Shiba park, followed by a huge parade throughout Tokyo. Similar celebrations are held in other leading cities.

5th Boys' Festivals—Just as March 3 is for girls to celebrate their doll festival, so this day is dedicated to the boys of Japan. All Japanese families having sons observe this classic festival. Appropriate dolls are on display in the alcoves of the guest rooms of the families, the festival being intended to bring health, success and prosperity to the boys. The sets of dolls displayed represent popular heroes of the Empire. The custom is of several centuries' standing and originated in a desire to encourage a martial spirit in boys. Large paper or cloth carp, often several yards long, are hoisted above the houses, symbolizing the idea that the sons of the families will be as strong as the spirited carp trying to swim up a waterfall.

June

June 1st Ayu fishing season—The seasonal ban on Ayu fishing is formally lifted on this day and anglers in Tokyo flock to the Tama and Sagami rivers to catch ayu, or sweet trout, a fish noted for its fragrance and delicious taste. A feature of the season is the picturesque cormorant fishing on the Nagara near Nagoya.

14th and 15th Annual Festival at Hiyé Shrine, Tokyo—Representative of many shrine festivals which take place in Tokyo and elsewhere in Japan is the annual festival of the Hiyé Shrine, known as Sanno-sama, which takes place on top of the Sanno Hill in Akasaka ward. The 'mikoshi,' or portable shrine, is carried on the shoulders of shrine hands through Kyobashi, Shiba, Kojimachi and other wards over which the deity presides.

17th Annual Festival of the Great Shrine of Isé, Miyé prefecture, and the Itsukushima Shrine at Miyajima, Inland Sea.

21st Annual Festival of the Atsuta Shrine at Atsuta, Nagoya.

July

July 1st Season for climbing Mount Fuji—The season for climbing Mount Fuji opens. A service is held at the Sengen Shrine on top of the sacred peak.

7th Feast of Tanabata—This evening the Weaver or the Star Vega meets her lover the Cow-herd or the Star Altair on the other side of the Heavenly River (Milky Way) on the only occasion in the whole year, according to tradition. This festival of the seventh eve of the seventh month is celebrated by some although the custom has of recent years been more or less neglected in Tokyo and other cities.

13th—15th O-Bon Festival—During the 'o-bon,' or feast of lanterns, tradition says that the spirits of the family ancestors and other dead members of the family visit the family, and due welcome is given them according to Buddhist rites. The family tombs are visited and vegetable sacrifices are offered. People make small bonfires of stripped hemp stalks and light lanterns to guide the spirits of their ancestors into their homes.

Bon Odori, or dance of the 'bon' season, is a simple folk dance which is given in the compounds of temples or elsewhere by common people, especially in the rural districts, under the light of lanterns.

15th and 16th Extra holidays for apprentices and servants—Semi-annual holidays are given apprentices and servants on either of these two days, as on January 15 and 16.

17th Annual fête of Gion Shrine in Kyoto—This picturesque shrine festival in the ancient capital of Japan lasts for a week.

21st. Hottest season—The doyo, the hottest period of summer, begins on or about this day, to last for about three weeks.

August

August 4th Annual festival of the Kitano Shrine in Kyoto.

6th Annual festival of the Sumiyoshi shrine in Tsukudashima, Kyobashi, Tokyo.

16th Annual Bon-fire Fête on Mount Nyoi in Kyoto.

19th Lantern Fête on Mount Atago in Kyoto.

September

September 1st Memorial Service for the Earthquake Dead—to comfort the spirits of those who were killed in the great earthquake and fire of 1923 services are held at the Earthquake Memorial Hall in Honjo on the banks of the Sumida River, Tokyo.

5th Suitengu Shrine Festival in Tokyo.

13th Festivals of Kanda Myojin and Hikawa Shrines in Tokyo.

17th and 18th Festival of the Great Shrine of Isé and the Hokoku Shrine in Kyoto.

20th Week of the equinox begins —the autumn 'higan' begins on September 20. As during the spring equinoctial week, Buddhist temples present busy scenes.

23rd Festival of the Autumnal Equinox—A Shinto festival in memory of the Imperial ancestors is performed at the Imperial Palace, the day being a national holiday.

26th Moon-viewing Festival—The custom of moon-viewing is no longer observed so generally as in the past, but it still delights the poetically minded in the cities, and people in general in the rural districts. Before twilight sets in, the house wife will bring a table to the veranda where it can catch the moon beams and spread upon it a feast in honour of the moon. A vase containing autumnal flowers will be placed on the left side of the table. As the moon rises, the members of the family sit around the table in the moonlight and spend the evening in merry-making.

October

October 10th Annual fête of the Kotohira Shrine at Kotohira, Kagawa prefecture and also of similar shrines in Tokyo and elsewhere.

13th Anniversary of the death of St. Nichiren—One of the most elaborate Buddhist demonstrations in Japan is held on the evening of the 12th, and the following day at the Hommonji temple at Ikegami, Tokyo, to commemorate the anniversary of the death of St. Nichiren, founder of the Nichiren sect of Buddhism. Thousands of believers and others march in groups to the temple, many beating drums so as to keep time, shouting all the time the Buddhist sutra, "Namu-Myoho-Renge-kyo." Large paper lanterns, all lighted, are carried at the head of those processions.

15th Hunting season—The ban on hunting in all districts is lifted.

17th Kannamesai (first Harvest festival) on this national holiday the Emperor makes an offering of the new grain harvested to the Sun Goddess enshrined in the Great Shrine of Isé and to the Imperial ancestors. A special service is held at the Imperial Sanctuary, while the Emperor despatches a messenger to the Great Shrine to offer prayers on his behalf.

22nd Festival of Yasukuni Shrine—The Yasukuni shrine begins its second semi-annual celebration, lasting for three days.

November

November 2nd Festival of Oh-tori shrines—the annual shrine festival known as 'tori-no-ichi,' is observed at various shrines of Oh-tori, a winged god of fortune and wealth in Tokyo and elsewhere.

3rd Celebration of the Emperor Meiji's Birthday—This is a national holiday and all schools and public buildings are closed in honour of the great Emperor during whose reign Japan became a world Power, and the week is celebrated as a national athletic week.

8th Festival of Bellows—This is celebrated in the household of every metal-smith, silver-smith, iron-smith, and the like. On this day also takes place the annual bonfire fête of the Fushimi Inari Shrine in Kyoto and elsewhere.

15th Celebration for children of 3, 5 and 7 years of age—This is known as "shichigosan (7, 5, 3) festival". On this day boys who have attained the age of 5 years and girls who have attained 3 or 7 years of age are taken to the

shrines of their tutelary deities, in their best clothes, and worship is offered at the shrines by way of expressing their gratitude for the protection of the guardian deities and their safe growth throughout the period of early childhood, at the same time beseeching future protection and happiness.

23rd Festival of Niinamé-sai—The Emperor observes Niinamé-sai, a national holiday, with the ancient Court ceremony of offering new grain to the Sun Goddess and the Imperial ancestors, and partaking of it himself. The occasion is one of thanksgiving, when the Emperor and his subjects return thanks for the harvest.

28th Anniversary of the death of St. Shinran—A religious fete in commemoration of the death of St. Shinran, founder of the Shin sect of Buddhism, is celebrated at the Hongwanji temples in Kyoto and Tokyo.

December

December 22nd Winter Solstice—On this day people take baths in hot water in which 'yuzu' or limes have been placed, according to the time-honoured custom.

25th Anniversary of the death of the Emperor Taisho, father of the present Emperor, a national holiday.

25th Christmas—Christmas has become an important affair for many Japanese living in cities. Although at first it was regarded by the general public as an event entirely foreign to Japan, it has now become a season of rejoicing for children in large cities, and the day is a regular annual feature, included in the Japanese calendar as such.

29th Close of official business—All government and public offices close for the year-end and New Year holidays.

31st Eating of noodles on the last day of the year—It being the last day of December, many businessmen eat noodles at their evening meal to bring the year to a happy conclusion. The noodle is regarded as a symbol of long life and continued prosperity.

CHAPTER XXXVIII

TOKYO

Historical Sketch

In 1192 Yoritomo Minamoto (See Chapter III, Kamakura Age) established a military régime at Kamakura, 56.33 kilometres south-west of the present Tokyo, and it was at this period that the name of Yedo was recorded in the report of a local war in which a son of Lord Shiro Kanetsugu Yedo took part, and the name seems to have been given before he became the lord of the district. Yedo literally means "entrance to the gulf."

After the fall of the Yedo family the district was occupied by a feudal lord called Sadamasa Uyesugi; and Dokan Ohta, one of his retainers, discovering the strategic importance of Yedo constructed the Yedo castle which was completed in 1457. After changing hands a few times, it fell, in 1590, into the possession of Iyéyasu Tokugawa, who settled down there to be the over-lord of the eight provinces of Kanto. From that time it gradually expanded until it became not only the capital of Kanto but the seat of the Tokugawa Shogunate during 15 generations. During the 268 years of the Tokugawa Shogunate the obscure village of Yedo became a thriving town and it is said that 2 million people lived there in the height of its prosperity in the Bunsei (1818–1830) and Tempo (1830–1844) eras.

In 1869 the Emperor Meiji transferred the Imperial capital to Yedo and renamed it Tokyo, or Eastern Capital. Then came still further growth and prosperity. Contact had just been made with Western countries and as Tokyo was serving as the gateway for Western civilization much attention was given to building the city on modern lines.

The fifty years of Tokyo culture met with a terrible catastrophe in September, 1923, when earthquake and fire, unprecedented in history, dealt the city an almost fatal blow. Nearly one-half of the entire city was completely reduced to ashes. But with hard work and the enthusiastic support of the whole country and the citizens of Tokyo, as well as the sympathy of the world, a new and better Tokyo has arisen from the ashes in but a decade.

Location and Climate

Tokyo is situated at the south-east corner of Kanto plain in 35° 31′ 59″–48′ 50″ N. latitude, 139° 33′ 56″-55′ 22″ E. longitude. The climate of the city is generally mild; the annual mean temperature is 13° 9′ C (57° F); the mean temparature in July is 24° 2′ C (75° 5′ F), in January 3° 1′ C (37° 5′ F); the annual average precipitation is 1,555 mm.

Population and Area

Growth of Population According to the 1935 census the population of Tokyo was 5,875,976 at the time when the census was taken, with male numbering 3,076,217 and female 2,799,450. Households then numbered 1,191,939.

Year	Population	Household
1878	813,400	235,943
1888	1,298,661	287,833
1898	1,425,366	316,527
1908	1,626,103	376,428
1920 (census)	2,173,200	456,816
1923[1]	1,527,489	340,278
1924	1,926,310	417,833
1925 (census)	1,995,567	429,852
1930 (census)	2,070,913	414,710
1931[2]	2,103,880	421,620
1932	5,314,700	1,112,640
1933	5,495,460	1,138,470
1934	5,682,370	1,164,890
1935 (census)	5,875,667	1,191,939
1936	6,085,300	1,236,500

1 Earthquake year.
2 Figures for 1931-34 are revised.

Buildings and Dwelling Houses At the end of 1935 there were 970,053 buildings and dwelling houses in the city, of which 578,697 were one storeyed, 383,320 two-storeyed, and 7,087 three storeyed wooden houses 950,107, stone houses 921, and brick houses 3,601, while steel or reinforced concrete buildings numbered 8,350.

Area The total area of the city of Tokyo at the end of 1936 was 577.95 square kilometres. The classified ownership at the end of 1935 follows:

Ownership	(In square meter) Area
Total	486,110,200
Imperial Household	6,391,833
State	74,235,307
Tokyo prefecture	975,368
City	13,791,763
Private Persons	390,715,929

Tokyo Enlarged

The development of modern Tokyo is best endorsed by the giant growth of the adjoining towns and villages.

Socially and economically the towns outside the city area have been closely connected with the city itself. The position regarding Tokyo during the 10 years ending 1930 was that the 82 adjoining towns and villages increased in population by 1,720,000, while the city of Tokyo lost 100,000 within the same period. In road construction, extension of communication facilities and in the execution of various municipal regulations the city experienced enormous difficulties due to the existence of over 80 different self-governing bodies surrounding the city area.

As is generally the case with great cities, a large number of people living in adjoining towns enter the city to earn their living. They are placed on exactly the same footing with the citizens in so far as the utilization of metropolitan facilities is concerned. Besides, as most of them are salaried men belonging to middle or intelligent class, to let them stand aloof from city government means an enormous loss to both.

It was after taking into careful consideration all these practical phases of administration that on October, 1932, new Tokyo was founded by amalgamating 20 more wards. The newly annexed suburban towns then had 3,211,580 inhabitants and 469.029 sq. km., a density of 9,034 persons to the square kilometre.

The enlarged Tokyo now covers 570.-337 square kilometres divided into 35 wards.

Commerce and Industry

Retail Business At the end of July, 1936, the number of retail shops in the city was 164,438. Sweetmeats shops numbered 18,225, rice shops 8,054 and vegetables and fruits shops 6,853. Retail price index numbers based on the prices of December 16, 1929, as 100 follow: Foodstuffs 90.0, cloths, etc. 87.7, fuel 92.3, building materials 100.7, miscellaneous 89.7 and average for 100 kinds of commodities 90.4.

RETAIL PRICE INDEX NUMBER IN TOKYO

(Of 100 Kinds of Commodities)

(The average retail price on Dec. 16, 1939 taken as 100)

	Foodstuffs	Clothing, etc.	Fuel	Building materials	Miscellaneous	Gross Average for Tokyo	Average for 13 cities
1930	90.9	87.5	92.0	89.3	91.9	90.2	91.0
1931	79.6	74.1	84.9	85.9	80.4	79.3	79.4
1932	81.0	74.6	82.1	87.6	79.8	80.1	79.7
1933	85.6	85.0	91.3	104.1	92.2	87.8	87.1
1934	86.9	87.9	91.9	104.9	90.6	89.1	88.8
1935	90.0	87.7	92.3	100.7	89.7	90.4	90.5

Wholesale Price The whole-sale average price index number for 100 kinds of commodities in 1935 was 98.7 against 100 of the average wholesale price index of December, 1929. Metals were high at 109.2. More so was miscellaneous at 115.9. Foodstuffs were comparatively lower at 96.0. Below are given detailed figures:

WHOLESALE PRICE INDEX NUMBER

	Foodstuffs	Textile goods	Metals	Building materials	Chemicals	Fertilizers	Fuel	Miscellaneous	Aggragate average in Tokyo	Average in 13 cities
1930	90	84	87	91	95	89	90	93	88.7	87.7
1931	73	70	72	86	82	71	77	83	75.4	74.0
1932	78	80	87	84	76	86	75	93	81.8	81.0
1933	86	98	114	99	105	92	88	116	97.5	95.4
1934	86	100	112	98	93	89	90	118	97.2	96.3
1935	96	96	109	93	87	99	90	116	98.7	97.4

Banks At the end of 1935 there were 27 banks domiciled in Tokyo and 256 branch offices. Four were special banks, i.e. semi-governmental banks. The number of ordinary commercial banks was 16, with 163 branches in the city. Savings banks numbered 7 with 91 branches. The aggregate capital of the special banks was ¥228,775,000 of which the amount paid up was ¥189,651,062. The aggregate of deposits was ¥640,484,698 and the aggregate amount of advances and discounts was ¥2,390,710,397. The aggregate capital of the ordinary banks was ¥505,488,500, the amount paid up was ¥336,147,000, deposits ¥4,074,920,491 and advances and discounts totalled ¥2,634,046,590. The aggregate capital of savings banks was ¥22,535,000 of which ¥16,672,500 was the total sum paid up, deposits ¥1,147,733,983 and advances ¥253,161,162.

Industry At the end of 1935 there were, in Tokyo, 29,047 small working shops, where less than 5 operatives were employed, with 49,225 workers, and 12,233 factories, where more than 5 operatives were employed, with 342,024 workers. On October 10, 1936 there were 975 factories, where more than 15 operatives were employed with 170,830 operatives, of which 124,633 were male and 46,197 female.

FACTORIES AND OPERATIVES IN TOKYO

(Factories where more than 15 operatives were employed)

(October 10, 1936)

Industry	Factories	Operative Total	Male	Female
Textile	140	24,426	6,271	18,155
Metal	122	21,215	19,074	2,141

Total	975	170,830	124,633	46,197

Companies At the end of 1935 there were 15,738 companies in Tokyo, with an aggregate capital of ¥9,927,377,651 of which ¥7,413,341,920 was paid-up, and their net profits in 1934–35 amounted to ¥742,851,522.

COMPANIES IN TOKYO CLASSIFIED BY INDUSTRIES

(At the end of 1935)

Industry	Number	Paid-up-Capital (In Yen)
Agriculture	105	69,348,543
Aquatic	27	84,650,000
Mining	249	711,627,182
Manufacturing	5,751	3,302,692,921
Commercial and Banking	9,145	2,813,542,863
Traffic	461	431,480,411
Total	15,738	7,413,341,920

Transportation

Roads At the end of 1935 the total mileage of public roads in the city was 7,850,130 metres covering an area of 45,262,654 square metres or 8 per cent of the total city area.

Railway Service In the fiscal year ending March 31, 1936 there were in aggregate 394,021,234 boarding passengers and 393,414,451 alighting passengers at 65 different governmental railway stations in the city, and the earnings in these 65 stations totalled ¥56,503,686 which was ¥2,000,000 more than in the previous year. The business results of 14 private railway companies in the year under review were : the aggregate number of passengers, 319,805,654 and the aggregate amount of earnings ¥25,179,766, the total number of employees 6,518 and the total length of lines in operation 905 kilometres.

TRAFFIC SERVICE OF STATE RAILWAYS FOR TOKYO

Year	Stations	Passengers Who Got in	Passengers Who Got off	Earnings (In Yen)
1930	63	343,997,611	339,973,445	50,119,289
1931	64	333,885,569	332,022,462	48,242,225
1932	63	335,659,845	334,105,799	47,353,630
1933	66	359,549,090	357,644,525	51,364,964
1934	65	374,591,543	373,084,109	54,050,989
1935	65	394,021,234	393,414,451	56,503,686

Tramway Service The business results of municipal tramways in the fiscal year ending March 31, 1936 over the total operation mileage of 346.7 kilometres were : the total number of passengers, 294,189,758 or 6,720,000 less than in the previous years and the aggregate amount of eannings ¥18,475,817, a loss of ¥450,000 as compared with the previous year.

TRAFFIC SERVICE OF THE MUNICIPAL TRAMWAYS

Year	Passengers	Daily Average	Fees	Daily Average (In Yen)	Year	Passengers	Daily Average	Fees	Daily Average (In Yen)
1930	16,555,638	45,358	495,096	1,356	1933	12,379,901	33,918	370,302	1,014

The decreasing tendency of the business results of the municipal tramways is largely due to the expansion of other traffic facilities in recent years.

Motor Bus Motor bus service in the city is being rendered by 40 firms beside the Municipal Bus Service and Tokyo Bus Company. In the year ending March 31, 1936 there were 2,398 buses with a total mileage of 1,367 kilometres. The aggregate number of passengers was 251,266,000 and the aggregate earnings ¥15,959,000.

BUS SERVICE IN TOKYO

(1935-36)

	Mileage in K.M.	No. of Buses	Passengers	Earning (In Yen)
Municipal	168.5	935	79,192,224	5,555,425
Tokyo Bus	51.3	497	67,481,749	4,007,864
Others	1,147.4	966	104,593,016	6,396,602
Total	1,367.2	2,398	251,266,989	15,959,891

Underground Railway The urgent need of a high speed underground communications to relieve the congestion and pressure of surface traffic has long been felt necessary. A private company opened its first section of an underground railway, from Asakusa to Ueno, in the latter part of 1927, and is pushing forward its line under the very centre of the city to Shinagawa. It completed the construction of the line to Shimbashi in June, 1934, and the distance in operation now is 8 kilometres. In 1935 it carried 27,986,367 passengers. The municipal authorities have under contemplation the construction of other lines totalling 65 kilometres and have completed geological survey borings in 367 places.

Bridges The city of Tokyo has a network of rivers and canals and the beauty of the city is greatly enhanced by the bridges of manifold designs which traverse them. Before the earthquake the bridges under municipal management numbered 668, of which 426 were of wood. At the earthquake 289 bridges collapsed or were reduced to ashes. By the co-operation of the Reconstruction Bureau of the Government and the Municipality new bridges were built in their place. At the end of 1935 there were 4,701 bridges in Tokyo, 831 of which were of stone, 457 concrete, 935 reinforced concrete, 523 iron, 5 iron and wood, and 1,945 wood.

Rivers and Canals The city is served with a veritable network of canals and rivers many of which are used for transportation purposes. Dredging has to be carried out continuously to keep them navigable. In 1935 there were 59 rivers with the total length of 88 kilometres.

Harbour At the time of the great earthquake in 1923 the city of Tokyo keenly felt the necessity of better facilities for maritime transportation, and when rebuilding of the city took place it was decided to construct a pier, sheds and warehouses at Shibaura, Tokyo. A sum of ¥18,000,000 was appropriated for the work and construction was completed in April, 1935. The length of the reinforced concrete Hinodecho pier is 564 metres and six steamers of 1,000 to 3,000 tons can be moored alongside at a time. Another pier of Shibaura has a length of 910 metres and can moor 7 steamers of 6,000 tons. Furthermore, there are 12 mooring buoys and 8 sheds. The total area of the harbour is 8,591 square kilometres. Steamers outgoing from and incoming to Tokyo and goods carried out from and into Tokyo follow :

MOVEMENT OF VESSELS IN TOKYO HARBOUR

(in 1934 and 1935)

Waterworks

The construction of modern water reservoirs was first commenced in 1890 and it was twenty years before the Yodobashi water reservoir was completed. But this proved inadequate to meet the ever growing water consumption and the Murayama water reservoir was constructed in 1916. It consists of two reservoirs, upper and lower, and the upper reservoir has a capacity of 3,576,000 cubic metres while the capacity of the lower one is 12,148,000 cubic metres. In 1934 another reservoir at Yamaguchimura was completed and it has a capacity of 18,824,000 cubic metres. The total volume of water which can actually be maintained by these reservoirs at any given moment reaches 30,056,000 cubic metres. The total number of hydrants in Tokyo in 1933 was 589,396, the total population dependent on public waterworks 3,801,292 and the total quantity of water distributed 234,555,888 cu.m. In March, 1935, the city bought all rights of the Tamagawa Waterworks which had been supplying water to the six southern wards.

Sewerage Works

General Conditions Until half a century ago waste water used to be discharged into moats, navigable canals and rivers. In 1876, there was a violent outbreak of cholera which impressed upon the Government the urgent need of a general water and sewerage system, but it was not until between 1883 and 1885 that Tokyo prefecture laid the first sewers, with a government subsidy. The subject of sewage disposal was not undertaken in earnest until 1911, and it was not until ten years later that the modern Mikawajima Disposal Works were opened. Extensions and modernization are still going on. At present there are 7 sewage siphons at Sunamachi and Mikawajima.

Within the old city limits there are no longer any open street drains visible, the same, unfortunately, cannot be said of the new city area, though further development of the sewerage system is being planned.

In 1934 there were 428,155 square metres of undergrounds in use for the laying of iron pipes and the aggregate length of iron-pipes laid down was 1,402,674.57 metres in contrast to 1,146,428.24 metres in 1932. Moreover, 169,090,004 square metres of sewerages were the aggregate volume that were siphoned in the year under review and the water volume disposed of totalled 167,398,778 square metres.

SEWERAGE WORKS IN TOKYO

(For the fiscal years 1932-1935)

	1933	1934	1935
Area covered in sq. m.	427,955	530,296	586,504

Sewerage washed out in cu. m.	6,491,972	25,227,310	

Parks

Parks The absolute necessity of parks is more keenly felt in Tokyo than in other cities in Japan because many lives were saved through the existence of parks on the occasion of the terrible earthquake of September, 1923.

At the end of 1935 Tokyo had 105 parks with an area of 2.747 square kilometres.

In the old city area there are three large parks :. Sumida, Kinshi and Hamacho and 89 others of about 2,682,136 sq. m., whereas before the earthquake the city had only Ueno, Hibiya and 32 other parks. Within the newly annexed quarters of the city there are two at Shinagawa covering an area of 3,900 tsubo.

Sumida park has an area of 174,400 sq. m., Hamacho park 36,000 sq. m. and Kinshi park 56,000 sq. m. All of the numerous small parks are laid out adjoining for the most part elementary schools. They serve as local parks, the largest being 4,700 sq. m. and the smallest 1,700 sq. m. in area.

Education

In the fiscal year 1935 there were 285 kindergartens in Tokyo of which 124 were in the old city limits. The number of elementary schools was 590,

of which 217 were in the old city limits. Schools equivalent to elementary grade numbered 74, of which 44 were in the old city limits; blind, deaf, and dumb schools numbered 9; middle schools 51 and girls schools 74. Various schools of middle grade numbered 27; business and technical schools 137, normal schools 3, young people's schools 206 and various private schools 281. As for higher education there were 2 higher girls normal schools, 3 business teachers' institutes, 72 professional schools (colleges), 4 higher schools, and 22 universities.

KINDERGARTENS, AND ELEMENTARY AND SECONDARY SCHOOLS

March 1, 1936

Universities	22	3,495	46,625	14,769
Total	103	7,541	103,788	29,484

Public Libraries There are 31 libraries in Tokyo, of which 6 are owned by the city, 1 by the Government and the rest by private persons. In the fiscal year 1935 the number of books held in all those libraries was 1,767,597, of which 823,269 were held by the Imperial Library at Ueno and 488,694 by the 26 municipal libraries.

LIBRARIES

At the end of the fiscal year	Total Number of Banks	Japanese & Chinese Books	Western Books
1931	1,438,456	1,236,853	201,603
1932	1,509,091	1,301,440	207,651
1933	1,574,691	1,362,023	212,668
1934	1,687,237	—	—
1935	1,767,597	—	—

Social Education The Social Education Bureau of Tokyo municipality, established in 1921, looks after the social education of the capital.

Adult education is effected through the medium of Commercial and Industrial Young Men's Cultural Schools and citizens' lecture courses, both of which give lectures to citizens for a term of half a year, at night or on Sundays and holidays. At other times short time lecture or training courses are arranged for citizens in general. Free use is made of music and the cinema.

The Tokyo Self-Government Hall, Hibiya park, is a permanent organ for social education with the object of fostering an autonomous spirit among the citizens. as its principal raison d'être.

Training of Young Men In July, 1934, there were 26 Young Men's Training Institutes with 15,599 students.

Young People's Schools In 1936 there were 175 municipal young people's

schools and 29 similar institutes with 31,698 aggregate number of students.

Religion

At the end of 1934 there were 1,874 Buddhist temples of various sects, the total number of priests counting 4,301 and adhering families 200,779. The Jodo sect was strongest in point of the number of temples, which were 422. The next position was occupied by the Shingon Sect with 392. Below are given details of various sects of Buddhism.

SHINTOISM BUDDHISM AND CHRISTIANITY IN TOKYO

	No. of shrines, temples or churches	No. of preachers	No. of Individual Believers
Shrines	913	353	—
Shintoism	1,207	0,130	608,425
Temples	1,881	4,459	267,701
Buddhism	289	478	112,907
Christianity	242	524	59,076

TEMPLES, ACCORDING TO DIFFERENT SECTS

(at the end of 1935)

Sect	No. of Temples	Priests	No. of Believing Families
Tendai	145	320	11,126
Shingon	401	784	49,567
Jodo	423	895	50,829
Rinsai	99	244	10,256
Soto	215	611	26,807
Obaku	10	20	1,120
Shin	240	510	54,845
Nichiren	341	1,060	62,006
Ji	7	15	1,145
Total	1,881	4,459	267,701

Social Work

Child Welfare At the end of March, 1936 there were 26 maternity hospitals including three municipal-owned, and in 1935–36 there were 25,248 in-patients of expectant mothers, and 552 patients treated in travelling and the number of births given was 21,897 of which 1,022 were still births. In the same year there were 100 relief nurseries where working mothers and fathers can leave their children when going to their daily work. The total number of babies and children who were brought into these nurseries in the year was 7,593.

The total number of facilities for child protection was 310 which included 100 for baby protection, 11 nurseries, 17 for juvenile protection, 37 health consultation rooms, 104 for the education of the poor and deformed, 31 children's play grounds and libraries, and 10 for special protection of children.

Labour Exchanges Activities of municipal and private labour employment offices which number 49 in all can be seen from the following :

BUSINESS RESULT OF LABOUR EXCHANGE

(at the end of the fiscal year 1935)

Kinds	No. of exchange	Persons wanted		Applicants		Persons who secured work	
		Male	Female	Male	Female	Male	Female
Municipal:							
General	39	213,330	131,282	222,895	101,498	66,584	32,061
Private:							
General	10	98,980	69,212	95,794	72,133	21,920	20,036
Total	49	312,310	200,494	318,689	173,631	88,504	52,097

Administration and Government

History In July, 1868, the Emperor Meiji granted an Imperial message on the proposed removal of the capital to Tokyo. It was the beginning of the regeneration of Tokyo. At the same time the downfall of the Shogunate régime was announced and new Japan was born.

The Tokyo prefectural office was established soon after the issuing of the Imperial Rescript. In 1871, the city was divided into 6 large wards, but seven years later these wards were abolished and 15 smaller wards established. In 1879, as the governor of the prefecture saw that these 15 wards were firmly established, he issued a decree concerning the formation and functions of ward assemblies, and thus instituted the first representative government system in this country.

Legislative Body To control mu-

nicipal business the city has a city council and board of aldermen with a mayor as the head. Further, there are several departments, bureaux, sections, etc., for the execution of municipal affairs and office work.

Membership of the city council is an honorary position, the term of service being 4 years. The membership at present is 144, but owing to resignation of and death of members, the actual membership at the end of 1934 was 139. The principal functions of the council are the enactment and reorganization of city regulations, decisions as to finance, approval of settled accounts, imposition and collection of city taxes; and the right of proposing any bill, except the budget for annual revenue and expenditure. The board of aldermen of Tokyo once was the executive body, but in 1911 it became a legislative body. It is composed of 15 honorary aldermen to whom the mayor is added as chairman. The functional powers include the right of proposing any bill or expressing opinions on other matters.

Executive From 1889 till 1898 the function of the mayor of Tokyo was entrusted to the governor of Tokyo prefecture, but on October 1, 1898 the city became self-governing. The mayor is elected by the city council. Under the mayor there are three deputy mayors, a city counsellor, a treasurer, directors of departments, chiefs of bureaux, ward heads and other numerous offices. There are various kinds of committees as consultative bodies. The organization of the municipality is as follows:

THE DEPARTMENTAL ORGANIZATION OF THE TOKYO MUNICIPALITY

Sections	Functions
Private secretariat	Secret matters, keeping of seals, ceremonies and reward
Personnel	Personnel administration
General secretariat	General affairs, municipal research, elections, legal affairs, etc.
Bureaux	
Supervising	Supervision and inspection of municipal affairs
Finance	Budget, loans, public land, taxation, purchasing, etc.
Industrial	Industry, promotion of industry and commerce, agriculture, fisheries and stock raising
Education	Management of schools; education, libraries, museums, etc.
Social Work	Protection and correction. Management of lodging houses, housing, labour exchanges, commercial training, etc.
Public Health	Management of hospitals, social hygiene, refuse disposal, park and playgrounds, auditoriums, cemeteries, zoological gardens, etc.
Water Works	Water supply and extension
Public Works	Roads. bridges, harbours and rivers, sewage disposal, buildings, etc.
Electric	Supply of light and power: electric cars, motor buses, subways, etc.
Divisons	
Harbour	Care of Tokyo harbour
Municipal Office Building	Building the City Hall at Tsukishima
Miscellaneous	
Central wholesale Market	Wholesale of provisions
Poor Asylum	Protection of helpless persons aged or young
Hygiene Laboratory	Investigations on epidemics, bacteria, etc.
Electric Laboratory	Examination of meters and scientific research on electricity.

Finance

The 1935 (1935–1936) municipal gross budget was balanced at ¥363,330,000 of which ¥1,872,000 was the sun brought from the previous year; ¥77,660,0000 was the sum transferred from other sources; ¥2,922,000 was the sum transferred from the reserve fund; and ¥86,151,000 was the sum obtained by means of conversion of bonds.

The genuine expenditure, however, was ¥200,872,000. The expenditure and revenue table follows:

Expenditure

Category of account	(¥1,000)
Office expense	11,046
Education	25,132
Industries	372
Public health	11,272
Social work	5,405
Public work	33,759
Public enterprises:	
1) Water work	15,931
2) Electricity	26,295
Expenses for bonds:	
1) General	33,505
2) Water work	9,514
3) Electricity	22,109
Loans made	1,875
Others	4,650
Total	200,872

Revenue

Items	Amount (¥1,000)
Income from properties	2,557
Fee & charges	59,044
Government subsidies	10,947
Compensation	4,174
Reimbursements of loans	4,536
Proceeds from sales of city properties	1,251
City tax	38,673
Municipal loans	54,944
Others	23,594
Amount carried from the previous year	1,872
Amount transferred from special reserve fund	2,922
Total	199,724

	Receipts	Disbursements	Per Capita Genuine Disbursement
	¥	¥	¥
1932	152,745,263	159,343,763	30.00
1933	165,575,185	173,344,002	31.60
1934	191,208,799	195,829,677	34.58
1935	199,724,127	200,872,604	34.19
1936	224,783,000	225,873,000	

The following shows the genuine receipt and disbursement accounts for the five years, 1931–35 :

City Properity On October 31, 1934 the aggregated value of all public properties of the city was estimated at ¥869,303,415, an increase of ¥24,655,180 compared with the previous year.

Loans. The total amount of municipal bonds as outstanding in 1935 was ¥782,568,598, while the total amount issued in the year was ¥120,974,195 and the amount reimbursed ¥90,579,445. The bond burden per household of the citizens was in that year ¥656,551 and that per capita ¥133.188.

CHAPTER XXXIX

FIVE BIG CITIES

Osaka

General

Geographical Position The city of Osaka is situated nearly in the centre of Japan proper, near the eastern entrance of the Inland Sea with easy access to the Pacific Ocean, while on the other sides extend the fertile plains of the provinces of Settsu, Kawachi and Izumi. The city of Kyoto, the ancient capital of Japan, is situated 43 kilometres to the north-east, and the city of Kobé lies 32 kilometres to the west. The river Yodo runs through the city, and with the numerous canals that connect with it affords excellent transportation facilities by water. The Yodo rises in Lake Biwa, the largest fresh water lake in Japan, and branches off into the Shin Yodogawa, Okawa, Dojimagawa, Tosaborigawa, Ajakawa, Kizugawa and the Shirinashigawa, which in turn connect with numerous canals, the most famous being the Dotombori Canal.

Area The area of the city of Osaka is 187 square kilometres which means it ranks third so far as the area is concerned exceeded by Tokyo and Kyoto, but in point of population it is the largest, next only to Tokyo. Its city limits were extended twice in its history, the first time in 1897 and the second in 1925. The city is divided into 15 ku (wards) which are : Kita, Nishi, Minami, Higashi, Konohana, Minato Taisho, Tennoji, Naniwa, Nishiyodogawa, Higashiyodogawa, Higashinari, Asahi, Sumiyoshi, and Nishinari.

Population The population of Osaka was on Oct. 1, 1936, 3,101,900, men numbering 1,654,900 and women 1,447,000 and the households numbering 655,900, according to the Cabinet Bureau of Statistics. The comparison of the last three years follow :

Population, 1934-1936.

	Men	Women	Total	Households
1934 (Oct. 1)	1,445,000	1,277,700	2,722,700	—
1935 (Oct. 1)	1,594,151	1,395,716	2,989,866	630,232
1936 (Oct. 1)	1,654,900	1,447,000	3,101,900	653,900

Each of the 15 ku (wards) is inhabited by a population of more than 100,000, with the Minato-ku 329,800 Higashinariku 324,900 and Minamiku, 118,900, according to the investigation of 1936. The average population in one ku (ward) was 206,700 in contrast of 178,-800 in Tokyo.

The population of Japan could be dividable in 1935 between 22, 666,307 (32.7%) of urban districts and 46,387,841 (67.3%) of rural districts and the population Osaka was 13.2% of the entire urban population.

In 1935 births numbered 87,417 (29.24 per 1,000 of population) of which 44,-916 were male and 42,500 female, 84,-91% of the 87,417 births were lawful and 15.09% unlawful. In the same year deaths numbered 47,459 (15.87 per 1,000 of population) of which 25,080 were male and 22,379 female. Women between 25–29 years of age ranked first as lawful birth-givers, while women between 20–24 ranked first as unlawful birthgivers.

In the same year still-births totalled 5,731 (1.92 per 1,000 of population) of which male numbered 3,098 and female 2,527, and 31% of the still births were of the parents unmarried.

Mortality in 1935 totalled 47,459 (15,-87% of 1,000 of population) of which men numbered 25,080 and women 22,-379. Deaths occurred most numerously in December and the least in September. 38.1% of the deaths took place in the ages between 0–4 and 39.1% in persons between 15–59.

As for the causes of deaths, 96.4% were illness and 1.2% suicide. Of the deseases 13.0% were pneumonia and 12.3% tuberculosis.

Residents from Overseas territories and Foreign Countries, Coreans residing in Osaka at the end of 1935 were 202,-

311 (121,400 being men and 80,911 women), an increase of 67,886 over 1934. Formosans numbered 995 (49 being men and 46 women). Foreign nationals run as follows : Manchoukuo 93 ; China 2,-969 ; British India 49 ; the United States 35 ; France 25 ; Great Britain 24 ; Rusia 20 ; and others 42, totalling 3,256 and Chinese occupying 91%.

Industries

Osaka is an important industrial and commercial centre in Japan surpassed by none but Tokyo and excelling the latter in many respects. The aggregate 1935 production (excluding gas and electric production) was valued at ¥1,-503,339,937 against ¥1,282,185,000 of the previous year. Further particulars follow :

Principal Industries	No. of factories	No. of working men	Production ¥ 1,000
Textile	5,388	44,316	251,391
Metallurgical	5,766	57,603	391,029
Machinery	8,288	65,148	287,908
Grammies	672	13,962	44,106
Ceramics	1,980	23,736	246,410
Milling and wood work	5,503	12,406	37,921
Printing and book binding	1,695	11,876	54,661
Foodstuffs	7,810	13,917	92,840
Gas and electric work	15	1,113	—
Miscellaneous	12,262	35,994	97,075
Total	49,379	780,073	1,503,340

Including those factories where less than 5 workers are employed which number 37,775 in all.

Commerce

Business Companies At the end of 1935 there were 9,574 business companies domiciled in Osaka, an increase of 1,-650 over the previous year. The aggregate paid-up capital amounted to ¥2,793,486,000 against 2,637,249,000 of the previous year, an increase of ¥156,237,-000. Of these companies 2,240 (23.4%) were joint stock companies of limited liability. The rest was in the co-operative basis either of names or funds.

Banks At the end of 1935 there were 9 banks domiciled in Osaka, and 95 banks domiciled in cities other than Osaka were found represented in the city by their branches. The aggragate capital of the 9 Osaka banks was ¥252,-800,000, of which ¥183,888,000 was found paid up at the end of 1935. The aggragate reserve of these 9 banks was valued at ¥118,877,000, an increase of 10.7% over 1934. Bills cleared at the Osaka Clearance House in 1935 amounted to ¥24,979,292,283, an increase of 10.2% over 1934.

Exchanges In Osaka there are 4 exchanges, viz., Osaka Stock Exchange, Osaka Dojima Rice Exchange, Osaka Sanpin Exchange and Osaka Sugar Excange. The Osaka Stock Exchange is a rival of the Tokyo Stock Eechange in the transaction of stocks. The Osaka Rice Exchange is the forerunner of rice exchange business in Japan. In the Osaka Saipan Exchange were cotton yarn and raw cotton only could be transacted, in February, 1933, artificial silk was admitted for the clearance transaction.

The Osaka Sugar Exchange is operated upon membership basis, but the other three are joint stock companies of limited liability. Transactions made at the Osaka Stock Exchange in 1935 were valued at ¥9,662,412,000, a reduction of ¥165,723,000 from 1934. Rice was transacted up to 35,985,000 koku for ¥1,100,275,000, a loss of 6,883,000 koku in quantity and ¥61,179,000 in value from the previous year. Cotton yarns were contracted up to 5,291,360 piculs valued at ¥1,083,584,000, reduction compared to 1934 being 191,550 piculs and in value, ¥63,617,000. Raw cotton was dealt up to 2,550,770 bales for ¥570,276,000, shrinkage in contrast to 1934 being ¥732,790 bales and, in money value, ¥184,380,-000. Rayon was transacted for ¥1,291,-710 bundles against ¥82,509,000 shrinkage from the previous year being 468,-200 bundles and in value ¥4,384,000. Sugar dealings were booked for 4,362,-900 sucks against ¥78,376,000 over 4,-424,200 sucks and ¥76,783,000 of 1934. Transactions made at any of these Osaka Exchanges in 1935 exceeded those in any of the 5 other big cities excepting sugar in which the Tokyo Sugar Exchange ranked first.

Warehouses At the end of 1935 Stocks in all the warehouses belonging to the 6 leading warehousing companies Su-

mitomo, Sugimura, Mitsubishi, Toshin, Shibusawa and Tokyo) were found to be 6,134,532 units valued at ¥120,848,000, stocks brought in during the year being 21,237,042 units valued at ¥563,877,000 and those taken away 21,645,440 units valued at ¥576,761,000.

Commodity Movements The aggregate quantity of commodities taken away from Osaka in 1935 was 13,199,271 tons for ¥3,999,979,000 and those brought into 22,955,364 tons for ¥3,542,476,000. The net result was the excess of influx in quantity by 9,766,093 tons but the excess of out-going movements by ¥457,503,000. The following table shows this trend in the 5 classified leading commodities :

PRINCIPAL INCOMING & OUTGOING COMMODITIES

1935

	Outgoing		Incoming	
	Quantity (1,000 tons)	Value (¥1,000,000)	Quantity (1,000 tons)	Value (¥1,000,000)
Foodstuffs	993	196	2,735	470
Raw materials	2,852	358	11,726	575
Manufactures as raw materials	3,001	562	4,831	803
Finished manufactures	6,303	2,897	3,422	1,669
Others	50	5	199	23
Total	13,189	4,000	22,955	3,542

Central Wholesale Market The aggregate amount of sales made at the Osaka wholesale market in 1936 was valued at ¥76,618,869, the average daily sales being ¥218,287. This market was inaugurated in 1931, and it deals only in daily necessaries of life such as fish, meat, eggs, vegetables and fruits, and there are six more central wholesale markets in the whole country.

Municipal Retail Markets There are 44 retail markets operated by the Municipality. Sales made at these municipal markets in the whole city of Osaka in 1936 totalled ¥22,847,966, a decrease of ¥142,359 from 1935. The steady declining tendency in the amount of sales at the Municipal retail markets is chiefly explained by the effect of the uniform price system at work and the increased number of private markets. The average monthly sales in 1936 resulted in ¥1,903,997 and the average sales per market in the same year ¥430,559.

Foreign Trade

The 1936 foreign trade returns of Osaka showed ¥672,232,979 in export and ¥593,263,783 in import, the excess of exports resulting in ¥78,969,196. In tonnage, however, the result was adverse up to 3,021,170 tons, a strong evidence that Osaka is an efficient manufacturing centre. Against the aforesaid export valued at ¥672,232,979 was an increase of ¥52,090,464 (8.4%) in export, and ¥46,513,642 (8.5%) in import, and of the excess of exports amounting to ¥5,576,822 (7.6%). Particulars follow :

FOREIGN TRADE OF OSAKA, 1936

Kinds	Exports	Imports	Excess of Exports or Imports (−)
	¥	¥	
Foodstuffs	7,205,301	13,490,834	(−) 6,285,533
Raw materials	8,374,954	389,588,602	(−)381,213,648
Manufactures for further manufacturing	115,337,012	143,958,101	(−) 28,601,089
Finished goods	523,223,514	41,801,818	481,421,696
Miscellaneous	8,612,417	2,284,069	6,328,348
Re-shipments	9,459,781	2,140,350	7,319,422
Total	672,232,979	593,263,783	78,969,196

As shown in the above total of exports amounting to ¥672,232,979, finished goods accounted for ¥523,514 (77.8%) and of the total imports raw materials accounted for ¥389,588,602 (65.7%) and materials for further manufacturing ¥143,958,101 (24.3%).

A further study shows that the excess of exports was due to increase in trade with the Asiatic Continent, Europe and America. Osaka is the third important foreign trade port city, Kobe ranking first and Yokohama second.

Transportation

Roads At the end of 1936 the total road area of Osaka was 13,051,061 square km., 7.0% of the entire area of the city compared with 6.7% of 1935, and the total road length was 2,522,281 metres. The total area of paved roads was 5,537,493 sq. metres, 12.4% of the entire road area.

Rivers, Canals and Bridges Osaka is the Venice of Japan in that there are many canals, and to that fact she owes much of her development as a big commercial and manufacturing center. Rivers that run through the city number 12 and canals four which are serving the city as effective means of transportations.

Tramway and Bus Lines At the end of March, 1936 the business kilometerage of street tramways was 106.5 kilometres, the number of passenger cars in use counting 765. The total number of passengers in 1936 was 263,031,378 (0.4% increase from 1935) and the total revenue ¥14,729,190 (0.2% increase from 1935). All tramway lines and some bus lines are operated by the Municipality.

The subway work was first started in 1930 and its operation between Shinsaibashi and Umeda was inaugurated in 1933, and then the line was extended southward from Shinsaibashi to Nanba in October, 1935, the total business kilometerage on December 31, 1936 being 4.1 and the number of cars 23. The total number of passengers in the whole year of 1936 was 17,624,237 with fares totalling ¥1,506,651. The subway lines are also operated by the city.

Suburban Electric Railways On March 31, 1936 there were 9 private companies oparating suburban electric lines to various suburban points with a total kilometerage of 839.4 carrying 1,059,280 passangers per day in average and an aggregate total number of passengers being 38,696,000 in the whole year of 1936.

These Companies are Nankai Railway Company, Hanshin Electric Railway Company, Hanshin Express Railway Company, Keihan Electric Railway Company, Osaka Denki Kido Company, Sangu Electric Railway Company, Osaka Railway Company, Hankyu Electric Railway Company, Hankai Electric Railway Company. Hamaden, Kishiwada, Wakayama, Nara, Yoshinoyama, Ujiyama and Kinuana and chief points that are reached by those electric railways.

Sea Transportation The Osaka Harbor is one of the three largest ports in Japan and steamships that entered the port in 1935 numbered 23,966, the aggregate tonnage being 35,822,282 tons. Sail boats numbered 167,931, with an aggregate tonnage of 4,836,441. The increase in the number of calling steamships compared with 1934 was 12.6%, another evidence of the growing prosperity of Osaka.

Airways Osaka is an important airway point in Japan. The Nippon Air Transportation Company is operating its regular airway passenger service with Osaka as a center-point, Tokyo to Osaka and Osaka to Fukuoka, thence to various points of Chosen and also southward to Taiwan. In 1936 passengers who left from the Kizugawa airport numbered 2,051 and those who arrived 2.097. The Nippon Air Transport Institute is operating the air way service between Osaka and Beppu and between Osaka and Shirahama. In the business year ending March, 1936 passengers who utilized the Institute's service totalled 645.

Education

On March 1, 1936 there were Kindergartens and schools in Osaka totalling 767 against 666 of the previous year; teachers, professors and nurses numbering 17,966 against 12,798 of the previous year; and pupils and students 486,842 against 446,751 of 1935. Schools and kindergartens established by the Municipality numbered 511: schools alone established by the Prefecture and the Municipality 30; and private schools and kindergartens 226.

Kindergartens numbered 119 on March 1, 1936, children enrolled numbering 15,086 and nurses 527. Attendants in elementery schools totalled 6,570, on March 1, 1936, with their teachers numbering 6,916 Middle schools and schools of the same grade totalled 71, with pupils numbering 57,575 and teaching forces 2,435. Institutions for higher and university education were 10 in number, faculties totalling 781 and students 7,937.

Furthermore, there were on March 1, 1936, Young Men's Schools numbering 148 in all, with teaching forces of 1,284 and pupils counting 29,271.

Educational expenditure of the Municipality for 1935 was ¥15,789,097 an increase of ¥2,657,203 (20.2%) over 1934. Of this expenditure for education ¥7,969,075 was for salaries.

Universities and colleges in Osaka are

the Osaka Imperial University (governmental), the Osaka University of Commerce (municipal), Osaka Higher School (governmental), the Osaka School of Foreign Languages (governmental), the Kansai University (private), Naniwa Commercial College (private), Osaka Girls' College (prefectural), etc. Libraries. At the end of March, 1935 there were 13 libraries, 1 being under governmental maintenance, 6 under municipal maintenance and 6 of private ownership. In the governmental library there were 671,265 books on March 31, 1936.

Social Welfare Works

Relief of the Poor Since the issuance by the Government in 1874 of the relief regulation, the municipality of Osaka has active interest in the relief of the poor, old-aged and deserted children. More recently it has undertaken to institute various social works directed for the prevention of poverty. In 1935 three municipal maternity homes received 6,135 expectant mothers of small means and births numbering 5,155 were obtained, still-births numbering 307, and daily average births 4.7.

Protection of Infants & Children At the end of 1935 there were 34 nurseries, poor children educational homes; 3 blind and deaf protection homes; 9 minors protection houses; and 16 children health consultation offices. Infants who were received in the 34 nurseries totalled 2,700.

Employment Exchanges The municipality also maintain 21 exployment exchanges and 1 training place for workseekers. The employment exchanges gave work to 40,532 men and 186,299 women during 1935.

Medical Relief On March 31, 1936 there were 63 relief hospitals. The total number of patients treated in all the relief-hospitals was 12,950 in 1935.

Social Education Work In 1935 there were 18 institutes for the social education work, of which 7 were under municipal management. Protection of infants and children, assistance to advice-seekers on matters of health, law, etc. and holding of necessary lectures for social educational purposes etc. are the works that are being carried on by the 18 institutes.

Unemployment In 1936 there were 28,105 unemployed per day in average including 7,328 Coreans, according to the Municipal Social Bureau. This unemployment number was 0.91% of the entire population of the city and a reduction of 14.2% from 1935. Though there was a reduction of 19.67% in Japanese there was an increase of 5.9% in the Corean unemployment.

Municipal Finance

The fiscal year 1937 budget was formulated, taking into consideration the need of meeting all that was urgent for the healthy expansion of the city and the promotion of the welfare of the citizens and it was balanced at ¥355,181,126, an increase of ¥47,719,788 over the previous year. The main items for which the expenditure was alloted cover the following: ¥1,381,764 for the 4th road improvement work; ¥3,235,006 for the 3rd city planning work; ¥6,221,232 for the 5th school equipment; ¥8,776,342 for extension of equipment work for the supply of electricity; and ¥2,500,000 for the extension of water work.

The municipal loans aggragated ¥527,933,555 on May 31, 1936, which means ¥177 per capita.

Kyoto

Kyoto, known in antiquity by the name of "Heian" (the city of peace), was for about a thousand years the metropolis of Japan. At the Restoration, the Emperor Meiji moved his capital to Tokyo, but Kyoto retained its position as a cultural centre, and today it is looked upon as "the classic city" and the leader of culture in the western part of the country. The city, lying in what is called the Kyoto basin, is surrounded by many famous hills and mountains such as Arashiyama, Atagoyama, Kuramayama, Hiéizan and Higashiyama. The area of the city is 288.65 square kilometres, the greatest length from N. to S. is a little over 26 kilometres and the greatest breadth is about 25 kilometres, the form being roughly rectangular. Osaka lies 43 kilometres to the southwest.

Boundaries The boundaries of the city have undergone considerable changes since 1888. At that date the first annexation of adjacent villages was made, a second extension was made in 1902 and a third in 1918. In 1929 three wards, Nakagyo-ku, Sakyo-ku, and Higashiyama-ku were newly added to the city. In 1931 the last annexation was made and two more wards, Ukyo-ku and Fushimi-ku, were constituted.

Population The population grew from 717,100 in 1927, to 736,000 in 1928, to 755,200 in 1929, and due to the above mentioned extensions in the boundaries, was found in 1930, to be 952,397. On October 1, 1935 the total number of population in Kyoto was 1,080,593, that of households was 224,663, and the estimated number of population on October 1, 1936, was 1,108,400, that of households was 230,238.

Industry and Commerce

In 1935 the conditions of factories which employed more than 5 persons in Kyoto were as follows :

	Factories	Operatives	Production (In yen)
Textile	1,020	30,606	92,814,395
Metallurgical	133	2,682	13,179,150
Machinery	185	7,792	22,929,879
Ceramics	51	983	3,466,576
Chemical	70	1,877	13,963,971
Saw milling & wood work	133	1,291	5,918,966
Printing & binding	79	1,570	6,568,332
Foodstuffs	294	4,605	28,070,978
Electric & gas	27	360	5,953,440
Miscellaneous	101	1,650	4,711,467
Total	2,020	53,416	197,577,154

TOTAL INDUSTRIAL PRODUCTION OF KYOTO

(1935)

Kind of Industry	Amount in yen
Agriculture	4,638,741
Livestock	4,490,184
Forestry	439,589
Mineral	247,504
Fisheries	52,756
Factries (including all petty shops)	388,892,931
Total	298,761,715
1934	264,128,150
1933	233,713,699

Foreign Trade Not being a port Kyoto cannot carry on trade with foreign countries direct except by parcel post, but the goods consigned to and from foreign countries through other ports were (in ¥1,000).

	1932	1933	1934	1935
Exports	22,334	28,270	38,984	42,490
Imports	4,317	5,315	8,198	9,528

Banking Statistics Figures concerning the banks in the city are quoted below :

(In ¥1,000)

At the end of	No. of Banks	Deposits	Loans
1932	88	453,702	156,344
1933	85	474,504	178,553
1934	80	494,295	208,386
1935	80	535,339	179,773

Commercial and Industrial Corporations At the end of 1935 there were 3,246 companies in Kyoto. Their paid-up capital amounted to ¥293,870. The Kyoto Stock Exchange sold, in the short term section, 14,982,960 shares with the value of ¥1,750,446,000 and delivered 1,500,560 sares with the value of ¥143,972,000.

Transportation

Vehicles At the end of 1935 the number of vehicles was 205,813, including 231 rikisha, 2,766 automobiles and 150,585 bicycles.

Municipal Tramways In 1935–36 the total length of the lines was 65.0 km., and carried 101,441,478 passengers, while the bus ran on 41.4 km. of the lines and carried 10,675,571.

State Railways In 1935–36 the number of passengers who moved through Kyoto and other seven stations in the city was 19,454,053.

Suburban Electric Railways On the north the Eizan Electric Railway extends from Demachi Bridge to Kurama and Mount Hiéi ; on the northwest the Arashiyama line starts Shijoomiya and goes to Arashiyama and connects with the Atago Electric line. To the south Kyoto is connected with Osaka and Nara by three electric railways, i.e. Kei-han Electric, Shin (new) Keihan Electric and Nara Electric. The Kei-han line extends to the east from the terminal of Sanjō to the city of Otsu by Lake Biwa.

Rivers, Water-Power Works

Rivers Almost all the rivers that meet in the Kyoto Basin, rise in the Tamba tableland. The Hozu River, which later changes its name into the Katsura River, touches the western side of the city ; the Kamo River and the Takano River, rise in the southern part of the tableland, join together and flow across the city to empty into the Katsura River. The Uji River, starting from Lake Biwa, and the Katsura River meet in the southern suburbs of the city to form the Yodo River which flows south-westwards, through Osaka, into Osaka Bay.

Canal and Water-power Work The first Biwa Canal, completed in 1895 at

the cost of ¥1,838,317, was designed for the conveyance of passengers and goods and for the supply of water power, while the second canal, completed lately at the cost of ¥4,477,805, supplies water for drinking, fire-brigades and for producing electricity, etc.

The waterworks were started in 1908 and completed in March, 1912, at the cost of ¥3,000,000 of which ¥750,000 came from the State treasury. The water is drawn from Lake Biwa by means of the second canal mentioned above and supplies water to 500,000 people. Further work, to cater to the needs of 200,000 people, is on the way. The supply in 1935–36 was 41,359,087 cubic metres to 147,114 households.

Education

Governmental and Prefectural : Kyoto Imperial University, the Third Higher School, Kyoto Higher Industrial and Art School, Kyoto Higher Sericultural School, Kyoto Sangyo Koshujo (School of Sericulture).

Municipal schools : Kyoto Painting School.

Private schools : Ritsumeikan University, Doshisha University, Ryukoku University, Otani University, Shingonshu University, Buddhist School, Military Arts School.

NUMBER OF EDUCATIONAL INSTITUTES

(March 1, 1936)

	No.	Instructors	Students
Kindergartens	53	180	4,331
Elementary schools	135	2,937	127,787
Blind, deaf and dumb schools	2	51	363
Girls' high schools	18	533	11,702
Middle schools	13	376	7,599
Technical schools	13	472	11,217
Normal schools	2	94	828
Higher schools	1	62	772
Colleges	16	626	6,203
Universities	6	1,084	9,336
Total	259	6,415	180,138

Libraries and Museums There are also in Kyoto other institutions for educational purposes as the Imperial Gift Museum, Kyoto Municipal Library, Kyoto Fine Arts Museum, and the Memorial Zoological Garden.

Shrines and Temples In 1935 the numbers of Buddhist temples and Shinto shrines for which Kyoto is famous were 403 shrines, 334 preaching places of sectarian Shinto sects, 1,413 Buddhist temples, while Christian churches numbered 52.

Social Work

Conditions of social undertakings under municipal management in 1935–36 were :

	No. of establishments			
Public markets	13		Sales account	2,487,226
Housing	5	places	No. of houses	250
Public baths	4	houses	Bathers	1,400,551
Labour exchanges	3		Cases handled	26,593
			Employed	11,413
Lodging houses	2		Lodgers	32,790
Lunch-room	1		Meals	91,504

Finance

The annual revenue and expenditure, both general and special, of Kyoto amounted to :

Fiscal Year	Revenue	Expenditure
	(In ¥1,000)	
1931-32	40,548	40,444
1932-33	37,517	37,002
1933-34	26,083	36,302
1934-35	27,453	37,884
1935-36	28,527	42,869
1936-37	30,608	43,945

Municipal debts outstanding on May 31, 1936 totalled ¥56,866,161 or ¥51.351 per capita of population.

Nagoya

Nagoya is situated in the very centre of the main island. Facing Isé Bay on the south and bordered by the fertile plain of No-Bi on the north, the climate

is always mild. Nagoya castle, with its famous golden dolphins, speaks of the glorious history of the city, but one cannot live on the past, and old and historically important as the city may be, she fills today a more important rôle than of old, for she is a distributing and industrial centre for the middle part of Honshu, a rôle that will grow in importance as time goes on.

Area and Population

The increases of population and area during the past 11 years, 1926–35, are shown in the following table :

On Octber 1	Population	No. of Households	Area (sq. km.)
1926	801,900	168,466	148.142
1927	835,700	175,567	148.929
1928	869,900	182,752	148.929
1929	904,700	190,063	148.929
1930 (census)	907,404	190,379	150.733
1931	934,400	198,000	151.044
1932	961,800	203,700	151.044
1933	989,600	209,700	151.044
1934	1,017,700	215,600	151.044
1935 (census)	1,082,816	219,737	151.093

Buildings Number of buildings at the end of 1935 was as follows :

Stone buildings	549
Brick buildings	310
Wooden buildings	261,289
Others	27,651
Total	289,799

Commerce and Industry

Companies and Banks At the end of 1935 the number of business corporations in Nagoya was 7,865, and that of banks 7 with 79 branches. At the end of 1935 their deposits amounted to ¥494,557,000 outstanding loans to ¥216,038.

Domestic and Foreign Trade Foreign and home trade values in recent three years were as follows :

	EXPORTS	INPORTS
Home trade	(In yen)	
1933	41,596,840	122,252,842
1934	47,397,255	137,081,837
1935	57,205,175	149,122,814
Foreign trade		
1933	89,420,348	91,178,124
1934	115,515,093	88,526,006
1935	129,478,126	95,528,520
Totals of home and foreign trades	(In yen)	
1933	131,017,188	213,430,966
1934	162,912,348	225,607,843
1935	186,683,301	244,651,334

In 1934, in home trade, shipments of rice, other cereals, wheat flour, sugar, confectioneries, cotton tissues, iron, timber, wooden board and boxes, knitted goods, chemicals, ceramics, iron, coal and fertilizers exceeded million yen each, ceramics heading the list with ¥6,094,393 ; receipts of rice amounted to ¥18,374,253, sugar ¥23,566,909, lumber ¥11,967,617, coal and charcoal ¥20,909,053, and iron and manufactures ¥20,129,153. In foreign trade, exports of wheat flour amounted to ¥1,303,195, beer ¥1,269,563, cotton tissues ¥48,187,708, ceramics ¥36,-967,953, iron manufactures ¥2,087,768, boards for boxes and casks ¥2,698,185, veneer boards and other planks ¥2,274,-281, rolling stocks ¥5,220,961, toys ¥3,191,-018 and sinning machines ¥2,325,325 ; imports of wheat amounted to ¥3,260,236, wool ¥41,873,854, cotton ¥2,521,439, timber ¥6,595,799, coal ¥5,820,519, and machines ¥5,844,474.

Exchanges Nagoya has three exchanges, i. e. the Stock Exchange, Rice Exchange and Cotton Yarn Exchange. In 1935, the turnover of the Stock Exchange was 178,730 shares long term transaction valued at ¥14,547,501. The Rice Exchange handled 5,026,100 koku while the Cotton Yarn Exchange handled 1,556,760 bales.

Industry Commodities that are brought into city are foodstuffs and raw materials such as rice, sugar, timber, coal, ginned cotton, iron, wool, etc., while those sent out are mainly lumber, coal, cotton piecegoods, porcelain and pottery, beer, cement and other manufactures. Nagoya has been from olden times a famous place for porcelain and pottery and in 1935 the output totalled as much as ¥21,819,000. It is only since the growth of the cotton spinning industry in the city that the value of the annual output of pottery has been challenged. The total production of the cotton spinning

industry reached ¥153,127,000 in 1935. An equally significant development is that of the machine and machinery. In 1935 the total output of machine industry reached ¥96,346,000, an increase of 19.8 per cent as compared with the previous year.

Number of Factories and Production Number of factories employing more than 5 operatives and productions of various industries in 1935 follow :

Kind of industries	Factories		Operatives		Output (in ¥1,000)	
	1934	1935	1934	1935	1934	1935
Textile	557	577	29,631	27,748	154,921	153,127
Metallic	284	362	4,884	5,600	12,860	15,813
Mechanical	725	815	28,580	32,674	80,401	96,346
Pottery and porcelain	183	194	10,484	11,268	21,467	21,819
Chemical	132	150	3,514	3,852	2,861	24,840
Saw mills and wood works	454	588	6,139	7,070	23,614	25,735
Printing and bookbinding	157	173	2,287	2,632	8,779	9,717
Comestibles and beverages	328	415	3,543	3,959	39,758	43,796
Gas and electric	3	3	203	198	9,241	7,196
Others	650	731	5,563	5,747	18,523	20,541
Total	3,473	4,008	94,828	100,748	390,425	418,930

Transportation

Railways Lying as it does between Kyoto, the old capital, and Tokyo, the present capital, Nagoya is known as Chukyo (middle capital). It is an important intermediate city on the Tokaido highway. The Kwansai line, which starts from Osaka, passes through Nara and Miyé prefectures and connects at Nagoya with the main Tokaido line to Tokyo. The Chuo line, which runs through Gifu, Nagano, Yamanashi and other prefectures to Tokyo, has Nagoya as its other terminus. Nagoya is thus one of the most important railway centres of Japan. The railway station and the harbour are directly connected by rail and the importance of the city as a distributor of goods is thereby enhanced. There are 8 stations, viz., Nagoya Minato, Atsuta, Chikusa, Ozoné, Hatta, Shiratori, and Horikawaguchi. The annual passenger traffic passing through these 8 stations is estimated at about fifteen million persons, and goods traffic amounts to approximately three million tons. The city is provided with an extensive network of electric railway lines to connect with outlying districts. The principal ones are :

(1) Mei-Gi Railway extends to Gifu, Ichinomiya, Inuyama and Tsushima ; (2) Seto Electric Railway runs to Seto ; (3) Aichi Electric Railway to Toyohashi and Tokonamé ; (4) Shimonoseki Electric Railway to Shimonoseki ; and (5) the new Mikawa Railway.

At the end of 1935 the total length of roads in Nagoya extended to 3,141 kilometres, the number of bridges 542, that of vehicles 190,133.

Harbour Works Nagoya has a splendid harbour well protected by Chita Peninsula from typhoons. Construction of the harbour was started in 1896 and the third stage of the entire plan was completed in 1928 after a total outlay of ¥15,490,000. The area of the wharves is 1.52 square kilometres, with anchoring space for thirty-eight steamers of ten thousand tons or so. The fourth stage of construction was undertaken at an estimated expenditure of ¥10,120,000. When the work is finished the area of the wharves will be increased to 2.23 square kilometres and there will be anchoring space for fifty-two steamers of ten thousand tons. At present direct trade is carried on with the American continent, Europe, China, the South Sea Islands, Australia and Africa.

Education and Social Work

Social Work Social undertakings in the city in 1935–36, were as follows :

	Establishment	Beneficiaries
Municipal houses to let	269	Households 227
Lodging houses	10	342,842
Public pawnshops	4	Persons 48,884 Loans ¥234,308
Labour exchanges	9	Cases handled 562,257

Educational Facilities In March, 1936 the number of schools and pupils in Nagoya was 369 and 208,681 respectively classified as follows: 39 kindergartens with 3,491 children; 111 elementary schools with 147,643 pupils; 151 secondary schools including the young people schools with 45,479 pupils; 7 collegiate schools with 3,254 students, 2 blind and deaf-mute schools with 313 pupils; and 58 miscellaneous schools with 8,121 students.

Among the above mentioned schools those belonging to the municipality were:

Kind of schools	No.	Classes	Instructops	Pupils
Elementary schools	109	2,686	2,977	6,530
Girls' high schools	3	—	85	2,676
Commercial schools	3	—	99	2,594
Technical school	1	—	40	605
Young peoples' schools	100	—	1,056	12,810
Business continuation schools	29	—	417	3,517
Kindergartens	4	23	24	687

Total educational expenditure including others ¥6,639,509

Finance

Revenue and Expenditure The annual revenue and expenditure of Nagoya city has shown a marked increase of late as it is clear by the following table:

Year	Revenue	Expenditure		
		Ordinary	Special	Total
	¥	¥	¥	¥
1928-29	19,438,161	11,663,553	7,275,835	18,939,388
1929-30	25,390,085	18,219,390	7,034,796	25,254,186
1930-31	31,477,355	23,545,976	6,878,659	30,424,635
1931-32	37,963,011	28,946,961	7,126,598	36,073,559
1932-33	45,421,218	36,644,010	7,163,058	43,807,068
1933-34	84,689,082	76,511,764	7,578,021	84,089,785
1934-35	35,894,410	25,738,008	10,156,402	35,894,410
1935-36	54,043,639	44,205,138	7,838,501	54,043,639
1936-37	66,689,000	25,639,000	41,050,000	66,689,000

Municipal Loans At the end of March, 1936, the total indebtedness of Nagoya city amounted to ¥99,597,000 or ¥91.00 per capita of population.

Yokohama

General

History Yokohama, in the Bunroku Era, about 1587, was a hamlet of twelve families and by the time it became an open port, July 1, 1859, it was only a small fishing village of one hundred families or 350 people. The real growth began with the arrival of the foreigners. The commercial treaties Japan entered into with the United States of America, the Netherlands, Russia, Great Britain, and France stipulated that Kanagawa should be an open port, because it stood on the open harbour nearest Tokyo, then known as Yedo and the seat of the Shogunate Government, but as that village was already very crowded the Tokugawa Shogunate opened up the village of Yokohama instead.

In the beginning four streets were laid out, but as more and more Western, Chinese and Japanese merchants gathered there the area was quickly extended. The population in 1877 was 30,000, five years later it had grown to 52,000, and five years after that there were more than 94,000 in the town. At the end of September, 1932, the population was 661,500. Yokohama received the status of a municipality on April 1, 1889. In 1901, the once thriving port of Kanagawa and other adjoining villages and towns were absorbed by the newly risen Yokohama, and in 1911 and 1927, further extensions took place.

Quake and Rehabilitation Yokohama and suburbs suffered severely in the great earthquake and fire which occurred on September 1, 1923. Prac-

tically the whole town was reduced to ruins and ashes, but with the untiring efforts of its citizens, together with generous support from outside, the reconstruction of the town was completed, as originally planned, within six years of the disaster. On April 22, 1929, His Majesty the Emperor honoured the city with a visit of inspection, and the following day the municipality celebrated the completion of its programme of reconstruction which, in truth, was the creation of a new city out of a pile of cinders.

On April 1, 1927, two adjoining towns and seven villages, with a population of 115,757, were annexed to the municipality, and on October 1 of the same year the whole city was re-divided into five wards; Tsurumi, Kanagawa, Naka, Hodogaya and Isogo. By that time the construction of the gigantic breakwaters, the reclamation at Namamugi and Koyasu and the extension of the waterworks was completed, and the perpetual land leases were being bought back by the municipality one after another.

Location Yokohama is situated in the south-eastern part of Honshu, the main island of Japan, on the western shore of the Bay of Tokyo about 22 miles from the entrance to the bay, in latitude 35° 27′ N., longitude 139° 38′ E. It is the seat of government of Kanagawa prefecture, of which it is also the largest population centre. It is surrounded by hills on which the better class residential districts are located.

Climate Yokohama's location on the Bay of Tokyo serves to modify the heat of summer, the nights being generally cool and comfortable. In the summer months there is an absence of rainfall. Rain is most abundant in June and September, the two rainy seasons of the year, at which times the humidity is trying, but never so bad that the climate is unbearable. In winter the sky is clear and the atmosphere crisp and invigorating. In February there is a short season of damp cold during which there are occasional snowfalls. From March spring begins, with bright sunny days and frequent strong winds. During the summer months typhoons are to be expected, but Yokohama harbour is protected from their violence.

Area and Population At the end of 1935 the area of Yokohama was 135.-63 square kilometres. The population of Yokohama was on Oct. 31, 1936 738,-400 of which 377,200 were male and 361,-200 female while the population in 1930 was 620,306, of which 321,415 were male and 298,891 female. The area of Yokohama was 135.63 square kilometres in 1935.

POPULATION

	Men	Women	Total	Households
1925 (Census)	214,341	191,547	405,888	95,377

Foreign Residents Foreign population in Yokohama numbered 5,484 at the end December, 1936, against 5,088 in 1935, the increase being 396. Chinese increased by 169 during the same period, Hindu 78, German 45, American 19 and English 18. But this foreign population of 5,484 is still a big decrease if compared to 7,-492 in 1922 which at the end of 1923 diminished to almost a few hundreds on account of the great earthquake.

1936	1,128,048	864,190,725	13,550	10,162,400

Banks At the end of December, 1936, the number of banks in Yokohama including branches of those banks having their head offices in cities other than Yokohama counted 16 of which 3 were foreign banks. The banks which are carrying on foreign exchange business extensively are Yokohama Specie Bank, Dai-ichi Bank (branch), Mitsui Bank (branch), Sumitomo Bank (branch). Bank of Taiwan (branch), Hongkong & Shanghai Banking Corporation (branch), Bank of India. Australia & China (branch) and National City Bank of New York (branch). The banks domiciled in Yokohama numbered 5 in December 1936, the most powerful one being the Yokohama Specie Bank, Ltd. The 16 banks showed the following accounts in aggregate as outstanding on Dec. 31, 1936 : Deposits ¥370,950,000,000 discounts & advances ¥203,788,000. 12 out of the 16 banks were on Dec. 31, 1936, member banks of the Yokohama Clearence House.

Companies At the end of 1936 there were 1,476 commercial and industrial companies in Yokohama of which 936 were for trade and 438 for industries.

Warehouses At the end of 1936 Stocks in all warehouses in Yokohama were balanced at ¥79,465,634 as against ¥113,366,674 at the end of 1935. Stocks stored in during 1936 were valued at ¥62,900,988 and those withdrawn ¥67,677,236.

Foreign Trade Goods exported from the port of Yokohama for foreign countries in 1936 amounted to ¥673,323,067 of which raw silk shared ¥296,600,978 and goods imported in the same year were valued at ¥687,012,153 the adverse balance being ¥8,689,086.

Industries

Factories and Production At the end of 1935 there were 115 factories for the spinning industry, 47 for the metallic industry, 107 for the machine and machinery manufacturing industry and 69 for the chemical industry, all showing expansion compared with 1934 while the most conspicuous one being the chemical industry which increased from 57 to 69. Both the number of workers and the amount of production also showed a corresponding increase, workers increasing from 31,184 to 47,625 and production from ¥278,151,503 to ¥334,409,880.

FACTORIES AND PRODUCTION IN YOKOHAMA

(1935)

Passengers Passengers by ocean-going vessels who landed and called at Yokohama in 1936 totalled 66,559 of whom 23,409 were those whose sea journeys ended at Yokohama and 43,150 were those who just called.

Below are given the nationalities of the passengers :

Nationalities	Number	
	Those who landed	Those who called
Japanese	12,261	6,388
Chines	1,823	15,974
British	2,673	3,331
French	121	118
German	442	396
American	4,809	12,053
Other foreigners	1,280	4,890
Total	23,409	43,150

Railway Passengers In 1935 the Government railway passenger who left and arrived at Yokohama, Sakuragicho, Tsurumi, Higashi-kanagawa and Hodogaya stations numbered 36,321,396.

Electric Tramways Tramways were first installed in July, 1904, by a private company and later were purchased by the municipality. There are now over 50 kilometres of lines and carried 43,543,943 persons in 1935. There are five private tramway companies attending to the suburban services, viz., the Keihin Electric Tramway, the Tokyo-Yokohama Electric Ry., Tsurumi-Rinko Ry. Co., Shonan-Electric Ry., and the Jinchu Electric Ry. The number of passengers of these private tramways for 1935 was 45,123,969.

Miscellaneous In 1934 the length of roads in Yokohama was 2,066.769 km. and the number of bridges 529.

In March, 1934, the total number of vehicles was 92,920, of which automobiles numbered 1,359 while bicycles totalled 73,062.

Education

Schools and Colleges On March 1, 1936, there were 71 elementary schools, of which 68 were maintained by the municipality. The number of children at these schools was 101,090.

There were 21 kindergartens with 1,286 children.

The number of middle grade, higher, and special schools and their pupils follows :

	No.	Students or pupils
Middle schools	6	4,180
Girls' high schools	8	5,101
Technical schools	10	5,230
Business continuation schools	25	3,878
Blind, deaf and mute schools	3	181
Colleges:		
Governmental	2	1,017
Municipal	1	366
Private	2	1,544
Total	5	2,927
Prefectural normal School	1	352

Young Men's Training Institutes The number of these institutes follows :

Municipal	30	3,372
Private	2	90

Libraries The library statistics as of March 1, 1936 were as follows :

	No.	Books	Visitors
Prefectural	1	10,012	1,580
Municipal	1	42,515	260,547
Private	2	22,560	10,654
Total	4	75,087	272,781

Religion In 1935 the number of Shinto shrines was 150, Buddhist temples 199, and Christian churches 30.

Social Works In 1935 the conditions of social works in Yokohama were as follows :

	Establishments		Beneficiaries
Employment exchanges	7	cases	356,945
		employed	333,116
Lunch halls	5		46,568
Pawnshops	12	Loans	¥678,901
Housing houses	2,063	households	1,525
Lodging houses	2		99,238
Proof relief			15,308

Finance

Revenue and Expenditure The ordinary revenue and expenditure of the city of Yokohama in 1929 to 1936, amounted respectively to :

1930-1931	¥16,171,428
1931-1932	15,182,861
1932-1933	16,540,066
1933-1934	18,799,462
1934-1935	15,245,519
1935-1936 (estimate)	14,087,166
1936-1937 („)	15,421,228

In 1936–37 budget of Yokohama the total amount of ordinary expenditure was estimated at ¥15,421,228. Itemized details follow :

Items	Amount in yen	Percentage
Municipal office	975,560	6.4
Education	3,320,000	21.5
Industry	242,178	1.6
Hygiene	560,780	3.6
Social works	403,776	2.6
Public works	903,335	6.0
Loans	8,381,364	54.3
Miscellaneous	634,235	4.0
Total	15,421,228	100.0

Bonded Indebtedness At the end of March, 1935, the total bonded indebtedness of Yokohama city amounted to ¥174,488,006.

Kobé

General

Located between the Osaka Bay and the Rokko mountain range, Kobé covers an area of 198 square kilometres, stretching 18 kilometres from east to west and 13.5 kilometres from north to south. With a population of 912,179 including about 9,122 foreigners, Kobé is one of the six largest cities in Japan. It is the "City of Wonders", as an international trade centre in the world. It ranks second in the revenue of bill-of-lading freight, London coming first.

Before the Restoration of Meiji in 1868, there were less than a thousand houses in Kobé, fishermen's village. In 1867 Hyogo harbour (Hyogo village) was first opened to foreign trade and then the foreign settlement came into existence near the East Recreation Ground in Kobé village and Kobé harbour has since been gradually turned to advantage. Since then Kobé has increased in population, Accordingly, Kobé village grew into the "Town of Kobé" in 1868. Hyogo and Sakamoto villages being annexed to it in 1879, the city of Kobé was born in 7889. Recently neighbouring villages being annexed again, Kobé has become a "Prospering Greater Kobé".

Geographical Position and Area The city of Kobé lies on the south-west coast of Hyogo prefecture in the Kansai district of Honshu, situated at 135° 5′–15′ E. long. and 34°38′–45′ N. lat. The greatest length from west to east is 14.47 kilometres and the greatest breadth from north to south is 13.5 kilometres, the total area being 83.06 square kilometres, of which about 60 per cent is occupied by mountains and hills, and the rest by farms and the city proper. The form of the city is like a long band, and is divided into eight wards known at Nada, Fukiai, Kobé, Hyogo, Soto, Minato, Hayashida, and Suma.

Climate The city of Kobé has an exhilarating climate at all seasons of the year on account of the advantage of its geographical position. It is backed by the Rokko mountain-chain and faces the Chinu Sea in Osaka Bay. The average temperature is 15° C (59° F). During summer the temperature sometimes runs up to 36° 4′ C (97.5° F), but the average temperature of August and September is 25°4′ C (77.7° F). In winter the thermometer sometimes ranges about 4° 4′ C below zero (24.1 F)′ but snow is rarely

seen. The highest temperature in 1935 was registered at 36.4° C (97.5° F), and the lowest temperature 3.8° below zero (27.0° F) the average of the year being 15° C (59° F). The precipitation in the same year was 1,759.9 mm.

Population The following are the results of the national census for the year 1935 :

Families	198,018
Population	912,179

As compared with the results of the general census taken in 1930, the population has increased 124,563 (15.8%), and the families 19,693 (11.0%) during the interval of five years.

Foreign Residents According to the statistics taken by the police office of Kobé, at the end of 1935, the total number of foreign residents in Kobé was 9,147.

Houses With the exception of public and municipal buildings and the houses of foreign residents, the total number of houses in the city was registered as 86,615 at the end of 1927, among which one-storied houses numbered 44,473, two-storied ones 41,185, and three-storied ones 957. There were 84,507 buildings of wood, 98 per cent of the total number ; of brick 1,651 ; of concrete 402 ; and of stone 11.

Waterworks The waterworks were at first designed in 1909 to supply 3 cu. ft. per capita a day to 250,000 inhabitants, but the plan was later altered to provided for 100,000 families, 25 cu. ft. a day. The work lasted until 1923 and cost ¥12,858,720, of which state grants amounted to ¥3,403,000. In 1926, the municipality increased its water supply by laying pipes in the eastern suburbs to draw water from the Sengari pond behind Mt. Rokko. In 1935 the city supplied 52,803,380 cubic metres to 167,576 households and other uses.

Police Stations The total number of police stations in the city at the end of March, 1935 was 10. Police boxes numbered 185, and policemen 1,800.

Commerce and Industry

Movement of Commodities The movement of commodities through the Kobé harbour and railway stations in 1934 within Japan proper and Chosen was as follows :

	Tonnage (in 1,000 tons)	Value (in yen) Japan proper	Chosen
Outgoing	2,436	477,315,042	32,191,212
Incoming	4,916	357,710,973	57,128,612
Total	7,352	835,026,015	89,319,824

Foreign Trade The grand total of exports and imports in 1935 was ¥1,732,540,000, showing an excess of ¥89,258,000 of imports over exports.

EXPORTS AND IMPORTS OF KOBÉ IN 1929-1935

(In 1,000 yen)

	Exports	Imports	Grand total	Excess of
1929	701,893	882,331	1,584,206	im. 943
1930	523,172	563,649	1,086,821	im. 40,476
1931	409,011	457,740	866,751	,, 48,729
1932	499,303	535,647	1,034,950	,, 36,344
1933	650,539	641,122	1,291,661	ex. 9,418
1934	790,601	791,544	1,582,145	im. 943
1935	910,899	821,641	1,732,540	im. 89,258

Warehousing At the end of 1935 number of principal warehouse companies in Kobé was 8 and the aggregate floor area covered by the warehouses was 146,803 tsubo. In 1935, goods received by these warehouses were valued at ¥627,570,000, while ¥684.016.000 worth of goods were delivered. Goods stored at the year end amounted to ¥96,949,000.

Electricity and Gas At the end of 1934 the number of electric lamps in the city was 836,176 and electric motors 8,354. In the same year the municipality which undertakes the electric business got ¥12,391,978 from it.

In 1934, gas was supplied to 133,448 families with 347,633 spouts.

Banks and Business Firms At the end of 1935 the total number of banks and branches was 65, i. e. 3 banks, 15 branches thereof, and 40 branches of banks in other cities including 7 branches of savings banks. The deposits of ordinary banks and branches outstanding at the end 1934 amounted to ¥475,635,736 and advances and loans ¥252,738,022.

In 1935 the clearing house turned over 3,088,841 bills with the value of ¥6,009,715,000, gaining over the previous year 226,632 bills and ¥576,355,000 respectively.

At the end of 1934 the number of companies was 3,082 with the paid-up capital amounting to ¥780,819,648.

Factories and their Workers At the

end of 1934 there were 859 factories. The total number of the staff was 5,888, that of workers 62,073, and the total production was valued at ¥367,379,325.

Transportation

Roads At the end of 1935 the total length of roads in the city reached 691.02 km. gaining 4.6 km. as compared with the previous year.

Sea Transportation In 1935 the number of ships which entered the Kobé harbour was 105,642 with 52,359,980 gross tons, of which registered tonnage was 28,334,334 tons.

Of the total number 101,224 were vessels sailing home waters and 4,418 on international courses. The foreign vessels numbered 1,272 Great Britain heading the list with 543 (2,907,690 tons), followed by the U.S.A. with 231 (1,497,666 tons).

VESSELS ENTERED KOBÉ

	Number of vessels	Tonnage
1933	90,479	46,382,542
1934	97,170	49,481,808
1935	105,642	52,359,980

Vehicles At the end of 1935 total number of vehicles of various kinds was 72,879. The itemized table follows :

March 31 of	Rikisha	Wagons and Carts	Automobiles	Autocycles	Bicycles
1931	1,046	15,336	1,549	684	65,379
1932	801	12,527	1,549	771	68,847
1933	654	12,151	1,584	862	71,609
1934	489	10,792	1,598	939	74,030
1935	302	8,591	1,656	973	72,614
At the end of 1935	334	6,652	2,333	1,572	61,988

Railways In 1934 the total number of passengers who left from and arrived at 12 stations in Kobé was 46,075,637.

Electric Tramways The tramways within the city limits are operated by the municipality, the total open mileage being 62,746 km. at the end of 1934. Attending to the suburban service, there are private companies, the Sanyo Eectric Tramway (Hyogo-Himeji), Han-Shin Electric Ry., (Kobé-Osaka), Han-Shin Express Electric Ry., (Kobé-Osaka), and the Shin-Yu Electric Railway (Kobé-Arima). Han-Shin Kokudo Ry. was laid along the national road between Osaka and Kobé in 1927 and opened business in 1932, forming a parallel line to the state railway.

Education, Religion and Social Works

Schools In 1935 the number of elementary schools was 67, including 64 municipal schools, with 2,406 teachers and 113,782 pupils. Middle schools numbered 5, of which 3 were prefectural schools and 2 were private schools, with 180 teachers and 4,935 boys. The number of girls' high schools was 17, and pupils 11,437. The number of business schools was 15, of which 8 were commercial, 2 were technical, 4 were business and 5 were young people's schools. The total number of teachers was 452 and students 10,636. There is a government university of commerce and a technical college. In 1935 Kobé expended ¥6,464,926 for educational purposes.

Shrines, Temples and Churches .At the end of 1935 there were 100 Shinto shrines, 152 Buddhist temples, 397 Tenrikyo and Shinto churches, 254 Buddhist halls, and 55 Christian churches.

Social Welfare Work At the end of 1935 municipal establishments for social welfare work were as follows :

Markets, 11 ; cheap eating-houses,6 ; employment exchanges, 4 ; public nurseries, 2 ; lodging-houses, 4 ; child consultation offices, 1 ; municipal dwelling-houses, 2 places ; municipal pawnshops, 3 ; relief houses, 2 ; peoples' hospitals, 3 ; sanatorium, 1.

Finance

In 1933–34 Kobé received ¥44,305,647 and expended ¥42,652,765. The ways and means of the municipality for the past 5 years follow :

	Revenue	Expenditure
1930-31	44,818,597	44,991,844
1931-32	39,993,340	46,897,568
1932-33	40,362,920	41,566,316
1933-34	44,305,647	42,652,765
1934-35 (estimate)	49,306,906	50,161,680
1935-36 (estimate)	52,421,173	53,928,579
1936-37 (estimate)	53,903,396	56,174,874

The total amount of the city loans standing at the end of March, 1936, was ¥107,273,938. The loans and the sum borrowed in cash in the fiscal year 1935–36 was ¥112,712,700 while the sum refunded was ¥5,438,762.

CHAPTER XL

CHOSEN (KOREA)

General Description

Chosen, a peninsula extending southward from the north-eastern side of the continent of Asia, is washed on its eastern and western coasts by the Sea of Japan and the Yellow Sea respectively, and borders Manchoukuo and the Maritime Province of Siberia on the north, from which it is separated by the two rivers, the Yalu or Oryokko and the Tumen. Between the upper waters of these two rivers there is a mountain range which separates and turns them in opposite directions, the former flowing through Antung into the Yellow Sea. On the south the peninsula faces the Island of Kyushu and the western coast of Honshu, across the Korean Straits, with the islands of Tsushima and Iki about midway. It lies between the parallels of 33°06′ and 43° north and 124°11′ and 130°56′ east, having a total area of 220,740.72 square kilometres which is about one-third of the area of the whole empire.

Surrounded thus by sea on three sides, Chosen has a long coast line extending in all to 8,674 kilometres. It has many good harbours on the south and west coasts, such as Fusan, Reisui, Moppo, Jinsen and Chinnampo. The tides rise far higher on the west coast than on the east, the difference between the highest and the lowest tide-mark on the former reaching over ten metres, while on the east coast near Gensan it is less than half a metre. The country is as a whole mountainous, the eastern side steep and rocky, but sloping down more gently on the western side toward fertile plains traversed by large rivers such as the Daido, Kan, Kin and Rakuto. The northern half of the peninsula is comparatively level and fit for agricultural work, whilst the southern half is rich in timber and minerals indicating good possibilities for future industrial development. The climate in Chosen is continental running to extremities of both heat and cold, the spring and autumn seasons being very short though highly delightful. One needs hardly add that the climate is decidedly rigorous in the north and milder in the south. Moreover, the eastern coast has on the whole a milder climate than the western, the average temperature being some 2° C. higher, except in the middle of summer.

Flora and Fauna Plants in Chosen are classified into 160 families, 883 genus, 3,070 species and 550 varieties. Of these five genus and 500 species are peculiar to the country. The pine, larch, spruce, juniper, oak, willow, maple, alder and birch trees are found over the whole peninsula, the spruce, larch and birch mainly in the north, and the pine, oak, maple and alder in the south. Large specimens of old sophora, ginko biloba and spruce are also scattered over the country, especially in the central district; they are remnants of ancient forests and old temple sites. The poplar tree of Korean type exists, but the Lombardy poplar and the acacia have been imported and both are found widely scattered as aids against erosion. Flowering shrubs such as azalea, cherry lilac, syringa and spiraea are numerous and grow profusely on hill sides. The beech, maple and paulownia found on Dagelet Island are peculiar to that place. The soil and climate of Chosen have proved most suitable for the cultivation of fruit trees, and large orchards for imported apples, pears, peaches and vines have been set up. The walnut, chestnut, pinenut and persimmon are indigenous and yield good crops.

Fauna of Chosen is of the Palaearctic geographical distribution. Animals commonly found are the boar, deer, wildcat, wolf, hare, weasel, tiger and leopard, (the number of the last two is now much reduced). Native horses are small, but strong and wiry; the cattle are large and useful and are widely distributed. Among birds are the crow, magpie, jay, kite, heron, crane, oriole, lark, sparrow, robin, tits, pheasant, and quail, while the goose, bustard, duck, teal, swan and snipe are migratory, passing Chosen in spring and in autumn. The variety of acquatic animals is extensive, comprising the mackerel, sardine, herring, sea bream, plaice, cod, pollack, whale, oyster, crab and lobster. Various kinds of the snake are

found everywhere, but few are venomous. Insect life has been well studied, as many are harmful to trees and crops. Among butterflies over two hundred species have been identified.

Population

According to the report of the Ministry for Overseas Affairs, the popuation of Chosen in 1935 was as follows :

POPULATION OF CHOSEN (Dec. 31, 1935)

Province	Japanese	Koreans	Foreign (incl. the Chinese)	Total
Keiki	147,671	2,171,713	11,186	2,330,570
North Chusei	8,530	904,228	649	913,407
South Chusei	25,219	1,442,614	1,807	1,469,640
North Zenra	35,475	1,497,946	2,406	1,535,827
South Zenra	42,908	2,365,465	1,229	2,409,602
North Keisho	48,607	2,419,140	1,356	2,469,103
South Keisho	95,078	2,095,270	1,164	2,191,512
Kokai	19,466	1,597,050	3,202	1,619,718
South Heian	37,039	1,367,239	4,753	1,409,031
North Heian	21,737	1,577,981	18,067	1,617,785
Kogen	13,641	1,514,908	808	1,529,357
South Kankyo	46,207	1,551,033	6,095	1,603,335
North Kankyo	41,850	744,277	6,166	792,293
Total	583,428	21,248,864	58,888	21,891,180
1934	561,384	20,513,804	50,639	21,125,827
1933	543,104	20,791,321	42,626	20,791,321
1932	528,452	20,037,273	39,151	19,599,876
1925	424,740	18,543,326	47,460	19,015,528
1920	347,850	16,916,078	25,031	17,288,989
1910	171,543	13,128,780	12,694	13,313,017

The following is the classification of the population of Chosen according to occupation :

POPULATION ACCORDING TO OCCUPATION (Dec. 31, 1935)

Occupation	Japanese	Koreans	Foreign	Total
Agriculture, forestry, stock-raising, fishery, etc.	47,794	16,899,866	58,888	16,959,615
Industry	80,606	540,221	10,799	631,626
Commerce and transportation	175,118	1,400,003	26,449	1,601,570
Public service and profession	235,964	633,926	1,938	871,828
Miscellaneous occupations	22,914	1,421,038	7,258	1,451,210
Others	21,032	353,810	489	375,331
Total	583,428	21,248,864	583,428	21,891,180

The density of the population average 104 per square kilometre, ranging from 172.6 in the thickly inhabited south-west to 36.5 in the north-east. The average is 77 per square kilometre less than in Japan proper.

Only ten per cent of the people live in towns and cities where population numbers more than 8,000 and eighty per cent or 16,400,000 live in the country or seaside occupied in agriculture, forestry, stock-raising and fishery.

Among the foreign population the Chinese and Manchu predominate who numbered 41,266 at the end of 1933. Next came 721 Americans, 239 British, 96 Germans and 73 French.

Origin of the Korean Race

Though no conclusive opinion has ever been given as to the origin of the Korean people, it is evident that they are of the Mongolian family, and it is generally admitted that their cradle was in the neighbourhood of Changchun, Manchoukuo, in and around the place now called Petna on the River Sungari. It seems, therefore, but natural that they should have a profound liking to emigrate and settle in those parts of Manchoukuo. From various historic relics it appears that they were of the same stock with the Manchurians and those Japanese dwelling in the western

half of Japan. In course of time much intermingling of blood seems to have taken place among the Koreans and the Chinese ever since Chinese colonies were first established along the north-western coast. But the latter did not supersede the native Korean race to any appreciable degree. This is clearly seen from the fact that the two races today have a distinctly different facial appearance, though both alike have black straight hair, dark oblique eyes and a tinge of bronze in the skin. The Korean language belongs to the Turanian group; it is poly-syllabic and possesses an alphabet of 11 vowels and 14 consonants, and a script known as Eunmonn. In grammatical construction it is almost identical with Japanese, though in sound and vocabulary it is quite dissimilar. From all these and other facts and evidences it is beyond any doubt that these two peoples were akin to one another from very remote times.

Administrative Organization

Chosen is administered by the Government-General which was inaugurated on August 29, 1910, and has 8 main administrative offices, viz., (1) Governor-General's Secretariat, (2) Home Affairs Bureau, (3) Financial Affairs Bureau, (4) Industrial Bureau, (5) Judicial Bureau, (6) Educational Bureau, (7) Police Bureau, and (8) Forestry Bureau. There are also 5 affiliated offices which are (1) Communications Bureau, (2) Railway Bureau, (3) Monopoly Bureau, (4) Customs Bureau and (5) Tax Bureau.

Position of Koreans For a number of years since the establishment of the Government-General in Chosen all Koreans in government service were placed under different regulations from those applying to Japanese officials. Gradually, however, almost all discriminative features in treatment and salary have been wiped out and in October, 1919, Korean officials were finally placed on the same footing as the Japanese and came under the same regulations. Moreover, prior to March, 1920, in the courts Korean judges were allowed to try only those civil cases in which both parties were Koreans and the criminal cases where the accused were Koreans, but now they are allowed to try all cases in which people of any nationality may be involved. Moreover, prior to 1919 the freedom of the press had been rigidly restricted. No newspaper except the few already in existence was allowed to be issued. Now, however, more daily papers are issued, and the restrictions placed on the holding of public meetings have been partly removed.

The Central Council As the highest consultative body there is the Central Council which is convened by the Governor-General several times a year to discuss such measures as may be presented by him. This Central Council consists of 5 advisors, 65 councillors, 1 chairman and 1 vice-chairman. One of the characteristic principles by which the Japanese administration in Chosen is guided is respect for the old Korean customs and manners, and the work of investigating these old customs so dear to the native people is entrusted to the Central Council. Koreans attach great importance to their ancestral tombs as a form of ancient worship, and the selection of a burial site is always made with great care. This, coupled with their age-old superstition that the fate of one's family would be greatly affected by the position of its grave, has resulted in the devastation of a large area of land; wherefore the Government-General in 1912 issued an order requiring all people to use the public cemeteries for the disposal of their dead. This order, however, was revised in 1919 so as to allow the people to follow their old customs.

Local Autonomy and Suffrage

In establishing local administrative system due consideration was given to the system obtaining under the old régime and also to Korean culture and customs. Revisions have been made from time to time to suit changes in local conditions, and the system has finally developed into what it is at the present day.

The main principle upon which revisions were made was to prepare the way for laying foundation for local autonomy. The establishment of advisory organs in the revision of the local administrative system effected in 1920 had this object in view. During ten years after that progress in the preparation for self-government was made to such an extent that the time was considered ripe to effect further important reforms in the local system. An ordinance was, therefore, promulgated on October 1, 1930, the substance of which was as follows :

Administration of Province The former provincial advisory council (Do-Hyogi-Kwai) was changed into the provincial council (Do-Kwai) which is vested with administrative power. Two-thirds of members of the council are elected by members of the municipal councils, yu councils and men councils in each province, and one-third ap-

pointed by the Provincial Governor.

The Provincial Governor acts ex officio as Speaker of the council and the Vice-Speaker is elected from among members of the council. The term of members of the provincial council is four years.

Municipal System Each municipality has two bodies of the first and second educational sectional councils. The former is composed of Japanese and the latter of Korean members of the municipal council.

Yu-Men System The "men" (township) system (men-sei) has been substituted by the yu-men-system, and the yu (town) council was established in each yu and made an executive organ. The "men" council, composed of elected members, remains as an advisory body. The term of members of the yu and men councils is four years.

Administration of County and Island Counties and islands have county and island councils, the councillors of which are elected by the members of the yu and men councils. The term of the councillors is four years.

Supervision of Local Bodies As in Japan proper the right to reverse, to cancel, or to reconsider any decisions reached by local administrative organs is reserved to the Government-General, which may suspend or dissolve meeting when necessary.

Those portions of the ordinance that apply to the municipal system, yu-men system, county and island councils were enforced on April 1, 1931 while other parts which apply to the administration of provinces on April 1, 1933.

Suffrage Since conditions have not yet adequately improved and the sense for civic responsibility is not yet sufficiently strong or wide-spread to abolish the franchise qualification, which is payment of local rates of five yen the subject is still left untouched. This may be reduced, as conditions improve, to one yen for the yu-men council election. A course in civics has lately been added to school curriculum which will aid in impressing upon the people the importance and benefit of franchise.

Finance

Budgetary System Introduced Under the old Korean régime there was no clear distinction between the court and the government in the use of money collected from the people in the form of various taxes. Moreover, most of the state revenue was from the ginseng monopoly, leasing of state lands, and granting of concessions of various sorts. Accordingly, therefore, there was no means of framing a yearly budget. This state of affairs, more than anything else, called for speedy remedies. When, therefore, a Japanese financial adviser, Baron Megata, took up his duties in August, 1904, his first task was to bring order out of this financial confusion and his work was quickly done during the protectorate period. He drew up necessary plans for introducing the modern budgetary system, and the gold standard with a central bank to act as a state treasury and empowered with a right to issue convertible notes. A rigid taxation system was brought into existence, with the burdens of the people more equitably distributed. The former method of tax collection which gave rise to many serious abuses was quickly corrected. All the monopolies, such as that of ginseng, were turned over from the Imperial court to the government, and a clear distinction was marked between the finances of the court and of the state.

Japan in Chosen Upon the establishment of the Japanese hegemony in Chosen the Government-General took on its shoulders the heavy task of developing the country in every possible way so as to promote the welfare of the Korean people to the utmost extent. It necessitated starting new enterprises and increased expenditure, and the government outlay for the year 1911 reached over ¥48,740,000, an amount twice that of the preceding fiscal year. Since that time the tendency had always been upward, till it reached ¥246,852,843 in 1929, the highest mark ever seen in the budgetary history of Chosen. In 1930 a slight decrease was seen; the figures fell to ¥239,729,783, with a further slight reduction in each year until it reached ¥219,132,671 in 1932. Mention must be made of the fact that the determination of the Government-General to do its utmost for the economic development of the country and the promotion of the welfare of the people is shared by the Japanese government at home, for the latter is yearly advancing a subsidy of more than ¥15,000,000 from the national treasury to the Government-General. The budget again took an upward turn in 1933, and in 1936 it reached the highest mark of ¥317,875,960. Below is given a budget table showing the trend of steady expansion of expenditure:

BUDGETS 1911—1936

	Revenue	Expenditure
	(In Yen)	
1911	43,741,282	48,741,782
1920	124,798,469	114,316,860
1921	162,474,208	162,474,208
1922	158,124,617	158,124,617
1923	146,007,225	146,007,225
1924	142,700,159	142,780,159
1925	178,082,382	178,082,382
1926	194,487,914	194,487,914
1927	210,910,111	210,910,111
1928	222,746,979	222,746,979
1929	246,852,843	246,852,843
1930	239,729,783	239,729,783
1931	238,923,617	238,923,617
1932	220,140,627	220,140,627
1933	232,026,949	232,026,949
1934	278,284,452	274,634,642
1935	290,267,414	290,267,414
1936	317,875,960	317,875,960

On account of the dissolution of the 68th session of the Imperial Diet the budget for 1936–37 did not get materialized. Therefore a supplementary budget for 1936–37 was presented to the 69th Extraordinary Session of the Diet, which passed it. The budget for 1935–36 and the supplementary budget for 1936–37 are as follows :

BUDGET FOR 1936-1937

REVENUE

Items	Budget for 1935-36	Supplementary budget for 1936-37
Ordinary Revenue		
Taxes	¥53,366,263	¥133,405
Stamp receipts	15,172,736	26,450
Receipts from government undertakings and properties	169,239,951	19,470,056
Miscellaneous	2,819,892	64,467
Total	240,463,427	19,694,378
Extraordinary Revenue		
Proceeds from the sales of government properties	311,603	—
Contributions	6,000	250,000
Temporary profit tax	323,595	—
Grants from home national treasury, etc.	12,825,822	92,285
Loans (public or otherwise)	24,000,000	—
Part payment for the improvement of rivers and harbours	217,350	—
Brought forward	10,200,867	11,258,592
Total	47,885,237	11,600,877
Grand total	288,348,664	31,295,255

EXPENDITURE

Ordinary expenditure		
Chosen Shrine	70,000	—
Prince Ri's household	1,800,000	—
Government-General office	4,247,582	293,714

Supervision of local public works	122,116	—
Construction of salt fields	1,180,000	—
Development of northern Korea	2,181,458	32,826
Improvement of farm districts	244,374	—
Manchurian Incident	836,284	—
For research works of students abroad	34,160	—
Supervision of foreign exchange	19,735	—
Control of cereals shipped to Japan proper	763,410	—
Purchase of land for military purpose	9,927	—
Measures for recovery of farming villages	—	620,981
Against calamities	932,095	983,457
Against thought crime	—	271
To General Account	—	1,900,000
Total	78,703,138	12,337,012
Grand total	288,348,664	35,469,199

Below is given the latest statement of receipts from domestic taxes and from leased state lands for the five years ending 1934 :

	1930	1931	1932	3933	1934 (Estimates)
			(In Yen)		
Land tax	15,617,023	15,810,219	15,422,197	15,853,159	14,738,161
Income tax	1,135,199	763,154	1,006,874	1,325,502	5,114,319
Mining tax	603,477	624,468	744,949	1,009,771	1,390,772
Business tax	1,591,627	1,291,983	1,233,306	1,329,090	1,563,446
Capital interest tax	314,882	332,874	345,881	483,918	447,760
Exchange tax	147,637	195,371	518,605	367,128	497,039

	1930	1931	1932	1933	1934 (Estimates)
			(In Yen)		
Bank of Chosen note tax	—	145,556	7,326	—	55,078
Liquor tax	12,322,234	11,248,536	11,366,132	12,385,013	16,583,149
Sugar consumption tax	3,181,858	2,393,536	2,397,016	1,517,248	2,643,065
Clearing dues	54,307	145,746	125,694	119,864	91,894
Total	34,968,367	32,951,434	33,167,814	34,391,131	43,124,683
Customs duties	8,466,029	7,401,819	7,966,105	11,157,771	12,728,187
Tonnage dues	44,316	39,049	32,227	39,046	33,682
Grand total	43,478,712	40,392,312	41,166,313	45,587,948	55,886,552

RECEIPTS FROM CUSTOMS DUTIES

	(In Yen)		
1910	3,606,000	1926	13,361,000
1914	4,140,000	1927	10,946,000
1918	16,870,000	1928	10,410,000
1920	16,309,000	1929	10,716,000
1921	—	1930	10,284,813
1922	15,620,000	1931	7,401,819
1923	9,211,000	1932	7,966,104
1924	9,311,000	1933	11,157,771
1925	10,781,000	1934	12,761,869

Investments by Japan Proper At the twenty-fifth anniversary of administration the sum disbursed by the home Government to Chosen was estimated at ¥300,000,000, exclusive of military and naval expenditures. Investments by private interests during the same period are estimated at ¥3,000,000,000 which have been utilized for the completion of communications, the development of national resources, promotion of industries, etc.

The following table demonstrates the remarkable progress attained in the course of twenty-five years.

Item	1910	1934	Ratio of Increase
Population	¥13,313,017	¥ 21,125,827	1.6 times
Government-General Budget	48,741,782	262,978,776	5 times
National debt	21,175,422	489,830,524	24 times
Total production	296,500,000	1,287,000,000 (1933)	4 times
Agricultural products	241,721,000	704,678,000 (1933)	3 times
Forestry products	19,240,000	55,069,000 (1933)	3 times
Cocoon nroducts	431,861	21,865,000 (1933)	56 times
Mining products	6,067,000	48,301,000 (1933)	8 times
Fishery products	9,410,000	89,911,000 (1933)	9.5 times
Industrial products	19,639,000	367,236,000 (1933)	19 times
Exports	19,913,843	465,367,435	25 times
Imports	39,782,756	519,149,930	13 times
Exports of rice	544,000 koku	7,571,000 koku (1933)	14 times
Total import and export	59,696,519	984,517,365	17 times
Bank deposits	18,355,000	367,460,000	20 times
Rural Credit Association deposits	68,044 (1914)	139,417,000	2,000 times
Railway construction	1,086 k.m.	3,078 k.m.	2.9 times

Government Monopolies

Several industries are being carried on as monopolies by the Government-General under direct control of the Financial Affairs Bureau; they are the manufacture or preparation of ginseng, tobacco, salt and opium.

Ginseng This medical herb is regarded as a wonderful cure for many diseases in China ond Korea. The drug is obtained from the root of the plant carefully tended for six years. The principal customers for this plant are the Chinese, who are ready to pay a high price for it. Figures relating to its production follow:

	Area	Raw root	Prepared product	Receipts
	(tsubo)	(kin)	(kin)	(yen)
1911	14,345	7,719	2,300	119,000
1919	195,620	103,989	26,002	2,082,000
1920	319,321	116,508	29,694	2,544,000
1921	371,328	136,066	36,266	2,102,000
1922	475,339	163,053	40,571	1,269,000
1923	419,788	166,282	46,022	2,225,000
1924	397,850	141,983	38,546	2,152,000
1925	303,713	112,988	31,629	2,658,000
1926	230,368	109,759	29,369	2,768,000
1927	332,102	154,237	41,540	2,444,000
1928	327,491	197,340	50,901	3,067,000
1929	334,479	165,897	54,099	2,482,000
1930	336,918	170,709	62,097	2,449,463
1931	—	161,952	59,302	2,039,541

	Area (tsubo)	Raw root (kin)	Prepared product (kin)	Receipts (yen)
1932	—	165,172	58,789	2,099,819
1933	—	142,686	49,525	1,339,941
1934	—	142,577	49,829	1,567,061
1935	—	142,662	—	1,703,788

Tobacco As practically all Koreans smoke, the tobacco industry is a great source of income to the government. Three kinds are grown in Chosen, namely, Korean, Japanese and American. There are four tobacco manufacturing centres, these being Keijo, Heijo, Taikyu and Zenshu, the annual production reaching thirty million yen.

In 1935 the output of cigarettes was 5,313,528,000 pieces, that of cut-tobacco 4,633,846 kwan, and that of leaf tobacco 300,000 kwan. Tobacco amounting to ¥87,000 was also imported from Japan and foreign countries.

AREA, PRODUCTION & SALES OF TOBACCO

Year	Area (cho)	Amount of leaf tobacco (kwan)	Value in yen: Korean product	Imported	Total
1930	14,227	4,026,914	31,693,010	123,100	31,816,110
1931	15,232	4,384,183	31,149,374	99,751	31,249,125
1932	13,637	5,309,923	32,076,449	91,290	32,167,739
1933	13,558	4,414,268	35,227,038	87,148	35,313,186
1934	14,692	4,107,358	38,941,646	84,030	39,025,676
1935	16,367	5,845,627	42,835,698	90,588	42,926,286

Salt The salt consumption in Chosen amounted to 560,000,000 kin in 1932 which is a great increase as compared with the amount ten years ago. The consumption in 1921 was 114,000,000 kin valued at ¥1,120,000. As the native production is not sufficient to meet the entire demand of the people, a considerable amount is imported from Japan and foreign countries under the control of the Monopoly Bureau of the Government-General. The following shows production and the area of salt-fields in 1935 :

PRODUCTION AND AREA OF SALT-FIELD IN 1935

	Area (cho)	Production (1,000 kg.)
Koryowan	1,157	125,893
Shusan	1,115	116,962
Nanshi	483	30,926
Total	2,755	273,781

Opium Owing to the strict control of the Government-General the number of opium smokers has in recent years greatly decreased, but at the same time the number of those indulging in morphine-injection has increased. The use of morphine has of course been prohibited by the government, but owing to the activity of cunning dealers all the efforts of the government to put an end to it have been fruitless. The government thereupon has come to the decision to monopolize the manufacture and sale of morphine so as more effectively to control the spread of its use. Accordingly, in March, 1933, the government's manufacture of morphine was started at Keijo, its production being sold to certain designated pharmacies to be used for medical purposes only.

MORPHINE MANUFACTURE IN 1935

Raw opium	18,348 kg.
Manufacture	
Morphine (salt)	84,250 g.
Diacethyl morphine (salt)	—
Opium for medical use	5,030 g.
Total	89,280 g.
Sale	
Morphine (salt)	66,955 g.
Diacethyl morphine (salt)	12,383 g.
Opium for medical use	7,774 g.
Total	87,113 g.

Overseas Trade

Prior to its annexation by Japan the overseas trade of Korea amounted to about 50 millions of yen a year. Now it is approximately put at ¥1,000,000,000 as per figures for 1934 show. The following figures indicate its developments :

OVERSEAS TRADE

Year	Exports (¥ 1,000) Foreign countries	Japan	Total	Imports (¥ 1,000) Foreign countries	Japan	Total
1912	5,616	15,369	20,985	26,359	40,753	67,112
1917	20,236	64,726	84,962	31,396	72,696	104,092
1918	18,697	137,205	155,962	43,151	117,273	160,424
1919	22,098	199,849	221,947	98,158	184,918	283,076
1920	27,639	169,381	197,020	106,174	143,112	249,286
1921	20,884	197,393	218,277	75,898	156,483	232,381
1922	17,489	197,915	215,404	95,798	160,247	256,045
1923	20,403	241,262	261,665	98,338	167,452	265,790

Banking

Banking on a modern system was first introduced into Chosen in 1878 when the Dai Ichi Ginko of Tokyo established a branch office at Fusan. Later on, the Juhachi Ginko of Nagasaki opened branches at Jinsen and Gensan. After the China-Japan War these banks opened their branches in Keijo and other centres, while two native banks, the Chon-il (later renamed the Korean Commercial) and the Hansong, came into being in Keijo.

In 1902 the Dai Ichi Ginko was authorized to issue bank notes for circulation within Chosen. In 1906, to promote economic development in the provinces, agricultural and industrial banks were formed in several of the principal towns, the Government taking shares in them or granting them loans free of interest, and in the same year a third native bank called the Han-il was founded in Keijo.

In 1909 the Bank of Korea capitalized at ¥10,000,000 was founded in Keijo as a de jure central institution, and to it was transferred all the functions belonging to a central bank hitherto performed by the Dai Ichi Ginko. After the Annexation the bank was renamed the Bank of Chosen and branches were opened by it one after another in important places. Nor was its sphere of activity confined to the peninsula, for many branches were opened in Manchuria where it enjoyed free circulation of its notes, and its activity even penetrated North China and East Siberia. The Bank also made loans to China, and opened an agency in New York with a view to facilitating exchange operations and to utilizing the American money market for the development of Chosen and Manchuria. Stimulated by the steady expansion of its business, the Bank increased its capital to ¥40,000,000 in 1918, and to ¥80,000,000 in 1920, while authority was given to increase its maximum limit of note issue as occasion demanded; but owing to continued business depression the Bank suffered severe losses and was compelled in 1925 to reduce its capital by one-half. (See Chapter IX, the Bank of Chosen.)

Since then, encouraged by the economic development in general, and especially influenced by the war-time boom, many local banks were established in the country. During this time, however, the agricultural and industrial banks in existence were found much too weak to cope with the increasing demand for funds, their capital all told being only ¥2,600,000, so in 1918 they were all merged into the Industrial Bank of Chosen under special government protection, with a capital of ¥10,000,000, which has since been trebled.

The first clearing house was opened in 1910, and banks in Keijo became its members. Later additional clearing houses were established in Jinsen (Chemulpo) and other large commercial centres—the total number being nine at the present time.

In 1911 there were in Chosen only 11 banks with 59 branches. The total aggregate capital was then ¥12,350,000, with total reserve funds amounting to ¥366,000 and the deposits totalling ¥18,335,000. In 1934 the number of banks was 11 and their branches 165. The total aggregate capital increased to ¥100,675,000 and the deposits to ¥567,754,000. The following gives a more detailed account:

	1925	1930	1933	1934	1935	1936
			(¥ 1,000)			
Capital subscribed	102,275	101,425	121,075	100,675	99,175	99,175
Capital paid-in	58,850	60,991	61,871	61,731	65,912	65,980
Reserve funds	7,024	14,464	21,358	22,673	23,829	27,276
Deposits	217,597	226,563	458,159	567,754	609,028	386,191
Loans	429,361	457,557	730,614	1,047,339	1,013,146	712,380

The banking institution which is utilized most by the Korean masses is the Post Office Savings Bank. In 1921 there were about one million and a half depositors at this bank, their aggregate deposits reaching ¥18,726,338. In 1936 the number of depositors increased to 3,571,237, with the aggregate deposits expanding to ¥54,820,710. The following figures show the annual expansion :

March, 31	Number of depositors	Amount (yen)
1922	1,416,325	18,726,338
1923	1,590,470	19,875,093
1924	1,694,087	21,040,342
1925	1,606,740	21,029,849
1926	1,711,590	21,531,122
1927	1,795,858	22,466,126
1928	1,910,289	26,961,217
1929	2,023,977	30,787,502
1930	2,078,602	36,286,417
1931	2,118,178	38,852,866
1932	2,283,871	41,432,670
1933	2,494,062	40,939,391
1934	2,840,656	44,807,154
1935	3,156,074	52,631,553
1936	3,571,237	54,820,710

Local Credit Associations Local credit associations were first organized in 1907 by virtue of the Local Credit Association Regulations promulgated in the same year. The object of the organizations is to assist the Agricultural and Industrial Banks in the capacity as their auxiliaries, accommodate small Korean farmers with funds, and look after their interests in several other ways so as to ensure a healthy development of agriculture. Membership is confined to those who engage in agriculture, and each association is organized as a corporate juridical person. The Government endows each association with ¥10,000 as foundation fund or grants subsidy to encourage its development.

Principal business of the associations is to loan funds to the members, and store crops for them. In addition they distribute and loan seeds, seedlings, and fertilizers to their members, and also undertake consignment sales of products for the members.

At the end of March, 1936, there were 698 associations with 1,438,949 members and an aggregate paid capital ¥11,237,000. The progress of these asscciations is illustrated in the table below.

Year	Associations	Members	Paid up capital in ¥1,000	Deposit in ¥1,000	Advance in ¥1,000	Reserve fund in ¥1,000	Government grant in ¥1,000
1926-27	547	446,576	6,510	54,505	76,082	8,144	3,417
1927-28	575	489,720	7,064	63,614	85,177	9,620	3,542
1928-29	597	530,407	7,509	74,089	91,381	10,889	3,662
1929-30	621	588,560	8,561	76,892	104,931	12,295	3,777
1930-31	622	606,813	9,010	80,128	123,368	13,131	3,777
1931-32	663	726,322	9,279	88,755	123,842	13,556	3,970
1932-33	674	831,805	9,362	103,752	127,832	14,316	4,027
1933-34	685	1,003,648	9,871	124,284	133,897	15,647	4,092
1934-35	692	1,178,769	10,580	139,417	150,107	17,779	4,132
1935-36	698	1,438,949	11,237	152,358	204,775	20,750	—

Agriculture

Chosen, though mountainous, is essentially an agricultural country. It is enough to point out that more than 83 per cent of its entire population is engaged in agricultural pursuits. Though the soil is not very fertile, it is sufficiently so to produce enough foodstuffs to support its entire population.

In 1934 the total agricultural products amounted to ¥1,021,147,882. In 1910, the year of annexation, the value of production scarcely reached ¥250,000,000, but in 1930 it more than doubled the above figure. Of all agricultural produce rice is the most important, production in 1934 reaching 16,717,238 koku valued at ¥415,546,387.

Ka-den-min In Chosen there are quite a good number of so-called "ka-den-min" or fire-field-people, who use fire for making their land ready for cultivation in a most primitive way. In ancient times, people set forests or plains on fire and then sowed seeds and cultivated vegetables on the blackened land without manuring. When this land became sterile, they moved to another place to repeat the operation. Among the lowest class of Chosen peasants this primitive system of agriculture is still in practice. There are nearly 400,000 ha. of the fire-field on which about 230,000 families or 1,160,000 people are living. They are mostly distributed over such northern mountainous districts as South Kankyo and North Heian. They plant the sweet potato, German millet, Indian-corn, soybean, red-bean, barley and buckwheat.

Steep slopes or mountain tops, even above 1,200 m. in height, are burnt by these farmers. One of the causes of the bare hills noticed by visitors to Chosen is said to be this long practice of burning the forests. Most of these people are nomadic and cultivate about 2 ha., the average family with an income of about 60 yen a year. After the establishment of the new Japanese Forestry Bureau the forestry police have been taking measures to prevent the continuance of this destructive practice by teaching these peasants a better method of farming; but all their efforts seem in vain so far.

Grains In 1910 the rice fields covered a total area of 1,350,000 cho, yielding 10,400,000 koku, which rose in 1935 to 1,711,000cho and 17,380,000 koku, its export during the same period increasing from 798,000koku to 9,030,000koku. This wonderful development has been achieved by the improvement made in cultivation, in the selection of seeds and manure, and in irrigation and reclamation. Next in importance come barley, wheat and rye, which are, however, mostly cultivated for home consumption. In almost every province these grains are raised in the paddy fields, after the rice crop is harvested, production of these in 1935 being 8,751,963, 1,932,817 and 1,626,516koku respectively. Owing to the help in various ways given by the authorities to aid in the cultivation of these three cereals, their production has been on the increase year after year. Third in importance comes soy bean. In earlier times it was far from being an important produce owing to ignorance on the part of Korean farmers of the proper method of preparation, such as drying and assorting. It is now, however, in high esteem on the Japanese market where there is a demand for it not only as food, but for chemical industrial purposes, and thus the amount exported to Japan is yearly on the increase. In 1935 the total area under cultivation was 791,857cho and the amount produced reached 4,375,278 koku, which was an increase of more than five times, compared with the year 1910. Millet is for most Koreans what rice is for the Japanese people. They depend more upon it than upon rice on account of its cheapness in price. The Korean farmers sell their rice, but use their millet crops for their daily diet, so that the supply of the grain hardly suffices to meet the entire demands of the Korean people. They, therefore, import much of it from Manchoukuo, its import from that region reaching 1,050,000 koku, worth ¥20,270,000 in 1935.

Cotton Cotton is another important agricultural produce in modern Chosen. The present scale of its growth is owing to the encouragement given by the Government-General. It was in 1906 that the first trial plantation of American cotton was carried out in the neighbourhood of Moppo. As its superiority over the old native cotton was sufficiently demonstrated, soon its cultivation was vigorously encouraged in all parts of southern Korea, so that the cotton acreage was increased from 1,200 cho in 1910 to 147,643 cho in 1935, and the crop expanded from 660,000kin in 1910 to 169,948,818 kin in 1935. If the production of the native plant is added, the total cotton producion in 1935 amounted to 213,748,967kin from the total area of 209,567cho, as against 21,000,000kin from 60,000cho, in 1910.

Sugar Beet A trial plantation of sugar beet was also made first in 1906. As it proved quite satisfactory every governmental assistance was given to its cultivation. A subsidy was given to ensure a sufficient distribution of improved seeds. Further exhaustive experiments proved that Keijo and its vicinity is best suited for sugar beet cultivation and consequently the authorities encouraged and assisted its plantation in that part of Chosen, with very good results.

Fruit Farming Fruit farming has also become a thriving industry of the erstwhile hermit kingdom. Soil and climate alike are suitable, especially for the growing of apples, and the government authorities are extending their assistance in this direction likewise, with the object of improving the quality of the fruit and gaining for it a world-wide market.

Many new varieties of apple, superior to the old native ones, are now cultivated, the quality being in some cases better than that of the fruit grown in Japan, the recent annual production reaching as much as 12,447,000 kwan with money value estimated at ¥4,311,000.

Sericulture By 1910 the Government-General had done everything in its power to improve the native methods of cultivating the mulberry trees and raising silk-worms after the Japanese fashion. In 1919 a new system was instituted for carrying on a compulsory examination of egg-cards and for giving adequate care to the growing of good mulberry trees. All this paternal care and effort on the part of the Government-General for the advancement of the economic welfare of the Korean farmer was by no means thrown away. In 1910 the cocoon production was 14,-

000 koku and the number of households engaged in the work was figured at 76,000. In 1932 the number of households increased to 786,060 and the output to 593,054 koku; in 1933 the number increased to 810,000 and the output to 608,000koku; and in 1935 the number increased to 821,573 and the output to 681,801koku.

Stock Farming As Korean beef is very palatable, the demand for it is rapidly increasing in Japan and Manchoukuo as well as in Siberia. In 1910 the cattle in all Chosen numbered only 700,000 head, which in 1935 increased to 1,679,000. The export of cattle and hides totals from ¥5,000,000 to ¥8,000,000 a year. The raising of both pigs and poultry has been greatly encouraged by importing from Japan animals and birds of superior quality, with the result that in 1935 the former totalled 1,620,000 and the latter 7,120,000, both more than doubling the numbers found in 1910. Sheep were unknown in the old days in Chosen. Efforts were made since 1919 to raise them but the results were not satisfactory. Since, however, it is of great importance to make Japan self-sufficient in respect to supply of wool a new plan for encouragement of sheep was formed in 1934. Carriedale, which suits to the climate and soil of Korea, has been decided upon as a kind to be raised in Korea. Subvention will be given to private undertakings, and the national sheep breeding grazing ground has been located at Ama, Meisen county of North Kankyo Province.

Conditions of Farm Households The type and size of farm households in Chosen vary to a large extent. The average size of farm land is about one cho six tan (about four acres), which is larger than the average in Japan proper where the size is just over one cho (2½ acres). However, in Chosen, due to poor methods of cultivation, the yield per tan is only slightly over one koku (5 bushels) while it is two koku in Japan. Supplementary products are as yet hardly worth mentioning. The large ownership of farm land by a few landlords is one of the roots of the difficulties. The majority of farming population have to hand over a greater portion of crops as interest at rates ranging from 3% to 4% per month on borrowed foodstuffs or money in addition to farm rent which is also high.

A farmer working one cho eight tan is regarded as a fairly good farmer in the central or southern Chosen. His annual cash income is, however, as small as ¥100. A farmer less favourably fared obtains ¥48 per year. Majority of farmers are in similar conditions and they form a poverty-stricken community.

Expenditure is always greater than income, as is shown in the table below. The farm household generally suffers from shortage of foodstuffs. It will be seen that deficit is ridiculously small but even a shortage of ¥10 or ¥20 is a great burden to a petty farmer who is altogether unable to make out any plan for covering it.

Eighty per cent of the farming community may be regarded as having debts, bearing interest at 3% or 4% per month.

A Korean farmer works from 70 to 100 days a year while a farmer in Japan works from 200 to 250 days. The margin of difference is too great and might be made good use of by Korean farmers.

CONDITIONS OF REPRESENTATIVE KOREAN FARMERS

Name of farmer	A.—	B.—	C.—
Number of family	6 persons	5 persons	5 persons
„ capable of work	2.9 „	2.1 „	2.4 „

Rural Revival To alleviate the severe agricultural depression, the Government-General devised a plan in 1932 for recovery of the farm through the effort

of farmers themselves. The results have so far been good and farmers regained hope. With improved economic conditions the relation between the Korean and Japanese became more harmonious, the industry more active, and living conditions of farmers as a whole improved. The concrete result of the plan has been that 4,695 villages comprising over 120,000 households have enlisted in the movement.

Measures Taken for Improvement of Condition of Farmers

Since 1912 steps have been taken to prevent possession of large estates by individuals. Uncultivated state-owned lands were leased to farmers who were willing to personally cultivate it and if the land were property reclamated it was given to these gratis. These measures were taken with a view to increase the number of independent farmers.

Tenant farmers, of course, predominate and form bulk of farmers. Their lives are miserable, and they have been driven into poverty, by their landlords and their agents. In view of this fact ordinances were put in force in 1920 with a special reference to the method of payment of rent. The ordinances were revised in 1928. In the new ordinances provisions were made for lease contract, farm rent payment, transport of crop, payment of taxes, improvement of yield, supervision of landlords' agents, etc. In 1932 regulations on mediation on tenancy disputes which had as their aim quick settlement of such disputes and lowering of the cost of law suit through simplification of the procedure were issued. Finally in 1934 the Chosen Farmland Ordinance was promulgated by which the safety of tenure of a tenant farmer and the right of his family or heirs were ensured. In accordance with provisions in the Ordinances local tenancy committees settle all questions regarding matters on tenancy, and actions of agents of landlords are subjected to control. This ordinance provides for : (1) the appointment and dismissal of "Saom", or landlord's agent to obviate abuses these agents make of their power ; (2) the term of lease, which has been made three years at the minimum for ordinary crops and seven years for perennial crops like mulberry, fruit, China grass, paper mulberry, etc., (3) inheritance of privileges and liabilities of the lease by heirs of a tenant ; (4) protection of the landlord against sub-lease ; (5) payment of farm rent, and reduction of its payment on its postponement in case of crop failure ; (6) appointment of tenancy committee and its duties, etc. The Ordinance was put in force on October 20, 1934.

Agricultural experimental stations have been established with staff of experts and their assistants. Many model villages have been selected and they are shown to farmers in other villages as model. Many young men have been trained also to get best out of their farms and to employ their own time most profitably.

Special agricultural courses are now given in common schools to infuse love of work in the mind of young people. Lastly the widespread self-help movement for the improvement of agriculture has been launched to make farmers endeavour to improve their conditions on their own account.

Forestry

The area of forests in Chosen covers 16,340,000 cho which corresponds with 73 per cent of the entire area of the land. But there existed before 1910 nothing like a forestry policy in Korea, and except a few protected ones, all forests were allowed to be devastated by ignorant and superstitious people. Therefore before 1910 nearly all the mountains in Chosen were treeless. The forests existed only in name. As a matter of fact, only one-third of the so-called "forest" areas was covered with standing trees, the remaining two-thirds being only thinly wooded. There was no system for safeguarding or protecting forests.

Afforestation Work Undertaken In 1908, however, the Korean government, by the advice of the Japanese, promulgated a forest law aiming at the protection of forests, and when the new régime was established the Government-General issued a new forest law providing, among other things, for the letting of forest lands to any interested party for the purpose of afforestation and, if the work were successfully carried out, the ultimate transference of them to the lessee. The total area thus leased now reaches 1,362,000 cho, of which more than 702,000 cho have been transferred to the successful planters. So far as the present situation is concerned, 5 million cho of the entire forest lands is owned by the state, and 120,000 cho is reserved for university research and as national parks, the rest being owned by private persons. There are at present 338 seeding plantations, where mostly pine, oak, chestnut, poplar, larch, etc. are being raised. In 1934 about 162,000,000 seedlings were grown by private undertaking, since the seedlings raised by the public plantations alone were not enough. Nor

is this all. Schools are given suitable pieces of ground whereon to plant trees, and the Third of April, the anniversary of the death of Jimmu Tenno, the first ruler of Japan, is fixed as Arbour Day, a day on which universal plantation of trees is encouraged throughout Chosen. In short, in the past twenty years more than a million cho have been planted with over 4,687,000,000 trees, and thus the mountain scenery in every part of Chosen is steadily undergoing a change with the accompanying effect of diminishing floods.

The Forest Districts There are several forest districts which escaped the almost wholesale denudation by kadenmin before 1910, the most important of which is the forest along the upper reaches of the Yalu and Tumen Rivers on the frontier. In 1906 the first systematic exploitation of the region was conducted by a joint undertaking organized by Japanese and Koreans and assisted by both the Korean and the Japanese governments with a capital of ¥1,200,000. This, combined with a similar enterprise financed by a group of Japanese and Chinese industrialists, forms one of the largest timber-supplies in the world. Since 1932, the government started the work of developing these forests with an expenditure of ¥12,183,000 to be operative for 15 years. The work consists of (1) development and utilization of forests, (2) education of kadenmin, and (3) protection of the forests.

Fisheries

Since 1910 all sorts of encouragement have been given to the Korean fishermen for the development of the fishery industry in Chosen, with the result that improvements in one way or another have been introduced in the building of fishing-boats and in the method of catching. Thus, while before 1910 the total value of catches was only about ¥8,000,000 a year, by 1935 it increased to ¥65,960,000, and other aquatic products in the meantime advanced from 2,650,000 to ¥65,000,000. The first fishery law in Chosen was issued in 1909, and this was replaced three years later by a new law providing for the definite establishment of fishing rights over a certain area of waters, the prohibition of certain actions harmful to fishing in specified areas and the prevention of individual monopolization of any fishing area. Trawling within special zones was also prohibited, and certain restrictions were made to the number of whaling-boats and to the diving apparatus carried. Mention should be made in this connection of famous "hanyo" (woman divers) of Quelpart Island. There are 7,000 of these women and they are engaged in catching sea-ears and many kind of shellfish, and gathering laver and other sea-weeds by diving into the deep sea. The total earnings of these women amount to one million yen a year.

The following shows the marine products for two years, 1934 and 1935, the value of each of which exceeds ¥1,000,000 :

Kind	1934 Value	1935 Value
	(In yen)	
Mackerel	5,716,000	5,438,000
Sardine	13,334,000	16,638,000
Guchi	3,621,000	3,835,000
Herring	2,548,000	2,539,000
Sea-bream	1,299,000	1,322,000
Hair-tail	1,931,000	1,912,000
Plaice	1,263,000	1,053,000
Cod	1,540,000	2,345,000
Shrimps	1,880,000	4,191,000
Mintai (Alaska pollack)	4,049,000	1,540,000
Mackerel-like fish	1,255,000	

Besides these, there are isinglass, yellow-tail, glue, shark, grey, mullet, rays, oyster, sea-eel, conger-eel, etc., valued each at between ¥500,000 and ¥1,000,000.

Mining

The present mining law, enacted in 1916, provides that mining rights can be granted only to Japanese citizens or to legal corporations under the Japanese law, and mining rights are treated as a form of real estate. As for mining rights secured by foreign citizens under the old régime, they are well respected. Of all minerals produced in Chosen gold occupies by far the most important position, the largest gold mine being the Unsan Mine operated by an American syndicate called the Oriental Consolidated Mining Company. Next in importance are the Shojo Mine worked by Frenchmen, the Suian Mine by Englishmen, and Sansei and Koyo Mines by Japanese. Formerly the mining industry in Chosen was carried on in a very primitive way except in those mines operated by foreign concerns. Soon after Chosen had been brought under Japanese protectorate rule in 1906 the Government tried hard to induce Japanese capitalists to invest capital in the mining industry of Chosen, but it was only in 1910 that Japanese capitalists began to display their energies in that lucrative undertaking. As, however, most of the more promis-

ing gold fields were already under operation by foreign capitalists, Japanese capitalists turned their attention to the exploitation of other minerals such as iron and coal. Iron ores in Korea hitherto found were mostly of hematite and limonite, the former being found in South Kankyo and Kokai provinces and the mixture of the two in South Heian and Kokai provinces. The amount of these ores stored, the purity of which is about 50 per cent, is estimated at about 20,000,000 metric tons. In 1933 about 570,000 metric tons of these ores were mined, of which about 394,000 metric tons were sent to the Kenjiho Iron Works and the balance of 176,000 metric tons to Japan proper. Fortunately a much greater store of magnesite ores is found in North Kankyo province. The purity of these magnesite ores is about 40 per cent on average.

As regards coal, almost unlimited quantity of brown and anthracite coals are stored in Korea, the quantity of the latter stored being especially large. Anthracite is mostly produced in the Heijo coal-field, and in South Kankyo, North Keisho and South Zenra provinces.

It must be mentioned that in Chosen nearly all kinds of minerals except sulphur, petroleum and asphalt are found in more or less abundance, gold, coal, and iron preponderating. The following shows the value of the mineral products of Chosen :

MINERAL PRODUCTION

(In 1,000 yen)

	1911	1921	1929	1932	1933	1934	1935
Gold	3,744	2,992	5,848	17,809	26,066	33,214	38,320

Total	6,069	15,767	26,488	33,746	48,301	69,172	88,039

Manufacturing Industry

It is only since 1916 that there has been any manufacturing industry worthy of the name in Chosen, and in 1935 the total value of manufactures reached ¥607,470,000, being over 20 times as large as that in 1911, in which year the total output was valued at ¥30,000,000. As the land has abundance of materials and a good labour supply, Chosen may be looked upon as a promising land for the future expansion of various industries. In 1911 there were in all the land only 252 manufacturing plants employing about 14,575 workers, but by 1934 this number of factories increased to 5,126 and the total number of employees to 138,809. The most important manufactures are :

(1) Cotton, hemp, and silk tissues, the total output in these goods expanding from ¥5,000,000 in 1911 to ¥82,320,000 in 1935.

(2) Paper increased from ¥382,000 in 1911 to ¥3,816,000 in 1929. Of late years the demand for foreign-style papers has grown, the imports expanding from ¥800,000 in 1911 to ¥12,355,000 in 1935.

(3) Ceramics, which show a yearly output worth ¥9,034,000 to ¥17,560,000 in 1935.

(4) Iron-wares, the annual production of which is now valued at ¥26,980,000.

(5) Fertilizers, which have an output of ¥5,292,000 a year.

(6) Tobacco, the total output being ¥39,479,319 in 1934.

(7) Marine products, the total product being ¥65,000,000 in 1935.

Total of industrial production of Chosen for the year 1935 was as follows :

INDUSTRIAL PRODUCTION
FOR 1935.
(In yen)

Textile industry	82,320,000
Metalic industry	26,980,000
Machinery and tool	11,520,000

Ceramics	17,560,000
Chemical industry	147,830,000
Wood works	8,240,000
Printing and book binding	12,740,000
Gas and electric	39,800,000
Foodstuffs	169,420,000
Others	91,020,000
Total	607,470,000

Of the total ¥607,470,000, ¥200,130,000 was the production by the so-called household industries, outside factories managed by industrial companies or where more than five operatives are employed.

Justice and Police

Chosen has now a judicial system similar to that of Japan. That is to say, in addition to the supreme court there are courts of appeal and local courts, the last-named having detached and sub-detached courts widely located. Both civil and criminal cases are first tried by local courts, while appeals against the decisions of local courts are made to the courts of appeal. The supreme court handles those appeals made against judgements rendered by the local courts or complaints against decisions or orders rendered in the second instance by the courts of appeal. Grave crimes of one sort or another have greatly diminished owing to the improvement in the work of maintenance of order and security. On the other hand, what might be called intellectual crimes such as fraud, forgery, and perjury have yearly increased. Prior to the establishment of the Japanese administration flogging was a common form of punishment. In 1912 its application to aged persons, women and children was prohibited, and in 1920 it was finally abolished as it was unsuited to modern ideas of penology.

Police The police service in Chosen had been under Japan's direction for some years even prior to the establishment of Japan's protectorate in 1906. But the system which had been in force at that period proved unsatisfactory. Accordingly, in June, 1910, a new system was introduced by which the commander-in-chief of the military police was appointed chief of police, and gendarmes and civil policemen were separately stationed as local needs required. In 1919, however, that semi-militaristic police system was displaced by the one now in force. This new and present police system is modelled on that in Japan proper, with its headquarters entrusted with the entire administration of police and sanitary affairs. Numbers of administrative officials of police, police superintendents, police inspectors, police, etc. as of 1933 follow.

Class of officials	Japanese	Koreans
Administrative officials	13	—
Police superintendents	48	9
Police inspectors	338	86
Assistant police inspectors	604	154
Police	10,163	7,913
Total	11,166	8,162

Education

In the old days Korean children were taught in school nothing but Chinese writing and classics, but soon after the new régime was introduced they began to receive a more modern education, with such new subjects as arithmetic, geography and the Japanese language. The parents at first objected to the introduction of these revolutionary methods, and specially to the forcible teaching of the Japanese language, believing that this was a deliberate attempt on the part of the government to deprive the Korean children of their national and inherited traditions. It was due to this misconception held widely among the Korean people that the educational authorities found much difficulty in enrolling pupils despite the fact that no tuition was charged and all textbooks were supplied to the pupils free of charge. In 1930 the Government-General, animated by a desire to respect the wishes of the native race and to foster oriental morals developed by Confucius, reopened the old Meiringaku-in (Confusian Institute) at the Keigaku-in (formerly known to Koreans as the "Songkyun Kwan."), the oldest and highest seat of learning in the country for the study of the Confucian classics.

Important Reforms But many more reforms of far-reaching importance were made in 1920, when the present educational system was introduced. By it not only was the standard of educational attainment raised, but the principle of equality was laid down firmly though no compulsory features were adopted with regard to elementary education, as in Japan. The following differences, however, were made and are maintained out of respect for Korean sentiment.

(1) The Korean language is made an obligatory subject in schools for Korean children exclusively, while it is optional in schools for Japanese children in Chosen.

(2) The teaching of Korean history

and geography is to be particularly emphasized in schools for Korean children.

(3) Different text-books, though of an equal standard, may be used in view of the difference of language and customs of the two races. That is to say, schools for Japanese children may use text-books compiled by the Education Department of Japan, but schools for Korean children those compiled at the Education Bureau of the Government-General. Koreans are mostly educated in common schools, higher common schools and girls' common schools. The term of the Common school is six years while that of the higher and girls' higher common school is two years. Korean children who prefer to receive education at the Japanese school may enter the elementary or the middle school as they chose. The system proved very efficacious in developing the education in Korea. While there was only 100 common schools before 1910, they number now 2,105 with 565,000 pupils. The table below shows clearly the development of educational work in Chosen since 1910 :

	1911		1934		1935	
	Schools	Students	Schools	Students	Schools	Students
Elementary schools	128	15,509	483	81,523	451	84,395
Common schools	172	20,121	2,716	636,958	2,362	720,757
Middle schools	1	205	11	6,553	12	6,715
Higher common schools	5	819	26	14,028	26	14,504
Girls' high schools	3	515	27	9,920	28	10,525
Girls' higher common schools	2	394	17	5,503	19	6,047
Normal schools	—	—	4	2,434	4	2,434
Industrial schools	20	961	58	16,229	63	17,072
Elementary industrial schools	3	93	92	4,661	97	4,163
Colleges	5	409	15	3,982	15	4,501
University preparatory schools	—	—	1	309	1	309
University	—	—	1	621	1	621
Total	2,006	110,789	2,951	782,721	3,079	872,043

Christian mission and other private schools are included in this table.

There are still a large number of Sohtang, which are old fashioned Chinese style schools where Chinese classics and brush-writing are taught. It is said that the number reaches 9,200 with 146,000 pupils. These schools are now utilized by the Government as agencies to foster public education and are controlled by regulations on Sohtang.

Short Course Elementary School Two million Korean children of school age are still unable to attend school, most of them living in remote agricultural and mountainous districts where it is not yet possible to provide educational facilities. To give some education to these children the Government introduced a plan to establish short course elementary schools with a two year course, which was put into force in April, 1934. The plan has been very popular in the country districts and the number of these schools established was very great. In 1935 they numbered 660 with 54,000 pupils.

Korean Students in Japan The Korean students in Japan now number about 4,519, most of them being in Tokyo. Those sent by the Government-General are comparatively few. The students sent by the Government-General are not only supplied with necessary funds by the Government during the period they stay in the colleges to which they have been sent, but are on graduation given official or educational positions.

Religion

Buddhism Buddhism first entered Korea about 370 A.D. It was introduced from China by a priest who brought with him a Buddhist image and the " sacred books ", and it flourished greatly in the peninsula during the days of Silla an Koryu. Under the dynasty of Yi, however, it met with persecution. The number of priests was limited and members of good families were forbidden to enter the priesthood, with the consequence that it soon lost its hold among the masses to a large extent. Things remained so until Japan extended her rule throughout the country. Then in September, 1911, an ordinance on religions was promulgated giving freedom of preaching and full protection to temples, and also raising the status of the priesthood. Since then Buddhism has been revived to a marked extent, so that at present there are

140 temples, 422 preaching houses, 610 priests and 268,000 adherents of whom 9,500 are the Koreans. There are several native religions not recognized by the Government-General, among which the most influential one is the Tendo-kyo, which in nature is a mixture of Confucianism, Buddhism and Taoism. This religion has followers numbering 82,200. Apart from Korean Buddhism and allied sects, we find Japanese forms of Buddhism lately established in the peninsula, priests of the Shin sect being the pioneers. Later three others, Jodo, Soto and Nichiren sects, entered the new religious field in competition with other sects and religions. At present nine sects of Japanese Buddhism are working among the resident Japanese as well as among the Korean masses, and at the end of 1933 there were 123 temples, 441 preaching houses, 597 priests, and 241,800 believers including 8,200 Koreans.

Christianity Christianity in Chosen was first brought by an official mission sent to Peking, China, by a Korean king in the latter half of the 18th century. This mission brought back with them a Bible and other Christian books. As its teaching, however, ran counter to the deep-rooted custom of ancient worship, King Seiso in 1784 issued an order prohibiting its preaching which was followed by a severe persecution. Though later occasionally the persecution was more or less relaxed, nothing for a time indicated a revival of Christianity. In 1833 a French missionary named Pierre Maubant came to Chosen to preach the Gospel. He was the first foreign missionary to tread the soil of the hermit kingdom. His energetic and devoted evangelistic work was not fruitless, but it alarmed the government officials, who in 1839 issued a prohibition edict. But it failed to suppress the spread of Christianity, and in 1863 there were as many as 18,000 converts. In 1866 the persecution against Korean converts was renewed with vigour, which cost the lives of 30,000 people. In 1882, however, freedom of worship was fully recognized in the country as a result of diplomatic pressure brought upon its government, and in 1885 several American missionaries came to Korea. This was the first time for Protestantism to be preached there, and it gained influence among the masses as time went on. When in 1906 Prince Ito, the foremost Japanese statesman at that time, was appointed first Resident-General, he pursued a policy of friendliness toward these foreign missionaries, this policy being pursued up to the present day under various Governors-General. The following table gives an idea on the situation of Christianity in Chosen in 1933 and 1934 :

1933	No. of mission	No. of missionaries	No. of members
Presbyterian	2,583	1,489	239,235
Roman catholic	327	184	95,520
Japan episcopal church	87	91	6,390
Japan christian church	12	15	1,802
Holiness	156	267	10,645
Methodist	16	21	1,655
Salvation army	74	77	6,523
Others	1,014	503	60,810
Total	4,269	2,647	422,580
1934	4,409	2,653	441,419

Communications and Transportation

Highways Highways existed in Korea in olden times. The Peking highway, which was one of them, connected Peking with Gishu and Keijo, and through that way embassies were exchanged between the old Korea and China. But in later years they were left in ruin. Under the Residency-General work for new ones was started with a sum of ¥1,500,000. As the first stage plan construction of four new lines aggregating 254.80 km. in four provinces was commenced in 1907, and in 1908 on another 196 km. highway in various provinces. In 1909 construction of three more highway totalling 188.16 km. in length was started, together with widening and readjusting works of streets in Keijo, Taikyu and Jinsen. In 1910 construction of twelve roads extending 164.64 km. in length was also commenced.

Since 1910 the Governor-General devised a plan to improve highway facilities through a construction of 23 roads extending over 2,263.60 km. with a sum of ¥10,000,000. The work was to run for five years consecutively, beginning with the fiscal year 1911. The plan included the followings :

First stage construction plan on 34 lines	2,690 kilometres.
Second stage construction plan on 28 lines	1,445 ,,
Highways along the frontier	863 ,,

In the fiscal year 1935, the total highways in Chosen extended 13,116 km. (1st and 2nd class highways) and 14,340 km. (3rd class highways).

Railways The construction of railways as a civilizing agency is being vigorously carried on in accordance with the 12 year programme laid in 1927. The programme covers the construction of a Tumen River line and four other lines totalling 1,384 kilometres and the purchase of five lines including the Zenshu-Riri Railway, totalling 339 kilometres. At the end of 1936 the total government-owned railway mileage reached 3,762.6 kilometres in active operation. The capital invested in the railways amounted to ¥467,700,000, and 16,557 persons are now employed in it. The following gives some idea of the development of railways in Chosen up to 1935.

	Length k. m.	Passengers	Freight (tons)	Receipts (yen)
1911	674 miles	2,024,000	888,000	4,095,000
1920	1,157 ,,	12,421,000	3,186,000	28,816,000
1925	1,309 ,,	18,241,000	4,297,000	30,708,000
1930	2,792	20,650,000	5,936,000	36,821,000
1931	3,009	19,673,704	6,025,150	36,300,512
1932	3,142	20,591,638	6,248,863	40,154,103
1933	2,935	22,238,338	7,254,859	43,611,142
1934	3,078	25,614,000	7,681,000	51,148,000
1935	3,389	29,344,188	8,667,642	56,477,897

As the through traffic between Tokyo and Europe is now established, the two main lines, Keijo-Fusan line and Keijo-Gishu line, form an important part of the railway system connecting Europe and Japan. Of all the lines now under construction the most important one is the line between Heijo and Gensan, 213 kilometres in length. When completed it will serve as an important traffic link between North China and Japan. As for the private railway enterprises in Chosen, regulations were issued in 1912 so as to provide adequately for effective supervision and protection. In 1921 new regulations were issued by which increased state aid was extended to private railway undertakings. These have in consequence made rapid progress, and at the end of 1933 their total mileage reached 1,163 kilometres operated by seven companies, though their earnings are far from being satisfactory. There are at present over 387 kilometres of additional lines either under actual construction or projected.

Tramways The followings are the main tramway lines now in operation :

49.0 km.	in Keijo
9.8 ,,	in Fusan
12.9 ,,	in Heijo
6.1 ,,	in Kanpei
1.1 ,,	in other parts
Total	82.2 kilometres

Navigation There are now 870 steamships with the total tonnage of 64,641 tons, their routes being interport, Korea-Japan and Korea-China-Russia. The following table shows the progress in this method of transportation in the last eight years :

	Steamers		Sailing-boats	
	Number	Tonnage	Number	Tonnage
1925	147	44,520	627	21,075
1929	185	47,161	694	23,083
1930	196	53,998	692	22,911
1931	202	52,302	745	24,778
1932	223	57,512	756	24,889
1933	235	57,920	796	26,573
1934	259	53,547	851	28,429
1935	870	64,641	10,502	134,386

Navigable Rivers The most important river in Chosen is perhaps the Yalu or Oryokko which, forming the boundary line between Chosen and Manchoukuo, rises in the Paktusan or "Everwhite" Mountains (2,744 m.) and empties into the Yellow Sea. Its length is about 800 km. of which about 700 km. is navigable by air-propeller boats under governmental subsidy. Timber felled on the mountain slopes is made into rafts and floated down until it reaches the lumber-yards at Shingishu or Antung. Another river of importance is the River Daido which flows through Heijo and empties into he Yel-

low Sea in the neighbourhood of Chinnampo. The river is 400 km. long, navigable for a distance of 245 km. These are also four other rivers wide enough for navigation by sailing boats and motor boats. These are :

Rakuto (flowing into Chosen Channel)	344 km. (Navigable course)			
Kanko (flowing into Yellow Sea)	300 km.			
Kinko	„	„	„	„ 130 „
Tumen	„	„	„	„ 85 „

Airways There are at present three airports established in Chosen. These ports are located at Urusan, Keijo and Heijo. Besides that in the following places ground marks are set up : Urusan, Kwokan, Taiden, Tenan, Shariin, Heijo, Teishu and Shingishu. Moreover, in Urusan and Keijo there are now built wireless stations for keeping in communication with the airways. At the airport of Urusan there is installed a meteorological observatory for forecasting weather conditions in the interests of air navigators. Most of the air traffic between Chosen and Japan is being done by planes belonging to the Japan Air Transport Company.

Post, Telegraph and Telephone Prior to 1905 there were 516 postal offices in the peninsula. In March, 1935, they numbered 1,009, but in this are included 913 offices engaged for telegraph and telephone service exclusively. Number of mails accepted and delivered in the same year amounted to 327,589,184 and 358,872,054, that of parcels to 2,505,926 and 3,728,794 and that of cables to 7,312,100 and 7,218,914 respectively. In November, 1926, a Radio Broadcasting Office was established in Keijo and opened to business in February, 1927.

With the advent of the Government-General the facilities of communication were further expanded as far as the budget could allow. Post offices now number 922, while the total length of telegraph and telephone lines reaches 8,758 km. and 9,531 km. respectively. Remote country places where there are at present no railway facilities mails are collected and delivered by automobiles. With the exception of a few islands, every town or village in Chosen has at least one mail delivered every day.

Public Hygiene

Prior to 1906 Chosen was a land practically without access to any medical service worthy of the name and the sick were simply placed under the care of unqualified practitioners of the old Chinese school or of witches or magicians. The situation was made worse by an entire lack of sanitary equipments and pure water, the consequence being frequent outbreaks of various infectious diseases. As soon as the protectorate was brought into existence in 1906 the first step taken by the government with a view to giving the nation the benefit of sanitation was the establishment of a modern hospital in Keijo. Since 1910 further steps have been taken to extend modern medical and sanitary benefits among the masses, even among those in very remote regions. The construction and extension of waterworks is another work pushed on by the government with vigour so as to provide the people with good drinking water. The Government-General has also taken efficient and energetic measures for the prevention of epidemics ; in consequence, small-pox which was formerly so virulent in Chosen, has almost died out. Moreover, sanitary regulations relating to foodstuffs, drinks, and drugs are rigidly enforced. Medical and hospital equipments have been greatly improved. At the end of 1934 hospitals numbered 136 including government institutions, and there were 2,302 licensed medical practitioners which meant that there was only one physician for every 8,836 of population. Korean medical practitioners numbered 4,155 in the same year.

Leprosy Asylums In view of a large number of lepers the Government-General established the Government Charity Hospital for Lepers at Shoroku Island, South Zenra Province in 1917. Since 1923 annual subsidies have also been granted by the National Treasury to private organizations engaged in this work. Apart from this the Government-General distributes free of charge to leper asylums as well as to individual patients medicine specially prepared for their cure. The number of lepers was estimated at 8,000 in 1932, of whom about 800 were taken care of at the Government Charity Hospital and 1,700 at three private institutions.

In December, 1932 the Sociey for the Prevention of Leprosy was organized by leading officials and citizens of Chosen. The primary aim of the society was to establish a colony large enough to accommodate 3,000 roaming lepers. The work was to be started in 1933

and completed by 1935. Contribution amounting to ¥1,580,000 was made, which consisted of ¥110,000 by the National Treasury, ¥170,000 from local funds and ¥1,210,000 by public subscriptions. In addition a special grant of ¥30,000 from Her Imperial Majesty the Empress Dowager, and another of ¥60,000 from His Highness Prince Yi were made. The society selected Shorokuto (Little Deer Island) as the site of the new colony where it purchased 1,100,000 tsubo of land. The construction work of the asylums was completed in October, 1935.

There are more than fifty lepers serving sentences in prisons of various places, where their segregation and treatment are very difficult. Accordingly the society made a plan to build a special prison on Shorokuto where these convicts might serve their term and might also receive proper treatment. 400 lepers were received in 1933, 1,600 in 1934, and by October, 1935 it was reported 1,000 more would be received. The colony and the Charity Hospital combined will ultimately be able to receive 3,800 in all.

Private Leprosy Asylums In addition to the asylum at Shorokuto three asylums have been founded by Christian missions. The Government-General has been granting them since 1923 annual subsidy of ¥36,500. This was increased to ¥62,596 in 1932. Her Imperial Majesty the Empress bestowed a special grant of ¥1,000 a year to each for five years beginning with 1930. Her Imperial Majesty the Empress Dowager, most graciously rewarded head of each asylum for their selfsacrificing services. Locations, etc. of these asylums follow :

Taikyu Leper Asylum.

Founded in March, 1913 at the outskirts of the town by Dr. A. G. Fletcher. At present patients number 500.

Fusan Leper Asylum.

Founded in March, 1911 by the late Dr. C. H. Irvin, and now managed by Rev. J. N. Mchenzie. Inmates number 600 at present.

Aiseien Leprosarium at Reisui.

Founded in February, 1911 by Dr. R. M. Wilson at the outskirts of Koshu (Kwangji) but in February, 1926 moved to Reisui, South Zenra Province. Inmates number 720 at present.

A comparatively accurate estimate on the number of lepers in Chosen made in 1934 put it at 12,000, of whom 6,000 were either poor wanderers or those whose disease was still concealed.

Prohibition of Opium Smoking

Soon after its inauguration the Government-General made a serious effort to deal with opium-smoking. The habit of pium-smoking among the Korean people had been quite strong, specially among those in the frontier regions, many deaths resulting therefrom. The Government-General's drive for the abolition of this vicious habit was a thorough one. Those who were found smoking opium were made liable for criminal punishment. It would be, however, an exaggeration to say that the land was entirely freed from the evil, as much opium still being smuggled in from China. In 1919 poppy cultivation was absolutely prohibited except for the purpose of supplying the needs of the medical profession and a certain limitation was placed on the area of its cultivation, and the product so raised was not permitted to be sold on the general market, being all taken over by the Government at a fixed price. In 1930, the Government-General granted a subsidy of ¥16,240, in addition to sufficient money to buy a necessary quantity of morphine to be divided among the provinces to assist in the cure of addicts. As a result 2,837 addicts out of a total of 2,944 treated at the provincial morphine asylums were completely cured. The following is the policy now being pursued by the Government-General in its effort to conquer the evil of opium-smoking :

(1) To attempt to cure all morphine addicts within 10 years ;

(2) To take into its own hands all the work of manufacturing and selling the morphine to be supplied to the registered addicts :*

(3) To permit no person other than those registered to use morphine, and to punish heavily those who smuggled or secretly sold it ;

(4) To educate the people so as to prevent any increase of addicts.

On March 3, 1930, the Government-General issued an order forcing all addicts to be registered and in the end of that year those who registered totalled 3,278 out of 5,094 persons known to be addicts.

Principal Cities and Places of Interest

Keijo (Seoul) In 1392, A.D. at the old palace in Songdo Yi Taijo, the founder of the Yi Dynasty, ascended the throne after a stormy coup d'état against the former Wang Dynasty, and selected Seoul as his new seat of government. His palaces were surrounded with great walls. Seoul became the scene of the

*The government manufacture began March, 1933.

Hideyoshi Invasion of 1592 and the Ching Conquest of 1636. More recently the Chino-Japanese War was fought around it.

The age-old lofty peaks of "Hokkansan" (Pukhan) on the north and the green-clad slopes of "Nansan" on the south, permanent sentinels of the old capital, look down on the transformed city. The Kan (Han) River which encircles the site of the town tells mysterious tales of the past, but its course is now spanned by modern heavy steel bridges over which run steam trains, electric trolley cars and hooting motors. Under these fussy motor launches thread their way through drowsy sails of the tenaciously enduring junks. A glimpse from the sky reveals the city changing to modernity, but withal the historical palaces and gates remain to draw attention and provide a panorama combined of the old and new.

Keijo Station is the main entrance to Seoul. Every day ten thousand passengers rush in and out of this station. It is located outside of the South Gate between main streets of Keijo and the suburb of Ryuzan.

The Commercial Museum was built in 1929. Visitors can readily get here the first hand information on agricultural products and manufactured goods of the peninsula as well as on its methods of commercial transaction.

The Nandaimon (the South Gate) is the largest and most beautiful of eight gates on way to Keijo. During the reign of the Yi Dynasty, the gate served as the main entrance to the capital. Then, when the great bell installed at the heart of the city rang in the evening the gate was closed and traffic stopped. The walls have gradually been removed and broad paved roads laid in their place. Their remnants still exists on mountain slopes nearby. The old gate was built in 1396 under the reign of King Yi Taijo and there it proudly stands with its splendor today, a flower of the oriental art, challenging modern buildings that surround it.

The Chosen Jingu. To the right towards "Nansan" from the "Nandaimon" by the broad asphalted road and still higher through the stone "Torii" by the granite stairway of 384 steps, the threshold of the grand Chosen Jingu is reached. This shrine is dedicated to the spirits of the great Amaterasu Omikami, Sun Goddess, and of the late Emperor Meiji as Guardian Deities of the peninsula. The construction work started in May, 1920 and completed after five years and six months at the cost of two million yen.

The Great Bell. In the heart of the city at Shoro (Chongno), a red painted belfry in Korean style towers which contains the Great Bell, ten feet high with a circumference of twenty feet. Though silent now, it rang twice a day under the old régime before daybreak and at sunset. The early morning bell announced opening of the eight gates of the city, while the evening bell ordered their closing and instructed men to withdraw from the streets so that women could go out. This bell was cast in 1468 by order of King Seicho, and at first it was placed in a belfry at the Nandaimon.

The North Palace (the Keifukukyu) was built in 1395 immediately after the removal of the capital from Songdo (Kaijo) to Seoul, but was burned in 1592. According to the old records, the original architecture bore splendid works of art which have been proved by archaeological discoveries made among the ruins in later years. In 1867 the Regent, Taiwonkun, started repair works on the palace, which was completed in two years. The Royal family then moved to it from the East Palace.

In the Audience Hall (Kinseiden) of the palace coronation and other important official ceremonies were performed and the King used to give audience to the princes of the blood and other high dignitaries. "Keikairo" means the "Pavilion of Happy Meeting," and here luxurious court banquets and other classical entertainments were given. The two storied pavilion is supported by forty-eight solid stone pillars, fifteen feet high. In 1909 most of palace buildings of lesser importance were dismantled and in 1919 the buildings which contained the royal bed chambers were also moved to the East Palace. The total area of the North Palace is 130,000 tsubo. The wall that surrounded the original palace was twenty two feet in height and extended more than three kilometres.

Government-General Office. The magnificent white building, with the old North Palace at the background, is the Office of the Government-General. Begun in the summer of 1916, it was finished in the winter of 1925, at the total cost of nearly seven million yen. The art museum is located between the modern Government-General Office and the old classical "Keifuku" palace.

The East Palace (Shotokukyu). The royal residence of Her Highness the Dowager Princess Yi was built as detached palace, but has since been twice burned. The present palace was built

after the Hideyoshi Invasion.

The Throne Room (Jinseiden or "the Hall of Benevolent Rule") and royal dwellings are located in the inner court. Here are the art museum of the Prince Yi household, and the zoological and botanical gardens. An old palace called the "Meiseiden" (The Hall of Bright Rule) belongs to the architecture of the later period of the "Koryo" Dynasty. Because it is facing the east contrary to all other palaces which are facing the south and because it is one of the oldest buildings in Keijo, this palace is the object of admiration for those who are interested in archaeology.

The Keigaku-in (Temple of Confucius). This solemn classical edifice is rich in Chinese colouring and is surrounded by gingko biloba and other venerable old trees. In this temple sacrifices are offered to the spirits of Confucius and other sages at festivals held twice a year, in the spring and autumn. Attached to the temple is a Confucian institute known as "Meiringaku-in" where young men are trained in the principles of Confucian teachings.

The Tokujukyu (Toksu Palace). Beyond a large red gate known as Taikanmon (Taihanmoon) are a group of palaces. Those which are built in Korean style stand on one side and European-styled granite palaces at the farthest end of the royal ground.

Pagoda Park was laid out in 1905-1907 over the buried ruins of an ancient Buddhist temple. The pagoda itself was erected in 1464 under the reign of King Seicho, together with the old temple. In the park there is also a huge stone tortoise with a stone tablet on its back—a memento of an old temple. The bronze statue in the park is a monument dedicated to the late Baron Megata, financial adviser to the Korean Government, who rendered meritorious services to the Government and who was greatly interested in having the park enlarged and improved.

The Chosen Hotel. One of the most palatial, yet most homelike hotels in the orient and is built on the site where the Emperor Yi held his coronation in 1897. As a souvenir of the ceremony a wooden pagoda known as the "Temple of Heaven" still stands in the centre of the "rose-garden" behind the hotel.

The Dokuritsu-mon (Doknip-moon or Independence Arch) bears inscription, "Independence". The arch was built commemorate the virtual Korean independence from China as the result of the Chino-Japanese War. In front of the arch there was once a gate known as "Geion-mon" which literally means gate of inviting favour from the celestial empire. Now only the lonely pillars remain.

Shochu-dan Park and Prince Ito Temple. To the east of the park across a stream stands Prince Ito Temple in the Kamakura age style, a magnificent two storied reinforced concrete building. The temple was erected to the memory of the late Prince Ito, the first Resident-General of Korea.

Jinsen (Inchun or Chemulpo) Until fifty years ago Jinsen was only a small fishing village lying on the coast of the Yellow Sea at the mouth of the Han River. It is a big port to-day. About 25 miles in distance to Keijo it stands in something like the same way as Yokohama stands to Tokyo and railway connection between the two is good. In its inner harbour lies Getsubito while in its outer harbour are Yeisoto and a large group of smaller islands. The difference in the height between mean high and low tides in the harbour is ten metres which used to cause a great inconvenience for steamers in anchoring, and loading and discharging cargoes. To overcome this difficulty a lock-gate dock was constructed with electric control. The dock is 454.5 metres long and 218.1 metres wide with the minimum depth of water of 8 metres, and was finished in 1918 after seven years' work.

Getsubito, meaning literally "Moon-Tail Island," is known to foreigners as Roze Island, where amusements of various kinds are provided. Kokato or Kangwha Island in the mouth of the Han River is rich in historical remains and is beautiful to look at. Kangwha was a shelter of refuge for the Korean royal families in turbulent days.

Kaijo, or Songdo Songdo is an interesting place full of historical remains and scenic beauties, and is also a land of ginseng. In the tower of the South Gate is a big bell six hundred years old, which bears artistic designs and wonderful inscriptions in Sanskrit. Songdo was the capital of the Koryo Dynasty. The Wangs ruled there for 460 years till it was destroyed by Yi Taicho in 1392. In the environs of Songdo mausoleums of kings and queens of the Koryo Dynasty are found. At these mausoleums are some of the best products of art of the Koryo Period. To the north from Kaijo Station is the famous Park Yun waterfall, above which is an elegant pavilion arch, which was the north gate of an old castle formerly used as a detached palace of kings of the Wang Dynasty.

Heijo, or Pyengyang Heijo, now the

greatest city in the northwest Chosen is situated on the extensive fertile plain watered by the Daido River and is a great industrial city.

There is an evidence that the people of the stone age made their dwellings along the Taitong River. A few miles north of Pyengyang are found remnants of this age, such as axes, knives, hammers, daggers, and arrowheads. Tangoon was believed to be the father of Korea and the name Chosen was given it by him probably in 2,333 B.C. Tangoon must have ruled Chosen and made Pyengyang his capital and made it, too, one of the oldest cities in the world. Pyengyang became later the capital of Naknang Province and flourished until the Kokuryu people, migrated here from Fuyo district north of the Yalu River, invaded and took its possession about 314 A.D. The tombs and remains of these people show that the degree of culture which they attained was high. About 20 miles to the west of Pyengyang, at Oohulli, are three great mounds, 30 feet high, 170 feet in diametre and 500 feet in base circumstance. They are built of granite with an unusual skill.

Kongosan or Diamond Mountain Of all places of interest in Chosen Kongosan is most famous and is always the centre of admiration and praise of tourists.

The mountain group is a portion of the main range which extend from north to south of Chosen and stretches along her east coast. It extends over 65 kilometres and the precipitous peaks are said to number twelve thousands. It is only six hours' comfortable trip by train to get there from Keijo.

The best season for visiting the mountain is mid-autumn when the land enjoys an unbroken spell of fine weather ideal for outings. Then the entire mountain is agleam with gorgeous tints of autumn foliage. Another season which is good for visiting will be April and May when lilacs, magnolias and azaleas are in glorious bloom. It is also a good summer resort for those desiring to escape the heat in that season.

Koreans in Manchoukuo

History of Emigration The emigration of Koreans to Manchuria across the Yalu and Tumen Rivers has a historical background in addition to geographical reasons. According to popular traditions, there were Korean farm villages already dotted in the district of Chientao (Kanto) during the reign of "Kiang Hsi" (1662–1723). In early days there was no frontier line defined by the Governments of China and Korea for Chientao which was sparsely inhabited though the soil was very fertile. It was therefore perfectly natural for many Koreans to cross the Tumen River. In 1890 there was a record outflow of the northern Koreans who attempted to escape from privations of a terrible famine. After the establishment of a branch office of the Residency General in Chientao in 1907 there was a further increase. According to the latest official statistics, these immigrants, who number now 453,345 and occupy about 80 per cent of the total population of Chientao, are mostly farmers who have turned the wild soil into the pres ent fertile land. More than half of the arable land in Chientao is owned by the Koreans while a portion of the rest, though under Manchou ownership, is cultivated by Korean tenants. So Chientao has appearance of being a portion of Chosen.

Other groups of Koreans crossed the Yalu River and advanced to the interior of Manchuria. After the Russo-Japanese War still greater number from the north and south of Korea swarmed into Manchuria through Antung, and many have settled in the regions now traversed by the North Manchuria and the Kirin Tunwha Railways. According to the latest official returns, they number about 354,000, but the actual figure may be twice as large. These Korean farmers have transformed vast dreary wilds into 100,000 chobu of rich paddy fields, which form a good economic resource to Manchoukuo. The Government-General, in conjunction with the Imperial Government and the South Manchuria Railway Co. are making efforts to promote education, public health, quarantine, banking, industries, relief work, police affairs, census registration, etc. for these people. With the birth of Manchoukuo the general conditions have changed and the Koreans in Manchuria are now fared well, so that the Koreans at home began moving afresh to the new state in increasing number.

In order to provide permanent settlements for new immigrants the Government-General established between 1931 and 1934 within safety areas of north and south Manchuria four large farm villages. At the same time various facilities to look after their health, education, economic welfare, etc. have been installed. Conditions of these farm-villages follow :

(1) The Tieh-ling farm-village is on the upper basin of the Liaoho, about three miles from Lan Hsieh-Shan Station on the South Manchuria Railway line. The

total area of the village is 720 chobu of which 600 chobu are paddy fields and 120 chobu dry land. At present the village has 250 Korean families with 1,200 people.

(2) Ujimiho farm-village is near a tributary of the Sungari River lying to the east of Harbin six miles to the north-east of Ujimiho Statin on the North Manchuria Railway line. The total area is 2,500 chobu, of which 2,000 chobu are paddy fields and 500 chobu dry land. A plan is now completed to accomodate a thousand Korean families on this farm.

(3) Yingkow (Newchwang) farm-village is at the mouth of the Liao River opposite Yingkow harbour. The total area is 2,500 chobu near which a vast grassland of 15,000 chobu extends along the right bank. There are one thousand families on the farm.

(4) Suika farm-village is about twelve miles to the east of Chin Chia on the Hulan-Hailun Railway in north Manchuria across the Sungari River. The total area is 1,300 chobu with 3,000 people and 600 families.

The Chientao district has long been a nest for Korean malcontents and communist bandits. They used to incessantly harass Korean farmers, especially after the Manchurian Incident. In 1932 and 1933 the Government-General set about establishment in Chientao of twenty five special farming groups. Each group organized its self-defence corps and fortified their village. These groups enlarged their safety zones, and succeeded in establishing them at various strategic points, which play an important rôle in the preservation of peace in Chientao. The Government-General provides there all means to further prosperity of the farmers and assists them in making the farms ideal ones. An agreement was also made with the Oriental Development Company in 1932 with a view to installing 2,500 families of independent farmers with a grant of ¥2,000,000 spread over five years. At the end of August, 1936, 2,830 families have been settled on an area of 13,264 cho, and the expenses needed for the purpose reached ¥1,474,153.

CHAPTER XLI

TAIWAN (FORMOSA)

General Description

Area and Topography Taiwan (Formosa) forms the westernmost part of the Japanese Empire. It is washed by the Pacific on the east, and is separated from China on the west by the Formosan Straits and on the south from the Philippines by Bashi and Balintang Channels. It extends from 119° 18′ to 122° 6′ E. longitude, and from 21° 45′ to 25° 38′ N. latitude. The Tropic of Cancer bisects the island, which is about 394.28 km. long, its greatest width being 122.31 km. The Pescadores (Bokoto) and other outlying islands form a political division of the Taiwan Government-General. They cover 126.86 sq. km. The area of Taiwan, including the Pescadores, is 35,973.55 sq. km., being about 5.3 per cent of the total area of Japan, a little smaller than Kyushu, and about one-sixth the size of Chosen (Korea). As regards its topography, Taiwan is an island which rises from the sea to a height of 3,950 metres, reached at the summit of Mount Niitaka (Mount Morrison). It consists of a mountain range with narrow valleys on both coasts which are the population centres. The valley on the west coast is the principal population centre. That on the east coast is little developed and is capable of but slight further development. The rivers are not long and their current is very swift; in the rainy season they flood the surrounding country, causing much damage. The climate is semi-tropical. In summer the north is visited by rains; in winter the south. The temperature rarely falls below the freezing point.

The Inhabitants The territorial system of Formosa was organized during five years, 1898 to 1902, by a large land-investigation enterprise made by the Government-General. The island is inhabited by Japanese, natives and foreigners. The Japanese went there after the occupation of the island by Japan, and the foreigners are mostly Chinese. The number of Western people is small. The native Chinese are mostly Mins from Fukien province and Cantonese from the China coasts across the Formosan Straits, composing 92 per cent of the total population. The aborigines consist of savages and semi-civilized tribes. The following figures show total number of the population at the end of 1934 and 1935 :

	1934	1935
Japanese	262.964	269,798
Koreans	1,316	4,990,131
Natives	4,882,288	150,489
Aboriginal savages	148,472	1,604
Chinese	48,193	53,900
Foreigners	219	209
Total	5,194,980	5,315,642

Including the savages, the total population at the end of 1935 in Taiwan was 5,315,642, showing an increase of 120,662 over that at the end of 1934 and 2,268,787 over the end of 1905, when the first census-taking results were announced. This means a yearly gain for the 30 years of 75,626.

The areas, population, number of counties and districts and number of towns and villages of five provinces, three districts and nine cities at the end of September, 1934 follow :

	Area sq. ri	Population	No. of counties or sub-districts	No. of towns and villages
Taihoku province	297.9	1,032,110	9	39
Shinchiku „	296.3	733,004	8	42
Taichu „	478.7	1,157,453	11	57
Tainan „	351.5	1,313,883	10	66

	Area sq. ri	Pupulation	No. of counties or sub-districts	No. of towns and villages
Takao province	371.0	718,491	7	43
Taito district	228.0	66,624	4	11
Karenko „	300.1	106,572	4	10
Boko „	8.2	66,843	2	5
Taihoku city	3.0	283,085	—	—
Keelung „	3.0	84,650	—	—
Shinchiku „	2.3	54,110	—	—
Shoka „	4.2	51,152	—	—

The Climate Being in the semi-tropical zone, the summer time is long and the winter is short. The highest temperature, however, is not very much higher than in Japan proper, but the weather is warmer during the winter time. Frost is very rare and water has been known to freeze over only twice since Taiwan came under Japanese rule. The island lies in the highway of typhoons, and is yearly visited by them, terrible damage being sometimes caused.

During a 38-year period ending in 1934, Formosa was hit by severe typhoons no less than 91 times; of these, as many as 7 occurred in the year 1914.

Typhoons originate generally in the offing northeast or east of Luzon Island of the Philippines, and cross the island or enter the Chinese mainland, passing the southern or northern extremity of the island. Taiwan forms a part of an earthquake zone connecting Kyushu, Okinawa Islands and the Philippines and naturally it is very often visited by seismic shocks. The number of earthquakes registered in the island or the neighbouring seas during 25 years ending 1933, was 8,502, which means 327 a year or nearly one every day.

Administration System

When Taiwan came under Japan's rule in April, 1895, the Japanese Government established the Taiwan Affairs Bureau in June of that year and then in August of the same year the Taiwan Government-General Act was promulgated in connection with the introduction of military administration. This was replaced by the civil administration in March of the following year. The Taiwan Government-General came under the supervision of the Minister of Overseas Affairs with the establishment of the Ministry in June, 1929. The Governor-General invested with authority to require military assistance from the commanders of the army and navy in the territory under his jurisdiction, when he deems it necessary to do so for the maintenance of peace and order in Taiwan. If the Governor-General is either a soldier or a naval man, he is able simultaneously to assume the command of the Formosan Army. The Governor-General also is invested with authority to supervise officials under him, promote them in rank, retire them from service, or recommend them for honours through the Minister of Overseas Affairs and the Premier, and to suspend or cancel orders and administrative measures of provincial governors under him, when such are deemed damaging to public interest or overstepping the sphere of their authority. The Taiwan Government-General consists, besides the secretariat to the Governor-General, of five bureaux, that is, the Home Affairs Bureau, Educational Affairs Bureau, Financial Affairs Bureau, Colonial Development Bureau and Police Affairs Bureau. The chief of general affairs, or civil governor, directors of the five bureaux and many other officials are under the supervision of the Governor-General. There is an Advisory Council to the Governor-General, which serves as a very important organ for the administration of the island. Not only does it give advice to the Governor-General on laws or regulations but also on general important business. The members consist of Government-General officials and leading persons in private circles in the island. The provincial administration extends over 5 provinces, 3 districts, 9 cities and 45 counties. There are the same number of provincial governors, district superintendents, city administrators and county chiefs, all under the Government-General.

Aboriginal Administration

The Taiwan aborigines are the oldest inhabitants of the island and are classified into semi-civilized aborigines and savage head-hunters. The former have now settled down as ordinary peaceful citizens and differ nothing in culture and general status from the natives who belong to the Han (Chinese) race. The head-hunters, on the other hand, live in mountainous districts and still adhere to their traditional habits and manners, their culture being very low. The Taiwan Government-General is concerned in its aboriginal administration mostly with these savage tribes. These savages lead a very primitive life, their dwelling-places being so difficult of access, and they still deter other tribes from settling near them by their traditional custom of head-hunting. Since Japan's occupation of Taiwan great efforts have been directed by the authorities to their subjugation and cultural improvement, and at the present time head-hunting is rapidly becoming extinct, and these savages are entering the first stage of civilized life. Some of them living along the mountain zone in west Taiwan, and those living on the sea coast in east Taiwan, pay taxes. These aborigines have a close resemblance to the Negritoes in the South Sea islands and are supposed by anthropologists to be of a Malay-origin. They may be classified into seven tribes: Taiyal, Saiset, Bunun, Tsuwo, Paiwan, Ami and Yami, and are entirely different in countenance, physical build, language and habits from the Han race who came over from continental China. These savages are distinguished by their extreme hatred of other tribes, and have a habit of combining together in an offensive and defensive alliance against any enemy. The number of these savages at the end of 1934 was 148,472, of whom 74,404 were male and 74,068 female. They lived in 24,496 houses in 592 villages. Their population in 1934 and 1935 was:

Tribes	1934	1935	Increase or decrease
Taiyal	34,957	35,639	682
Saiset	1,462	1,482	20
Tsuwo	2,191	2,168	23
Bunun	18,408	17,757	(−) 651
Paiwan	42,614	43,460	644
Ami	47,064	48,237	1,193
Yami	1,682	1,695	13
Others	455	51	(−) 404
Total	148,472	150,489	2,017

Note: (−) shows decrease

The Four Tribes The savages of the Taiyal and Bunun tribes are known as the most ferocious of all. Occasionally they quarrel with and even kill their own comrades. The Tsuwo tribe abolished the custom of head-hunting many years ago. The Saiset tribesmen are the gentlest of all, and are quickly losing their savage proclivities. The Japanese authorities have cudgelled their brains how to bring these wild people under control. When Holland occupied the south of Taiwan and Spain the north, they tried to pacify them principally through the medium of religion and medicine. During the time when the Cheng family from south China ruled the island, force and conciliation were adopted in turn, but the results were not satisfactory. Conciliation has dominated Japan's policy toward these savages in the island since her occupation of Taiwan. When the campaigns against rebels came to an end in 1902, attention was given to the aboriginal control policy. Owing to the stubborn resistance offered by the savages, the Governor-General, General Viscount Samata Sakuma, drafted a five-year plan for dealing with the aborigines and established the campaign headquarters in the Government-General in 1909 to start the enterprise on an elaborate scale. The fundamental policy was based on conciliation, and training the savages to become law-abiding people on the one hand, and chastisement of the insubordinate on the other. The confiscation of their arms was one of the important tasks. All arms were given up to the Japanese authorities by the northern aborigines in 1914. This completed the task of aboriginal pacification in January, 1915. Occasional raids on police stations and head-hunting of innocent people were committed after that, owing to the instigation of malcontents. The worst outbreak that took place was the Musha Incident in October, 1930, which culminated in the sending of troops. Many of them are engaged in farm work and pay taxes. Some of them receive special education. Policemen are stationed at various points of vantage in the savage districts and peace maintenance, job-finding, education, medical care, traffic, public works and sundry other affairs are being looked after by them. Since the occupation of Taiwan to the end of 1934 rifles confiscated numbered 30,021, of which 14,286 rifles were confiscated in 1914, when the five-year campaign plan came to an end. Spades replaced rifles. During the 39 years which ended in 1934, 7,082 people lost their lives at the hands of savages and the

largest number of them in a single year was 761 in 1912. In 1930, 158 deaths were reported. This is due to the Musha Incident. Of the total of 7,082 victims during those 39 years, those of police, Japanese and native, numbered 2,205 and those of officials and ordinary people together 4,877. During the same period 4,099 were wounded in connection with the campaign against savages. A change, however, is beginning to be made in the lives of these people in recent years. They are emerging from their primitive condition into an economic existence. They are glad to work on paddy fields and take up other sorts of labour. They are now pretty well initiated into money-saving habits. Their postal savings deposits at the end of 1934 amounted to ¥440,725, representing 22,853 depositors, the highest single deposit being ¥5,464 and the average deposit ¥19.29 per head. At present the aboriginal administration consists mainly in finding work for the aborigines and giving them education.

Occupations of Aborigines The work in which the aborigines are mainly engaged is cultivation of paddy fields, stock-raising, sericulture and other kinds of farming. They raised 24,792 koku of unhulled rice in 1934 (one koku being 5.1116 bushels), showing a gain of 1,434 koku over 1933. The authorities also encourage stock-raising. At the end of 1934 the natives had 33,319 pigs, 6,733 buffaloes, 3,373 cattle, and 3,857 goats. The value of their cocoon crop for 1934 totalled ¥36,671. They also raised sundry other farm products valued at ¥129,742 for the same year. Education is gradually spreading among the aborigines. At the end of 1934 there were 8,291 aboriginal children attending 183 schools maintained at the expense of the Government-General specially for these tribes. The Government-General authorities also are directing their energy to cultural enterprises for them. The aborigines have their own social organizations, such as the chiefs' societies, women's societies, young men's associations, school children's patron societies, and others. Members of these societies numbered 42,863. Also there were about 18,713 at the end of 1934, who were able to understand Japanese to the extent to perform some simple work. Superstition is being gradually eradicated from among the aborigines, as medical attention is being increasingly given them. Free dispensaries provided exclusively for them numbered 226 at the end of 1934. The Government-General established 106 "exchange" houses for them to sell their products. The sales at these houses in 1934 totalled ¥611,977.

Police and Judicature

The Police The Taiwan police consist of men appointed from among Japanese, natives and semi-civilized aborigines. Their services are divided into the ordinary service and aboriginal police service. The police in aboriginal districts are reenforced by police assistants appointed mostly from among naitves. These are features of the police services of Taiwan. What is known as the tithing system of Taiwan provides a feature of peace preservation in the island. This system is of Chinese origin and was first adopted as an auxiliary to the police system in 1898. Owing to the satisfactory results attained, it also was extended to the lower grades of the administration in 1909. One tithing group consists of 100 houses and it looks after the peace of the group. In case these groups organize an association, the matter has to be sanctioned by provincial governors or district superintendents. Each group has its chief, who is elected and sanctioned by governor or superintendent. His duty is to maintain peace and order in his tithing district. Members of groups consist of men ranging from 17 to 50 years old and must be of good character. They offer their services free. The number of groups involved in the tithing system of Taiwan was 5,383 at the end of 1934. Many pirates infest the coast of Taiwan, mostly coming from south China. They attack junks during the summer time. The police on duty against these sea raiders are attached to provincial or district governments.

Judicature The judicature of Taiwan consists of two grades of courts, viz., the supreme court and three district courts, the latter having four branches in all—all under control of the Governor-General. The functions of the various courts are practically the same as those of the courts in Japan proper.

Religion and Education

Religion There are 26 Shinto shrines in Taiwan. The Taiwan Shrine is a first-rank Government shrine and is the central shrine of worship for the Japanese people in the island. It is located in a suburb of Taihoku, the capital of the island, and is dedicated to Okuninushi, Oanamuchi and Sukunahikona, all legendary leaders of the early Japanese race, and to His Imperial Highness General Prince Yoshihisa Kitashirakawa,

who died in the island when commanding the Japanese expeditionary force in Taiwan during the Sino-Japanese War. Shintoism, Buddhism and Christianity have been propagated by the Japanese since 1895. Confucianism is observed among the natives and Chinese people in the island.

Education The continuous efforts of the Government-General have been rewarded to such an extent that the natives have been receiving education since 1922 together with Japanese in the classes of middle-school grade and in higher institutions, although the elementary education is still given both in the vernacular and Japanese languages. Besides numerous elementary schools. Taiwan had at the end of April, 1935, 10 middle schools, 13 girls' schools, 6 special schools of middle school grade, 4 normal schools, 4 colleges and 1 Imperial University. The Taihoku Imperial University was founded in March, 1928. It consists of two departments, one literature and politics and the other physics and agriculture. The educational expenses for the last six years are :

	Total amount	State expenses	Provinces and districts	Cities, towns and villages
		(In ¥1,000)		
1930	16,916	5,638	7,707	3,570
1931	17,074	5,428	7,709	3,936
1932	16,289	4,820	7,842	3,627
1933	16,723	4,895	7,842	3,985
1934	18,026	5,042	8,391	4,593
1935	21,264	5,839	9,379	6,251
Average	17,714	5,277	8,145	4,490

Agriculture

Agriculture is the most important industry of Taiwan. Since the island came under Japan's control, it has made a rapid development and the total farm production in 1935 was worth ¥361,040,000, composing about 50 per cent of all the industrial production of the island. The area under cultivation in 1900 was 363,290 ko(one ko being 2.377 acres or 2,934 tsubo). It increased to 856,775 ko at the end of 1935, more than double that of 31 years ago. The cultivated land is more than 20 per cent of the island's total area. The area of cultivated land since 1900 has been as follows :

Year	Paddy field	Dry land	Total
	(In 1,000 ko)		
1900	211	151	363
1908	328	345	673
1912	346	364	710
1917	330	412	742
1922	376	397	773
1927	399	422	821
1928	403	425	829
1929	406	423	829
1930	408	428	836
1931	411	424	835
1932	439	400	839
1933	482	362	845
1934	463	388	851
1935	493	363	856

People engaged in agriculture are about 54 per cent of the total population. At the end of 1935 their number was 2,790,331 of whom tenant-farmers were 842,823, landed farmers 850,878, and landed tenant-farmers 842,823.

Rice Crops The climate is very well suited to rice cultivation especially in the western district, where crops are harvested twice a year. The production in 1935 was about 9,120,000 koku with a value of over ¥192,000,000. Rice forms the chief of the three most important farm products of Taiwan, that is, rice, sugar cane and potatoes. Rice known as Hōrai rice is grown heavily in recent years. Its plantation area for 1935 totalled 304,986 ko and the crop amounted to 4,496,003 koku for two crops a year. The plantation areas and rice crops since 1900 follow :

	Plantation areas (In ko)	Crops (In koku)
1900	360,922	2,052,970
1912	495,128	4,046,611
1917	480,642	4,833,813
1922	527,096	5,445,814
1927	603,153	6,898,672
1928	603,058	6,795,005
1929	579,274	6,480,762
1930	633,444	7,370,516
1931	653,380	7,479,846
1932	684,928	8,949,216
1933	696,423	8,361,839
1934	687,664	9,088,886
1935	699,675	9,122,152

Sweet Potatoes. Sweet potatoes also are extensively produced almost everywhere and all through the year in the

island. The chief producing centres are Potatoes serve as fodder for cattle besides being used as ordinary foodstuff. Dried potatoes are shipped to Japan as material for producing alcohol and starch. The export value of dried potatoes for 1935 totalled 44,332,580 kin (one kin being 1.3 pounds), worth ¥1,290,-529. The crop of sweet potatoes for 1902 amounted to 501,160,292 kin and the amount has been increasing yearly since. The 1934 crop totalled 2,706,834,982 kin. The plantation area of 63,147 ko for 1902 increased to 142,448 for 1934.

Tea Tea is one of the principal exports of Taiwan. The export totalled once as large as ¥11,500,000, though somewhat declined in recent years. The tea production amounted to 20,808,765 kin (in plantation area of 28,308 ko) for 1902 and that for 1935 amounted to 17,-000,000 kin (in the area of 45,765 ko). Tea plantation was introduced there by immigrants from China. In 1868 some amount of tea roughly made in Taiwan was exported to Amoy, where it was refined, but later the Taiwan producers, bringing tea operators from Amoy and Foochow, began to export refined tea, and in 1869 as much as 280,000 pounds of refined tea were exported to New York. This was the first export of Taiwan tea to America. Then tea production developed considerably year after year. Export tea is classified into varieties, viz., Oolong, Pouchong, green and black. Oolong and Pouchong teas are most abundantly produced ; the former, appreciated by Americans, and the latter, preferred by the people of the South Sea Islands, is exported to Java and Siam. Black tea extending its markets, and, although not as good as Ceylon tea, it is better in quality than Japanese black tea.

Other Products Other agricultural products are peanuts, beans, wheat, sesame, longan, (otherwise known as "dragon's eye") and vegetables. The yielding areas and production of these farm products for 1935, as compared with those for 1900, follow :

	Yielding area (In ko)		Production (In koku)	
	1900	1935	1900	1935
Peanuts	11,958	31,466	120,838	580,868
Beant	11,365	29,267	50,281	¥615,735
Barley	1,479	540	11,460	29,267
Wheat	1,857	845	11,282	13,808
Sesame seeds	6,889	3,948	36,279	12,871
Jute	1,155	5,260	1,481,548 (kin)	20,881,402 (kin)
Hemp	1,654	1,490	1,022,063 „	2,104,149 „
Tobacco	240	951	363,900 (kg)	2,035,175 (kg)
Oranges	.317 (1905)	4,492	2,025,965 (kin) (1909)	53,783,430 (kin)
Pineapples	—	7,026	—	87,119,146
Longan	—	534,458 (trees)	—	4,223,399 (kin)
Vegetables	—	—	—	¥13,498,142

The export of raw pineapples for 1935 totalled ¥182,710 and that of canned pineapples ¥8,078,174.

Bananas are Taiwan's representative fruits. They are planted everywhere in the island, but are produced most heavily in Taichu province, where 52 per cent of the total production is got. They occupy the third position in the export list of the island, the first being rice and the second sugar. Bananas exported during 1935 totalled 3,090,446 baskets, worth ¥14,216,211. In 1909 the plantation acreage was 560 ko with a crop of 10,-536,062 kin, which increased in 1934 to 19,062 ko with a crop of 302,418,306 kin.

Live-stock The live-stock raising industry in Taiwan is flourishing. The number of cattle at the end of 1935 was 394,865, of which buffaloes numbered 306,874. Buffaloes play the most important rôle in agriculture. Hog-raising industry is widely maintained and hogs are kept by almost all native farmers. Their number at the end of 1934 was 1,836,169, having increased three-and-half times since the cession of the island to Japan. Poultry consists of chikens and geese, their total number at the end of 1935 being 8,627,530. It was in 1912 that sericulture was started in the island. Before that year no sericulture existed existed there. It took nearly 10 years before native farmers appreciated it as a side-line. This industry is becoming important among farmers. In the first year the cocoon crop amounted to only 84 koku and it increased to 2,201 koku in 1934. One of the unique features of sericulture in

Taiwan is that silkworms can be raised at any time of the year, since even during the winter-time mulberry leaves are grown. Moreover, no insect ravage is experienced in the island. The cost of production is scarcely half of that in Japan.

Agricultural Equipment The Taiwan Government-General has taken every possible measure to encourage the rice cultivation and improve the quality of rice. "Hōrai rice" is a Japanese variety, and after many years' experiment the island succeeded in raising rice of good quality. The inspection of rice has been made under control of the Governor-General since July, 1926. Silkworms are raised and distributed by the Sericultural Experimental Station of the Colonial Development Bureau in the Government-General. The Government-General also is adopting all possible steps for improvement of tea cultivation and for this purpose is training tea-raising experts at its Tea Institute. The Pineapple Experimental Station is maintained under control of the Government-General for promotion of this industry. Agricultural warehouses, numbering 36, are doing business upon Government subsidy. The immigration of the Japanese into Taiwan so far has failed to realize satisfactory results. Farm settlers from Japan proper numbered 3,995 at the end of 1935. They maintain an area of paddy fields covering 1,183 ko and farms covering 1,641 ko. Fundamental farm investigation is being constantly carried on by the authorities. The investigation involves that of land management, tenancy, farm economy, farm production, demand and supply of products and fertilizers, land utilization, farm labour, market prices of farm products, etc. Irrigation work also is pursued on an approved plan. The Landlord and Tenant-Farmers Harmonization Society was established in 1927 with government aid for the improvement of relations between landlords and tenants.

Sugar Industry

Taiwan is the centre of the sugar industry of Japan. The industry has existed since the coming of the Han race to the island and, when the Dutch occupied the island in 1624, sugar had already become one of the staple products of the island. It has maintained the topmost position of Taiwan's industries. At the time of Japan's occupation of Taiwan the annual output was only about 80,000,000 kin, one kin being 1.323 pounds. Japan proper consumed more than 300,000,000 kin of sugar, most of which had to be imported from abroad.

Dr. Nitobé's Plan Alive to this situation, the Taiwan Government-General concentrated its energy on the increased production of sugar by means of business improvement and expansion, and this has resulted in the present industrial prosperity. Not only has this prevented the import of foreign sugar, but it has contributed a great deal to the exploitation of natural resources and the financial and industrial development of the island. The late Dr. Inazo Nitobé was engaged by the Government-General to work out a sugar-industry development plan. He proposed several measures for industrial development, namely, the improvement of kinds of sugar cane and their cultivation, improvement of pressing and manufacturing methods, the application of artificial irrigation, increased land cultivation and expansion of sugar plantations, the establishment of sugar experimental stations, and the organization of sugar production guilds, as well as other measures. These formed the basic policy of the Taiwan sugar industry. The sugar encouragement regulations were issued in June, 1902. According to these regulations, the Government-General would give a subsidy to sugar-cane planters or sugar manufacturers for cane plantation, fertilizers, cultivation, irrigation, and manufacturing machines, or, if necessary, implements will be lent or given. The subsidies given in this connection up to the end of the fiscal year of 1931–32 totalled ¥12,908,698. The Government-General is adopting a policy of reducing the subsidy with the progress of the sugar industry. With the establishment of sugar mills the competition for the acquisition of canes became severe.

Upon Consolidated Basis In order to prevent evils arising out of this competition, the authorities issued regulations restricting the spheres of cane plantations in 1905. This caused sugar-makers to work on a consolidated basis yearly. As it was impossible for sugar manufacturers to get material from districts other than those designated for them by regulations, the makers took great care of the planters working on their fields. Planters also were placed on a definite basis of economy by the regulations, because the canes raised by them could be sold to the mills to which they belonged. When the sugar policy was established, the Extraordinary Taiwan Sugar Affairs Bureau was organized, but it was later replaced by the Sugar

Refinery Section of the Colonial Development Bureau. The Government-General first established the Young Cane Seed Experimental Station in Taichu province in 1913. Seeds raised there were distributed to intermediate experimental yards, where they are further grown. Manufacturing companies are bound by duty to distribute these seeds free to farmers within their plantations. Thus the improvement of canes was realized. Young plants distributed till the end of March, 1934, totalled 574,243,540.

The Sugar Experimental Station. The Taiwan Government-General Sugar Experimental Station was reorganized and was founded in Taiwan city in March, 1932, as the central organization for the promotion of sugar plantation. At first, the Hawaiian "rose bamboo" canes were adopted for the Taiwan sugar cultivation and canes of this kind occupied 96 per cent of all grown in 1913. Due to lack of adequate measures to keep the quality unchanged, and also to the fact that these canes had little power of resistance against storms they finally deteriorated. Then they were replaced by Java canes. At the end of March, 1932, the land under irrigation totalled 112,416 ko. The following are figures showing the area of sugar plantations and crop per ko since 1902 :

Fiscal year	Plantation area (In ko)	Cane crop (In kin)	Crop per ko (In kin)
1902–03	16,526	683,157,902	41,338
1905–06	35,158	1,690,206,794	48,078
1908–09	39,035	2,219,471,541	56,858
1910–11	75,329	3,159,598,569	41,944
1914–15	85,150	3,933,805,780	46,199
1917–18	150,450	6,817,535,709	45,314
1919–20	108,376	4,382,506,262	40,438
1920–21	142,032	6,752,838,826	47,544
1921–22	123,233	7,793,688,518	63,243
1923–24	130,480	8,825,841,621	67,641
1925–26	123,426	8,615,430,295	69,802
1926–27	101,531	7,411,962,535	73,002
1927–28	108,318	9,697,644,651	89,529

Production of Sugar

The sugar industry at the time of Japan's occupation of Taiwan was very primitive. Out of about 1,100 sugar mills, not a single mill had adopted the modern mechanical method of manufacturing, and all of them used animal power. Owing to insufficient pressing power, a large percentage of sugar-substance was wasted during the manufacturing process and, moreover, the product was inferior. By 1934 there were only 92 mills of this kind, as the majority of them were gradually eliminated. In these primitive mills two stone wheel cars or three metal wheel cars are employed for grinding by animal power. Improved mills use pressing machines and motors. Brown sugar is also manufactured. Such mills numbered only 6, with a total productive capacity of only 910 tons for 1934. The modernly-equipped mills have pressing capacity ranging from 300 to 3,000 tons a day and are able to produce in great quantity. The Taiwan Sugar Manufacturing Company founded in 1901 was the first of its kind. During the financial boom following the Russo-Japanese War many sugar-manufacturing concerns were established, and Japan finally leaped into a prominent position among the world's sugar-producing countries. In 1934 there were 50 mills with the daily productive capacities of 28,150 British tons and 13,400 American tons. Most of them produce crude sugar known as centrifugals. Some of them turn out white sugar by a change of milling operation. Sugar-cane pressing capacity and production of white sugar follow :

Companies	Cane pressing capacity (In tons)	Production of white sugar 1929 (In kin)	1933 (In kin)	1934 (In kin)
Taiwan Sugar's Taihoku mill	Brit. 500	7,143,743	4,273,350	3,636,984

Summary Summarizing the status of the sugar industry, the caneplantation area at the beginning of 1902 was 26,-167 ko, and there was only one mechanically-operated mill with a daily capacity of 200 tons and capitalization of only ¥1,000,000. In 1927 such mills numbered 45 with a daily productive capacity of 39,414 American tons and total capitalization of ¥290,520,000, although this dropped to ¥250,966,600 in 1934, owing to mergers or readjustment of business. But the capacity increased to 43,528 American tons for 1935. The total production in 1902 was only 90,000,000 kin, but in 1927 it rose as high as 1,315,540,-000 kin and further to 1,648,440,000 kin in 1932. It decreased to 1,078,310,000 in 1934 due to curtailment of production as agreed upon among sugar companies.

Companies	Head offices	Capital		No. of mills
		Sub-scribed	Paid-up	
		(In ¥1,000)

Forestry and Afforestation

The surface of Taiwan is covered by mountains to the extent of almost two-thirds of its entire area, and the island is rich in thick forests of immense depth. Forest protection and afforestation are done on an approved system by the Government-General. The great mountain ranges running north to south with numerous peaks provide vegetation peculiar to temperate as well as to tropical and sub-tropical regions. The most renowned of the natural forests of Taiwan are those on the mountains in the central ranges, from Taibysan in the south to the peninsula of Koshun; those on famous Mt. Arisan; those on Mt. Rokujodaisan in the north; and those on Mt. Seiran. Besides these, there are also extensive forests in the valleys of the River Dakusui and in some districts of Karenko. The total forest area in Taiwan in 1934 was 2,444,387 ha., of which 2,183,025 ha. government owned forests. Building-timber, sleepers and other forest products turned out in the same year amounted to ¥12,666,794. When the Portuguese first discovered the island, they were impressed with the immense expanse of forests and cried "Formosa!" signifying "beautiful." Reckless cutting of trees was done by Chinese immigrants and this, combined with the lack of adequate forest administration of the Manchu Dynasty, resulted in the devastation of forest districts. The Forest Bureau was established in 1915 and since then forest protection has been carried on in an approved manner by the Government-General.

Timber Industry The timber industry of the Arisan group is controlled by the Government-General. This famous mountain group is located east of Kagi in Tainan province and is on the Tropic of Cancer. It stands 9,240 feet high. It is covered with red cypress, Mongolian oak and hemlock. The former two kinds of wood are highly valued. There are many trees aged more than 3,000 years. Even the Imperial forest at Kiso in Nagano prefecture has few oaks of such great age. Timber used for the building of important shrines such as the Kashiwabara Shrine, dedicated to the memory of Jimmu Tenno, the first Emperor of Japan, the Imperial Mausolea at Momoyama for the Emperor Meiji and Empress Shoken, and the Meiji Shrine was grown on these mountains. The two great pillars constituting the torii of the Meiji Shrine are estimated to be 1,900 and 1,090 years old respectively. Both came from these mountains. The number of these valuable trees was originally estimated at 1,468,416 with 6,073,970 cu.m. But as the result of cutting down since the actual volume of trees at the end of 1934 was found at 1,481,000 cu.m. The Government- General spent ¥4,898,212 as initial outlay for the five years ending in 1912. This included ¥2,643,015 for railway construction, ¥1,200,000 as subsidy for Fujita Gumi, Osaka, which temporarily undertook the enterprise for the Government-General, ¥1,052,869 as general expenses, and ¥2,327 for other purposes. Lumbering work started in 1912. Sales of lumber amounted to ¥1,586,458 for 1929; ¥1,366,296 for 1930; ¥1,210,274 for 1931; ¥1,061,852 for 1932; ¥1,139,310 for 1933; and ¥1,138,432 for 1934.

The lumber industry on Mt. Taihei near Rato town in Taihoku province is considered one of the most promising of all in the island. Until 1913 the mountain was not exploited, because it was a stronghold of the most savage aboriginal tribe. The quantity of timber on the mountain is estimated at 14,159,000 cubic metres, nearly four times that of Mt. Arisan. Work started in 1915 and has so far realized satisfactory results. Sales of lumber totalled ¥1,135,780 for 1930; ¥1,038,067 for 1931; ¥905,705 for 1932; ¥1,024,507 for 1933; and ¥1,079,096 for 1934.

How Disposed Taiwan wood is not only used for shrine and temple construction, but for building of warships and merchant-ships. Demand from naval arsenals and dockyards is yearly increasing. Taiwan wood is exported to Japan proper, Korea, China, British India, South Africa, Australia and other places. Sales to the market in the island, Japan proper and foreign countries from 1916, when the sales began, to 1933, follow:

	Amount (In cubic m.)	Value (In ¥)
1916		
Sales in islands	42,296	835,098
Sales to Japan	17,728	385,900
Sales abroad	911	24,556
Total	60,935	1,245,554
1929		
Sales in island	67,934	2,435,373
Sales to Japan	22,582	1,125,117

Aquatic Products

The seas about Taiwan are rich in various kinds of fish and shell-fish, and catches are especially abundant in spring and autumn. Fishing is to a great extent still conducted in a primitive manner. There are, however, now 27 fishing companies of which 4 have their head offices in Japan proper and the rest in the island with capitalization of ¥34,500,000 for the former and ¥5,843,583 for the latter. There were 91 fish markets in the island at the end of 1934, and the total fish sales there during the year amounted to ¥11,620,000 and showed an increase of ¥1,351,000. The Takao Fish Market led the list. The Taiwanese are a fish-eating people, but the annual catch is so great that a large quantity is exported to Japan proper and other countries. Taiwan's marine product trade for 1934 amounted to ¥16,438,490, exclusive of salt, showing an increase of ¥4,241,922 over the previous year. Trade figures include exports abroad totalling ¥2,973,875, imports from abroad totalling ¥548,406, exports to Japan proper totalling ¥3,042,223 and imports from these districts totalling ¥9,873,986. The making of dried bonito is the largest marine products industry The annual output of dried and canned marine products is worth about ¥2,300,000, half of which goes to the dried bonito production. The marine production of Taiwan follows :

	Catches	Manufacturing	Cultivated fish production	Total
		(In yen)		
1921	5,943,217	1,665,125	2,153,856	9,762,198
1923	9,030,651	3,303,756	1,943,565	14,277,972
1927	10,822,119	2,505,311	3,920,591	17,248,021
1928	12,670,180	2,706,623	3,401,779	18,778,582
1929	14,446,265	2,775,420	3,734,684	20,956,369
1930	11,771,144	1,793,273	3,142,981	16,707,398
1931	8,482,776	1,524,869	3,047,254	13,054,899
1932	9,197,468	1,545,164	3,130,800	13,873,432

1934	11,452,341	2,290,923	2,890,340	16,633,604
1935	13,639,986	2,290,741	3,483,582	19,414,309

Mineral Products

The principal mineral products of Taiwan are gold, silver, placer-gold, quicksilver, copper, iron, lead, zinc, coal, petroleum, sulphur and phosphorus. The mine-lots at the end of March, 1933, numbered 611 with a total area of 182,645,280 tsubo, one tsubo being six feet square. Mines in operation numbered 199 covering an area of 83,460,349 tsubo. Of these 199 mines, 1 was gold mine, 2 gold and silver mines, 1 gold-copper mine, 14 placer-gold mines, 157 coal mines, 10 sulphur mines and 14 oil fields. The mineral production for 1935 totalled 22,838,751 showing an increase of ¥3,891,084 over 1934. The mineral production during the past five years, 1931-1935, inclusive follows :

	1931	1932	1933	1934	1935
		(In yen)			
Gold	636,486	722,733	1,681,592	1,581,328	3,494,040
Gold-copper ores	3,457,187	3,027,792	3,709,157	3,773,194	3,995,854

Carbon black	—	43,552	205,527	341,079	516,125
Others and total	15.141,198	13,337,790	13,950,888	14,196,250	22,838,751

The Government-General conducted a mineral and geological investigation for eight years over the island following the introduction of civil administration in 1896. As a result, oil distribution was found almost all over the island. Subsidies were granted to those who had proper equipment for boring for oil to a depth of more than 2,000 feet. The subsidy was given from 1901 to 1924. It was then suspended, owing to financial reasons, but was resumed in 1930. Metal ores are found exclusively in the extreme north and the eastern district, coal in the northern and central parts and oil all over the island, especially in the central and southern districts. The mineral production in 1897 was only ¥112,000, but in 1907 it increased to ¥2,255,000, and in 1936 to as much as ¥15,196,250. Of this more than 50 per cent was coal, gold-copper ores 25 per cent; gasolene 4 per cent; gold 10 per cent; other minerals in smaller amounts in the following order: petroleum, carbon black, copper, placer-gold, gold ore, and sulphur.

Gold and Silver. Placer-gold was first discovered by Japanese invaders in Taiwan over 400 years ago, when Japanese pirates infested the neighbouring coasts of China. It was then got at Takkiri Gorge in Karenko district. In later years placer-gold was found in several localities, but at present the mining is conducted along the Keelung and other rivers. When the mining was most prosperous in 1903, the annual output reached 161 kan, one kan being 8.267 lb., valued at ¥610,000, but since then the industry has been sinking. The 1931 output was only 3.165 kan. A gold vein was first discovered at Mt. Kubu in 1893. In the following year gold deposits were found at Kinkwaseki and in 1891 another vein was discovered at Butanko. The gold mining interests at Butanko and Kinkwaseki was merged in 1913. The mining operation is done at Zuiho and Kinkwaseki. The Kinkwaseki mine is located about 10 miles east of Keelung. It is managed and operated by the Tanaka Mining Company, Ltd. The mining area at the end of 1931 was 4,053,000 tsubo. It has its own refinery.

Production at the mine for four years ending 1935 follows:

		1932	1933	1934	1935
Gold	Output in g.	208,844	32,301	—	—
	Value in yen	433,341	80,049	—	—

Other Minerals The output of sulphur in Taiwan for 1932 amounted to ¥37,148 and that of quicksilver for the first six months of 1931 amounted to ¥2,488, but since then the mining operation has been at a standstill. The coal output for 1932 amounted to 1,354,995 tons, worth ¥6,571,195, showing a drop of ¥593,403 from 1931.

Oil Oil in Taiwan was discovered by a Chinese about 80 years ago at Shukotan, near the Koryu valley, over an area covering 599,670 tsubo. Since 1905, 71 oil wells have been sunk. Well No. 18 is the best of all. From 1913 to 1925 the oil output from this well totalled 53,205 koku, by the Nippon Sekiyu Kaisha (Japan Oil Company, Ltd.). Owing, however, to the concentration of energy on the exploitation of the Kinsui Oil Field by the company, the output has gone off from the daily output of 300 koku. Lamp oil, gasolene, light oil and paraffin are manufactured from crude oil obtained here. The oil refinery is in Byoritsu.

The production from the crude oil is gasolene, 5 per cent, lamp oil 85 per cent, heavy oil 8 per cent and wax.

The kinsui oil field is the most important one in Taiwan. It is operated by the Japan Oil Company. A government subsidy was paid to exploit wells No. 1 to No. 5. It took eleven years for well No. 5 to realize satisfactory results. Well No. 10 produced an enormous output of 30,000,000 cubic feet a day in March, 1930, and a gasolene plant was installed there in November of the same year. When the capacity of the gasolene plants is fully developed, the daily output of gasolene will be 1,000 koku.

Other Industries

Prior to the World War, industries other than sugar and tea developed very little in the island. Since the War, however, chemical, spinning, machinery and other miscellaneous industries have developed to a considerable extent. The more important of them for 1934 follow :

	¥
Metal Industry:	
Tin plates	1,790,000
Gold and silver works	1,531,000
Machinery Industry:	
Sugar refining machinery	3,887,000
Agricultural implements	1,178,000
Ceramics Industry:	
Tiles	2,162,000
Cement	3,810,000
Chemical Industry:	
Alcohol	5,922,000
Mineral oil and wax	1,128,000
Vegetable oils	1,297,000
Refined camphor	1,242,000
Mixed fertilizers	3,652,000
Food Stuff Industry:	
Soy sauce	1,859,000
Flour	2,314,000
Sugar	119,725,000
Confectioneries	4,923,000
Canned pineapples	6,250,000
Macaroni	3,042,000
Ice	1,259,000
Polished rice	965,000
Miscellaneous Industries:	
Woodworking	4,175,000
Hats	5,066,000
Others and total	214,000,000

Of the total 1933 industrial production amounting to ¥214,000,000, the foodstuff industry totalled ¥153,000,000, or 72 per cent, the chemical industry ¥20,000,000, or 9 per cent, other industries ¥13,000,000, or 6 per cent, the ceramic industry ¥6,500,000, the mechanical and tool industry ¥5,800,000, the metal industry ¥3,900,000, and the spinning industry ¥2,500,000.

Overseas Trade The overseas trade of Taiwan, although it has experienced temporary set-backs from time to time, has made remarkable progress in recent years. The bulk of overseas trade is, however, with Japan proper, the rest being chiefly done with China, the United States, the Straits Settlements, the Dutch East Indies, the United Kingdom, Germany, British India, the Kwantung Leased Territory and Hongkong. The trade is carried on principally through the four large ports of Keelung, Tamsui, Anping and Takao. As Keelung is the most important port of trade in the north, so is Takao in the south. The trade volume for 1898 amounted to ¥30,000,000 which increased to ¥50,000,000 in 1906, and, owing to the phenomenal growth of the sugar industry and import of sugar milling machinery, the amount went up to more than ¥100,000,000 in 1910. In 1917 the amount recorded a further gain to ¥234,000,000, due to active trade in sugar, alcohol and rice and heavy transit trade with China. An all-time record of ¥613,000,000 was made in the trade volume for 1935. The amount gained ¥93,000,000 over the year before. In 1929, the trade figure amounted to ¥476,000,000, but declined to ¥366,000,000, affected by a great economic defression. Taiwan's overseas trade since 1897 has been as follows :

OVERSEAS TRADE VOLUME

	Exports abroad and exports to Japan proper and its colonies	Imports from abroad and imports from Japan proper and its colonies	Total	Index
		(In yen)		
1897	14,856,848	16,383,020	31,239,868	100

Of the above, tea deserves special mention. In 1934 production of unrefined tea amounted to 18,392,028 kin, worth ¥7,546,869, and that of refined tea 16,996,587 kin, worth ¥10,894,283. Refined tea included ¥3,562,301 of Oolong tea, ¥3,074,989 of Pouchong tea, ¥4,250,395 of black tea, and ¥6,600 of green tea. The tea is almost exclusively produced in Taihoku and Shinchiku provinces. Oolong tea is appreciated by Britishers and Americans. The largest amount goes to the United States and the second largest amount to Great Britain. Pouchong tea is shipped to the South sea islands. Tea exports for 1934 show that the exports of black tea greatly increased amounting to ¥2,889,002 against ¥557,963 for 1933. Exports of Pouchong and Oolong tea for 1935 totalled ¥6,855,930, gaining ¥909,405 over 1934. Details follow :

Finance

The Bank of Taiwan is invested with authority to issue notes. This bank was founded in September, 1899, replacing the Taiwan Agency of the Bank of Japan. The bank was capitalized at ¥5,000,000 when it was founded. After 1920 its capitalization was increased to ¥60,000,000, but in September, 1925, it was cut to ¥45,000,000 and further to ¥15,000,000 in November, 1927, due to its readjustment following the great financial panic of the spring of 1927. The head office is in Taihoku and it has 31 branches and one agency in Japan and abroad. The Japan Hypothec Bank maintains its real estate business in Taiwan and the outstanding balance of its loan in the island at the end of 1934 amounted to ¥82,870,000. The aggregate capitalization of banks having their head offices in the island at the end of 1934 was ¥28,300,000, of which ¥20,670,000 was paid up. The balance of deposits at the end of 1934 was ¥151,420,000, of which savings deposits totalled ¥10,310,000 and the outstandings deposits totalled ¥10,310,000 and the outstanding balance of loans totalled ¥252,640,000. Exchange deals for the 1934–1935 fiscal year totalled ¥967,900,000 for income and ¥942,020,000 for payment. The average amount of note issue of the Bank of Taiwan for 1935 totalled ¥67,173,000, the highest being ¥73,466,000 and the lowest ¥61,970,000.

Government-General Finance The finance of the Taiwan Government-General has become independent from subsidization by the general accounts of

the Central Government since the 1905–06 fiscal year, owing to favourable income following the Russo-Japanese War. In 1897 the revenue was about 11 million yen. In 1907, 10 years after the establishment of special accounts in Taiwan, the revenue increased to three times that amount; in 1917, after 10 more years, to six times; in 1927, to 12 times; in 1929 to 13 times the first figure. Revenue and expenditure follow :

	Revenue (In yen)	Expenditure
1897	11,283,265	10,487,610
1917	65,425,496	46,166,558
1927	138,626,830	101,533,285
1929	150,420,607	122,295,326
1930	129,757,760	109,970,881
1931	115,972,147	99,060,013
1932	120,303,279	97,240,295
1933	130,812,152	102,220,615
1934	141,617,595	112,176,683
1935	156,549,000	123,943,000
1936 (estimate)	133,536,000	133,536,000

Bonds Expenses required for enterprises such as the railway construction, land investigation, Keelung harbour construction, building of government offices, river work, Takao harbour construction, and purchase of private railways were raised by bonds. The outstanding balance of bonds in 1900 was ¥3,200,000, which increased to ¥34,465,399 in 1910, ¥94,213,038 in 1925, ¥106,946,733 in 1927 and ¥128,057,690 at the end of 1935.

Monopolies

The products of Taiwan, opium, salt, camphor, tobacco, and saké are placed under monopoly of the Taiwan Government-General.

Opium The Taiwan Chinese, mostly natives, were addicted to opium smoking when Japan assumed ownership of the island. It was found impossible to eradicate the habit at once, and in order to limit the use of the drug a government monopoly, controlling the manufacture, sale and retail distribution of opium, was established. Smokers are registered and have to obtain a licence to buy the drug. In this way and also through education of the rising generation the vice is being gradually eliminated. The total names registered in September, 1900, reached 169,064, to whom the licences were granted. The number of licenced smokers at the end of 1932 had decreased to 19,532, of whom 16,532 were males and 3,254 females. The Chinese people who smoke opium on licence at the end of 1932 numbered 191, of whom 174 were males. Japan, in conformity with the spirit of the League of Nations' International Opium Treaty, has been endeavouring to stamp out the bad habit of opium smoking and has realized satisfactory results so far.

There are two forms of opium, viz., "treacle-opium" for smoking, and powder; the latter is sold only for medicinal purposes. Raw material obtained from poppies is imported from British India, Persia and Turkey. The Persian products are widely used now. Sales to licensed smokers are made by the Monopoly Bureau to specially designated wholesalers through provincial and district governments. The sales price to these wholesalers is ¥1.61 per 15 grammes, that from wholesalers to retailers is ¥1.63 and that from retailers to consumers is ¥1.77. 15 grammes is the maximum amount that one smoker is permitted to buy at one time: this must last him for three days.

Sales have been decreasing yearly as follows :

	Quantity	Total sales
1902	130,723,125 grammes	¥3,008,386
1906	87,690,750	4,359,497
1910	80,320,875	4,844,534
1913	86,326,500	5,289,495
1918	76,326,750	6,650,764
1922	51,558,000	5,449,345
1930	38,095,125	4,010,655
1931	31,535,625	3,320,071
1932	26,136,075	2,819,388
1933	21,553,200	2,350,363
1934	19,668,600	2,146,692
1935	—	2,567,588

Salt This was monopolized in 1899 by the Government-General. In former days the fields were only 197 ha. producing about 10,800,000 kg. a year, but in 1934 they were increased to 1,878 ha., producing 191,340,000 kg. Sales of salt in 1905 were only ¥557,876, which increased to ¥3,108,000 for 1935.

Camphor Taiwan maintains a monopoly on the cutting, distillation and selling of camphor. The island is rich in camphor trees, particularly in what are known as the "savage districts", and is the greatest camphor-producing place in the world. For many years after it came into Japan's possession, the production of camphor was a free industry, but the necessity of improving the quality compelled the Government-General to assume monopoly in 1899. The camphor production amounts to about 3,000,000 kilogrammes a year,

which represents 70 per cent of the world's production. The manufacturing of camphor and camphor oil used to be entrusted to the Taiwan Seino Kaisha, but in July, 1934, the Government-General purchased it and now places the production and sales of their articles under its direct control. The improved B-quality camphor is sold by the monopoly bureau as material for refined camphor or celluloid. Refined oil is directly sold by the bureau in Taiwan, but in Japan it is sold to industrialists through the Japanese Government Monopoly Bureau. It is exported abroad on consignment mostly to the United States, Great Britain and other countries. The United States is the largest consumer. The sales price of improved B-quality for 1932 was ¥145.-50 per kilogramme f.o.b. Taihoku and ¥148 f.o.b. Kobé. By-products are widely used for making insecticides. As the demand for camphor increases yearly, the Taiwan Monopoly Bureau is carrying out a camphor-tree plantation plan covering an area of 135,246 acres, for the production from natural-grown trees is expected shortly to become too small to meet the future demand. The proceeds from the camphor monopoly for 1935 totalled ¥7,710,000. The United States used to buy about ¥2,400,000 of camphor a year, but the export amount has decreased somewhat in recent years, owing to the invention of synthetic camphor.

Tobacco The tobacco monopoly in Taiwan dates from 1905. At the beginning of the monopoly the quality of tobacco grown in Taiwan was so poor that the leaves had to be imported from China. Efforts were made by the authorities for the improvement of native-grown leaves. Now tobacco cultivated in Taiwan is not inferior to Chinese tobacco. In addition to the Chinese variety, a successful experiment has been made in the cultivation of an American yellow variety for cigarettes, and another for cigars. The area of tobacco plantation in Taiwan was about 776 ha. in 1933 and the crop of leaves about 1,535,689 kg. The proceeds of tobacco monopoly for the fiscal year 1906–07 totalled ¥1,492,284, which increased to ¥11,531,850 for the year 1921–22, ¥16,-275,916 for the year 1929–30, but declined to ¥14,465,962 for the year 1931–32, advancing to ¥16,552,070 for the 1934–35 year, further to ¥18,420,000 for the 1935–36 year.

Saké and other drinks These have been placed under monopoly since 1922. The sales of saké and other alcoholic drinks under the monopoly are not restricted to those made in Taiwan only, but include all drinks imported from Japan proper and other countries. Drinks now brewed in Taiwan are of 30 kinds besides saké. The saké monopoly furnishes a large source of revenue for the Government-General and brought in ¥20,960,000 for 1935.

Railways

At the time of Japan's occupation of Taiwan there was a 62-mile railway between Keelung and Shinchiku. Railway construction was undertaken by the Government-General subsequently and now the total mileage is 881 km. The railway receipts are as follows :

Fiscal year	Passenger fares	Freight receipts	Others	Total	Indices
		(In ¥1,000)			
1900-01	214	127	1	342	100
1906-07	1,062	1,138	9	2,209	643
1916-17	2,575	3,544	44	6,163	1,455
1926-27	7,488	9,711	—	17,199	5,008
1927-28	8,002	10,644	—	18,646	5,428
1928-29	8,277	11,420	—	19,697	5,735
1929-30	8,349	11,915	—	20,264	5,900
1930-31	7,720	11,391	—	19,111	5,564
1931-32	6,897	11,367	—	18,264	5,317
1932-33	7,109	11,742	—	18,851	5,488
1933-34	7,468	11,862	—	19,331	5,628
1934-35	7,966	13,458	—	21,425	6,238
1935-36	9,599	13,931	—	27,495	—

Formosa Development Company

In connection with Japan's economic expansion in the island, the Formosa Development Company was founded by virtue of Law No. 43 of 1936 upon approval at the Imperial Diet on May 26 of the same year. The company is capitalized at ¥30,000,000, a half of which is invested by the Government in the shape of Government-owned property, consisting of fields, farms, forests, pastures, land and other real estate. The other half was invested by private persons. The Government organized an establishment committee of 81. Formal sanction of the company's establishment was given by the Overseas Minister on August 27. Its virtual establishment took place on November 25 of the same year. The company's paid-up capitalization to ¥18,750,000. Its head office is in Taihoku and a branch in Tokyo. Its president and vice-president are appointed by the Governor-General of Formosa on sanction of the Overseas Minister. The company is authorized to issue Formosa Development debentures three times its paid-up capitalization.

Because of its nature as a special business institution, the Government is vested with authority to issue necessary instructions for supervision to the company. The company is not bound by duty to pay any dividend to the Government's investments until it is able to declare an annual 6 per cent dividend rate to shareholders other than the Government. When it can declare a 7 per cent dividend, it will have to pay a 4 per cent dividend to the Government, and, when it can declare more than an 8 per cent dividend, it will have to pay the same dividend to the Government. Mr. Kyohei Kato is its president.

The company has a mission to do the following enterprises: land management, cultivation of agricultural and forest lands, mass emigration of farmers, financing and investments in promising enterprises overseas.

The company adopted a 10-year plan for the industrial development of Formosa. The plan calls for investment of ¥1,000,000,000. First-period enterprises in the 10-year plan include raw cotton cultivation, colonial development and industrial emigration. These enterprises are expected to require for the first year about ¥4,500,000, which will be supplied by the company. The company has authority to issue debentures to raise necessary funds. Later, the company will develop plantations of cinchona and cacao trees and mericinal herbs. The company has decided to found a Formosa Raw Cotton Company with a capitalization of ¥3,000,000, making it its subsidiary. Its factory will be built at Kagi. Eventual object of the cotton company is to raise 100,000,000 kin of cotton a year on a plantation covering 100,000 chobu. This amount is expected to be raised 10 years hence. Total expenditures will be about ¥30,000,000. The first year's cotton crop is estimated at about 6,000,000 kin.

Electricity

The Taiwan Electric Power Company, Ltd., was established in April, 1919, under ordinance of the Taiwan Government-General. The Government-General appraised all of its electric assets at ¥12,000,000 and offered them to the company. The Government-General owns the company's shares to that amount, being the largest shareholder. The company started a gigantic power-generating undertaking, utilizing the water of Lake Jitsugetsutan, in August of the same year, but, owing to the subsequent financial depression, the work was suspended. In 1929 the resumption of work was decided on and the necessary amount, $22,800,000 (¥45,737,211) was raised in America in July, 1931, on Government guarantee. Work was actually resumed in October of the same year on a three-year plan. Taiwan's electric enterprises at the end of 1934, are summarized as follows :

Companies	Capitalization	Lamps fitted	Power supplied kw.	Fans fitted
Taiwan Electric Power	¥34,495,000	646,994	20,822	25,934
Taiwan Electric Light	1,500,000	81,272	2,213	2,592
Taiwan Godo Electric	2,000,000	28,664	779	340
Karenko Electric	1,240,000	10,806	365	202
Koshun Electric	100,000	1,408	—	—
Nansho Electric	8,500	204	—	—
Total	39,343,500	769,348	24,179	29,068

Principal Cities

Taihoku Taihoku is the capital city of Taiwan. It is situated on the Tamsui River, near the northern extremity of the island. Formerly is consisted of three districts, Jonai, Daitotei and Manka, but with the introduction of the municipal system in 1920, all the surrounding villages were included in the greater Taihoku, and at present the city covers an area of about 15 square miles, embracing a population of 283,085, including 81,277 Japanese, 185,594 natives and 16,214 foreigners, mostly Chinese residents. In Jonai are found the important pubilc buildings, such as the official residence of the Governor-General, and many governmental buildings. Most of the Japanese residents live in this district. Daitotei is the commercial centre. It is inhabited by more than 63,000 people and is renowned for its tea trade. Manka is situated close by the Tamsui River, west of Jonai. This district was formerly the most flourishing part of the city. During the Manchu Dynasty its commercial supremacy was transferred to Daitotei. This district is populated by 37,000 inhabitants. There are many places of interest in and around Taihoku, of which the more famous are :

TAIWAN SHRINE This shrine is situated at a point two miles east of Taihoku. The sanctuary is built in the old Japanese style. In the neighbourhood is the noted Maruyama park commanding a very fine view.

THE RAPIDS OF SHINTEN KEI Situated at a point about 8 miles from Taihoku and at the confluence of the two rivers of Shinten-Kei, the rapids are among the chief attractions for visitors to Taiwan. On both sides stand out precipices. Shooting the rapids by boat affords a favourite pastime.

Shinchiku Shinchiku had been the cradle of civilization for the inhabitants in the northern Formosa. It became a city in 1930 and revived as a trade port since 1932, having a population of 54,110 in 1934.

Tamsui This is one of the four great ports of trade with a population of 25,666 in 1934. It is located 13 miles north of Taihoku. About one mile west from Tamsui Station lies the ruins of an old Khomoh castle, built by the Spaniards in 1626.

Keelung This is the starting-point of the railway which runs from north to south throughout the whole length of the island. The city with its 84,650 inhabitants extends as far as Taihoku covering a distance of 18 miles. Keelung is not only a port for liners from Japan proper, but is an important for those sailing to and from south China and the South Seas. Keelung was once occupied by Spaniards and afterwards by the Dutch, and was under the control of the Manchu Dynasty. About 1.5 miles distant from Keelung is located the famous Courbet Beach, where the French Admiral Courbet, in command of the French Asiatic Squadron consisting of 15 warships, landed during

the Franco-Chinese War in 1884. This admiral was one of the victims of infectious disease, which claimed a heavy toll among his men. He died on Boko Island where his tomb still stands.

Taichu Located about 100 miles south of Taihoku in the centre of rice production. It is the seat of the provincial government of the same name, with a population of 68,414. Lake Jitsugetsu-tan is in this province.

Kagi Kagi has a population of 70,-083 and is situated 163 miles south of Taihoku. Kagi is the starting point for climbers of Mt. Arisan.

Tainan Tainan has a population of 109,887, being the second largest port of Taiwan. Kaizan Shrine is dedicated to the spirit of Chen Cheng-kung, a loyal subject in the last days of the Ming Dynasty, who came over to this island, drove out the Dutch setlers, and opened war against the Manchu Dynasty, but failed.

Takao Takao has a population of 31,-582. Terminus of the central railway line, situated at a distance of 229 miles from Taihoku, this port is as important in the south as Keelung is in the north.

CHAPTER XLII

KARAFUTO (SAGHALIEN)

General Survey

Geography Karafuto is a long island situated in the extreme north of the Empire of Japan along the Maritime Province of Siberia, and separated from it by the Mamiya Straits. The eastern coast is washed by the cold waters of the Sea of Okhotsk, which is bordered by the mainland of Siberia on the north, the Kamchatka Peninsula on the east, and the Chishima Islands (the Kuriles) on the south-east. Japanese Karafuto is the southern half of Saghalien Island, the dividing line being the 50th parallel of latitude; the northern half of the island is under the jurisdiction of Soviet Russia.

At the extreme southern end of the island lies Cape Nishi-Notoro. On the east or opposite side of it, across the Aniwa Gulf, is Cape Nakashirutoko, and embraced by these two capes is the port of Ohtomari at the northern extremity of the Gulf, which is an important port connecting with Kakkanai the extreme northern port of Hokkaido, across the Soya Straits. The traffic connection between Ohtomari and Wakkanai is maintained by freight boats run by the Imperial government railways.

Beyond Cape Nakashirutoko lies Taraka Bay, on the farther side of which Cape Kitashirutoko runs out to the north-east. Thus, Karafuto is deeply indented by the two large gulfs, Aniwa and Taraka, the latter lying to the north-east of the former. The island has two mountain ranges running parallel from north to south with the plains hemmed in between. The total area of Karafuto is 36,090.3 sq. km., the length being 455.6 km. and the breadth from 27.5 at the narrowest to 157 km. at the widest.

Climate The months which enjoy an average temperature above the freezing point are the seven months from April to October. The coldest month is January and the warmest August. The temperature rises suddenly as the thawing season approaches and falls abruptly when the snows set in. The western coast is warmer than the eastern owing to the warm ocean current. The island is, as a whole, high in humidity on account of the frequency of sea fogs, except for the southern point of the western coast, but in both spring and autumn it decreases. Rainfall is most abundant in the summer and autumn seasons.

Population The great majority of the population of Karafuto is Japanese. The following table shows the racial distribution at the end of 1935 :

POPULATION BY RACE OR NATIONALITY

Japanese	Korean	Ainu	Other Natives	Chinese	German	Polish	Russian	Total
313,115	7,053	1,508	447	105	7	42	197	322,475

POPULATION IN CHIEF TOWNS

(Dec. 31, 1935)

Toyohara	35,390	Shirutoru	18,298
Ohtomari	27,965	Esutor	25,743
Shikuka	27,375	Ochiai	14,421
Hontocho	11,040	Tomarioru	10,966
Maoka	18,810	Rutaka	9,475

Note: For 1935 census see Chapter II.

Administration The chief administrative office of Karafuto is the Karafuto government and the governor is under direct control of the Minister of Overseas Affairs, but the powers of the former are far wider than those of a governor in the home land, as they extend over mining, forestry, taxation, railways and the postal service. The governmental work of Karafuto is subdivided into four main offices, i. e., Secretariat, Interior Bureau, Forestry Bureau and Police Bureau. The revenue budget of 1935 amounted to ¥24,890,000, of which ¥21,392,488 was from taxes and others, and the rest from various government undertakings and loans to the extent of ¥3,810,000.

Finance

The revenue of the Karafuto government is derived from taxes and other

sources of income as well as an annual replenishment from the ordinary account of the national treasury. The principal taxes are :—the town homestead tax, income tax, business profit tax, liquor-brewing tax, liquor-export tax, consumption tax, mining business tax, and fishery tax. The revenue from all these taxes was, in the 1936–37 budget, estimated at ¥29,435,533. The revenue, other than from taxes, consists of receipts from the sales of stamps, railway traffic and freight charges, medical treatment charges at governmental hospitals, charges receivable at the Central Experiment Station, receipts from the sales of trees felled in the state forests, rents of homesteads and various Government buildings and loans. Below is given a brief fiscal history of the Karafuto government :

REVENUES (Yen)

	Taxes and non-tax elements	Replenishment from national treasury	Sum brought forward	Loans	Total
1907	1,037,046	629,406	—	—	1,666,452
1910	1,229,705	544,714	260,524	—	2,034,943

1935	27,565,141	—	15,339,451	—	42,904,592
1936 (estimates)	29,435,533	—	3,898,053	—	33,333,586

Expenditure

The expenditures have been increasing yearly. In 1907 they totaled only ¥1,211,968, but for the 1936–37 fiscal year the amount increased to ¥33,333,586, of which ordinary expenditures totaled ¥18,655,367 and extraordinary expenditures totaled ¥14,678,219. Items of expenditures consist of administrative, educational, forestry, employers, Karafuto development enterprises, public works and many others. Expenditures for the preceding five years are ¥17,734,099 for the 1926–27 year ; ¥19,982,340 for the 1927–28 year ; ¥25,691,270 for the 1928–29 year ; ¥28,587,359 for the 1929–30 ; ¥24,629,293 for the 1930–31 ; ¥26,123,936 for the 1931–32 ; ¥22,428,353 for the 1932–33 year ; ¥23,566,668 for the 1933–34 years ; ¥25,929056 for the 1934–35 year ; and ¥28,703,053 for the 1935–36 year.

Monetary Organs

The principal monetary organs in the island are the Hokkaido Colonial Bank and the Karafuto Bank. The former is represnted by its branches at Toyohara, Ohtomari, Maoka, Honto, Noda, Tomarioru, Ochiai, Shirutoru, Shisuka and Rutaka ; its head office being located at Sapporo, Hokkaido. The business

operation of the bank in the island at the end of 1934 showed deposits amounting to ¥207,522,989 and loans advanced to ¥30,041,495. The Karafuto Bank is the only one having its head office in the island, its deposits totaling ¥15,910,897 and loans advanced ¥7,188,561 on the same date. The bank came into existence in May, 1934, with a capital stock of ¥500,000 which was increased to ¥2,000,000 in March, 1919. The Karafuto Bank has its head office at Ohtomari and a branch at Maoka. The two banks are doing good work for the development of the island. Besides these banks there is a special bank which has a branch at Toyohara, and that is the Hokumon Savings Bank. This savings bank branch was opened on April 1, 1922. Its local business operation showed at the end of 1934, advances figured at ¥720,504 and deposists at ¥1,473,561.

Military Training Camps

The military training camps ordinance was promulgated in April, 1926, providing for the establishment of camps for the military drilling of youths below the conscription age. The ordinance, however, was not promulgated in oversea territories, the only exception being Karafuto, where the local authorities in view of the almost complete lack of nationalistic social work in operation and of the smallness in the number of non-Japanese elements in the population, issued an order in May of the same year, making possible the growth of the military drilling work for the youths. Below is shown the present status of the work so far carried on :

MILITARY TRAINING CAMPS

Town	No. of Camps	Attendants
Toyohara	8	238
Ohtomari	7	249
Honto	5	146
Maoka	7	351
Tomarioru	7	164
Motodomari	3	115
Shisuka	4	81
Total	41	1,344

Overseas Trade

The history of the overseas trade of Karafuto since 1905 is a history of steady expansion, though it underwent a frequent recession in the course of those 31 years. The table below illustrates the trend in a more graphic way :

Year	To Foreign Countries	To Japan proper	Total
		(In yen)	
1927	755,135	90,193,622	90,948,757
1928	937,710	97,000,380	97,938,090
1929	2,042,652	103,034,631	105,077,283
1930	2,335,126	82,140,506	84,475,632
1931	841,655	80,233,395	81,075,050
1932	274,447	92,626,343	92,900,790
1933	367,088	104,886,093	105,253,181
1934	430,644	133,777,256	134,207,900
1935	869,965	130,940,201	131,810,166

SHIPMENTS TO AND FROM JAPAN PROPER

Year	Outward-bound	Inward-bound	Total	Excess of Outward-bound
		(In yen)		
1927	48,740,382	41,453,240	91,193,622	7,287,142
1928	50,915,329	46,085,051	97,000,380	4,830,278
1929	56,388,752	46,645,879	103,034,631	9,742,873
1930	46,812,144	35,328,362	82,140,506	11,483,782
1931	50,984,860	29,248,535	80,233,395	21,736,325
1932	63,510,076	29,116,267	92,626,343	34,393,809
1933	73,455,524	31,430,569	104,886,093	42,024,955
1934	96,648,171	37,129,083	133,777,256	59,519,086
1935	92,884,992	38,055,209	130,940,201	54,829,783

Principal shipments to Japan proper in 1934 consisted of pulp, lumber, paper, marine fertilizer, salt-salmon, salt-codfish, dried herring, dried codfish, fish oil, edible seaweed and canned crabs. Principal shipments from Japan proper

during the same year consisted of rice, cotton goods, oils, beer, saké, oats, peas and beans, salt, sugar, soy (Japanese sauce), miso (bean paste), tobacco, fish and shellfish, vegetables, fruits, and mineral products.

Trade with Foreign Countries

The ports open to foreign trade in Karafuto are Ohtomari and Maoka. The countries with which Karafuto has trade relations are Chosen, China, Eastern Russia, the Kwantung province, America, Germany, Spain, Belgium, the Dutch Indies and Egypt. The following table contains detailed information on the foreign trade of Karafuto in the past 6 years :

EXPORT TRADE OF KARAFUTO

Agriculture

There was practically no agriculture in Karafuto prior to its cession to Japan in 1905. No sooner had it passed into Japan's possession than vigorous steps were taken for the reclamation work of all arable lands. Today the annual farm production reaches approximately ¥4,000,000, farming households 11,593 and arable lands over 469,000 hectares. Yet the lands under actual cultivation cover only 31,600 hectares, which shows that there is still room to accommodate more farming inhabitants. The chief agricultural products are grains, peas and beans, potatoes and green vegetables, and of the grains oats and rye are most abundantly produced. Keeping livestock goes hand in hand with agriculture in the island, for it is by pasturing that the livelihood of the agricultural settlers is made more stable. Every assistance is, therefore, being given by the Karafuto government to live-stock raising. Cattle, horses, swine and foxes are the principal animals kept, with some sheep, rabbits, chickens, ducks, etc. In 1934 the total live-stock product amounted in money value to ¥2,116,000, just one-half of the entire value of farm products.

Mineral Products

Coal The most important mineral product in the island is coal and next to it comes petroleum. The coal producing centres are divided into the northern, southern and central districts. The coal bed is of the tertiary formation consisting of upper, middle and lower measures. Of the three coal districts the central is the largest and belongs to the lower measures. It runs for 100 kilometres from north to south and has a breadth of from 2 to 5 kilometres. A portion of the southern coal field along the western coast and the greater portion of the northern and eastern coal fields belong to the upper measure. On the northwestern coast there are several important coal fields belonging to the middle measure. The upper measure belongs to the Pliocene and the middle and the lower to the Eocene Period.

At the end of 1934 there were 21 coal fields under operation of an aggregate area of 127,186,700 square metres as against 6 coal-fields of a total area of 23,562,593 sq. metres in 1921. The following table shows the general trend of the increase :

Year	No. of coalfields	Area (sq. m.)	Quantity	Value ¥
1921	6	23,562,593	115,255	1,328,512
1922	6	23,562,593	114,547	1,238,198
1923	6	23,562,593	167,304	1,809,422
1924	9	32,030,708	199,385	2,255,713
1925	7	34,413,720	250,615	2,737,970
1926	11	36,982,649	245,220	2,712,289

1933	16	111,848,900	888,907	—
1934	21	121,186,700	1,196,647	—
1935	22	—	1,510,000	—

Of all the coal mines that of Kawakami used to be the most productive, though now superseded by O-hira mine. Its annual output coming up to 175,875 metric tons in 1932 and 190,210 tons in 1933. The O-hira mine had an annual production of 204,277 tons in 1932 and 290,901 tons in 1933. The Kawakami Mine extends over about 800 hectares located at a distance of 32 km. from Toyohara and is owned and operated by the Mitsui Mining Company, Ltd. The O-hira Mine is operated by the Oji Paper Mills, Ltd. The mine is located at a point 15 km. northeast of Esudori. Other large coal mines are the Shirutoru, Osakayé, Higashi-Shiraura, Kashiho, Amauchi, Naihoro, Estoru, Chitosé, Mita and Tokai.

Petroleum Petroleum was first discovered at a point on the south-western coast of Karafuto in 1907 when an official investigation was conducted, after which oil strata were discovered in the neighbourhood of Hontocho, Konotoro, Karabutsu, Maruyama and several other places. In 1934 digging operations were conducted by the Japan Petroleum Co., Ltd., on Well No. 2 of Maruyama of Ochiai-machi while such operations were carried over a total area of 23,204,106 square metres in 1930 and over 13,344,900 square metres in 1929 and 10,000,800 square metres in 1925.

Fishery Products

The chief fishery products of Karafuto are herrings, salmon, codfish, trout, crabs, whales and fur-seals, the average yearly catches reaching as much as ¥10,000,000 to ¥20,000,000 in value. Of these varieties the herring comes first in importance, the 1935 catch being figured at ¥8,155,731. Most of these fishery products are canned in the distributing centres in the island. Of all the canning centres Maoka ranks first, followed by shisuka and Tomarioru. Edible seaweed is obtained along all parts of the coast, but principally along the western coast and Aniwa Gulf. The Island located on the north-eastern edge of Taraka Bay is the only breeding spot of fur-seals in Japan. When the southern half of Saghalien came into Japan's possession in 1905, seal hunting in this small island was prohibited, and every possible protection was given to their breeding. In 1911 the hunting ban was

alleviated, the annual number to be killed being limited to 550. In 1913 it became apparent to the supervisiors that the number of landing fur-seals was decreasing, so in 1915 the ban was again imposed and was maintained until 1917. It was then withdrawn, with an annual permit to kill up to 550 head. In 1924 the hunting of old, non-breeding fur-seals was started. This increased the production in the year to 824 head and that in the following year to 942. In 1930 the total reached 1,715 and 1,704 in 1931. In accordance with the Fur-Seal Treaty concluded by Japan with the United States and Russia in 1911, Japan is paying 10 per cent annually of the profit from this fur-sealing to the governments of these two countries. Whales are principally hunted by the ships of the Oriental Whale-Hunting Company which has a base for that purpose in Aniwa Gulf. The following shows the money value of the chief fishery products :

FISHERY PRODUCTS IN MONEY VALUE (Yen)

Kind	1930	1931	1932	1933	1934	1935
Herrings	9,811,698	8,020,723	6,756,851	6,868,066	9,356,354	8,155,731

Others	507,067	344,526	388,842	674,039	747,964	878,996
Total	15,909,075	12,750,419	10,638,131	13,195,350	15,673,760	18,737,619

Timber Production

The island is so thickly and extensively covered with primeval forests that, according to an authoritative estimate, about 2,976,491 hectares, i. e., about 83 per cent of the entire area of the territory, is forest land. In this estimate is included 833,333 hectares reserved for future growth and 79,365 hectares in use for the field work of the Imperial Universities of Tokyo, Kyoto, Hokkaido and Kyushu. There are about 49 species of trees and 73 of shrubs growing on the island, but those that have any commercial value are the Ezo-matsu (Picea ajanensis, Fisch), todo-matsu (Abies sachaliensis, Mast), gui-matsu, ichii (the yew, Taxus baccata), shirakaba (the silver birch, Betula alba), doroyanagi (a willow), hannoki (the black alder) tamo, and a few others. Their distribution is regular, according to districts. In the low coastwise districts we find the yanagi, hannoki, tamo, etc.; on the higher levels grow the todo-matsu and Ezo-matsu, and as we climb the slopes forests of the graceful silver birch mix with and replace the pines (matsu), growing thicker and thicker as the mountain peaks are approached. The guimatsu (a pine species) grows principally in the lower, damper land. But the todo-matsu and Ezo-matsu are the species which predominate in nearly all parts of the island, occupying as much as 80 per cent of the total forest land. The revenue from the forestry amounted to ¥21,680,893 in 1934.

Forest Administration In ancient times the entire island of Karafuto was nothing but thick forest and the natives seem to have no rules to prevent them from felling trees whenever or wherever they chose; but they apparently felt no need to fell any large amount of standing trees. The land was almost as primeval as could be imagined when it was ceded by Russia to Japan in 1905. Moreover, during the earlier period of the new régime, devastation by fire was not infrequent. On the other hand, the increased number of population in the island had the effect of increasing the demand for timber in various ways. The first task which confronted the Karafuto government in their forest administration was therefore how to protect the forests from devastation, how best to fell and how to re-stock. As a tentative re-stocking measure large amounts of seeds of todo-matsu, Ezo-matsu, Kara-matsu and silver birch were sown on a wide burnt

patch of mountain-side in the neighbourhood of Oehiai in June, 1920. As the experiment was satisfactory, seedings were carried on a tract of 15.47 hectares and 50.01 hectares in 1921 and 1922 respectively. Then in 1923, the seeding work was carried on over a total tract of 4,285,09 hectares, then it was carried in the same way in 1926 and 1927 until in the latter year seedings were carried on over a tract of 10,460.74 hectares and the supplementary sowings made on a tract of 2,569.68 hectares. Below more detailed figures are given :

Year	New Seeding (Hectares)	Supplementary Seeding (Hectares)
1921	15.47	—
1922	50.01	—
1923	4,285.09	—
1924	4,754.39	—
1925	7,259.07	—
1926	11,272.60	7,740.26
1927	10,460.74	2,569.68

1930	445.00	—
1931	—	—
1932	407.03	—
1933	35.10	—
1934	181.66	—
Total	50,188,21	10,309.94

Seedling Work With the increased need of re-foresting with saplings, the seeding work has become quite important. Since the first sapling plantation was established at Toyohara in 1912 its number began to increase, and now there are 17 sapling-plantations established throughout Karafuto producing annually about 6 million saplings. Details follow :

Location	Acreage (Hectares)	Date of Establishment
Toyoharp	15.2110	5/1912
Shimizu	4.9500	5/1920
Tokobo	13.0485	5/1920

Total	137.8869	—

Felling Work The present Government's felling work was started in May, 1927, on the estimated basis of an annual production of 535,743 cubic metres of timber. But, in view of the difficulty felt in marketing, the annual aggregate felling was reduced to the basis of 196,-370 cubic metres. The business result in the year 1935 was as follows :

	¥
Receipts	2,449,705
Expenses	778,631

TIMBER PRODUCTION DURING 1924-1933

Year	Felling (Koku)	Shipment (Koku)	Delivery (Koku)

1932	201,020.000	196,532.000	196,532.000
1933	199,555.000	200,371.000	200,371.000
1935	202,413.000	169,751.000	173,367.000

Forests for University Field Work It was in April, 1914, that a forest tract of 20,000 hectares along the basins of the Ai-kawa (Ai River) and Odasamu-kawa (Odasamu River) was given to the Tokyo Imperial University for the field work of forestry students of its College of Agriculture.

Before or after that year the forests for the field work of the Hokkaido, Kyushu and Kyoto Imperial Universities were established. The amount of stand-

ing timbers of these forests at the end of March of 1934 were 11,459,715 koku for the coniferous trees and 772,767 koku for the broad leaved trees.

Fire Prevention Work The work of fire prevention was initiated in 1922 over a stretch of 13,495 metres of forest area, mostly of the area artificially re-planted. But in recent years the prevention work was extended over natural forests, it consisting in making openings or glades, so that in 1934 the total length of these openings for protection from fire reached 1,015,945.

FIRE-PREVENTION OPENINGS

Year	Extension (metres)
1922	13,495
1923	78,297
1924	87,973
1925	15,173
1926	237,973
1927	157,530
1928	119,129
1929	95.729
1930	22,062
1931	27,962
1932	82,840
1933	55,444
1934	28,568
Total	1,015,945

Re-foresting Work The forest-re-stocking work is now attained by encouraging the natural recruiting process and in 1929 over an area of 173.36 hectares and then in 1930 over an area of 47.90 hectares have been recruited. In 1931 the same work was carried on over an area of 92.60 hectares, bringing the total area accorded this treatment to 313.86 hectares.

Development of Various Kinds of Industries

With the growth of railway facilities the population began to increase, and, with it, various trade and industrial opportunities became more promising. Ohtomari and Maoka are the two ports with the best future outlook, being connected by railways at Toyohara, the seat of government of the island. Paper-pulp manufacturing, canning, brewing, starch manufacturing and butter-making are the leading industries in Karafuto. In 1934 products of various industries amounted to ¥126,538,366 of which products of manufacturing industries aggregated ¥75,466,270 which as compared with ¥37,569,366 of the products of all kinds and ¥17,987,842 of manufacturing industries in 1920, they show tremendous improvements. Various experiments for industrial purposes were conducted and are being continued at the Industrial Experimental Laboratory at Toyohara.

Pulp In 1913 the first pulp factory was opened at Ohtomari by the Oji Paper Manufacturing Company; then another was opened at Tomarioru by the Karafuto Kogyo Kabushiki Kaisha, both starting operations in 1915. Soon the World War gave an opportune stimulus to the speedy development of the industry and at present there are nine pulp factories in the island turning out an aggregate of 200,000 metric tons of pulp valued at ¥32,460,000 and 160,000 metric tons of paper valued at ¥38,900,000 in 1935. This means that at present about one-half of the total pulp supplies are from Karafuto. Below is given further information in this respect:

PULP FACTORIES IN KARAFUTO

Company	Location
Oji Paper Manufacturing Company[1]	Ohtomari
" " " "	Toyohara
" " " "	Noda
" " " "	Tomarioru
" " " "	Maoka
" " " "	Esutoru
" " " "	Ochiai
" " " "	Shirutoru

1 The Oji, Karafuto Kogyo anb Fuji were amalgamated in May, 1933, into one concern which retains the name of Oji Paper Manufacturing Co., with a capitalization of ¥ 150,000,000.

PRODUCTION AT EACH PULP FACTORY (AT THE END OF 1932)

Company	Factory	Manufactures	Productive Capacity (French ton)	Quantity Produced	Amount (¥)
Oji	Otomari	Pulp	13,000	—	—
„	Toyohara	Pulp	71,000	21,925	2,042,141
		Paper		2,197	284,800

Total		Pulp		162,091	17,395,963
		Paper		129,710	24,537,313

Brewing Early attempts to brew saké on the island were unsuccessful. The local demand for saké was so pressing, that it led enterprisers to improve all defects in equipment and to procure water of better quality. The result proved promising, and today the island-brewed saké is as good as any produced in Japan proper. There are at present about 45 breweries. The productive value for 1935 amounted to ¥3,257,000.

PRODUCTION AND SUPPLIES OF SAKÉ

	Production		Import from Japan Proper	
	Quantity (thousand deci-litre)	Value (¥)	Quantity (litre)	Value (¥)
1926	72,613	3,842,245	197,710	1,240,445
1927	69,467	3,636,155	195,670	1,222,755
1928	66,603	3,862,093	254,670	1,490,544

1933	58,876	2,662,936	393,400	—
1934	70,423	3,205,850	502,900	—
1935	72,382	3,257,035	—	—

Canning Industry The canning industry in this island goes back to 1909, and in 1917 the canneries numbered 111, with a total production of ¥3,370,558. Crab-canning heads the list; but the reckless catching following that year caused a falling-off in the production, which was reduced to ¥1,458,000 in 1920. The canneries were also reduced in number to 14 and amalgamated. As a result both the number of mills and products decreased. But the industry has been for a while consolidated and is developing steadily. The number of canneries and their products during the years 1932–35 follow :

Year	No. of canneries	Qty. prod'd	Value (¥)
1932	25	32,041	915,335
1933	29	38,979	1,660,643
1934	38	54,985	2,268,286
1935	28	—	3,380,000

Legal System and Status

Karafuto is different from other dependencies of the country in that more laws of the home land are applied there than in any of the other dependencies. But in the sense that the legal administration is different from that of Japan proper it resembles

Taiwan, Chosen, Kwantung Province and the South Sea Islands. The chief point of difference is that all the laws concerning the judicial system, such as the civil law, criminal law, the laws of civil and criminal procedures, and the law of the constitution of the courts of justice are equally enforced in Karafuto and Japan proper. At present there are 169 laws of the land applied or made applicable in Karafuto, of which 13 laws are operative only partially.

There are one local court, 2 district courts, and 7 detached offices of the two district courts in Karafuto.

Education

In 1905 Japan found the island a vast, primitive desert with practically nothing done towards bringing the inhabitants to a civilized way of life. But as the immigrants settled down there arose the necessity for schooling their children. It was in August, 1906, that the first elementary school was opened at Toyohara, and in October of the same year 2 other elementary schools were opened, one at Ohtomari and the other at Maoka. At the same time, private educationists started simpler elementary schools. In 190 all elementary schools were brought under the Karafuto government. A middle school was opened at Ohtomari in 1912, a girls' high school at Toyohara in 1916, a middle school at Toyohara in 1925 and another middle school at Maoka in 1927. Meantime, girls' high schools were opened at Ohtomari, Maoka and Tomarigishi. The following tables give the main educational statistics of Karafuto :

NUMBER OF SCHOOLS, TEACHERS AND PUPILS

(March, 1936)

District	No. of Schools	Teachers	Pupils
Toyohara	42	260	10,793
Ohtomari	58	270	10,718
Honto	23	96	4,047
Maoka	32	189	8,300
Tomarioru	46	212	8,999
Motodomari	19	102	4,308
Shisuka	20	104	4,648
Total	240	1,236	51,813

Education of the Natives There are some 2,000 natives in Karafuto including Ainus, Gilyaks, Orochones and Tunguses. The Karafuto government is undertaking to educate the children of these backward natives. At the educational institution established at Shisuka-machi, where about 30 children of the natives are taught along the line of the primary school.

Religion

The three principal religions, i. e., Shinto, Buddhism and Christianity, are competing with one another in this promising field of labour. Tere are 42 propagating centres for Shintoism representing five sects, viz., Shinto proper, Kurosumi, Tenri, Konko and Taisha. There are three governmental shrines and these are (1) Karafuto Shrine, (2) Toyohara Shrine and (3) Ani Shrine, all of which are dedicated to Imperial ancestors. August 23 is the day set for annual festival of the Karafuto Shrine, which is also the Inauguration Day of Japanese administration in Karafuto. The shrine is located at Asahiga-oka in a quiet western hilly suburb of Toyohara, and strikes the chance visitor with a sense of admiration for its grave beauty. The anniversary of the Toyohara Shrine falls on July 11. Buddhism is represented by the Shin, Nichiren, Soto, Shingon, Jodo and other sects. There are 72 temples and 126 preaching houses. Christianity is being preached by missionaries of six denominations, i. e., Episcopal, Methodist, Presbyterian, Roman Catholic, the Salvation Army, and the Holiness Church. The number of Christian churches in Karafuto is 12.

CHAPTER XLIII

SOUTH SEA ISLANDS

(UNDER JAPAN'S MANDATE)

Geographical Features

The South Sea Islands mandated to Japan, numbering 2,550, are the Mariana, Marshall and Garoline groups, between 131° 10′ and 172° 10′ of east longitude and between 1° 15′ and 20° 32′ of north latitude. They have a total area of 2,148.80 square kilometres. The Hawaiian Islands are to the east; the Philippines and Celebes to the west; the Bonin Islands to the north, and New Guinea to the south. Only one island among them, i. e. Guam belongs to the United States.

The Mariana archipelago starts close to the southern end of the Bonin Islands, stretching towards the equator, and the Marshall and Caroline groups extend to the east and west along the equator, forming an inverted letter "T" with the Marianas. About 740 miles south of the Bonin Islands lies Saipan, the largest of the Marianas, and about 180 miles farther south is Truk, one of the largest of the Carolines, which marking the crossing point of the inverted "T," is the centre of the mandated territory. The line of 148° east longitude divides the Carolines into the West Carolines, with Palau and Yap, and the East Carolines, with Truk and Ponape. Because of the distances between the islands and the extensive area covered by them, communications are difficult. The fact that each group of isles uses different words peculiar to itself sufficiently demonstrates the degree to which they are separated.

So small are the individual islands in area that the premier ones, such as Ponape and Babelthuap, cover barely 269 square kilometres. Their topography differs according to geological conditions. The Marshalls, which are made up of coral reefs, rise only 1.5 or 2 metres above sea level, but the Marianas and Carolines, which are composed largely of volcanic rocks, have peaks rising as high as 758 metres and little level land. There are no navigable rivers, and in several places good roads are still lacking.

With the exception of Yap, practically all of the islands are composed of volcanic rocks and coral reefs. There are three kinds of coral reefs, though no clear demarcation can be drawn; and the volcanic rocks are of two kinds, basalt and andesite, the former being found in Truk, Ponape and Kusaie, of the Carolines, and the latter in Palau and Saipan. Everywhere in the islands, sea-birds nest and deposit phosphate, but principally on Angaur, Peleliu, Togobei and Fais. The soil also contains some amount of phosphoric acid, which helps vegetables and trees to grow. The narrowness of each islet, the volcanic topography and the dearth of rainfall, however, are handicaps to agriculture.

Groups of Islands

The Marianas The Marianas, the northernmost part of the territory, consist of 14 islands covering 632 square kilometres. At the southern extremity is Saipan, the seat of the Saipan Branch Office, with jurisdiction over the whole of the Mariana archipelago. The Saipan group, 183,89 square kilometres in area, starts 64.36 km. to the northeast of Guam and stretches 104.59 km. to the southwest. Being nearest to Japan proper, the group forms the gateway to the South Sea Islands. It not only enjoys favourable communication with the mainland of Japan, but is endowed with fertile soil adapted to the cultivation of sugar cane, which has drawn no small number of immigrants. Here the South Sea Islands Development Company engages in the refining of sugar.

The Carolines The Carolines, lying along the equator, are divided into the four administrative groups of Palau, Yap, Truk and Ponape. On the island of Corrol in the Palau group are located both the South Sea government and its Palau branch office. The number of isles under the jurisdiction of this branch office is 109, covering an area of 80.29 square kilometres. Babelthuap, commonly called the Main Island of the Palaus, has 370.37 square kilometres. Angaur, about 64.36 km. southwest of Corrol, is called the treasure island of the archipelago, being buried under

phosphate mounds. A regular steamship line connects it with Menado of Celebes and Davao of Mindanao, in the Philippine Islands. The Palaus are not only the administrative pivot, but are important geographically.

The Yap group lies 418.34 km. to the northeast of Palau and consists of 85 islets covering 228.91 square kilometres and extending 804,50 km. from north to east. The four main islands, with an area of 36.26 square kilometres, are widely known as a junction of submarine cables. Here also is located the Yap branch office.

The Truk group lies 1,383.74 km. east of Yap, dotting the surface of the sea like a nebula. The Truk branch office, located on Natsu Island, controls 245 islets, which total in area only 124,16 square kilometres. As Natsu Island was formerly the seat of the German local government and later the headquarters of the Japanese defence corps for the entire mandated territory, it is fairly well known to the outside world.

The Ponape group is located 627.51 km. due east of Truk and consists of 138 islets covering more than 492.10 square kilometres. The island of Ponape, with 380.73 square kilometres in area, ranks first among all the islands of the territory. It is full of hills and is lacking in level land. Textile manufacturing and sugar refining were once started here by the Japanese, but later discontinued. Hope is still retained for some industrial undertaking, and a branch laboratory of the Industrial Experiment Station of the islands was established here in 1925 to make trial plantings of rice and medical herbs.

The Marshalls The Marshalls are located 1,222.84 km. east of Ponape. At the southern tip is Jaluit, on which is located the Jaluit branch office, which has control over the main portion of the archipelago, 32 islets, made up of more than 860 coral reefs comprising an area of 150.94 square kilometres. The soil being quite suited to the growth of cocoanut palms, they flourish everywhere. The copra industry of the islands is chiefly dependent on the material produced in this group.

Atmospheric Conditions

All the islands being within the tropical zone, they have one season instead of the four of the temperate zone. Cool sea breezes sweep over them day and night, contributing much toward balancing the temperature, and the inhabitants are favoured with a mild maritime climate rarely found in tropical countries and free from the danger of attack by venomous snakes, wild animals and miasma peculiar to the tropics.

There is an observatory established by the South Sea Government, where all sorts of atmospheric observations are conducted, and four hyetographical observatories. In addition, each branch office of the government has its own observation station. Thorough study of the insular climate is now being planned.

Atmospheric pressure in the neighbourhood of Truk and Ponape is generally low; in the vicinity of the Carolines and western Marianas, it is high in February and March and low from October till December; in the eastern islets of the Carolines, high from May to September and low in other months. The temperature is about the same all over the islands and shows little change through the year, the highest in the daytime ranging from 29° to 31° C. It seldom rises above 31°, and the difference during 24 hours is only 4 or 5 degrees. Humidity averages 82% and rarely falls lower than 60%.

From November to April, the wind generally comes from between the east and northeast. This is the trade wind. From May to October, the direction differs according to the position of the islands. The velocity averages 5 metres in the Marianas, weak in August and September and strong between October and February; in the western part of the Carolines, it is weak in April, May, June and September and strong in November, December, January, February and March.

The mean annual rainfall is more than 3,000 mm., and at Ponape it reaches even 4,000 mm. The rain comes in sudden torrents and passes away with the same suddenness. By this the unbearable tropic heat is greatly mitigated. The rainfall is greatest during July, August and September and least in January, February and March.

The Islands are, as it were, the hotbed of the typhoons that devastate Formosa and Japan proper, but locally the wind rarely gathers hurricane strength. If a typhoon does strike, it leaves the islands in a miserable condition, and the natives fear typhoons as they do their gods. When Ponape was struck in 1906, nearly all the cocoanut palms fell. Jaluit suffered in 1918 and Yap in 1920 and 1923.

A third tempest at Yap caused tidal waves to sweep over the coast, considerably damaging houses, woods and farms. A typhoon at Palau in May, 1927, swept away practically all dwellings in Peleliu and caused no small damage to other islets far and near.

History

The discovery of the islands dates back to the 16th century, when Spain and Portugal were vying with each other for discovery of untrodden soil in any corner of the world. As they are scattered and insignificant, not all of the groups were found at the same time. The Marianas were found first and the Carolines at about the same time, though exploration of the latter was neglected for a long time until about 1885, when the Marshalls were discovered.

Found by the Portuguese, the Marianas came into the possession of Spain. Toward the close of the 19th century, Germany took possession of the Marshalls and threatened to encroach on the Carolines, then under Spanish control. Spain protested, and arbitration by the Pope in 1886 terminated the dispute amicably, the whole of the Carolines remaining under Spanish rule. Assiduous efforts by the Spanish to exploit and govern the islands continued until 1899, when, financially straitened due to the war with the United States, they sold the Marianas and Carolines to Germany. The whole of the present South Sea Islands mandated by Japan was thus shifted to the possession of Germany. The German reign lasted until 1914, when a Japanese squadron occupied the islands, which were later juridically placed under Japanese mandate, following the conclusion of the Paris Peace Treaty and other relevant agreements.

German Administration It is generally agreed that the establishment of sovereignty over the Marianas and Carolines by Spain in 1886 and the complete domination by Germany of the Marshalls in 1885 should be made the starting point in historical study of the archipelagos. Until purchased by Germany, the Marianas and Carolines had no government worthy of mention, and nothing now remains to recall the Spanish administration except the defence works on Yap and Ponape and a few buildings standing here and there. After the transfer to Germany, a complete change was effected. In the manner of the British East India Company, Germany started the Jaluit Company shortly after acquiring the Marshalls. The Government took over the business in 1906, when the company's contract expired, and tried to put all the island industries under its monopoly. Thus Jaluit has naturally flourished as the business centre of the territory, reinforced by communications with Singapore, Hong-Kong, Australia and the United States.

In looking back upon the German programme in the South Sea Islands, we are struck above everything else with the largeness of its scale. A general government was first established in New Guinea, which sought to implant German authority in the Orient by embracing the numberless islets between New Guinea and Tsingtao. A step to this end was the laying in 1904 of a submarine cable connecting Yap with Shanghai, Guam and Menado, and in 1913 a radio telegraph station of gigantic size was erected on the same island. To make a scientific study of the South Sea Islands, the German Government dispatched a number of experts. One of their discoveries was phosphate, of which a deposit of 3,000,000 tons was found on Angaur. The German Phosphate Company, founded in Bremen in 1908, conducted mining operations until the Japanese occupation. Other deposits, though less valuable, were located at Peleliu, Togobei and Fais.

Germany exercised special efforts in diffusing culture among the natives, and to this end it dispatched no less than 100 missionaries, who opened churches in all the principal villages of the islands. The older natives still keep the German style of Roman letters to this day. Besides paying attention to educational advancement within the territory, the authorities sent men of talent to Tsingtao for further study.

Relations with Japan It is presumed that there must have been some early intercourse between Japan and the archipelagos because of their geographical position, but there is no reliable evidence of it. The Japanese training cruiser Ryujo in 1884 touched at Kusaie, an islet belonging to the Ponape group, where the chief of the natives enthusiastically welcomed the crew, declaring that his people were descendants of the Japanese race. In the same year, the Japanese Government, informed of the massacre of a Japanese on Raye Island, of the Marshalls, dispatched Mr. Taketaro Goto, who succeeded in settling the matter with the local chieftain. Early commercial relations were initiated by the South Island Company (Nanto Shokai), established at Ponape with the capital of ¥44,000, but its business was soon transferred to the Ichiya Shokai, which failed in 1895. In the year following the appearance of the Nanto Shokai, two other trading firms, the Kaitsu Sha and Koshin Sha, came into existence; the former lasted only two years, but

the latter carried on business until the Japanese occupation of the islands. The Hioki South Sea Trading Company was founded in 1893 with branches at Ponape, Truk, Saipan and Guam. Since amalgamation with the Murayama Shokai in 1906, it has been operating as the South Sea Trading Company and doing an extensive business.

Population

According to the census taken on October 1, 1935, the total population of the mandated territory is 102,537, comprising 50,573 natives, 51,861 Japanese and 103 foreigners. Of the natives, there are 46,848 Kanaka and 3,725 Chamorro. The Chamorro enjoy high birth rate, but the Kanaka scarcely maintain the status quo. Those within the jurisdiction of the Yap branch office show yearly decrease.

When Japan took over the archipelagos, there were only a few scores of Japanese dwellers. Gradually increasing, there are now 31,158 males and 20,703 females, most of them dwelling within the jurisdiction of the Saipan branch office and being engaged in agricultural pursuits.

When placed under Japanese control, the territory had a hundred Germans, mostly engaged in missionary work and commerce. After they left, there remained fewer than 20 foreigners, chiefly Americans and British. The census taken on April 1, 1935, gives the number as 97 who are nearly all engaged in missionary service, cocoanut cultivation or the copra trade.

A census is taken every five years. The village officials and policemen also keep in constant touch with every change. As for Japanese settlers and foreigners, complete investigation is made in accordance with regulations. The first general census was taken in October, 1920, when the first national census was taken in Japan proper, attended with great difficulties and at enormous expense. Subsequent censuses came in 1925 and 1930.

DENSITY OF POPULATION,

(April 1, 1935)

District under Branch Office	Population	Area sq. km	Density per 1 sq. km

Tribes, Customs and Manners

Tribes Opinions differ as to the tribes residing in the mandated South Sea Islands. Some say that they immigrated from the Malay Peninsula, while others maintain that they are of the Polynesians. Though anthropologically named the Micronesian race, it is evident that they are a hybrid. Separate groups are clearly discernible, each with its own language and customs and manners. Roughly they are divided into the Kanaka and Chamorro. The former belong to the Micronesian race, and the latter are said to be of mixed White and Kanaka extraction, though other explanations are sometimes given.

The Chamorro are supposed to have settled first in Guam, later removing to neighbouring isles, and the fact that they now flourish largely in the Marianas, Yap and Palau seems to endorse the supposition. Though the tribe thrived fairly well under the Spanish régime, it has gradually dwindled, due mainly to massacres, until today it numbers only 3,400. The characteristic features are yellowish brown skin and black hair. The Chamorro, unlike the Kanaka, are industrious and mild in nature. Their mode of living is advanced, and some even reside in foreign-style houses with modern improvements. Their present culture owes much to religious influences in the time of Spanish control.

Kanaka is the general term for the natives of the Pacific islands. Most of those dwelling in the mandated islands belong to this group. They have dark brown or yellowish brown skin, black hair, heavy eyebrows and a big mouth. They are not hairy, and are simple and mild in nature. Though generally of medium stature, some are fairly tall. The Kanaka are cheerful in disposition, but extremely lazy. Their cultural standards are very low, and the mode of living lingers in the primitive stage. Of the total of 50,000 natives in the islands, those belonging to the Kanaka number 46,600.

Customs and Manners Because of the warm climate, it was originally the custom of the natives to wear nothing except a piece of cloth around the waist. Contact with advanced people, however, has brought a change, and some now use foreign clothing. In Saipan and the Marshalls, the natives are clad after the fashion of Europeans, but those in Ponape, Truk, Palau and especially Yap are almost stark naked. The natives are not indifferent to personal adornment. Tattooing is an outstanding example. The more complicated the tattoo marks and the larger the space they cover, the more respected is the owner. There is also the strange ornamentation of scars deliberately cut into the flesh, which has more influence in Ponape than in the other islands. The custom of driving a hole through the ear-lobe for an earring or other dangling ornaments has been becoming less common of late years, due principally to the diffusion of education.

The staple foods of the natives are fruits, fish and meat. Nature bountifully supplies cocoanuts and tubers, which are mainly relied on, and tapioca, bananas, pineapples, mangoes, lemons and oranges, all of which are used as subsidiary food. Under such circumstances, it is but natural that little attention is given to agriculture. Fishing has made but little advance, but the supply of beef and pork is fairly sufficient. Wine and tobacco are greatly sought after, though the use of the former is almost completely prohibited. The habit of chewing areca still prevails.

The structure and appearance of dwellings vary in accordance with the cultural standard of each group of isles. In Saipan there is a street that looks like one in Europe, but in Yap one is reminded of how people lived in prehistoric ages. The dwellings in Truk and Jaluit are far inferior to those in Palau and Ponape, having not even floors. A general lack of windows leaves the interiors sombre and damp. "All men houses" are found everywhere in the archipelagos, which serve as a sort of rendezvous for the male villagers or inn for travellers. On Yap there are one or two houses to every village where women live when ailing.

Social Conditions

As the natives are not yet far removed from the primitive stage, their knowledge is very limited. They adhere to the traditions handed down from their forefathers and seem incapable of assimilating with any rapidity the cultural attainments of the outside world with which they come in contact. Only a few can count correctly. Yet they

have been progressing in education since primary education has been introduced. Whatever their intellectual deficiencies, they are fit for manual work.

There are two main social classes, superior and common, and between them there are several transition levels. Every village has its own chief, at whose mercy formerly were the life and property of the villagers. Among the chiefs there used to be ceaseless fighting. Under the German administration, their powers were greatly diminished, and at present they collect taxes and transfer government orders besides attending to the welfare of the people.

As has already been said, their mode of living is very simple, requiring little clothing and no farming for food. They are content to live in any miserable structure which affords shelter from wind and rain. Save for a handful of the Chamorro and a very small number of wealthy people, they live from hand to mouth in perfect contentment and have no thought of providing for posterity. They see no need of taxing their otherwise simple existence by using money. Such as they obtain is invariably spent for such luxuries as soap, perfume, tobacco and canned food, for their daily necessaries are freely provided by nature. Of late years, however, a desire to own cocoanut trees and land has become discernible. They have aversion to anything that requires systematic labour. This is because they are little accustomed to it, there being no need for hard work where food is plentiful without it. In former times they were absorbed in subduing neighbouring villages, but in recent years their barbaric temperament has greatly abated in consequence of appropriate measures taken toward this end by the Japanese Government.

Each group uses its own language or dialect, and there are many instances of different languages in a single group of islets. Between the main island of Yap and the islets within its orbit, there is no common language. Since Japan took charge of the educational work, Japanese has been taught, increasingly meeting the daily needs of the natives.

Administration

Following severance of diplomatic relations with Germany, the Japanese navy occupied in October, 1914, the German territory of the South Sea Islands and established a military government. In December, 1915, when military headquarters were instituted at Truk, the islands were divided into six administrative districts, each governed by a resident garrison commander. In June, 1918, subsequent to the issuance of an Imperial ordinance, a civil administration was created under the commander of the Provisional South Sea Defence Corps, and civil officials took over the functions formerly entrusted to the commanders.

By conclusion of the peace treaty in January, 1920, the islands were placed under Japanese mandate. Realizing the need of effecting fundamental renovation in the administration, the Japanese Government, upon withdrawing the troops, established the present South Sea Government in April, 1922. This was in accordance with an Imperial Ordinance of March, 1922, parts of which were later revised in 1924, 1927, 1930 and 1935. The Governor, who presides over the entire administration, is under the control and supervision of the Overseas Minister. Communications affairs are supervised by the Communications Minister, and currency, banking and customs matters by the Finance Minister. In emergencies, however, the Governor is authorized to act upon his own discretion and if necessary to request the commander of the naval station or the nearest responsible naval commander to take military action. The Government Office is composed of nine sections: Governor's Secretariat, Archives, Local, Finance, Police, Colonial, Aquatic, Civil Engineering and Communications. The Provisional Saipan Harbour Repair Office, a products museum and an experimental fishery station also belong to it. Under the government there are branch offices at Saipan, Yap, Palau, Truk, Ponape and Jaluit. All such general administrative business as census-taking, alms-giving, salvation, policing, hygiene, tax collection, education, religion, industry, engineering and harbour works are conducted by these local branches.

Besides the afore-mentioned, there are, under the control of the Governor, 15 elementary schools, 23 public schools, a woodwork training institute, a high court of justice with a public procurator's office, 3 local courts of justice, each with a public procurator's office, 1 industrial experimentation station with its two sub-stations, 7 hospitals, 1 mine, 9 post offices, 1 meteorological observatory and its 3 branches and 1 industrial school.

The branch offices are assisted by sosoncho, kucho, son-cho and joyaku, who are mostly native chiefs. Those in charge of the Kanaka are called sosoncho and son-cho, and those among the Chamorro are named kucho and

joyaku. The so-soncho and kucho act under the control and instructions of the branch office to which they belong, and the son-cho and joyaku assist them. The duties entrusted to these officials are (1) thorough diffusion of knowledge of the law and regulations, (2) the making of applications and reports to the branch office, and (3) the conveyance of official instructions and their fulfilment.

Police Administration Under the Police Affairs Section of the government there is a branch section at each of the six branch offices of the government. In addition, there are a police officer's detached station at Tinian, another at Rota, assistant police inspector's detached stations at Kusaie and Angaur and policemen's offices at 23 less important villages. The distribution of these stations was determined more by special local conditions than by the density of population, for each branch office of the government has its own peculiar geographical and cultural conditions. On August 1, 1935, the number of police officials at each branch office ranged from 18 to 65.

The regulations for control of the islanders established in 1916 to guard against immigration of persons without property and criminals were amplified and revised in 1917 and 1925. Special consideration is given to firearms and gunpowder, the possession and use of which are strictly prohibited to the insular inhabitants. Beverages of more than 3 per cent alcoholic content are forbidden except for medical use and religious rites. The possession and consumption of dangerous narcotics, save for medical purposes, are prohibited. Other regulations cover game hunting, publications, social gatherings and the formation of associations, collection of donations, fisheries and the employment of geisha and waitresses.

Finance

The expenditure for insular administration had been met by the military special account until an independent account of the South Sea Government was established in March, 1922. Since then the South Sea Government Special Account has been arranged and expenditures of the Government have been met by taxes, other revenues and the sum advanced from General Account. But its own revenue has increased so much that since 1932 the Islands have been receiving no budgetary assistance

from Japan proper and have thus virtually become independent financially. The budget receipts and expenditure for the past several years follow :

ANNUAL REVENUE AND EXPENDITURE

Fiscal Year	Revenue Ordinary Revenue	Revenue Extraordinary Revenue	Revenue Total	Expenditure Ordinary expenditure	Expenditure Extraordinary expenditure	Expenditure Total
1926	¥2,399,369	4,608,958	7,008,327	2,310,110	1,638,464	3,948,574

1936*	—	—	7,388,000	—	—	7,388,000

* The figures for 1936 are estimates.

The poll tax, customs duties and clearance charges on shipments constitute the premier taxes. A poll tax not exceeding ¥10 is levied on every male native aged 16 or more and from ¥2 to ¥50 on Japanese and foreigners, although there are quite a number of exceptions. All imports from foreign countries are subject to customs duty in accordance with regulations established in May, 1922. These regulations also provide that all shipments to Japan and dutiable at the destination are subject to a clearance duty at the same rate as levied at the destination.

The details of revenues are given below :

Import Duty, Clearance Dues, and Mine-Lot Tax in 1934

Land and Agriculture

All transactions in real estate owned by natives are subject to approval by the government, a practice initiated by the German administration to safeguard the interests of those whose concepts of property are rudimentary. Total acreage is put at 213,000 hectares, of which about 71,000 hectares are thought fit for cocoanut plantation and general farming. The land already cultivated is calculated at 51,300 hectares for paddy field and dry land, and for cocoanut plantation, leaving more than 20,000 hectares for future development. Engaged in agriculture are 40 per cent of the entire native population, viz., 20,252 natives and 8,730 Japanese. There being little need of depending for their daily necessaries upon farming, the agricultural technique of the natives is still in a primitive stage, but the rapid increase in the number of Japanese, who are setting good examples, will sooner or later bring about some improvement. Livestock farming is also undeveloped, though the natives raise cattle, hogs, goats, hens and ducks, the cattle for transportation and farming purposes and the hogs and hens for food.

Sugar-cane cultivation dates as far back as the beginning of the 16th century, but until the arrival of the Japanese there was no sugar refinery and the inhabitants ate the cane raw. The island of Saipan being found fully qualified in both climate and soil, there was established there by the Japanese a sugar industry, which has made a healthy development. From 20 hectares in 1916 cultivation increased to 455 hectares in 1919 and to 6,140 hectares in 1933. There were two companies, with eight factories, in 1919, but in view of the inadvisability of continuing business on so small a scale, the South Sea Development Company, Ltd., capitalized at ¥20,000,000, was established, taking over the Nishimura Colonial Company, Ltd., and purchasing the South Sea Industrial Company, Ltd. Factories of this company are now located on the islands of Saipan and Tinian, the two principal sources of the raw material. Each has a pressing efficiency of 1,200 English tons, but completion of the factory now under construction at Tinian will increase the capacity there to 2,200 tons. Statistics taken in 1932–33 showed 6,140 hectares under cultivation, yielding 43,150 tons of sugar.

Industry

The lack of communication facilities greatly handicaps commercial and industrial advancement, and inadequate supplies of coal, water and iron disqualify manufacturing. The natives have little purchasing power, and the Japanese settlers, numbering 47,000 and possessing superior purchasing power, are scattered all over the isles.

Daily wages for both Japanese and natives at the end of 1934 were roughly as follows :

Japanese:	
Carpenter	¥2.50—¥4.00
Shipwright	2.50— 4.50
Plasterer	2.50— 3.50
Blacksmith	2.00— 3.00
Sugar refinery worker	1.50— —
Mine worker (mechanic)	2.50 —
Mine labourer	1.20— 2.00
Natives:	
Carpenter	¥1.00—¥1.50
Shipwright	1.00— 1.50
Day labourer	.70— 1.20
Mine labourer	.70— —

The value of the annual production of the principal industries for 1935 amounted to ¥17,163,552, of which the followings are principal products :

Sugar	¥ 15,526,770
Alcoholic drinks	332,408
Spirits for industrial use	515,521

Forestry All of the islands may appear to casual travellers to have good forests, but inspection would disclose

that most of the trees are of no practical use. The natives have been careless in removing timber and have disregarded the necessity of reforestation. The only trees receiving attention are the cocoanut palms growing on the island coasts. But this does not mean that forestry enterprises are hopeless. Various kinds of useful trees are seen thriving among the bushes, and the natural benefits here are the very conditions required for the growth of plants,

The cocoanut trees have long been depended on by the islanders for food, and practically every island is shaded by their long trunks and broad fronds of pinnate leaves. According to statistics for 1934, all the cocoanut plantations total 33,572 hectares in area, and the copra yearly produced therefrom amounts to 12,276 tons.

Fisheries There are no records available of fisheries in the islands before the Japanese occupation. A few Japanese made a start shortly after 1914, but unfortunately they all failed, due principally to unpreparedness to cope with the peculiar geographical and climatic conditions of the region. Only recently have profitable undertakings been established. The lack of transportation facilities, the unique conditions and the limited island market make it imperative that the industry be remodelled.

Bonito, tunny, mackerel, sardine, horse-mackerel and shark are found in abundance in neighbouring waters. In shallow waters near the coasts there are seen everywhere shoals of poly-coloured small fish and all sorts of shell-fish. The crocodile, hawk's-bill turtle and sponge of good quality are also plentiful.

The manufacturing side of the fishing industry is still in its infancy and is still limited to the drying of horse-mackerel, bonito and mackerel.

Bonito fishing has, however, advanced to a considerable extent. At present Saipan has 26 motor boats, Palau 30, Truk 17, Ponape 13 and Jaluit 2, which, totalling 88 boats, are all engaged in bonito fishery. Catches in 1934 amounted to ¥22,000,000 or more in value. If fishing districts near the islands other than mentioned above were developed, further advance in the industry would be possible. In addition, some pearls and sponges are cultivated, chiefly at Palau.

Mining The only mining is for phosphate on the Island of Angaur, south of the main island of the Palau group in the Carolines. The island is 15.54 square kilometres in area. The thickness of the phosphate deposit varies from about 3 metres to 7 metres, and the amount available was estimated in 1935 at 1,600,000 tons. For some time after the Japanese occupation of the territory, the mining was carried on by the Navy, but it is now an enterprise of the government. Yearly production is put at 60,000–70,000 tons. In addition to the superintendent, who is an expert, there were in 1935 five assistant experts, 16 clerks, 440 mine workers, 13 labourers and 5 other employees.

The production of phosphate rocks and the value since 1930 follow :

year	Quantity in tons	Value in yen
1930	55,455	1,153,463
1931	59,251	1,125,769
1932	64,573	1,205,172
1933	65,442	1,308,840
1934	71,008	1,778,750
1935	69,355	1,762,310

Encouragement of Enterprises Encouragement and financial assistance are given to a number of undertakings, including vegetable farms ; coffee plantations, which have been receiving subsidies since 1927 ; the breeding of cows, pigs and oxen ; the growing of sugarcane and the manufacture of sugar, which were subsidized to the extent of ¥481,856 in 1934 ; laundries, barber shops, shoe-repair shops and hotels ; the cultivation of pearls ; and the preparation of dried bonito. As the raising of cocoanut trees is recognized as one of the most promising industries in the islands, regulations were issued in 1922 stipulating that to those who seriously undertake the planting of cocoanut palms a subsidy is to be given at a rate not exceeding ¥20 per 2½ acres of newly planted land and not exceeding ¥10 per 2½ acres of old cocoanut groves put in order. Furthermore, the regulations were revised in 1931 to provide a subsidy of one-fourth of the cost of constructing factories for drying copra.

Since 1924, Saipan and Palau have held competitive shows of the local agricultural produce and handmade articles, supported by the government. In addition, representative products of the islands are exhibited at various shows and exhibitions in Japan proper through the good offices of the government. The South Sea Government Products Museum was established and opened at the beginning of 1930 for the exhibition of all sorts of insular products and geographical and historic studies.

An official investigation is being made in places sparsely inhabited by the na-

tives to see whether there is land for additional immigrants, and wherever land is found and designated suitable for colonization every care is taken to assure comforts for settlers. A survey made in October, 1932, showed the existence of land for 393 families. Another investigation is seeking to distinguish lands owned by the government from those possessed by private citizens. Although no accurate figures are yet available, government-owned cocoanut groves are estimated at about 6,600 acres, with 298,000 trees. From these figures, however, it is difficult to calculate the approximate amount of copra obtainable, for some of the groves are unproductive. A comprehensive survey is in progress.

Experimental Stations The Industrial Experimental Station in the islands, where all kinds of experiments and investigations connected with agriculture and stock-breeding are conducted, utilizes farms totalling 145 acres. The Aquatic Products Experimental Station, initiated in 1931 under the control of the Colonial Section of the government, experiments, among other things, with the preservation of bonito and mackerel and the breeding of sponges, turtles and shell-fish. Since the islands, though small in area, extend over vast expanse of sea, it was considered that the natural resources hidden therein deserved a careful investigation. Having found that small experiment boats would not serve for the purpose the Government has built a ship having a displacement of 183 tons with 360 h.p. This vessel is now engaged in investigation of the resources of the sea.

Trade The staple exports are phosphate, copra, sugar, dried bonito and alcohol, which account for 96 per cent of all exports. As to imports, 61 per cent of the total consists of cereals and other provisions and drinks, cotton textile and manufactures, clothing and fittings, metal goods, lumber and various wooden articles.

The open ports are Saipan, Palau, Angaur, Truk and Jaluit. Almost the entire overseas trade of the archipelagos is done with the Japanese mainland save for sundry goods exchanged between Saipan and Guam, and between Jalut and the Gilbert Islands, and for a nominal amount of sugar from Hawaii and copra and sundry goods from Guam, the Gilbert Islands and Manila.

The total exports in 1935 were ¥26,374,195, of which export to the Japanese mainland was ¥23,741,761. Among exports to Japan, sugar represented ¥15,583,934, phosphate, ¥2,166,236, and copra, ¥1,745,573. The total imports in the same period were valued at ¥15,221,411 of which ¥14,620,044 were from Japan. With countries other than Japan, exports amounted to ¥2,632,434 and imports ¥601,367.

Trade with Japan in 1935

Transportation and Communications

There are no roads worthy of the name on the islands, though the Government realizes that they are the first requisite for industrial development. As large appropriations will be needed, their construction will have to wait for some years to come. Nor are there railways for public use. The short one at Angaur extending for 12 miles to the phosphate mine, and that at Saipan and Tinian which extends for 93 miles are exclusively for the hauling of freight belonging to the South Sea Development Company.

Land transportation is now principally carried through the help of motor cars and other vehicles imported from Japan. The character of the roads, length of each and the number of vehicles are illustrated in the following tables :

Extension of Roads, Dec. 31, 1934

Branch office	Width of Road: Less than 4 m	Less than 7 m	Over 7 m	Tota
Saipan	58	33	14	105
Yap	85	—	—	85

Total	149	22	7,780	134	2,651	10	10,746

Improvement of transportation facilities is now being concentrated on harbours. Generally speaking, the ports are favourable for mooring of steamers with a displacement of 3,000 tons, but the long distance between vessels lying at anchor and the landing places, as well as coral rocks extending far into the sea, handicaps their healthful growth as modern commercial ports. The construction of modern harbours depends upon magnanimous appropriations and years of labour. The first real harbour, started in 1926 and completed in 1931 at a cost of more than ¥1,000,000, was at Saipan. A second project was launched in 1927 at Corrol, where, between the vessels at anchor and the landing place, lies a coral-reef. The work came to the completion after the expenditure of ¥106,992 in 1930, as the result of which the route has been reduced to one-third of what it used to be. A new wharf was constructed then with an expenditure of ¥84,00, and since 1934 a work to enlarge the wharf to three times its present size is being pushed on.

Shipping Routes Upon the creation of the South Sea Government, all government-controlled shipping routes were placed under the Nippon Yusen Kaisha, Ltd. The schedule for these lines in 1935 follows :

(1) West Round Line : Plying between Japan and the Philippines, the ships touch at Yokohama, Osaka, Kobé, Moji, the insular ports, Menado and Davao, covering both ways in 44 days. 20 voyages are made in a year.

(2) East Round Line : Plying between Kobé and Jaluit, the ships of the line call at Saipan, Truk, Ponape and Kusaie, covering both ways in 50 days. 10 voyages are made yearly.

(3) East and West Connecting Line : Between Kobé and Jaluit, this line includes calls at various insular ports. Both ways are covered in 53 days, and 6 voyages are made in a year.

(4) Saipan Line : The ports of call are Yokohama, Osaka, Kobé, Moji, Futami, Hachijo Islands, Saipan and Tinian. 28 round-trips, each made in 28 days, are scheduled for the year.

The number of vessels on these lines is 8, ranging from 2,444 to 6,143 tons.

Among the islands themselves, shipping has been entrusted to the South Sea Trading Company, Ltd., which is subsidized by the Government. The services now available are : the Mariana line, connecting scattered islets within the Mariana Archipelago, available 12 times a year ; the Yap, Palau, Truk and Ponape lines, each with 4 trips a year, and the Marshall line, which makes 7 trips a year. In addition there are Ponape, Truk and Palau lines. Five vessels are used, ranging from 196 to 545 tons.

During 1933, vessels that entered and cleared the nine ports of the territory numbered 507 and 520 respectively—381 steamships, 126 sailing vessels clearing and 381 steamships, 131 sailing vessels entering. The number of passengers landing and embarking were 65,083 and 29,697 respectively.

Other Means of Communication All means of communication were placed under the control of the local government when it was established. The Communication Section thus takes care of (1) post, telegraph, telephone, exchange and deposit services, (2) postal insurance, and (3) sea-routes, vessels and nautical markings. There are nine post offices. situated at Saipan, Jaluit, Tinian, Rota, Palau, Yap, Ponape, and Anguar. Each handles wireless messages. The cable and wireless lines now operated are as follow :

(1) Between Yap and Bonin Islands : dispatched by the Chichi-jima Wireless, relayed at Saipan.

(2) Between Yap and all except the Bonin Islands : despatched on the submarine cable through Naha, Ryukyu (Loochoo).

(3) Between the South Sea Islands, except Yap, and Loochoo and Taiwan : sent by submarine cable.

(4) Between the South Sea Islands, except Yap, and the Bonin Islands : sent by the Chichi-jima Wireless, relayed at Saipan.

(5) Between the South Sea Islands and all outside points except the Bonin Islands, Taiwan and Loochoo : despatched by the Tokyo Wireless, relayed at Palao.

Telephone facilities are still limited, switch-boards being installed at only Palau and Saipan.

Judicial System

The judicial branch of the South Sea Government employs the double trial system, the court for the first trial being one of the Local Courts of Justice and for the second trial the High Court of Justice. To each court is attached a public procurator's office. In remote places, minor irregularities, both civil and criminal, are disposed of by the judgment of the branch office heads.

The South Sea Government High Court of Justice is located in Palau. The Palau Local Court of Justice has jurisdiction in the Palau and Yap groups ; the Saipan Local Court of Justice, in the Saipan group, and the Ponape Local Court of Justice, in the Ponape, Truk and Jaluit groups. In 1935 there were three judges, two procurators and four secretaries in the judicial system.

Most legal regulations are the same as in Japan, but due consideration is given to the customs and conditions peculiar to the natives. Their civil affairs are handled quite independently of those settlers from outside ; hereditary practices in land ownership are preserved, none but government officials being permitted to sell, purchase or mortgage their land ; legal proceedings are made as simple as possible, and natives sentenced to less than one year of penal servitude may be subjected to labour instead of being sent to a prison.

Education

Besides elementary schools for the Japanese, there are 24 for natives throughout the insular territory. Though education is not compulsory, schools are provided, clothing and food supplied in particular cases and pupils from remote places received into dormitories. At the schools for native children, natives are employed as assistant instructors. The Japanese instructors must have the full qualifications of elementary school teachers in Japan proper.

There are schools for Japanese children in Saipan, Palau, Truk, Tinian, Yap and Ponape, and where there is no near-by Japanese school a Japanese class is attached to the native elementary school. The course of instruction, requiring six years, and the textbooks are the same as in Japan proper. The natives' elementary education takes three years, and after that they are free to enter continuation courses of two years. The lessons are about the same as those taught in the Japanese schools, save for the stress placed on ethics, calculation and the Japanese language. To teach carpentry, a special institute is attached to the Corrol Public School for natives.

Christian schools number 3 in Saipan, 2 in Palau, 6 in Truk, 2 in Ponape and 1 in Jaluit. All of them are attached to churches and naturally concentrate on diffusing knowledge of Christianity. They are not worthy of being called educational institutions in the strict sense.

With the object of popularizing education, a scholarship society was formed on the foundation of an Imperial donation, ¥2,000, in February, 1924. The society is headed by the Governor, who, with the interest accruing to the original and yearly scholarship grants by the government, does everything possible to encourage deserving students. There is also the South Sea Islands Educational Society, headed by the Governor and with branches at the seats of branch

offices of the government. Its sole object is elevation of the educational standard of the islanders.

The elementary schools for the Japanese, according to statistics taken at the end of April, 1936, have 101 instructors and 5,706 pupils. The instructors number 83 and pupils in the continuation course 3,050. The schools for natives have 58 Japanese teachers and 24 native assistant teachers, 1,310 boys and 1,024 girls attending elementary school course, and 420 boys and 200 girls in the continuation course.

There are some private institutions, mostly kindergartens, for Japanese children. Kindergartens are found in Saipan, Yap, Palau, and Ponape, having in all 14 Japanese teachers and 328 children. A private elementary school for natives in Jaluit has 42 children under 2 instructors, 1 of whom is Japanese.

As there were not very many Japanese children, no middle school was in existence in the archipelago prior to 1933. But owing to the industrial development and the increase of Japanese residents, it became necessary to establish one, and in accordance with the prefectural ordinance of March, 1933, an industrial school was established in the island of Saipan.

Religion

Among the native inhabitants there is no religion worthy of the name, but they have a sort of religious belief. Christianity was first introduced and propagated by Spaniards in 1666. A Jesuit missionary worked enthusiastically in Guam until banished in 1766 by Charles III and is said to have initiated the islanders into the methods of cultivating corn, tobacco, cocoa and potatoes. In more recent times, an American missionary group gained influence, though it finally abandoned work in Ponape and Truk, as did a Protestant mission group from Germany in the former island. Catholicism went on evangelizing side by side with Protestantism and is said to have had more funds. Priests of the Otani branch of the Shinshu Sect of Buddhism established themselves in Saipan for religious propaganda in 1919, and in 1926 a Tenrikyo church was opened in Palau.

Soon after the evacuation of the German Protestant missionaries, the Japanese Congregational Church despatched four missionaries to Ponape and Truk. American missionaries in Kusaie and Jaluit are engaged in educational as well as religious work, and Catholic missionaries, who came in 1921 from Spain, are also active. It is generally accepted that the natives' mild temperament is the result of the long and untiring efforts of the missionaries. Generally speaking, Christianity seems to have placed the entire population under its influence, but very few of the churchgoers understand its tenets.

The Charitable Society, founded on an Imperial donation of ¥1,000, was organized in May, 1927, in commemoration of the demise of the late Emperor Taisho. It is financed by the interest accruing to the foundation and contributions, and its principal mission is salvation of the poor and afflicted. So far its main accomplishment has been caring for lepers, 54 of whom were accommodated in 1935 in 4 sanatoria.

Medical and Hygienic Services

In general, there is less malignant disease in the islands than in other tropical lands. But the fact that most of them are coral reefs and small in area makes it difficult to obtain water supply. Rain-water tanks are the usual source, and they often prove an agency for spreading sickness. When the trade wind begins and ends, bringing changes in the climate, influenza occasionally rages. The natives are most unsanitary and even when taken ill hesitate to consult a doctor. Despite untiring efforts by the authorities to better hygienic coditions, long-establish-

ed customs have impeded progress.

The principal endemic diseases peculiar to the islands are amœboid dysentery, farmbœsia and dengue. Dysentery breaks out at places all the year round, but the symptoms are generally slight. Frambœsia, rampant among the natives, afflicts but few Japanese. In recent years, in consequence of injecting salvarsan as a remedy, the number of those contracting it has decreased.

Dengue is at times so prevalent that nearly every inhabitant has it, but few fall victims to it. Fortunately, the islanders have never been attacked by malaria fever, cholera, pest, yellow fever or sleeping sickness. Typhus, paratyphus, dysentery and a few other infectious diseases, however, are common. One suspected case of small-pox was reported in 1926, but it was agreed that the patient had contracted it while travelling in China and Japan.

Medical Facilities Medical practitioner's offices are maintained by the government, and for the benefit of those living in remote places visiting doctors are despatched several times a year. The entire territory is divided into three classes, A, B and C, according to the standard of living, and medical charges are fixed differently; class A, for instance, paying from a third to half as much as the resident Japanese. The task of health protection lies heavily upon the shoulders of the government, for the number of private medical practitioners within the territory is still far from sufficient. According to statistics taken in June, 1935, officials in the government medical service throughout the insular territory include 24 doctors, 7 pharmacists, 3 secretaries, 8 employees, 9 assistants, 8 midwives and 22 nurses.

Number of Out-Patients of Hospitals, 1934

Special precautions are exercised against the outbreak of epidemics, and all arriving vessels are subjected to strict quarantine inspection. Compulsory vaccination is being practised, as in Japan proper. Geisha and waitresses undergo examination at least once a month. Lepers are found in several places, though the exact number is not yet available. The government opened a sanatorium in Saipan in 1926 and added others in Jaluit and Palau.

The health inspection is conducted in the schools once a year. The results indicate that though the physical growth of the native children generally surpasses that of the Japanese, cases of malnutrition and disease are much more numerous among the former. Inspection of water, and investigation of the causes of deaths are practised to aid health and hygienic improvement.

South Sea Development Company

The South Sea Development Company was founded, as a result of necessary appropriations approved by the Imperial Diet in May, 1936. Following this an Imperial ordinance No. 229 proclaiming its establishment was issued. An establishment committee of 28 were organized and on November 27 the company was formally founded. It is capitalized at ¥20,000,000 of which the Government invested ¥10,546,000 in the shape of its property mostly connected with the mining right of phosphate rocks on Angaur and Fuais Islands in the mandated South Seas and appended property. The remaining amount was invested by those interested in enterprises of these islands.

Its head office is on Kokor Island in Palau group and a branch in Tokyo. The Company's president is appointed by the Cabinet on recommendation of the Overseas Minister. It is vested with right to issue South Sea debentures three times its paid-up capitalization. The Government has power to supervise the company by virtue of the Imperial ordinance. The Company's business scopes include agricultural, aquatic, mining and shipping enterprises, phosphatic rock mining and others, all connected with economic development of South Sea Islands. Baron Ryutaro Fukao is its president. The Company also has established a South Sea Aluminum Mining Company with a capitalization of ¥2,000,000. The Mitsui Mining Company is heavily interested in the new concern, because the former has made an elaborate investigation of bauxite deposits on several mandated islands. As a result of investigation on Palau, Yap and Ponape, the Company has found these three islands have about 5,000,000 tons of bauxite. Annual mining production of bauxite is estimated at about 50,000 or 60,000 tons. Mining of bauxite, ore dressing and loading into ships will be undertaken by the Company. The first consignment is expected to be brought to Japan late in 1937. The proposed enterprise is very significant in that, through this, Japan is expected to be self-sufficient in its annual demand for about 20,000 tons of aluminium, for which 80,000 tons of ore is needed. The discovery of ores on these islands means a guaranteed supply of ores, for which Japan is dependent upon foreign countries, for the next 40 years at least. The South Sea Development Company this year will also establish a South Sea Electricity Company.

MANCHOUKUO

MANCHOUKUO

Geography

Position Extending between 38°43′ and 53°30′ North latitude and 117°50′ and 135°20′ East longitude Manchoukuo is bordered on the north by Siberia and on the east by Korea and the Maritime Province of Siberia.

On the west its borders touch Outer Mongolia, Eastern Inner Mongolia and China proper, while on the south its shores are washed by the waters of the Yellow Sea and the Gulf of Pechili, the coast line extending over 855 nautical miles.

Topography Topographically, Manchoukuo is vast expanse of plains, traversed from north to south by the Great and Little Hsingan (Khinyan or Khingan) mountain ranges in the northwestern section, and by the Changpai mountains near the south-eastern boundary.

Several great rivers with many tributaries run through Manchoukuo, irrigating the plains which they pass. The most notable of these rivers are the Heilungkiang (Amur), Sungari, Ussuri, Yalu, Tumen and Liao rivers.

Climate The climate of Manchoukuo is typically continental, despite the fact that this country lies within about the same latitudes as Japan, Korea, France and England.

Almost unaffected by ocean currents, Manchoukuo has a dry, cold climate with long severe winters and short hot summers. The spring season is windy, strong winds often carrying yellow dusts from the west.

The temperature falls as low as 49° C. below zero in winter and goes up as high as 40.0° C in some localities in summer.

Area, Population, Language, etc.

Area and Population The area of Manchoukuo is put at 1,300,000 sq. km. and is about twice as large as the combined areas of Japan proper, Korea, Formosa and Karafuto. Prior to 1932 little effort was made to obtain reliable census. In that year the population of Manchoukuo was estimated at 30,000,000 souls. Rapid increase immediately followed with the great influx chiefly of Chinese, Chosenese and Japanese. The total population reaches 33,836,898, exclusive of S.M.R. Zone and Kwantung Leased Territory, according to the latest Government figures, showing an increase of about 830,000 in round numbers per year.

Language Chinese is the official language of Manchoukuo, although native Manchus and Mongols living in the interior districts speak their own dialects and Japanese is now being taught at many native schools in Hsinking and other important centres of the country.

The original Manchus now living in the country are estimated to number between six and seven millions, but most of them speak Chinese, only those who live in some districts of Kirin province keeping to their own native dialect.

As the official, social and commercial language, the Peking mandarin language is most widely used in Manchoukuo, but the Shantung, Nanking, Shanghai, Canton and other dialects are spoken among the immigrants from these different parts of China.

Among other foreign languages Japanese and Russian are the best known in the country.

Banditry Manchoukuo has long been noted for its mounted bandits who ravaged the country. Under the old militarist régime even regular soldiers turned to banditry and quite often they were enlisted among the regular troops when in need, so that the troops and bandits were not clearly distinguishable from each other.

Bandits in Manchuria once numbered as many as 200,000 after the Manchurian Incident owing to the fact that the regular troops in the army of Chang Hsueh-liang resorted to banditry. But the strenuous efforts of the Japanese and Manchoukuo troops have reduced the number to about 20,000 by the end of 1935.

As a result of the pacification of Jehol early in March, 1933, the base of operation of the major bandit groups was completely wiped out. With a view to furthering the work of restoring peace and order, a central peace preservation committee was organized in Hsinking. Between the autumn of 1933 and the early spring of 1934, an intensive campaign was directed against the remnant outlaws in Kirin province. Efforts are being made to confiscate the weapons illegally possessed by the people, to reduce the number of the so-called vigilance corps of the professional type, and to give work to the roaming outlaws who surrender to the authorities.

History

Before Ching Dynasty Nearly twenty different dynasties have ruled successively in the territory now under the sovereignty of Manchoukuo, which includes Manchuria and part of Mon-

golia, from the Sushen dynasty to about the second and third centuries down to the Ching dynasty, which lasted from 1636 until 1911, when its rule was replaced by the new régime of the Republic of China.

The Ching dynasty was known as the Nuchen tribe before it gained hegemony in China proper. In 1636, the chief of the Nuchen tribe declared independence at Mukden against the Ming dynasty which was then in power in China proper, naming his country, which extended over the area now forming the territory of Manchoukuo, "Taching."

After rising to independence in Manchuria, Taching gradually expanded its territory until 1664, when conquering the Ming forces it occupied Peking and made that city its capital, after which Manchuria seemed deserted, except for the Han immigrants who came from China proper and settled in Manchuria, though only sparsely.

Thus Manchuria was left neglected by the Manchus, who were almost entirely occupied in colonizing China proper, and when Russians penetrated into Manchuria they could do as much as they liked in this region.

It was not until after the Russo-Japanese War that the Chinese authorities came to see the need of attending to the administration of Manchuria with any degree of seriousness. With this object in view, Hsu Shin-chang was appointed Viceroy of the Three Eastern Provinces in 1907, and notable improvements were effected in the systems of administration, communications and transport during the following few years.

The late Marshal Chang Tso-lin came into power in Manchuria after the Revolution of 1911, when Chao Erh-hsuan, then Viceroy of the Three Eastern Provinces, asked him to render military assistance to resist the advance of the revolutionary forces on Manchuria.

Rise of Chang Tso-lin The rapid ascendancy of Chang Tso-lin then followed and in 1916 he was appointed Inspectator-General of the Three Eastern Provinces, thus virtually placing the entire territory of Manchuria under his autocratic rule.

After a series of three civil wars with the Chihli army, in the course of which General Kuo Sun-lin, one of his lieutenants, made an unsuccessful attempt to overthrow him, Chang Tso-lin started hostilities with the Kuomin army of Feng Yu-hsiang, the so-called "Christian General", in January, 1926, and occupying Peking in December that year, installed himself as Generalissimo at Peking in June, 1927, thus attempting to reign over the entire territory of China.

This marked the peak of the ascendancy of the Mukden war-lord, for, in June, 1928, he had to leave Peking for Mukden ostensibly with the intention of spending the rest of his life in retirement. It was on this trip back to Mukden that the Marshal was killed in a train wreck near Mukden.

Under Chang Hsueh-liang Chang Hsueh-liang, known as the young warlord of Mukden, then stepped into his father's shoes, but finding himself unable to keep effective control over the lieutenants of his late father, he declared allegiance to the National Government in December, 1928, and was appointed commander-in-chief of the North-Eastern Frontier Army. This was followed by the renaming of Fentien province as Liaoning in March, 1929. During the civil war of 1930, Chang Hsueh-liang maintained an attitude of sympathetic neutrality, thereby making it possible for the National Army to defeat the rebels under Yen Hsi-shan and Feng Yu-hsiang. Apparently in appreciation of this, the National Government appointed Chang Hsueh-liang Vice-Commander-in-Chief of the National Army, Navy and Air Forces.

In 1931, Chang Hsueh-liang moved his headquarters to Peking and during his absence, all his influence in Manchuria was overthrown following the outbreak of the Manchurian Incident on September 18, 1931.

Founding of Manchoukuo The effort directed at restoring peace and order as the Chang Hsueh-liang government was driven out of Mukden by the outbreak of the Manchurian Incident first materialized in the Committee for Preservation of Local Peace and Order organized at Mukden. This soon led to the organization of the independent government of Fengtien province, the example of which was followed by Kirin and Heilungkiang provinces. Later, an Administrative Committee composed of members coming from various provinces was organized and preparations for establishment of the new state were made.

On February 18, 1932 the Committee fulfilled its first duty by announcing the declaration of the establishment of an independent state and appointing a standing committee of seven members for discussing various detailed problems. The fundamental principles of the new state as announced by the com-

mittee on February 25 are as follows: the new state to be called Manchoukuo; the ruler to be called Chief Executive; the flag to be a five-coloured one; the new era to be called Tatung; and the capital to be Changchun, which later came to be called Hsinking.

Mr. Pu Yi, who was formally elected Chief Executive by the Administrative Committee, took office on March 9. The law regulating the organization of the government and the law guaranteeing personal rights were promulgated on the same day. On the following day, Cheng Hsiao-hsu, Prime Minister, and other high officials were appointed.

At the request of the people of Manchoukuo, who appreciated and enjoyed the benevolent administration of the new régime under His Excellency Pu Yi, many of their leaders in Mukden and other principal cities and towns petitioned for his enthronement as Emperor of Manchoukuo in the beginning of 1934. This was accepted, and the Chief Executive was formally enthroned on March 1, 1934, the second anniversary of the founding of Manchoukuo. The state was thereafter called Manchoutikuo, which means the the Empire of Manchuria, the Chief Executive the Emperor Kangtê, and the new era Kangtê.

Japan in Manchuria Japan's close relation with Manchuria began with the Sino-Japanese War of 1894–95. The actual invasion of Manchuria by Russia, which was active in that region since 1858, came after the Three Powers' intervention in 1895, which wrested from Japan Liaotung Peninsula, a territory acquired by Japan as a fruit of the War. This was but the beginning of unrestrained activities of Russia in Manchuria. She established the Russo-Chinese Bank with a capital of 15,000,000 roubles, which was followed by acquisition of right from China to build the Chinese Eastern Railway through Kirin and Heilungkiang provinces, together with the right to operate mines in these two provinces.

In March, 1898 Russia acquired a twenty-five years' lease of Liaotung Peninsula, which included the right to construct a railway from a point on the Chinese Eastern Railway down to Port Arthur. This railway line was completed in 1902.

Moreover, Russia took advantage of the Boxer Uprising in 1900 and despatched troops to many important places in Manchuria. These troops Russia refused to withdraw, in spite of her promise to do so after the suppression of the uprising, and concentrated her forces on the Korean border, thus obviously menacing the safety of Japan through Korea.

All these were sufficient to lead to the Russo-Japanese War of 1904–05, in which Japan was victorious. By the Treaty of Portsmouth, Russia transferred to Japan the lease of Kwantung province and all rights, privileges and concessions connected with or forming part of this lease. The Treaty also provided for Russia's transfer to Japan of the railway between Changchun and Port Arthur and all its branch lines, together with all rights, privileges and properties appertaining thereto.

What are known as the special rights and interests of Japan in Manchuria are mainly based on the Treaty of Portsmouth and also on the terms of loans advanced to China for the construction of railways, as well as several other agreements.

Government

Manchoukuo abrogated, with the accession to the throne of the Emperor on March 1, 1934, the Organic Law, which was in force since 1932, and promulgated on the same day the new "Organic Law of Government", which may be taken as provisional constitution. According to the new Law, the Emperor exercises all the executive powers with the assistance of the Privy Council, which may advise him on important state affairs.

The governmental power of the state is divided into four and vested in Executive, Legislative, Judicial and Supervisory Yuans.

The Executive Yuan, which corresponds to the cabinets of other countries, is headed by the Premier and comprises the various Ministers of State respectively heading the Home Affairs, the Foreign Affairs, the Defence, the Finance, the Industry, the Communications, the Justice, the Education, the Imperial Household and the Mongolian Affairs departments.

The legislative power is vested in the Legislative Yuan, whose approval is necessary for all laws and revenue enactments, while the Supervisory Yuan supervises the conduct of officials and audits their accounts. The members of the Council may not be dismissed except for criminal offence or as disciplinary punishment, and may not be subjected to suspension or transfer of office, or reduction of salary, against their will.

The personnel of the Manchoukuo Government, in 1936, includes the following:

Privy Councillors:
Tsung Shih-yi (president).
Kuei Fu, T. Tsukushi,
H. Tanabe, H. Yada.
Hu Ssu-yen, Shen Jui-lin, Chi-mo-te-sai-mu-pei-lo
State Affairs Yuan (Executive Yuan):
Prime Minister—General Chang Ching-hui
Home Minister—Sun Chi-chang
Finance Minister—Han Yun-kai
Foreign Minister—General Chang Ching-hui
Defence Minister—General Yu Chih-shan
Industry Minister—Lu Jun-huan
Communications Minister—Li-Shao-keng
Education Minister—Yuan Chen-tse
Justice Minister—Chang Kuan-hsiang
Imperial Household Minister—Hsi chia
Mongolian Affairs Minister—General Chang Ching-hui
Legislative Yuan
President, vacant

Preparations had been made to effect fundamental revisions in the system of local administration and the four provinces of Fengtien, Kirin, Heilungkiang, and Jehol were reorganized into ten new administrative provinces, and the new system became effective on December 1, 1934. At the same time a new Department known as the Mongolian Affairs Department was formally inaugurated, and the four sub-provincial governments of Hsingan Province were left unchanged. The names of provinces and their governors in March, 1936, follow :

Provinces	Governors
Fengtien	Pao Kang
Kirin	Li Ming-shu
Pinkiang	Yen Chunang-fu
Lungkiang	Chin Pi-tung
Chinchou	Hsu Shao-ching
Antung	Wang Tsu-tung
Jehol	Liu Meng-keng
Sankiang	Chin Ming-shih
Chientao	Tsai Yun-sheng
Heiho	Chung Yu
Hsingan, Eastern Division	E-lei-chun
„ Southern „	Chang Cheuh
„ Western „	Cha-ko-erh
„ Northern „	Ling Sheng

Changes of Government System

Thorough reform of the administrative machinery of the Manchoukuo Government was announced on May 8, 1937, and went into force on July 1 of the same year. It was designed to increase the efficiency of administration and to prepare for further national development. Under the new plan, the Legislative and Supervisory Councils and the six Ministries—of Foreign Affairs, Defence, Civil Affairs, Finance, Industry and Mongol Affairs—were abolished. The Premier became the only State Minister. The remaining Ministries are placed under his direct control.

In place of the six Ministries abolished, four new Ministries, namely, Public Peace, Civil Life, General Industry and Economic Affairs, were established, while two new bureaux were established to deal with foreign affairs and matters relating to Khingan Province respectively. An auditing bureau also was established to replace the Supervisory council. The director of the new office, which came under the direct control of the Premier, is to report to the Premier on the result of auditing every fiscal year.

As the focal points of the administrative reform, the General Affairs Board of the State Council is strengthened and the president is entrusted with the task of assisting the Premier in State affairs. The present system of advisers of State affairs was abolished.

Under the reform plan, the Premier is held directly responsible for the administration of foreign affairs, direction of general affairs relating to local administrative organization and the supervision of local administrators, including governors of the sub-provinces of Hsingan. The heads of the Ministries are to supervise local administrators in regard to matters which come under their respective jurisdictions.

To deal with foreign affairs, the new foreign affairs bureau was created, while the home affairs bureau, also created, is entrusted with the general instruction of local administrative bodies and the supervision of local administrators.

The home affairs bureau consists of a secretariat, control section and supervision section.

Directors of the foreign affairs bureau and the home affairs bureau came under direct control of the Premier, while the president of the General Affairs Board, in the capacity of chief aide to the Minister of State, is practically in a position to exercise control over the affairs of these bureaux.

Under the presidency of the Premier, is created a Planning Council, which is divided into three committees to deal with economic affairs, educa-

tion and the promotion of people's welfare respectively. In these committees, fundamental questions relating to these subjects will be discussed by experts to help the Premier establish national policies.

Into the new Public Peace Ministry was incorporated the War Ministry and the police section of the Civil Affairs Ministry. Its head office is divided into a secretariat and staff, military affairs and police sections. The staff section is to deal with the command and training of the army as well as co-operation between the army and police.

The offices of War Minister and chiefs of the staff and military affairs sections are taken up exclusively by military officers, while civil officials are appointed vice-chiefs of these two sections and director of the police section. All sectional vice-chiefs are prohibited from taking part in matters relating to the command of the army.

The Manchoukuo army is reorganized and divided into two classes, namely, one held responsible for national defence, and the other is called "police army," which is entrusted with the maintenance of peace and order in various parts of the country. The former is requested to assist the latter in the maintenance of peace and order at home.

All local administrators are empowered to call out units of the army whenever they find it necessary to do so in order to maintain order in their respective administrative districts.

All the advisers to the War Office are to carry on as advisers to the Manchoukuo army for the time being. The existing route police forces are reorganized into the special railway police forces, which come under direct supervision of the Minister of Public Peace.

The new Hsingan bureau is to deal with all Mongolian affairs, and its director is requested to assist the Premier in connection with the administration of Mongolian tribes and also in co-ordinating Mongolian affairs. The director is automatically entitled to participate in a meeting of the State Council.

The Civil Welfare Ministry is to take charge of education, social welfare, insurance and other fields involving the stabilization of national livelihood, while the new General Industry Ministry is entrusted with the task of preserving and developing national strength as well as the exploitation, utilization and conservation of natural resources for the purpose of replenishment of national defence.

All economic administration necessary for or incidental to the exploitation and utilization as well as conservation of natural resources is undertaken by the Economic Affairs Ministry, which is to consist of the commercial, taxation and financial sections, in addition to a secretariat.

While all the existing focal administrative organizations are reorganized so as to best adapt themselves to prevailing conditions in the respective localities, efforts will be made by the Government to strengthen local autonomous administration.

The main object of the present reform programme is to harmonize all the races living in the country, to disseminate the common spirit and virtue underlying the rapprochement between Japan and Manchoukuo, and to effect the healthy development of the rising State. The salient features of the present administrative reform plans may be summed up as follows :

1. A substantial simplification of the whole administrative machinery will be effected, with strengthening of the system of unified control over the planning and operation of all the departments in the Government in order to promote the efficiency of the State administration.

2. To establish stricter peace and order promptly, all the organizations in this regard will be co-ordinated and unified under a single authority, while consideration will also be given to the regulation of local military and police forces and the general administration.

3. Specific attention will be paid to facilitating the execution of the five-year industrial development programme with the formula of controlling staple industries in the country be consolidated.

4. For the purpose of elevating the public spirit, cultivating national power and developing agrarian communities, all the organs relating to the respective administrations will be unified and strengthened rationally.

5. Steps will be taken to effect a closer co-ordination of the Central and local governments, while the local administrative organs will be replenished and strengthened so as to break the tendencies of standardization.

6. Efforts will be made to replete the substance of the local administrations as organic and combined organizations in the lines of politics, culture and economics, as well as to encourage the

development of local autonomy.

General Chang Ching-hui remains as Premier. Important appointments in the central and district governments include the following :

Mr. Han Yun-chieh, Minister of the Department of Finance, is Minister of the Department of Economy.

Mr. Lu Jung-huan, Minister of the Department of Industry, is the Minister of Industries.

Mr. Sun Chi-chang, Minister of the Department of Civil Affairs, is the Minister of Civil Life.

General Yu Chieh-shan, Minister of the Department of Defense, is the Minister of Peace Preservation.

Mr. Chang Huan-siang retains the post of Minister of Justice.

Mr. Li Shao-keng retains the post of the Minister of Communications.

Mr. Naoki Hoshino, chief of the General Affairs Board of the State Council, became director of general affairs.

Simultaneously with the renovation of the central government, two new provinces were formed. Tunghwa Province includes parts of Antung and Fengtien Provinces, while Mutanchiang Province is formed from part of Pinchiang Province.

Provincial officials under the reorganization include the following :

General Yen Chuan-fa, Governor of Pinchiang Province, became the Governor of Kirin Province.

General Chin Ming-shih, Governor of Sanchiang Province, became Governor of Jehol Province.

Mr. Shih Li-pen, mayor of the Special Municipality of Harbin, became the Governor of Pinchiang Province.

Mr. Wang Tzu-tung, Governor of Antung Province, became the Governor of Chinchow Province.

Mr. Huang Fu-shun, chief of the board of district affairs of the Department of Civil Affairs, became Governor of Antung Province.

General Yu Shen-chang, commander of the 1st Army District, became the Governor of Sanchiang Province.

Mr. Hsu Kuei-heng, chief of the civil affairs bureau of Antung Province, became the Governor of Heiho Province.

Mr. Lu Yi-wen, secretary of the Premier, became the Governor of Tunghua Province.

Mr. Rikutaro Oshima, chief of the police board of the Department of Civil Affairs, became the Governor of Mutanchiang Province.

General Elochun, Governor of Hsingan East Province, remains in office.

General Jumeiah, Governor of Hsingan South Province, retains his office.

General Nolakachapu, chief of the civil bureau of Hsingan West Province, became Governor of Hsingan West Province.

General Erkinpato, Governor of Hsingan North Province, remains in office.

Mr. Hsu Shao-ching, Governor of Chinchow Province, became mayor of Hsinking Special Municipality.

Mr. Wei Huan-tsang, chief of the educational bureau of Fengtien Province, became the mayor of Harbin Special Municipality.

Mr. Amiichi Ebara, chief of the general affairs bureau of Harbin Special Municipality, became mayor of Harbin.

The Manchoukuo Condordia Society

This is one of the national organizations of Manchoukuo Empire and also organization for Manchurians for achievement of ideals of the foundation of Manchoukuo by the hands of Manchurians. It is known by Manchoukuo name Hieh Hu Hui. Since its establishment on July 25, 1932, it has spread its influence to various parts of the Empire. Its members consist of people of all walks of life, Government officials, the military, tradesmen, farmers, labourers and others. Its headquarters are in Hsinking with 74 main branches and 1,987 sub-branches. The number of members at the end of September, 1936, was 439,728. The president is Premier of Manchoukuo, its vice-president is Minister of Industry, honorary adviser is Commander of the Kwantung Army and its adviser is Chief of Staff of the same army.

Manchoukuo Five-Year Plan

Approximately ¥2,353,000,000 is estimated to be necessary to carry out Manchoukuo's five-year industrial plan. The plan was filed with the Manchurian Affairs Bureau of the Cabinet, the Finance Ministry and other Japanese Government institutions. The South Manchuria Railway Company is charged with raising ¥900,000,000, the Manchoukuo Government ¥700,000, special companies in Manchoukuo ¥260,000,000, private companies ¥340,000,000 and the Industrial Bank of Manchou ¥100,000,000. Details follow :

IRON AND STEEL

	Goal of increased production (1,000 met. tons)	Present production	Money needed for the Plan (¥1,000)
Steel	2,250	580	88,500
Pig iron	2,400	850	108,500
Ore	6,600	2,700	31,440
Total	11,250	4,130	228,440

FUEL OIL

Fushun liquefaction	100	—	73,000
Fuhsin „	200	—	100,000
Hsulan „	150	—	50,000
Ssupingkai „	50	14	18,000
Shale oil, Fushun	500	140	36,900
Shale oil, Sanshin	300	—	81,900
Alcohol	56	6	13,000
Total	1,356	159	317,300

COAL

Black coal	24,600	11,700	140,110
Brown coal	900	—	9,900
Total	25,500	11,700	150,010

POWER

	(k.w.)	(k.w.)	
Water power	350,000	—	—
Steam	850,000	420,000	—
Total	1,200,000	420,000	214,500

ROLLING STOCK

Locomotives, pasenger cars and freight cars	—	—	27,813

MISCELLANEOUS

	(m. tons)		
Aluminium	20,000	—	38,000
Magnesium	200	—	560
Pulp	120	60	15,000
Salt	875	275	15,750
	(Yen)		
Gold mining	20,000,000	—	50,000
Soda ash	72	36	4,000
Asbestos	5	—	500
Lead	124	22	4,800
Meat	50	—	7,000
Automobiles	4,000	—	20,000

Armaments Manufacture of war supplies, including tanks, will be increased to five times the present amount with an estimated expenditure of ¥100,000,000.

Aviation Manufacture of 240 planes a year is the goal. For this, ¥30,000,000 is appropriated.

Expenditures for the above enterprises total ¥1,223,673,000.

Agricultural Production A total expenditure of ¥122,194,000 is required to increase agricultural production.

Stock Breeding Expenditure of ¥7,500,000 needed for the five-year stock-

breeding plan.

The cost of all the above enterprises totals ¥1,353,367,000, plus ¥1,000,000,000 for transportation expenditures.

National Defence

History The Manchurian army has its origin in the Liian army which rendered great services in founding the Ching dynasty. They were since then hereditary and were garrisoned in various important points. After the Chinese Revolution of 1911 the army was modernized, and in Manchuria, there were stationed two divisions of the 27th and 28th numbering from 30,000 to 40,000. When Chang Tso-lin came into power, he increased it to 200,000, which was again increased by his son to 260,000 regulars with an additional 100,000 held as provisional forces. There was kept also a small fleet of 7 gunboats to protect trade carried on the rivers. These were the military forces in service under Chang Hsueh-liang at the time of the outbreak of the Manchurian Incident.

Present Status The army and navy of the empire is under the supreme command of the Emperor, and is garrisoned in defence of particular districts prescribed by the Emperor.

The Defence Department of Manchoukuo combines both services of army and navy having the following bureaux and sections :

(1) Staff Bureau, (2) Supplies Bureau, (3) General Affairs Section, (4) Justice Section, (5) Personnel Section, (6) Survey Section, (7) Accounting Section, (8) Auditing, (9) Naval Administration, and (10) Armaments Section.

Besides there are the Military Advisory Board, where a number of Japanese officers are engaged who direct the military administration and the Investigation Board which engage in the investigations into the subjects of military affairs and also in propaganda.

The military forces at various points are :

1. The Imperial Guards
2. The Seian Force
3. The Flying Corps
4. The Gendarmerie Corps
5. 1st Brigade in command of 1st military district
   2nd „ „ „ „ 2nd „ „
   3rd „ „ „ „ 3rd „ „
   4th „ „ „ „ 4th „ „
   5th „ „ „ „ 5th „ „
6. Kirin army
7. Heilungkiang army

The army numbers 80,000. As to the coastal and river defence, the country maintains 11 gunboats and 4 other vessels.

Foreign Relations

With Japan (1) Recognition by Japan. Japan is the only country with which Manchoukuo is exchanging envoys. Her relation with Japan is defined in the Japan-Manchoukuo Protocol signed on September 15, 1932, between the two countries at Hsinking, providing for their mutual defence. (See p. 205) The document is also notable for the fact that by virtue of it, Japan accorded recognition de jure to the new state far ahead of other nations.

(2) Emperor Kangtê's visit to Japan. In June, 1934, Prince Chichibu was sent to the Empire to convey the Imperial Message of Congratulation to the Emperor and Empress of the new state. In return for this, the Emperor Kangtê paid a visit to Japan, arriving in Tokyo on April 6, 1935, and made a formal call on the Emperor of Japan on the same day. He stayed till April 24.

(3) Abolition of Extraterritorial Privileges. Manchoukuo has confirmed, by the Japan-Manchoukuo protocol, the extraterritorial privileges which Japan had been enjoying under treaties with China. But the development and progress of the country, since its founding, in all branches of administrative system, which are connected with extraterritoriality, for instance, in judicial, police and taxation systems have been noteworthy. In fact more than ¥8,000,000 was set up for the reform of these systems in the budget for 1934. Accordingly Japan decided to give up the rights of extraterritoriality and obtained the Imperial sanction for doing so on August 9, 1935. It was decided in principle, but the actual abolition is to be effected in gradual stages and in accord with the reform of the governmental systems and organs of Manchoukuo.

The Government is exerting full efforts, according to the report published on January 19, 1936, to draw up laws in connection with Japanese industrial activities in Manchoukuo, to make improvements in the tax system and tax offices, to readjust and complete the police system, to institute modern judicial procedure in the country and to effect improvements in special local and supreme courts in city districts, and to make preparations for having communications business transferred to the Manchoukuo Government which hitherto has been carried out by Japanese post and telegraph offices in Kwantung

province and the South Manchuria Railway Zone. A joint committee of the representatives of both Governments had been making studies as to the scope and adequate date for the abolition of the extraterritoriality and the treaty between Japan and Manchoukuo concerning the residence of Japanese subjects, taxation, etc. was signed at Hsinking, June 10, 1936, which is to come into force on July 1, 1936. (The treaty is given in full in the Appendix.)

(4) Japan-Manchoukuo Economic Agreement. The agreement regarding the establishment of a joint Japanese-Manchoukuo economic commission was signed on July 15, 1935, at Hsinking by General Jirō Minami, Ambassador to Manchoukuo and commander of the Kwantung Army, and Mr. Chang Yen-ching, Foreign Minister of Manchoukuo. The object of the agreement is to extend to the economic field the inseparable relations between Japan and Manchoukuo that already exist in the defence and diplomatic fields and to accelerate the formation of the economic bloc between the two countries.

(5) Establishment of Custom-houses at Korean frontier. The Japanese- Manchoukuo agreement for the establishment of the Manchoukuo custom-houses at the three northern Korean ports and on the frontier bordered by the Tumen River along the Hsingking-Tumen River was signed on May 22, 1935 at the Foreign Office of Manchoukuo by General Jirō Minami, Ambassador to Manchoukuo and Mr. Chang Yen-ching, Foreign Minister of Manchoukuo.

(6) Conclusion of Postal Treaty. With the formalities as to the conclusion of the postal treaty between the two countries completed the Postal Treaty was signed on December 26, 1935, and was put in force as from January 26, 1936.

(7) Lease of Land. Though there was a provision as to the right of the Japanese to lease land in southern Manchuria, nothing of the kind existed as regards northern Manchuria, and the subject of extending the right of the Japanese to the north had been discussed ever since the establishment of Manchoukuo. The matter had been carefully studied between the two countries and the result of the study was published on December 30, 1934 as a preliminary arrangement. According to this arrangement, the right of the Japanese to lease land in southern Manchuria would be extended to the north, which will be soon invalidated by a treaty between the two countries in due course.

With the League of Nations In regard to the issue of the Sino-Japanese dispute at the League of Nations, Manchoukuo was concerned only indirectly as it is not a member of the Geneva organization. During the Council and the Assembly meetings of the League at which the problem was discussed, late in 1932 and early in 1933, General Ting Shih-yuan, who was later appointed Manchoukuo Minister to Japan, stayed in Geneva as a personal representative of the then Chief Executive, now the Emperor Kangtê. With the assistance of a few advisers he presented the case of his country on several occasions to the League of Nations through the Japanese delegation, and otherwise made efforts, though without avail, to influence those attending the League meetings in favour of his country.

With Soviet Russia (1) Purchase of N.M.R. In view of ceaseless troubles concerning the North Manchuria Railway, Soviet Russia proposed to Manchoukuo to dispose of the railway. The first conference was opened at Tokyo in June, 1933, between the representatives of Manchoukuo and Soviet Russia with a few Japanese officials attending the parley. On account of the great disparity of opinions as to the value of the railway the conference had not proceeded smoothly until, at last through the mediation of Mr. Hirota, then Foreign Minister of Japan, Soviet Russia finally came to agree on March 23, 1935 to transfer the railway to Manchoukuo at ¥140,000,000. (See Appendix.)

With Great Britain and the U. S. A. The Manchoukuo Government decided to make the Petroleum Monopoly Law effective as from April 10, 1935. The governments of Great Britian and America protested against Japan stating that the above law infringes the principles of the Open Door and Equal Opportunity established by the Nine-Power Treaty. The Japanese Government replied that it was an independent action of the state of Manchoukuo, and that Japan could do nothing with it. The reason of the protest of the British and American Governments was that the capital invested in petroleum in Manchoukuo by their nationals would be practically expelled from the country by the coming into force of this law. But the Manchoukuo Government had to issue this law to effectuate the control of its principal industries which were absolutely necessary for her development, with no aim to expel foreign capital.

With China (1) Postal and Railway Business. Manchoukuo, when she proclaimed her independence on March 1,

1932, notified China that her relation with the latter would be the same as with any other power, and declared that she would take over the business of postal service on the 20th of the same month. The country made new stamps and post cards, and had actually taken over the postal business on July 25, 1932. Matters in connexion with the revival of the postal business which had been pending between Manchoukuo and China were satisfactorily settled and ordinary mail service was opened between the countries as from January 10, 1935, and that on money order and parcels as from February 1. As regards cables the negotiation came to a satisfactory conclusion on October 17, 1935. As to the collection of customs duties, the business was also taken over by the Manchoukuo Government on September 25.

The question of railway, which was another important problem, came to a satisfactory solution on June 28, 1934, and the railway connection which had been severed for 2 years and 9 months since the occurrence of the Manchurian Incident was restored. Since July 1, 1934, one train each from Peiping and Mukden is being despatched every day.

(2) Exchange of Amity Commissions. The East Hopei régime decided to enter into formal relation with Manchoukuo. A goodwill commission was sent by the East Hopei Anti-Communist and Autonomous Government headed by Chih Tsung-mo which formally presented to Foreign Minister Chang Yen-ching of Manchoukuo a personal letter from Mr. Yin Ju-keng, chairman of the Tungchow Council, voicing a desire for friendship and amity with Manchoukuo. The commission was received in audience by the Emperor Kangtê on the 17th. In return the Manchoukuo Government despatched an amity mission of six headed by Mr. Kao Chung-lu which delivered a letter of amity signed by Foreign Minister Chung Yen-ching to chief Executive Yin Ju-keng on May 18.

According to the statement of the chairman of the East Hopei régime, the Government expects to conclude a treaty of friendship with Manchoukuo and the negotiation with the latter country would then be made direct by the new régime.

With Germany The German economic mission to East Asia headed by Dr. Otto Carl Kiep arrived at Hsingking on February 32, 1935. Since then the commission made a study of economic conditions in Manchoukuo, and later proceeded to Tokyo to take up the subject of concluding a treaty with Manchoukuo through the intermediation of Japan. As the result an announcement of the conclusion of a German-Manchoukuo trade agreement was made by the Manchoukuo Embassy on May 1, which was signed on April 30.

Diplomatic Relations with Dominica On August 16, 1934, the President of Dominica presented his autograph letter to the Emperor of Manchoukuo through the Foreign Office of that country, in return for which the Emperor sent his dated January 21, 1935, to the President. The Foreign Minister of the Republic therefore sent a letter of appreciation to the Emperor through the Foreign Office of Manchoukuo, and in this manner diplomatic relations between the two countries have been established.

Recognition by Salvador On March 3, 1934, the Republic of Salvador declared that she would recognize Manchoukuo as an independent state.

With the Holy See Under date of April 18, 1934, the Holy See notified the Manchoukuo Government of its decision to form a separate mission field in Manchoukuo, independent from that of China, and appointed the Rt. Rev. Bishop A. Gaspais as Acting Apostolic Delegate in Manchoukuo with the intention to contribute to the moral and intellectual development of the country according to the disposition of the Manchoukuo authorities. This notice was confirmed on August of the same year by His Eminence Pierre Cardinal Fumasoni-Biondi, prefet de la S. Congregation de la Propagande.

Passport Visé Meanwhile, the Department of Foreign Affairs of Manchoukuo assiduously endeavoured to pave the way for the opening of diplomatic relations with European and American countries, and promulgated new regulations governing the granting of passports and their visés effective June 1, 1933, and otherwise took steps to provide travelling facilities for foreigners.

Simultaneously with the enforcement of the new regulations, the Manchoukuo Foreign Office opened four passport offices in Antung, Dairen, Yingkow and Suifeng on June 1 to which Shanhaikwan, Manchuli, Tumen, Heiho and Kupeikou were added later, pursuant to the stipulations of the said regulation. Between June 1, 1933 and September 30, 1934, a total of 11,395 passports of foreigners entering or passing through the country were examined and viséd, an average of 950 a month.

Manchoukuo Consulates Another event worth mentioning in connection with Manchoukuo's foreign relations

was the opening of the Manchoukuo consulate at Blagoveschensk, the first consulate to be established in a foreign country by the new nation, late in September, 1932. Mr. Kuei Heng-chin was appointed in charge of this consulate.

The number of Manchoukuo residents in Blagoveschensk, which is a Soviet city located near the Siberian border on the bank of the Amur River on the opposite side to Heiho, a Manchoukuo town, is approximately 7,000, most of them being engaged in the retail business.

Manchoukuo's second consulate in Soviet Russia was opened at Chita in January, 1933, the staff being headed by Mr. Li Yuan as consul.

Also the consulate at Shingishu, Korea, the first of the kind to be established in the Japanese Empire, was opened on November 9, 1934.

Exchange of Ambassadors The recognition of Manchoukuo by Japan on September 15, 1932, was acknowledged by the despatch of Pao Kuan-cheng to Japan by the Manchoukuo Government, to stay in Tokyo as Manchoukuo's representative, towards the end of the same month, and later by the visit to Tokyo by the Foreign Minister of Manchoukuo, Hsieh Chieh-shih, in November, 1932.

Meanwhile General Nobuyoshi Muto, commander of the Kwantung army, ambassador to Manchoukuo and governor of the Kwantung Leased Territory, who signed the Japan-Manchoukuo Protocol on September 15, 1932, presented his credentials as ambassador to the Chief Executive of the country.

This was followed by the arrival of General Ting Shih-yuan on May 10 in Tokyo as the first Manchoukuo Minister to Japan. Meanwhile Manchoukuo desired to elevate the legation at Tokyo to the status of an embassy in view of the increasing importance of her relation with Japan, which was endorsed by Japan on May 21, 1935. The first ambassador of Manchoukuo to Japan was Mr. Hsieh Chieh-shih, the former minister of Foreign Affairs.

Shortly after the conclusion of the Jehol expedition, Marshal Muto, to which rank he was promoted, fell ill in Hsinking and died on July 27. He was succeeded at his post by General Takashi Hishikari, and then by General Jirō Minami. The latter resigned and the post has been taken by General Kenkichi Uyeda in March, 1936.

Diplomatic Representations Japan is the only nation which has an embassy in Manchoukuo. Consulates established by Japan and other powers in that country and their locations follow:

Japanese Embassy at Hsinking.
Japanese Consulates-General at Hsinking, Mukden, Harbin, Kirin and Lungchingtsun.
Japanese Consulates at Antung, Yingkow, Tsitsihar, Paitsokuo, Chihfeng, Tunghua, Hailung, Taolu, Hunchun, Manchouli, Chengchiatun, Toutaokou, Chinchow, Hsinminfu, Hailar, Suifenho, Yenki, Tumen, Tunhua and Chengtê.
British Consulates-General at Mukden and Harbin.
British Consulate at Yingkow.
American Consulates-General at Mukden and Harbin.
French Consulates at Mukden and Harbin.
U.S.S.R. Consulates-General at Mukden and Harbin.
U.S.S.R. Consulates at Tsitsihar, Heiho, Suifenho and Manchouli.
German Consulates at Mukden and Harbin.
Italian Consulate at Harbin.
Dutch Consulates at Harbin and Yingkow.
Belgian Consulate at Harbin.
Danish Consulate at Harbin.
Norwegian Consulate at Yingkow.
Polish Consulate at Harbin.
Czechoslovak Consulate at Harbin.
Portuguese Consulate at Harbin

At Dairen, Kwantung Leased Territory

American Consulate
British Consulate
U.S.S.R. Consulate
German Consulate
French Consulate
Dutch Consulate
Swedish Consulate
Finnish Consulate
Belgian Consulate
Estonian Consulate
Norwegian Consulate

Finance

While the finance under Chang Tso-ling was comparatively sound in his earlier administration, the expenditure commenced to increase steadily due to his army being enlarged in latter days. Thus in 1926, the total expenditure was ¥120,000,000 and showed a budgetary deficit of ¥12,000,000. When he was succeeded by his son, Chang Hsueh-liang, the deficit was further increased. The recklessness of his finance was evidenced by the fact that, of the total expenditure of ¥142,500,000, the sum defrayed for the military purpose amounted to ¥114,720,000. The deficit thus creatd was

met by increased taxes and inflation of currency, thereby causing the people great misery.

In view of the deplorable state of affairs, as above stated, the leaders of Manchoukuo directed their efforts for the stabilization of the financial conditions of the country without increasing tax economic pressure on the people. It is much to the credit of the new state that such a rapid and sound development has been made in finance and currency in so short a time.

Manchoukuo's national budgets since its foundation follow :

MANCHOUKUO'S NATIONAL BUDGET

(In M¥1,000)

Fiscal Years	Revenue			Expenditure		
	Ordinary	Extra-ordinary	Total	Ordinary	Extra-ordinary	Total
1932-33	97,386	15,922	113,308	104,482	8,826	113,308
1933-34	132,134	17,035	149,169	107,449	41,720	149,169
1934-35	163,321	25,404	188,725	131,662	57,063	188,725
1935-36	88,605	16,392	104,993	62,917	42,081	104,993
1936-37	193,234	26,170	219,405	134,322	85,082	219,405

Manchoukuo Budget for 1937 The Manchoukuo Government's budget for the fourth fiscal year of Kangtê covering the period from January 1 to December 31, 1937, which had been approved by the Privy Council on December 24 last, was published in the Official Gazette of the 26th of the same month.

The new budget, exclusive of the Special Accounts, shows, as compared with that of previous fiscal year, an increase of M¥28,693,760 in both revenues and expenditures (an increase of M¥18,-397,748 in ordinary revenues and M¥ 10,-296,012 in extraordinary revenues ; a decrease of M¥15,210,367 in ordinary expenditures and an increase of M¥43,-904,127 in extraordinary expenditures).

Increases in revenue estimates are attributable mainly to increases in tax revenue estimates amounting to M¥15,-100,000 (it may be noted that the previous fiscal year's tax revenue estimates contained M¥23,848,000 from the salt gabelle, whose estimated revenue for the current fiscal year has been included in the monopoly profits owing to the inauguration of the Salt Monopoly), in the monopoly profits amounting to M¥4,-600,000 (revenues formerly classified as Salt gabelle and the Salt Transportation Office profits have been included in the monopoly profits for the reason stated above), and in the amount brought from the Special Accounts, amounting to M¥8,000,000 including an increase of M¥ 5,000,000 in receipts from bond issue.

New special accounts have been created, namely, the Hydro-Electric Power Enterprise Construction Account for financing the construction work of the projected hydro-electric power plant on the Second Sungari, the Horse Race Account, the Prison Account for effecting improvement in the system of criminal administration, and the State Loans Account, while on the other hand the former Opium Monopoly, Oil Monopoly and Salt Transportation Office Accounts have been unified into the Monopoly Enterprises Account and the Sinking Fund Account and the Adjustment Fund for Old Loans secured on Customs Duties and Salt Gabelle Account have been merged into the Loan Adjustment Fund Account.

Loans to be raised during the current fiscal year total M¥151,398,000, of which the sums M¥15,000,000, M¥83,500,-000, M¥40,663,000 M¥3,150,000 and M¥9,-085,000 are to be alloted, respectively, to the General Accounts, the Investments Special Account, the Railway Loans Special Account, the Hydro-Electric Power Enterprise Construction Special Account and other working funds.

A characteristic feature of the new budget is that, though the traditional policy of conservative and sound finance has been adhered to in financing the general governmental outlays, the floatation of a domestic loan amounting to M¥15,000,000 is projected to finance undertakings for the promotion of the people's welfare such as building of state highways or other public works. Furthermore, in regard to various development works to be financed in the Investments Special Account, the outlays for which are to be met by floating loans in Japan, not only has a source of revenue been secured for the redemption of such loans, but care has also been taken not to allow any hitch to occur in their financing, by restricting

disbursement from that Account to enterprises which offer ample possibilities of immediate gains only, making those outlays which promise no interest, such as the investments in the Manchuria Air Transport Company and the Manchuria Colonization Company or loans to be advanced to the credit associations without interest, fall on the General Accounts.

Of the amount of loans to be raised during the current fiscal year, M¥83,500,000 for the Investments Special Account and M¥3,150,000 for the Hydro-Electric Power Enterprise Construction Special Account may be considered the sums to be invested by the Government in enterprises under the so-called Industrial Five-Year Plan, but as part of the Sinking Fund amounting to M¥52,000,000 may be utilized to this end, the final amount of loans to be floated in Japan for the Five-Year Plan will be something between M¥60,000,000 and 70,000,000 this year. The sum of M¥3,150,000 appropriated for the hydro-electric power enterprise construction is the first yearly instalment of the total outlay of M¥47,300,000 for the undertaking, which is to be spread over five years.

It is noteworthy that in the new budget reductions in taxes and duties have been set down to the amount of M¥8,000,000 with a view to lightening the people's burdens. This comprises roughly M¥4,100,000 reduced by the inauguration of the salt monopoly, M¥2,210,000 and M¥300,000 by the restoration of the live-stock tax and the slaughtering tax to the revenues of the provincial governments, M¥700,000 by the revision of the stamp duty and M¥750,000 by the abolition of Shui-Kiang Chuan (river conservancy tax).

The figures of the new budget are as follows :

GENERAL ACCOUNTS BUDGET FOR 1937

Revenue Estimates

Jurisdiction	Ordinary	Extraordinary	Total
General Affairs Board	30,330	25,933,904	25,964,324
Dept. of Civil Affairs	11,141,911	477,919	1,619,830

	Gold Refining Enterprise	1,500,000	1,500,000
Dept. of Communications	Postal Administration	5,898,249	5,898,249
Dept. of Justice	Prison	5,414,622	5,114,622
	Total	542,959,029	506,086,364

Government Monopolies As a means of lightening the tax burdens of the people and to suppress the smuggling of salt in the Korean border districts, the Government, since September, 1933, has reduced the price of salt in the Chientao district by sums ranging from M¥2.20 to M¥3.55 per picul. For the relief of the inhabitants of Kirin and Heilungkiang provinces who suffered greatly during the old régime, the authorities have cut down the salt tax and salt price by M¥1.00 per picul since March, 1934, although this has resulted in the decrease of the monopoly profits by M¥1,100,000.

The opium monopoly system has been instituted for the purpose of eliminating the evil practice of opium-smoking and controlling the smuggling of opium and the cultivation of poppy. The profits from the monopoly are set aside to cover the expenditures for the control, relief and education of the opium addicts.

National Loans and Sinking Fund Although the Government makes it a point not to float loans to cover any revenue deficit, the following national loans have been raised since the founding of the new régime :

	Domestic	Foreign
Loans	M¥61,825,250.00	G¥100,000,000.00
Cash Debts	39,246,452.46	18,290,000.00
Total	101,071,702.46	118,290,000.00

(A) Loans

1. Old Foreign Claims Liquidation Fund Loan M¥5,147,950.00
2. Shen-Hai, Hu-Hai, Tsi-Ko Railway expropriation Fund loan 11,928,000.00

3.	Loan for paying bonus to Customs staff	3,599,300.00
4.	Central Bank of Manchou loss compensation loan	33,000,000.00
5.	State founding bonus loan	8,150,000.00
	Total	61,825,250.00
1.	State founding loan	G¥30,000,000.00
2.	First enterprises loan	10,000,000.00
3.	First N.M.R. loan	30,000,000.00
4.	Second N.M.R. loan	30,000,000.00
	Total	100,000,000.00

(B) Cash Debts

1.	National Highways Construction Fund	M¥7,000,000.00
2.	Forestry Recovery Fund	1,689,526.70
3.	Capital Construction Fund	5,500,000.00
4.	State Founding Fund (Central Bank shares)	7,500,000.00
5.	Opium Monopoly Fund	2,600,000.00
6.	Cities Construction Fund	2,500,000.00
7.	Manchou Development Co. Investment Fund	3,000,000.00
8.	Harbin Electric Co. Investment Fund	9,456,925.76
	Total	39,246,452.46
1.	Debts from Bank of Chosen	G¥18,000,000.00
2.	State Highways Repairs Fund	290,000.00
	Total	18,290,000.00

In addition to the above, cash debts to the amount of M¥18,952,081.42 have been contracted by the provincial governments.

In conformity with the practice of preserving international good faith the Government has put aside a special sinking fund to meet its due share of foreign loans secured on the Chinese Maritime Customs and Salt Gabelle as follows :

1932	M¥13,386,192
1933	11,848,655
1934	6,420,000
Total	M¥31,654,847

Furthermore, the Government has since the 1933 fiscal year put aside a sum equivalent to ten per cent of the surplus of annual revenues as a sinking fund to cover the national loans in general. This fund at present totals M¥1,758,600.

Banking

General Prior to the founding of Manchoukuo and under the régime of the Chang family each of the Three Eastern Provinces had its central bank. Each of them took advantage of its note issuing power conferred on it. Especially the central bank in Fengtien province was almost reckless in the issue of paper money, the amount it issued in 1929 for providing funds for military purpose reaching M¥1,500,000,000 with the resultant slump of the value of the paper money to one-seventieth of its worth. The new government, therefore, aimed at the effective control and stabilization of the currency. It enacted laws for this purpose, adopted the silver standard, as this system better suits the character of the country, and established the Central Bank of Manchou.

Central Bank of Manchou This bank was established on July 1, 1932, and it opened business on the same day. In it were included four old banks of issue, the Three Eastern Provinces and the Frontier Bank. It has its head office at Hsinking, and branch offices at Mukden, Kirin, Tsitsihar and Harbin. It is capitalized at M¥30,000,000, and the Manchoukuo government hold more than 50,000 shares of M¥100 each. It is authorized to mint coins and issue notes.

The balance statement of the Central Bank of Manchou as at the close of business, June 30, 1936, follows :

ASSETS

Capital unpaid	M¥15,000,000
Advances to the Government	51,256,925
Time loans	55,870,108
Overdrafts	48,180,099
Bills discounted, etc.	1,633,493
Deposits with other banks	95,249,562
Liabilities of customers for acceptances and guarantees	136,388
Suspenses (short-term advances)	1,937,570
Various securities	53,441,586
Bullion	44,261,222
Foreign money	33,067
Bank premises	19,230,037
Cash on hand	10,422,841
Total	396,652,905

LIABILITIES

Capital subscribed	M¥30,000,000
Legal reserve	1,730,000
Notes issued	133,864,993
Government deposits	99,864,993
Fixed deposits	18,989,108
Current deposits	33,806,472
Special current deposits	11,392,228
Deposits at notice	16,299,912
Other deposits	7,613,630
Loans from other banks	212,785
Bills payable	1,747,774

Acceptances and guarantees	212,785
Sum payable	136,388
Suspenses (short-term deposits)	23,544,305
Balance carried over	507,658
Net profits for the half year	943,093
Total	396,652,905

Currency Problem The currency in Manchoukuo has been in an extremely complicated condition, native and Japanese and other notes and coins being in circulation. But in the newly regulated system of Manchoukuo currency 23.91 grammes of pure silver is taken as the unit called the yuan, there being 100 fen or 1,000 li in one yuan. The new paper notes are issued in five different denominations of 100 yuan, 10 yuan, 5 yuan, one yuan and chian, or 50 fen, circulated together with 1-chiao and 5 fen nickels and 1-fen and 5-li coppers.

Note Issue Before opening for business on July 1, 1932, the Central Bank of Manchou took over old notes of 15 different kinds and 136 denominations amounting to M¥142,234,881 calculated in the new currency at the exchange rate fixed officially. This figure was gradually reduced and by the end of June, 1935 a total of M¥138,200,000 or 97.2% had been redeemed by the Bank. The amount of the notes in circulation at the end of December, 1936, reached M¥254,243,000.

Industrial Bank of Manchou This bank was founded in accordance with the Industrial Bank of Manchou Law issued by the Manchoukuo Government on December 3, 1936. Its capitalization is ¥30,000,000, a half invested by that Government. Its object is to supply capital necessary for industrial development of Manchoukuo, and the domain of its business is not only limited to supply of capital to commerce, but to large and small industries on a basis of long-term and low interest rate. The bank is vested with authority to issue industrial debentures 15 times its paid-up capitalization. The Manchoukuo Government will guarantee for payment of principal and interest of loans for the bank, when the latter intends to raise necessary loans by floatation of its debentures abroad. Its president is Mr. Yutaro Tomita. Its head office is in Hsinking and branches in various cities of Manchoukuo.

Other Banking Institutions Though the Central Bank of Manchou occupies the controlling position in the monetary market as the note issuing bank, there are other banks which do substantial banking business. The names and capitalizations of the principal banks follow:

Name	Authorized Capital
(1) Manchoukuo Banks	
Fentien Commercial and Industrial Bank	M¥2,200,000
Fentien Commercial Bank	1,000,000
Yingkow	1,000,000
Kung Cheng "Yu Bank"	500,000
Tungpien Industrial Bank	1,500,000
I Fa Bank	1,000,000
I Tung Commercial Bank	1,000,000
Hui Hua Bank	250,000
(2) Japanese Banks	
Yokohama Specie Bank	¥100,000,000
Bank of Chosen	400,000,000
Shoryu Bank	12,000,000
Manshu Bank	10,000,000
(3) Chinese Banks	
Central Bank of China	25,000,000
Bank of Communications	10,000,000
Chin Cheng Bank	10,000,000
Ta Chung Bank	4,000,000
(4) Other Foreign Banks	
Russo-Asiatic Bank	R65,000,000
The Far Eastern Bank	$5,000,000
Hongkong Shanghai Banking Corporation	$5,000,000
National City Bank of New York	$150,000,000
The Chartered Bank of India, Australia & China	£3,000,000

To aid the sound development and proper control of banking, the Government promulgated a new Banking Law in November, 1933.

Encouraged by the favourable results of the two credit associations which were created in 1932 in Fengtien province the Finance authorities in 1933 inaugurated eight similar associations in Fengtien, two in Kirin and one in Heilungkiang province. In 1934, 39 more such associations were established and preparations have been made for the establishment of 30 others during 1935.

Coupled with the credit associations referred to above, the Government is planning to grant special licences to chartered banking firms for the issue of premium bonds whereby they may be able to advance long-term low-interest loans to farmers and small industrialists.

The Government also is planning to create and subsidize a larger number of credit associations for the specific purpose of improving the finances of small and middle class farmers, merchants and minor industrialists. Such association would be subject to appropriate regulations and supervision by the Government. At the same time the Government is planning to assist and exercise necessary control over pawn-

shops.

Japan's Investments in Manchoukuo Japan's investments in Manchoukuo were estimated to have amounted to about ¥2,928,716,000 at the end of August, 1936. The figure does not include those before the Manchurian Incident, such as those in limited and unlimited partnership companies, private companies and others. If the pre-Incident figure is added, the actual investments in Manchuria are believed to have totalled at least ¥3,400,000,000 or so. The fact also must not be overlooked that, in addition, the Manchurian Incident expenditures paid by the Japanese Goernment for six years, 1931–1936, amounted to ¥1,067,528,000. The combined total of Japan's "investments" thus makes the aggregate ¥4,467,528,000. This enormous amount of money is penetrating into that State and is forming sources of economic boom of Manchoukuo.

Of Japan's total investments, about ¥1,700,000,000 was invested before the outbreak of the Incident. According to the South Manchuria Railway Company, the pre-Incident investments were distributed as follows : 30 per cent in transportation ; 11.6 per cent in finance ; 6.7 per cent in commerce ; 16.2 per cent in agriculture, forestry and mining ; 9.2 per cent in industry ; and 26.3 per cent in other enterprises. It is further classified that out of the ¥1,700,000,000 investments, ¥837,000,000 took the form of investments in securities and the remaining ¥863,000,000 in limited and unlimited partnership companies and private companies.

Investments in securities before the Incident consisted of those in debentures and stocks and loans, which may be partially regarded as investments in securities. At the end of 1931, the total investments of Japan in securities related to Manchuria amounted to ¥837,536,000, of which ¥710,906,000 was those connected with the S.M.R.Co. The fact shows Japan's investments in Manchuria before the Incident was almost exclusively limited to those in the railway company. Details are :

1. Debentures. The S. M. R. Company first floated £100,000 sterling debentures in 1907. Its first debenture floatation in Japan took place in 1917 and since then all debentures, except its 19th £4,000,000 sterling debentures in 1923, have been issued in Japan. All debentures floated up to the end of 1931 totalled £18,000,000 (¥175,734,000) and ¥545,000,000. Out of these, £14,000,000 (¥136,682,000 and ¥268,000,000 were redeemed. The outstanding loans at the end of 1931 amounted to £4,000,000 (¥39,052,000) and ¥277,000,000. The total was ¥316,052,000.

Other companies' debentures were ¥2,000,000 raised by the Chinfu Railway Company, ¥2,000,000 by the Penchihu Coal and Iron Company, and ¥1,850,000 by the Tosho Development Company. The total ¥5,850,000.

2. Stocks. At the end of 1931, the paid-up capitalization of the S.M.R. Co. totalled ¥387,156,000 out of the authorized capitalization of ¥440,000,000. Investments in the capitalization of other Japanese companies totalled ¥120,728,000.

3. Loans. The S.M.R. Co. borrowed loans totalling ¥77,500,000.

As regards the figures concerning Japan's investments in Manchoukuo since the Incident, they differ according to investigations of the Manchurian Affairs Bureau of the Cabinet and the S.M.R. Co. Economic Research Department. The amount based on the former's investigation totalled ¥905,000,000, while that based on the latter's totalled ¥788,000,000, with a difference of about ¥117,000,000. This comes from the fact that the former investigated Japan's investments in Manchoukuo from Japan's own position, while the latter investigated a net amount of Japanese capital imported into Manchoukuo. The figures below are taken from the investigation of the Manchurian Affairs Bureau. The investments are divided into four items, those in national bonds, debentures, stocks and loans. The list of Japan's investments in Manchoukuo after the Manchurian Incident up to the end of March, 1936, follows :

	(In ¥1,000)
(1) Calling in of unpaid shares by S.M.R. Co.	158,000
(2) Net increase of S.M.R. debentures	325,200
(3) Loans by S.M.R. Co.	75,000
(4) Net increase of debentures and loans by companies allied to S.M.R. Co.	71,025
(a) South Manchuria Electricity Co. debentures	10,000
(b) Manchuria Chemical Company's loans	12,000
(c) Electricity and Telephone Co.'s debentures	15,000
(d) Manchuria Coal Mining Co.'s debentures	10,000
(e) Manchuria Electricity Co.'s debentures	10,000
(f) Showa Steel Work's debentures	10,000
(g) Others	4,250

		(In ¥1,000)
(5)	Investments in stocks of newly-established corporations	141,090
(6)	Investments in Manchoukuo Government bonds	20,000
(7)	Investments in Manchoukuo Foundation Bonds	30,000
(8)	Investments in North Manchuria Railway bonds	60,000
(9)	Loans from Japan by Manchoukuo for North Manchuria Railway	15,400
(10)	Investments in Manchoukuo Special Enterprise Bonds	10,000
	Total	905,715

Foreign Investments The foreign investments in Manchoukuo in 1933 amounted to ¥2,063,850,000 distributed among the various countries as follows, according to the statistics compiled by the South Manchuria Railway Company :

Country	Amount of Investments	%
Japan	¥1,510,755,000	73.201
Russia	465,051,000	22.531
Great Britain	39,590,000	1.918
United States	26,400,000	1.279
France	21,086,000	1.022
Sweden	850,000	0.041
Denmark	157,000	0.008
Total	2,063,880,000	100.000

According to the most statistics, foreign investments in Manchoukuo before the Incident are roughly estimated at ¥2,400,000,000, of which those by Japan are approximately ¥1,700,000,000 ; those by the Soviet Union ¥590,000,000 ; those by Great Britain ¥40,000,000 ; those by the United States ¥30,000,000 ; and those by France ¥25,000,000.

Foreign Trade

Manchuria was first opened to foreign trade in 1862, when Yingkow was opened as a commercial port. This port lost its former prosperity when Russia made Dalny (Dairen) a free port and built a railway between Harbin and Dalny.

Dairen became the greatest port of export for Manchurian products after completion of its harbour facilities. The rebuilding of the Antung-Mukden Railway and the construction of the bridge spanning the Yalu River have made possible the recent development of Antung as a commercial port.

A noteworthy feature of Manchoukuo's foreign trade during the 20 years or so up to 1930 was the annual excess of exports, ranging from several tens of million hk. tls. to 100,000,000 hk. tls. or more. These features have completely changed since the world depression which started in 1930 and the establishment of Manchoukuo which followed the Manchurian Incident. Imports began to increase at an unprecedented rate due to the huge demand for building materials required for the construction projects throughout the country. Imports continued to surpass exports at such a rapid pace that in 1933 Manchoukuo's foreign trade finally registered an import excess of M¥90,000,000, which further increased to M¥145,000,000 in 1934, and thus completely reversed the former tendency. It is believed that this new trend will continue for quite a long time, as imports will in all probability continue to grow with the development of industry and commerce.

As staple exports of Manchoukuo soy beans, bean oil, kaoliang, wheat, wild silk, coal and lumber are the best known. Among the imports are cotton fabric, cotton yarn, sugar, tobacco, petroleum, iron, steel machinery and paper. The growth of the foreign trade of Manchoukuo is illustrated in the following table :

Year		Imports	Exports	Total
		(In 1,000 Haikwan Tls.)		
1907		35,516	24,421	59,929
(Average of 5 years 1907-1912)		73,528	74,590	148,119
1917		158,562	161,120	319,682
1926		421,992	566,770	988,762
1927		268,913	408,036	678,949
1928		302,956	434,035	736,991
1929		329,603	425,651	755,255
1930		306,999	396,714	703,713
1931	(In M¥1,000)	323,975	693,903	1,017,878
1932	,,	301,068	616,152	917,220
1933	,,	514,540	423,325	937,867
1934	,,	593,562	448,426	1,041,988
1935	,,	604,149	421,077	1,025,227
1936	,,	690,693	598,675	1,289,368

The decrease in the amount of exports and imports in 1932 is due to the Manchurian Incident.

Among the countries trading with Manchoukuo, Japan by far occupies the most conspicuous position as may be seen from the following table which shows Manchoukuo's foreign trade since 1931 with various countries :

MANCHOUKUO FOREIGN TRADE RETURNS FOR 1936

(Released by the Dept. of Finance)

Agriculture

General The vast plains of Manchuria consist for the most part of agricultural land, covered with fertile soil or humus, and agriculture has always been the main occupation of the people of Manchuria. The recent development of transport facilities has encouraged the coming of immigrants in large numbers from China, especially from Shantung province. Undeveloped land is being thus brought under cultivation, and every year sees some increase in the total amount of farming products. Unfortunately, these immigrants possess neither scientific knowledge nor capital, and, as they still follow primitive methods of cultivation, the productiveness of the land is not yet fully exploited. The wide plains that characterize the country invite the use of machinery for large-scale cultivation and if capital and technical skill were applied, their agricultural products could certainly be multiplied manifold. One novel feature of the agriculture in Manchoukuo is that Korean farmers who migrated there are doing a large share of work.

Cultivated Area The plains along the lower Liao River, the upper and middle Sungari River, and the Hurka River are most fertile and constitute the main agricultural territory of Manchoukuo. Next come the lands in the centre or Lungkiang province and along the lower reaches of the Sungari. These districts have been developed with an astonishing rapidity by the Chinese immigrants from Shantung and Hopei.

At the end of 1931 the area under cultivation totalled 13,733,000 hectares, an increase of 876,000 ha. since 1929. In 1932, however, due to the outbreak of the Manchurian Incident and by a devastating flood in North Manchuria, the area decreased by 300,000 hectares. A further decrease of 170,000 hectares was withnessed in 1933, partly due to floods in North Manchuria but more to a great decrease of the exports of soy beans to European countries and consequent fall in the prices of agricultural products in general.

A decline in 1934 in agricultural prices, together with the plight of farmers in the North somewhat contracted the area under cultivation. Possibilities, however, for the future extension of farm areas are abundant inasmuch as more than 50 per cent of

Manchoukuo's arable land is yet uncultivated.

The area of arable land in Manchoukuo in 1935 follows :

AREA OF CULTIVATED LAND IN MANCHURIA

(Unit in hectare)

Provinces	Total Area	Arable Land
Kirin	11,276,777	4,618,860

Thus the country has an abundant supply of food to feed the people, which now roughly numbers 34,000,000. The surplus of crops is exported every year, the total amount of which in 1932 was M¥211,562,000, and in 1934 M¥244,282,000. The quantity and value of agricultural products which were exported during 1931–1935 follow :

Soy Beans Manchoukuo produces about 60 per cent of the total production of soy beans in the world. The beans contain about 10 per cent of oil, and the cake which is obtained in pressing the beans is exported as fertilizer. The latest figure for production of soy beans in Manchoukuo was 3,820,000 metric tons and its total plantation area 3,249,000 hectares. The average crop per hectare was 1,180 kg.

Kaoliang Kaoliang comes next in importance to soy beans. It serves as the diet of the people. Its production in 1935 was 3,842,000 metric tons, and the area planted reached 2,764,000 hectares. The average crop per hectare is 1,390 kg. It grows more in the southern districts than in the northern part of Manchoukuo, and its export to Japan and China is increasing in recent years.

Millet The yield of this crop reached 2,970,000 metric tons in 1935 and its area of plantation 2,380,000 hectares. The average yield per hectare is 1,250 kilogrammes.

Wheat The northern districts of Manchoukuo are better suited than the southern part for wheat. The production reached 934,000 metric tons in 1935, more than one-half of which was consumed in the country as raw material for flour.

Paddy-field Rice Rice grown in paddy-fields is of comparatively recent origin in Manchoukuo. But the climate and soil of Manchoukuo are well adapted for this method of growing rice. Though the area of paddy-fields in 1935 was but 120,000 hectares and the yield 284,000 metric tons, it is not difficult to make it ten times as large both in area and yield.

Maize The product reaches 1,801,000 metric tons, its area of plantation about 1,235,000 hectares. It is mostly consumed within the country.

Special Crops In addition to the above-mentioned crops, the soil of Manchoukuo is well adapted to cotton, tobacco, hemp, ground-nuts, fruits, etc. The plantation area of cotton totalled in 1934, 48,270 chobu, while its production is estimated to be about 67,490,000 kin. The Government inaugurated in 1933 the Raw Cotton Association with branches at various cotton producing districts with the object of studying ways and means to raise 150,000,000 kin of raw cotton by bringing some 750,000 acres of land under cultivation within the next 20 years. It also formed in 1934 the Manchurian Raw Cotton Co., whose purpose is twofold : to aid farmers to sell their cotton without losses and to improve the quality of cotton. Tobacco is produced in Kirin and Fengtien provinces, and its production is estimated at 7,800,000 kwan a year. The production of tusser silk in Manchoukuo is a hundred years old, and it has now become one of the principal staple products in the country. Its production in Fengtien province alone reaches about ¥11,000,000 in value.

Live Stock Raising of domestic animals is indispensable to Manchoukuo's agricultural system, as they serve well for the daily life of the farmer as well as for transport purpose. They are widely spread and almost every family raises some kind of them. Farm wastes are utilized for feeding them, while their excrements are used as fertilizer, and ploughing, stamping, harrowing, manuring, transporting and threshing, etc. are carried out with their help. The number and principal kinds of live stock follow :

NUMBER OF LIVE STOCK IN 1933

Wools and Hides Sheep are raised for the purpose of getting meat, but not for wools. Wools obtained from them are very coarse. They are not good for woollen cloth making, and are therefore used only as carpet wools. The amount of wools produced is estimated at 9,000,000 lbs. a year.

As meat is of universal demand in Manchoukuo, the number of live stock slaughtered every year is very large. Owing to the lack of accurate statistics, the number actually slaughtered is not known, but the production of hides is estimated at 450,000 from cattle, 2,000,000 from sheep, and 380,000 from mules and donkeys. But there is no tannery which is equipped with modern machinery to put a good finish to the hides, though a large number of hides is exported every year.

Forestry

General The total forest area in Manchoukuo is estimated at 358,684 sq. km. which is equal to about 36 per cent of the entire area of the country. Some 350 species of timber are found in the forest regions located in the Yalu Valley, Tumen Valley, Mutan Valley, Lalin Valley, Sanhsing District, Great Hsingan Range and Small Hsingan Range. The volume of standing timber is estimated at 15,000,000,000 koku. Investigation conducted by the Manchoukuo Government, however, shows that the deforestation seems to have been done in a reckless manner in the past and the real volume of the standing timber may perhaps be about 9,000,000,000 koku.

STANDING TIMBER IN MANCHOUKUO

Districts	Estimated Standing Timber in 1,000 koku	Principal Species of Timber
Right bank of the Yalu and the Hunho valley	276,635	Korean pine, Korean fir, Korean larch, silver-fir, maple, birch, oak, ash, doronoki.
Sungari valley	874,036	
Tumen valley	420,401	Korean pine, fir, spruce, larch, lime,
Hurka valley	420,951	oak, elm, ash, birch.
Lalin valley	300,490	
North Manchuria Railway eastern line district	898,296	Korean pine, fir, spruce, maple, birch, doronoki, Siberian cork-tree, Manchurian walnut.
Sansing district	2,615,302	Korean pine, fir, spruce, Siberian cork-tree, ash, birch, oak, lime.
Great Khingan range	5,600,000	Larch, Japanese birch, Siberian red
Little Khingan „	3,500,000	pine, willow, alder.
Total	14,906,111	

For the purpose of preserving forests and securing their rational management, the authorities of the new régime have stopped granting fresh forest concessions and have commenced to classify forests into three categories, viz., State, public, and private, under a three-year programme. At the outset the authorities took over the various forests of the Central Bank in Kirin province as State forests, for which purpose a sum of M¥2,000,000 was appropriated in the 1933 supplementary budget. The forestry offices established in 1933 at Chia-

cho, Tunhua, Yenki, Wuchang and Peianchen and the branch office at Hailar, have been entrusted with the rational management of State forests and the improvment of forestry. Some 15 other forestry offices were also established in various other districts during 1934-35. A five-year programme for the investigation of forests by means of aerial photography is also being worked out. It is expected that with the progress of the forest investigations and the enactment of new forest laws and regulations, the most scientific and up-to-date management of forests will become possible in the near future. A pulp manufacturing plant will probably be put up as soon as conditions warrant it.

Species of Timber In Manchuria there are as many as 350 species of timber, but the more common species are the following :

Evergreen : Korean pine, silver fir, Korean fir, spruce, larch.

Deciduous : Korean oaks, birch, Amur lime tree, ash, elm, willow.

The proportion of evergreen to deciduous is 4 to 6, and in the evergreen the Korean pine constitutes more than half of the total.

Lumber Industry Lumber industry is carried on in the districts of Antung, Kirin and Harbin, but that in Antung districts is best known. Production of lumber in Manchoukuo runs from 2,000,000 to 4,000,000 koku a year. Owing to activities in buildings and public works in Manchoukuo, the domestic product is not enough to meet the demand, and large quantities of lumber are being imported. The production of lumber in 1934 follows :

LUMBER PRODUCTION IN MANCHOUKUO

Unit in koku

Districts Where Produced	For Ordinary Purpose	Sleeper	Others	Total
Along Eastern route of N.M.R.	450,000	66,000	350,000	866,000
„ Western „ „ „	350,000	33,000	30,000	413,000
Near along the Sungari	320,000	—	50,000	370,000
Districts along the Ning-Tumen R'y	200,000	50,000	20,000	270,000
Manchoukuo lumber produced along the Tumen	220,000	16,000	25,000	261,000
Districts along the upper course of the Kirin along Hsinking-Tumen Railway	1,150,000	45,000	65,000	1,710,000
Manchoukuo lumber produced along the Yalu	1,200,000	—	50,000	1,250,000
Others	150,000	66,000	100,000	316,000
Total	4,040,000	726,000	690,000	5,456,000

Fisheries

General In spite of the largeness of area, the coast line of Manchoukuo is comparatively short, its total length being only 855 kilometres. Moreover, the coast is made up of shallow bays, which readily get frozen in winter, and is not therefore favourable for fisheries. The amount of catches is valued only at about ¥3,000,000 a year.

Fresh Water Fishery Fresh water fishes are abundantly found in the Sungari, the Nonni, the Mutankiang, the Ussuri, the Amur and the Liao Rivers as well as Lake Hujunti, Peierhih, etc. The amount of catches in 1932 follows :

CATCHES OF FRESH WATER FISHES

River or lake	Catches in kg.
Hulanpeierh	4,500,000
Sungari river	4,200,000
Mutanchiang	500,000
2nd Sungari river	1,500,000
Nunchiang	6,000,000
Ussuri river	2,000,000
Liao river	1,000,000
Yalu river	2,000,000
Heilung kiang river	2,000,000
Total	23,700,000

Salt Industry The coast line of Manchoukuo stretches only for 855 km. which is but one-eleventh of the en-

tire border line of the country. However, the coast on the Yellow Sea and the Po-hai has very little rainfall and as the evaporation is very rapid and the air dry, the district is well adapted for salt manufacturing by evaporation. The total area of salt fields as at the end of 1934 was 15,400 chobu of which 8,300 chobu belong to Manchoukuo and 7,100 chobu to Kwantung Leased Territory. The production in 1934, though much reduced on account of the weather, totalled 700,000,000 kin of which the quantity produced by Manchoukuo amounted to 280,000,000 kin and that by Kwantung Leased Territory to 420,000,000 kin. The salt field extension plan of Kwantung Leased Territory made a great progress and on account of fine weather the quantity produced by the Territory in 1935 amounted by July to 700,000,000 kin, while that in the outside of the Territory was 500,000,000 kin. The annual exports of the product to Japan runs between 150,000,000 to 200,000,000 kin.

Mining Industry

General Numerous kinds of minerals are found in Manchoukuo, of which iron, gold, coal, magnesite, fireclay, and shale oil are most abundant. The production of the principal minerals in Manchoukuo and a brief account of a few of them follow.

PRINCIPAL MINERAL PRODUCTS OF MANCHOUKUO

(In metric tons)

Kind of Minerals	1930	1931	1932	1933	1934	1935
Iron ore	832,228	922,649	993,143	1,176,643	1,291,790	1,576,178
Pig iron	348,054	342,270	368,181	433,523	—	—
Iron sulphide	3,028	3,919	3,620	1,671	—	—
Lead ore	—	—	—	—	—	—
Manganese ore	609	270	60	750	43	—
Copper ore	840	—	—	—	—	—
Coal	10,048,652	9,048,703	7,108,282	9,062,644	8,827,000	10,944,234
Coke	485,312	418,625	416,306	476,278	—	—
Shale oil	981,004	1,245,094	1,412,554	2,683,440	—	3,436,648

Dolomite	688,489	545,131	477,350	691,040	—	—
Fire-clay	53,664	35,476	51,799	112,070	—	—

Iron Iron and coal constitute the two most important minerals in Manchoukuo. Iron deposits are mostly found in Fengtien province, especially in Anshan and Miaoerhkou, ores coming from these deposits being turned into pig iron in Anshan and Penhsihu iron works. The estimated iron deposit is about 1,080,000,000 metric tons, of which, however, the deposit containing more than 50 per cent iron is less than one-half of one per cent. The ore is mostly hematite and magnetite, and is not of good quality.

Coal Coal is even more important than iron. The estimated coal deposit in Manchoukuo is 4,804,000,000 metric tons, and its production in 1933 was about 9,000,000 metric tons. The production of coal in various provinces follows (in 1,000 metric tons) :

Province	1922	1929	1930	1931	1932	1933	1934
Fengtien	4,508	8,569	8,794	7,506	6,750	8,353	8,827
Kirin	25	570	523	530	218	271	—
Heilungkiang	—	120	170	300	95	362	—
Jehol	66	445	544	691	45	76	—
Hsingan	—	188	7	20	—	—	—
Total	4,600	9,893	10,040	9,048	7,108	9,063	11,413

Fushun Coal Field The Fushun coal field is the most famous in Manchoukuo. The right of mining this coal was transferred to Japan by Russia as a result of the Russo-Japanese War, and since 1907 the mining has been under the management of the South Manchuria Railway Co. The average thickness of the coal seam is 40 metres, the thickest part of the seam reaching 130 metres. The

estimated deposit of coal is put at 950,000,000 metric tons. The coal is bituminous, and its characteristics are a large content of volatile matter, a small quantity of ash, and generally a large amount of nitrogen. When the mine was transferred to Japan, the daily output was 300 metric tons, which in 1934 was increased to over 7,000,000 metric tons a year. The annual production of the coal field since 1925 follows :

Year	Production in metric tons
1925	5,844,478
1926	6,591,908
1927	7,030,193
1928	6,900,233
1929	6,785,000
1930	6,864,100
1931	6,114,700
1932	5,570,100
1933	6,712,100
1934	7,798,000
1935	8,119,000

Shale Oil This is a layer of brown rock which covers the coal bed at Fushun to the thickness of about 400 feet. The rock contains oil. This rock deposit is estimated at 4,400,000,000 metric tons, and its oil content at about 6 per cent, so that more than 300,000,000 metric tons of crude oil may be obtained from it. The South Manchuria Railway Co. started early to utilize the rock, and established an oil mill at Fushun. The company is now obtaining more than 54,000 metric tons of the crude oil through dry distillation method, and also along with it paraffin, ammonium sulphate and coke.

In addition to the above, there are gold, silver, lead, etc., the gold deposit being estimated at ¥5,000,000,000. Also magnesite produced near Tashihchiao and fireclay produced in Yentai and Penhsihu deserve a serious consideration. Light metal producing companies which use these products as raw materials are being organized.

Manchoukuo has such vast mineral resources as above stated. Since most of these products are very important for national defence, coal, gold and petroleum industries will be managed by special corporation under the Government supervision. With this in view, the Government has established the Manchuria Petroleum Co., Ltd., the Manchuria Coal Mining Co., Ltd., the Manchuria Gold Mining Co., for the investigation, management, and exploitation of these mines. As regards other minerals, permits for mining will be given out with the promulgation of new mining law.

Conforming to the general policy of recognizing the validity of mining concessions obtained under the old régime as well as of the mining applications filled up to the present since the founding of the new State, provided they do not conflict with existing laws and regulations, the Government is examining the old concessions permits and studying the actual conditions of the various mines.

The Government is considering the establishment of a gold refinery, a fuel research institute, a mineral laboratory, and a mineral products museum, all under State management, to assist and encourage private mining enterprises, secure good markets so that their products may be turned into cash promptly, and in general to contribute to the development of the mining industries.

Manufacturing Industries

General In spite of the abundant supplies of various raw materials and cheap labour, the industry in Manchoukuo is not yet in an advanced stage. This was particularly the case before the advent of Japanese into the country, owing to the undeveloped state of transport and the backward condition of most regions. At present industries have developd in the Kwantung Leased Territory and the South Manchuria Railway Zone. Aside from it the industry of modern type sprang up around Harbin. As a whole the industry in Manchoukuo is based on raw materials produced in the country which use them as material for products intended for exports as well as for the domestic consumption. Spinning industry is at present the only industry which uses raw materials imported from abroad. But except those in Kwantung Leased Territory most of the cotton spinning mills are of a class which are barely able to fulfil domestic demands.

Mills which employ more than 5 operatives in Manchoukuo number about 4,000 the products of which amount to more than ¥300,000,000 a year. Industries which yearly produce more than ¥10,000,000 are as follows :

Articles Produced	Amount Produced in yen
Bean cakes	72,000,000
Bean oil	32,000,000
Tobacco	29,000,000
Cotton yarns & fabrics	23,000,000
Wheat flour	23,000,000
Rolling stock	20,000,000
Cereals	19,000,000
Intoxicants	13,000,000
Pig iron	11,000,000

Oil Industry Making of soy bean oil and bean cake by pressing the soy beans early developed in Manchoukuo. With almost limitless supplies of soy beans, the industry advanced from mere handicraft work into the modern advanced industry as soon as the real worth of bean oil and bean cake was recognized. The bean oil and bean cake produced in this way constitute the most important items for export. The prosperity of Manchoukuo largely depends on this industry. According to the investigation made on oil mills in Manchoukuo by the Dairen Oil Mill Association, the mills number more than 3,000, of which mills equipped with facilities large enough to produce articles for exports are as follows :

PRODUCTION CAPACITY OF BEAN OIL AND BEAN CAKE PER DAY

Place of Production	No. of Mills	Amount of Bean Oil Produced (In 1,000 kin)	Amount of Bean Cake Produced (In 1,000 pieces)	No. of Men Employed in 1933-34
Dairen	50	744	149	4,107
Yingkow	20	166	33	850
Antung	23	185	33	891
Harbin	43	468	94	—
Various places in southern Manchoukuo	238	440	88	1,086
Various places in northern Manchoukuo	28	190	38	—
Total	402	2,193	439	—

EXPORTS OF BEAN OIL AND BEAN CAKE 1933-1935

(In 1,000 piculs)

Destinations	Bean cake 1933	1934	1935	Bean oil 1933	1934	1935
Japan proper	12,181	14,677	11,498	4	21	8

Total value in ¥1,000	57,614	51,508	51,370	18,472	16,262	20,132

Textile Industry Tusser silk is another export article next only to bean oil in importance. With the increased demand for pongees in Europe and America, the Japanese silk weavers in Fukui, Gifu and Kyoto prefectures began weaving them and the demand for this silk comes from these prefectures in Japan. The reeling is carried on by the Chinese farmers as a side line, and necessarily on the household basis. The production is largest in Antung. In 1932 it was M¥9,775,000, in 1933 M¥9,555,000 and in 1934 M¥7,408,000. About 70 per cent of the total export goes to Japan.

Of the total population of 30,000,000 in Manchoukuo, about 90 per cent wear cotton clothes. Therefore, from ancient times, there existed in Manchoukuo small, primitive plants for cotton weaving, but no large modern factories rose before the Great War. The establishment of the Cotton Spinning and Weaving Plant by Chinese at Mukden was followed by the establishment of three companies by Japanese, viz.: the Manchurian Cotton Spinning Company, the Chinchou Factory of the Naigai Spinning Company, and the Manchuria Fufang Company. The total number of mills in 1932 was 83, the number of labourers 9,621, and the total production ¥17,401,310. The production of course cannot keep pace with the demand, and

cotton cloth constitutes one of the principal imports for Manchoukuo, the amount reaching from ¥40,000,000 to ¥74,000,000.

Flour Milling Flour milling industry is one of the three main industries of Manchoukuo. It is carried on either by the old-fashioned native mills or the modern mills run by machinery. Harbin is the centre of flour milling and has 40 mills, there being only 8 other mills in the southern part of Manchoukuo. The consumption in 1930 was only about 24,000,000 bags a year, which included both domestic and imported products. This increased in 1934 to 23,000,000 bags, exclusive of domestic product. If, therefore, the domestic product amounted in the year to 15,000,000 bags, the amount of consumption totalled 38,000,000 bags. Even this per capita consumption in Manchoukuo was a little over one bag, so that there is still a vast room left for further consumption. Import from Japan in 1934 amounted to 17,000,000 bags and about 6,000,000 bags were imported from Australia and America. The amount of its import is only second to that of cotton cloth in value.

Regarding the status of other industries, mention is omitted here, but their general aspects may be inferred from the figures in the table given at the outset of this subject.

Encouragement of Manufacturing Industries In spite of the existence of such potential factors as motive power, ample fuel and labour resources, the manufacturing industries in Manchuria have lagged behind owing to the lack of industrial knowledge and shortage of capital. The Government is therefore making strenuous efforts for the development of manufacturing industries. For this purpose, rationalization of management and intelligent control are deemed necessary. With the increased cultivation and improvement of wheat, raw cotton, wool and hemp, for which the Government is now working, the flour milling, cotton spinning, hemp manufacturing and woollen textile industries will see greater development. Chemical industries including the light metal industries, and the manufacture of soda, oil shale products, cement, pulp, alcohol and sulphate of ammonia will also be stimulated shortly.

The Government is working for the rational development of industries by instituting necessary measures of control over various industries, instead of leaving them to the indiscriminate exploitation of entrepreneurs due to free competition. With respect to the electric and gas enterprises, the Government is endeavouring to remove the wasteful competition and bring them under a unified management. At the same time it is considering the promulgation of new regulations concerning the electrical industry. To secure a cheap supply of electricity, the Government has officially fixed the frequency at 50 cycles, and has subsidized the Association of Electrical Enterprisers in that manner.

Transportation and Communications

Railways before the Great War The first construction of railways in Manchoukuo was made by Great Britain and Russia, starting about 1890. Great Britain established the North China Railway which now connects Peiping with Mukden. Later this line was extended to Suichang, about 90 kilometres from Shanhaikwan, and then in 1903, the main line was extended to Hsinmintun on the middle course of the Liao River, and a branch line to Yingkow on the lower stream of the Liao, which was only open port of Manchuria until October, 1903.

In 1896, Russia obtained the right of constructing and operating a railway line crossing North Manchuria east and west. Then in 1898, she secured a similar right to construct a branch line from Harbin on the main line to Port Authur and Dairen as well as to Yingkow. The construction of the main line extending from Manchoukuo to Vladivostok via Pogranichnaya was finished in 1901, and the southern line, including the Yingkow branch, was completed in 1903. The main and branch lines, comprising 2,500 kilometres, were opened to traffic on July, 1903.

By the terms of the Portsmouth Treaty, Japan succeeded to the Russian railway in Manchuria, south of Changchun, or Hsinking, totalling about 840 kilometres. Also Japan secured the right of improving the light railway between Antung and Mukden from China, about 290 kilometres. In 1912, Japan completed construction of the Kirin-Changchun Railway, 128 kilometres.

The above is an outline of railway construction in Manchuria prior to the Great War. By that time the total length of railways in Manchuria reached 4,035 kilometres, of which railways constructed by Japanese, Japanese loan and Sino-Japanese joint capital were 1,265 kilometres, lines constructed by Russia 1,726 kilometres, and that constructed through British loan 1,014 kilometres, while the line constructed by China

stretched only for 29 kilometres.

Present Railway Situation While the area of Manchoukuo is about 1,300,000 square kilometres, which is three times the area of Japan proper, or about 1.9 times the entire area of the Japanese Empire, or slightly larger than the area of Germany and France put together, the total mileage of the railways in the country is about 8,440.3 kilometres, including poorly constructed light railways. It is less than one-third of the total railway length of Japan, which is about 25,600 kilometres. The railway per one thousand square kilometres of area is about 54 kilometres in Japan, but in Manchoukuo it is only 6.5 kilometres, a little over one-tenth of the rate in Japan, though somewhat better than China in which country the rate is but one kilometre.

Railways in Manchoukuo comprise the state railways, now extending 6,955.9 km., the South Manchuria Railway Co. lines which extend 1,129 km. and private railways extending 355.3 km. which total 8,440.3 km. At the end of 1931, shortly before the founding of Manchoukuo, the total length of railways in Manchuria was 6,252.3 km., or 2,188 km. less than the present length.

As transportation routes, which serve as substituting or supplementary lines to the railways, there are motor roads, water-ways, and coastwise ship lines. Motor roads in the former Three Eastern Provinces stretched only 13,200 kilometres in 1928, which excludes roads in cities, towns and villages. Compared with 43,200 kilometres of motor roads as of 1927 in Japan, which excludes the roads in cities, towns and villages, the Manchurian roads are still few and undeveloped. Manchoukuo, having a coast line of only 855 kilometres on the Sea of Pechili, the coastwise ship lines are not worth mentioning. There are, however, good inland water-ways as Manchurian rivers run through great plains from their sources to the sea. Particularly the Sungari River is navigable by ships of more than 1,000 tons for a distance of about 700 kilometres from its confluence with the Amur to Harbin. But the great drawback to the river is that during the five months of freezing in winter, steamship navigation is impossible, although motor cars can use the frozen river as a highway during these winter months. Next comes the Liao River, but this is not navigable for large ships as the stream near its mouth is shallow.

Railway Policy of Manchoukuo Railways come under the supervision of the Minister of Communications. In view of the fact that railways in Manchoukuo were still in an undeveloped stage the Manchoukuo Government deemed it advisable to entrust the management to an experienced body, and placed the management of the entire state railways in charge of the South Manchuria Railway on March 1, 1933. Thereupon, the latter created the General Direction of State Railways with its headquarters at Mukden and entrusted to it the management of the state railways and the business attached to them. Since then the railway business and the construction work which is also taken care of by the General Direction have made rapid progress.

An epocal change of the framework of the South Manchuria Railway Company was introduced on October 1, 1936. The most important one is unification of the South Manchuria Railway proper, State railways of Manchoukuo, North Korea Railway and construction of new railways under one management, that is, the Railway General Direction of the railway company with its vice-president as the bureau's director. Thus, the State Railways of Manchoukuo, which operations used to be entrusted to the South Manchuria Railway Company on contract and which operated by the General Direction, were established by the company, independently of the company's own network. This General Direction, however, was no longer independent, but was included into the S. M. R. Company's framework on October 1, 1936. Simultaneously, the Railway Department of the S.M.R. Co. was abolished and was included into the General Direction of the company. It now controls the railway lines with a total length of 8,895 kilometres on January 1, 1937. The whole railway lines are controlled by five railway bureaus and three railway offices as follows: Chinhsien Bureau controlling 1,594 kilometres; Kirin Bureau 1,181 kilometres; Mutan Bureau 1,177 kilometres; Harbin Bureau 1,426 kilometres; Tsitsihar Bureau 2,041 kilometres; Dairen Office 481 kilometres; Mukden Office 647 kilometres; and North Korea Office 344 kolometres. The total number of railway employés was 114,000 at the end of August, 1936.

Receipts of the South Manchuria Railway proper forming the company's business nucleus for the 1935–36 year amounted to ¥134,686,176 as against expenditures totalling ¥50,655,794. The profit amounted to ¥84,030,382, increasing ¥10,786,637 over the year before. This set an all-time record. No business results of the Manchoukuo State

Railways have been made public so far, in consideration of defence, but, according to unofficial report, their business receipts for the 1935–36 year amounted to ¥120,620,000 as against their expenditures totalling ¥106,180,000. Expenditures spent for their enterprises for the year totalled ¥36,000,000.

The status of the railways at the end of 1933 and new constructions made since October, 1933 follows :

S. M. R. CO.'S LINES

Lines	Terminals	Distance in kilometre
Dairen-Wharf	Dairen Station and Wharves	3
Nankwanling-Kanchingtzu	Nankwanling and Kanchingtzu	12
Shakako-Irifune	Shakako and Irifune	4
S.M.R. Main Line	Dairen and Hsinking	701
Dairen-Port Arthur	Choushuitsu and Port Arthur	51
Tashihchao-Yingkou	Tashihchao and Yingkou	22

Mutankiang-Linkou line	110.0
Yehpeishow-Chifeng line	147.1
Chienkuochi-Talai line	64.8
Talai-Taoan line	120.0

State Railways The transference of the North Manchuria Railway by the U.S.S.R. to Manchoukuo made it possible for the General Direction of State Railways to unify the control over the whole of railways in Manchoukuo. The lines which are entrusted to the General Direction number, on Jan. 1, 1936, 31 which extend 6,835.6 km. In addition there are three lines which are temporarily engaged in business and extend in length to 362.4 km. These are together supervised and managed by the General Direction. There are subbureaux in the General Direction located at Mukden, Kirin, Harbin and Tsitsihar.

As regards business conditions of the railways under the General Direction the Government does not yet permit publication of the working results. It is, however, roughly estimated that the total receipts in 1934 amounted to ¥66,550,000 of which ¥16,040,000 were from passenger traffic and ¥50,510,000 from goods carried, which was an increase of ¥15,000,000 as compared with the receipts of 1933. The number of passengers and the amount of goods carried and receipts therefrom follow:

NUMBER OF PASSENGERS CARRIED AND RECEIPTS THEREFROM 1932-1934

Sub-bureaux	Passengers 1932	1933	1934	Receipts 1932	1933	1934
Mukden	2,927,736	3,584,262	3,520,929	5,535,179	7,333,578	7,797,994
Kirin	1,489,243	2,057,757	2,855,284	1,990,616	2,935,383	3,980,372
Harbin	386,116	696,302	1,227,601	548,682	822,803	1,768,011
Tsitsihar	1,413,383	1,734,980	1,653,133	2,892,118	3,614,577	4,305,533
Total	6,216,478	8,073,301	9,256,947	10,966,595	14,706,341	17,851,910

AMOUNT OF GOODS CARRIED AND RECEIPTS THEREFROM 1933-1934

Districts of Subbureaux	Goods Carried in m.t. 1933	1934	Increase or Decrease	Receipts in yen 1933	1934	Increase or Decrease
Mukden	3,102,654	2,797,671	304,983	12,291,495	12,504,280	×212,785

Harbin	1,897,809	1,120,269	777,540	8,771,797	2,219,842	6,551,955
Taonan	3,807,878	2,932,490	875,388	17,410,316	15,165,411	2,244,905
Total	11,895,500	8,900,041	2,995,459	50,513,474	36,079,644	14,433,830

Water Transportation For the purpose of regulating shipping on the rivers in Manchoukuo, the Government has promulgated the River Shipping Law, in addition to establishing a navigation bureau in Harbin, Yingkow and Antung for the administration of matters relating to water courses, harbours, shipping, and water transportation in general. The Yingkow Navigation Bureau in January, 1934, took over the Liao River Conservancy Board, which had up till then been operating independently of the Government. This action taken in view of the difficulties the Board was encountering in carrying out its projects owing to the lack of funds.

Steamers and sailing boats operating under the Manchoukuo flag at the end of September, 1935, numbered as follows:

Registered at Harbin:
116 steamers with 50,893 tons;
284 "pachuan" boats with 76,465 tons,
107 sailing boats with 3,630 tons.
Registered at Yingkow:
58 steamers with 19,875 tons;
245 sailing boats with 6,987 tons.
Registered at Tutung:
13 steamers with 630 tons;
150 sailing boats with 2,597 tons.

Rivers The rivers of Manchoukuo are serving as important transportation routes supplementing the insufficient railway lines, as they run for long distances from their sources to the sea and mostly traverse large plains. The largest river is the Sungari, and the second is the Liao. The Sungari and the Liao Rivers with their numerous branch streams traverse south and north of Manchuria and give facilities for boat and steamship navigation.

The Sungari River is a branch of the Amur or Heilungkiang River and for a distance of about 700 kilometres from its confluence with the Amur River upstream to Harbin, it is wide and deep with more than 7 feet of water, and is possible for navigation by steamships of more than 1,000 tons. The river traffic is very busy in this section. Whence small steamships and junks are able to navigate a further distance of 500 kilometres on the main stream to Kirin, and also on its north-western affluent, the Nonni River, up to Tsitsihar. But the Sungari and its branches have the disadvantages of being frozen in winter for about five months.

In the contract drawn between Manchoukuo and the South Manchuria Railway Co. in the management of the State Railways there is a clause providing that in the management of part of the water transportation on the Sungari River rests with the General Direction of State Railways. On the strength of it the General Direction operates vessels under its management and their vessels engage in the transportation work on the river. The routes number 12 and covers 5,194 km. Passengers embarked and landed at various points and goods loaded and discharged in 1935 follow :

PASSENGERS EMBARKED AND ARRIVED AT VARIOUS POINTS ALONG THE SUNGARI RIVER IN 1935

	Points of Arrival					
Points Embarked	Harbin	Ilan	Chiamussu	Fuchin	Others	Total
Harbin	—	12,052	9,146	9,860	49,782	80,840

VOLUME OF CARGOES CARRIED ON THE RIVER IN 1935

(Unit in m.t.)

Points of Loading	Soy Bean	Wheat	Articles Various Cereals	Coal	Lumber	Others	Total
Harbin	—	—	509	2,673	299	59,411	62,891
Ilan	81,923	1,797	442	—	16,504	1,451	112,118
Chiamussu	30,938	18,763	90	—	604	2,608	52,643
Fuchin	45,598	28,763	1,681	—	205	6,901	83,143
Heiho	11	—	—	—	1,401	2,140	3,635
Hulin	—	—	—	—	—	29	31
Others	166,166	35,298	12,767	205,763	45,269	42,344	502,607
Total	324,636	79,261	15,574	208,436	74,277	114,885	817,069

Motor Bus Line The motor bus business has expanded enormously with the construction of new highways. On September 1, 1935, there were 90 bus lines operating 725 cars as the following figures show :

	No. of Bus Lines	Total Length	No. of Motor cars	Capital Invested
State	28	3,746	318	M¥2,409,382
Private	62	4,185 km.	507	2,738,400
Total	90	7,931 km.	725	5,147,782

All bus services along railway lines or running parallel to such lines, and other routes which will later become railways, as well as those which play an important rôle in the opening up of undeveloped regions and in the maintenance of peace and order, and which are not paying propositions are managed by the State through the General Direction of State Railways as a subsidiary business of the latter. The other bus lines, however, are left to private management.

State Highways On March 3, 1933, the Bureau of State Highways was established to undertake the building of national highways. In Hsinking, Mukden and Tsitsihar local state highway construction offices were opened and each was entrusted with the construction of State roads within its territory. The Bureau has spent so far M¥15,600,000 for building and improving roads.

By the end of June, 1935, a total of 58 State highways extending 5,471.4 km. were completed. If finished sections of the other uncompleted highways are added the total length would reach 6,378 km. At the outset the State Highways Bureau drew up a road construction programme calling for the completion of 60,000 km. of new highways during the next ten years. The programme included the following :

A. First class roads (connecting the capital with chief cities or ports) 12,500 km.
B. Second class roads (between chief cities) 12,500 km.
C. Third class roads (between hsiens) 35,000 km.

Air Transport Civil aviation has made rapid strides since the advent of the new State. At present there are no less than 13 regular air routes, stretching 4,715 km., operated by the Manchuria Air Transport Company which was established in October, 1932, with a capital of M¥3,580,000. Aviation in this country is favoured by the vastness of territory and suitable climatic and topographic conditions. The air routes are as follows :

1. Hsinking-Mukden-Shingishu.
2. Harbin-Hsinking-Mukden-Dairen.
3. Hsinking-Harbin-Tsitsihar-Manchouli.
4. Hsinking-Taonan-Tsitsihar.
5. Tsitsihar-Nonkiang-Taheiho.
6. Hsinking-Kirin-Yentai-Hungchingtsun-Seishin.
7. Harbin-Peianchen-Taheiho.
8. Harbin-Ilan-Chiamussu-Fuchin.
9. Mukden-Chinchow-Shanhaikwan.
10. Mukden-Chinchow-Chaoyang-Linyuan-Jehol.
11. Mukden-Chinchow-Chaoyang-Chihfeng.
12. Harbin-Mutankiang-Suifenho-Misan-Hulin-Taheiho-Fuchin.
13. Harbin-Mutankiang-Poli-Chiamussu.

South Manchuria Railway Co. This railway was acquired by Japan as a result of the Portsmouth Treaty of September, 1905, and the Sino-Japanese Treaty of December, 1905. The rights Japan secured in respect to the railway line between Dairen and Hsinking, and branch lines, were those originally held by Russia. The company is capitalized at ¥800,000,000 following the issuance of 3,600,000 new shares of ¥100 each on August 10,1933. Until then the capital of the company was ¥440,000,000, one-half of which was held by the Japanese Government, the other half being distributed among private shareholders.

The president and vice-president of the company are appointed by the Japanese Government with Imperial sanction, while the directors are also appointed by the Government, though without Imperial sanction. The auditors are elected from among the shareholders.

(1) Volume of Business. Since its formal organization in 1906 the railway business of this company has grown with the years as is shown in the following table :

Year	Passenger Revenue	Freight Revenue	Other Revenue	Total
1907	¥ 3,594,239	¥ 6,160,274	¥ 14,375	¥ 9,768,887
1912	5,008,633	13,913,341	985,482	19,907,456
1916	6,040,453	19,882,476	1,892,420	27,815,349
1921	12,194,288	59,615,835	6,394,010	78,204,132
1926	15,216,353	89,513,059	3,194,155	107,923,567
1927	16,102,953	94,040,819	3,100,408	113,244,180
1928	17,619,293	97,738,147	3,281,649	118,639,090
1929	17,451,585	101,089,474	3,562,684	122,103,743
1930	11,461,175	77,936,688	5,932,867	95,330,730
1931	9,135,663	70,897,756	4,539,937	84,573,356
1932	14,812,045	85,022,314	4,012,153	103,846,512
1933	16,434,000	94,263,000	8,980,000	119,677,000
1934	17,405,000	101,489,000	7,631,000	126,525,000
1935	22,412,000	103,362,000	8,911,000	134,686,000

Among the goods transported by this railway, beans, bean cake, cereals and coals are the most important items.

(2) Accessory Business. In addition to its transportation business, the company is engaged in activities in many other fields including manufacturing, warehousing, shipping, mining, real estate and building, and various public works.

(a) As regards manufacturing, the company makes and repairs its own locomotives and other rolling stock at its Dairen shop, which occupies a site of 340,000 tsubo in area.

(b) The company operates warehousing business at 31 different places at the wharf of Dairen and along its railway lines.

(c) As for marine transportation, the company started a steamship service between Dairen and Shanghai in 1907. The opening of the Tsingtao line and the Hong-Kong line followed later, the latter being intended to facilitate the shipping of the company's coal, mined at Fushun, to South China.

All these three lines were later transferred to the Dairen Steamship Company, which is capitalized at ¥25,000,000 by the company.

(d) Harbours are a wing of the railway business and is in inseparable position from it. Therefore, the South Manchuria Co., Ltd. has invested a sum amounting to ¥97,280,000 in Dairen, Port Arthur, Antung and Yingkow. A special attention has been devoted to the improvement of the harbour of Dairen, and the greater half of the entire harbour programme has already been finished, its present facilities being capable of handling 7,000,000 tons of freight annually with a berthing capacity of 190,000 tons of shipping at the same time.

Dairen. Dairen is at the extreme end of the Kwantung Penninsula, and has a population of 400,000, being the second largest city in Manchuria. It was leased in 1898 by Russia and was made an open port in July, 1907. Soon the harbour was much improved so as to berth simultaneously 27 steamships, ranging from 1,000 tons to 25,000 tons. Furthermore, in 1930, a coal wharf was constructed at Kanchingtzu on the other side of the bay opposite Dairen. The harbour freezes in winter from December to February, but only slightly and the entrance and departure of ships are made possible by the use of ice-breakers. The management of the wharf is conducted by the South Manchuria Railway Company under the supervision of the Kwantung government.

The trade via Dairen now totals M¥703,000,000 a year, or 75 per cent of the entire trade of Manchuria. In passenger traffic, Dairen occupies a very important position in the Europe-Asia international routes. From this port the South Manchuria Railway Company operates international trains to connect with the Korean Railway to Japan, and with the North Manchuria Railway and the Trans-Siberia Railway to Europe.

The recent traffic at the port of Dairen is shown in the following tables :

PASSENGER TRAFFIC AT DAIREN

Passengers Embarking	1931	1932	1933	1934
Manchurians	183,956	239,393	252,465	232,905

Total	786,525	1,268,420	2,169,857	2,085,000

Other Ports. Yingkow harbour is situated at a place 21 kilometres above the mouth of the Liao River. Its depth is from 7 to 20 metres, but the greatest defect of Yingkow harbour is its shallowness, as the water is only 2 to 1.5 metres deep at low tide. Exports, which consist of soy beans, bean cake, coal, pig iron, amount to over 1,300,000 tons while about 350,000 tons of commodities are imported through this port annually.

The harbour of Antung is located 31 kilometres above Hsintao at the mouth of the Yalu River. At Antung the river is from 1,000 to 1,500 metres wide, and the water under the Antung Railway Bridge is 3.7 metres deep at average low tide. But the water in front of Wutaokou in the lower stream shoals at low tide is only 0.9 to 1.8 metres deep. This shallowness in the lower stream has greatly hindered the development of Antung. Also, the river freezes from November to February. Though Antung has such defects, it possesses the advantage of being able to surpass other Manchurian harbours as a shipping port for lumber.

Conditions of these two and other ports are, in 1934, illustrated by the following tables :

ARRIVALS AND DEPARTURE OF VESSELS

Wharfs	Steamers No.	Tonnage M. tons	Junks No.
Dairen	5,377	16,219,000	880
Port Arthur	138	333,000	—
Yingkow	674	1,403,000	4,660

Total	3,647,000	9,298,000	12,945,000

(e) In mining, the company operates coal mines at Fushun and Yentai, and in addition to this, it is also engaged in shale-oil mining and steel foundry work.

(f) In the railway zone, the company is engaged in the real estate, building business and municipal administration, attending to the needs of sanitation, education and policing, while at the same time promoting agriculture, industry, commerce and mining in this area. The sum invested by the Company in these branches of work amounts to ¥188,620,000.

(g) The landed estate owned by this company extends over a total area of 371,430,000 square metres, of which approximately 59,000,000 square metres is leased to individuals. The company also owns some 14,200 buildings, of which 859 are rented to individuals.

(h) Another notable achievement of the company is its city-planning in various places. Up to the present it has built 25 cities at Liaoyang, Mukden, Hsinking, Yingkow, Antung, and other places. In these places the company has constructed roads, bridges, sewerage, schools, parks, markets and other modern municipal facilities.

(i) In education, the company now operates 26 kindergartens, 36 primary Schools, 5 middle schools, 4 girls' high schools, 2 colleges, one university, 10 public schools for Chinese students, 34 business supplementary schools, 13 girls' housekeeping schools, 2 commercial schools, one mining school, and six other schools. It has also opened two public libraries, one each at Dairen and Mukden, and 21 other reading rooms.

(j) Among other enterprises of the company are 16 hospitals and 5 branches, and for research and experimental work it carries on a hygienic station, an agricultural station, a farm, a tobacco farm, a geological research station, a central experimental station, and other institutions.

(3) There are in Manchoukuo 72 companies directly connected with the S.M.R. Co., with an aggregate paid-up capital of M¥461,675,000, about 43 per cent of which being borne by the mother company.

Communications (1) Postal and Telegraph Service. The post office is under the direction of the Department of Communications and Manchoukuo now has 353 post offices and 783 postal agencies, as compared with 283 and 720, respectively, in March, 1932. Since July, 1932, postal charges for both domestic and foreign mails have been reduced. Postal savings which were started in May, 1933, now total M¥1,150,000 (end of Aug., 1935). Money orders can be exchanged between this country and Japan, as well as China, Germany, Dutch Indies, Poland and Netherlands. Ordinary mail between Manchoukuo and China, too, is now exchanged without serious hitch, while international postal air service has also been inaugurated.

With the pacification of Jehol in 1933, the Government succeeded in bringing the postal administration throughout the country under its complete control. Since then postal charges have been reduced for both domestic and foreign mails. In May, 1933, postal savings, telegraphic transfer, postal note and savings transfer, and account services were opened for the benefit of the masses. In addition the new administration has inaugurated an international postal air service. Mail matters collected and delivered by Manchoukuo in recent years follow :

MAIL MATTERS COLLECTED AND DELIVERED IN KWANTUNG PROVINCE AND THE S.M.R. ZONE

	Collected	Delivered
1933–34	146,894,363	119,848,362
1934–35	154,304,137	152,794,660

There are the following telegraph lines between Manchuria and Japan proper :

Dairen-Sasebo submarine cable, laid during the Russo-Japanese War.
Dairen-Osaka direct line, via Korea, laid in May, 1919.
Mukden-Osaka direct line, via Korea, laid in June, 1919.
Dairen-Nagasaki submarine cable, laid in April, 1921, by the South Manchuria Railway Company and leased by the government.
Mukden-Shimonoseki direct line, via Korea, laid in December, 1926.

Although the telegraph and telephone enterprises were formerly under the control and management of the Depart-

ment of Communications, they were amalgamated into the Manchuria Telegraph and Telephone Company, a Manchoukuo-Japanese joint enterprise with a capital of M¥50,000,000 in August, 1933. This step was taken to unify all electric communication enterprises in the country. Since its establishment, telegraphic communications between principal cities in the country have been improved and with the completion of wireless service at Hsinking on Aug. 1, 1934, it succeeded not only in effecting wireless telephone service with Japan, but also in opening the service with Europe and America. The telegraph and telephone offices throughout the country now total 376, twice the number recorded at the time of the founding of the State. A 100-kw. broadcasting station, one of the largest in the Far East, was opened in Hsinking in November, 1934, while the stations at Harbin and Mukden were reorganized to meet the requirements of the times. Following tables show the status of telegraph and telephone services in Manchoukuo in recent years.

TELEGRAMS DESPATCHED AND RECEIVED IN KWANTUNG PROVINCE AND THE S.M.R. ZONE

Year	Despatched	Received
1933-34	3,370,794	3,146,673
1934-35	3,861,807	3,532,926

Telephone Subscribers

Year	No.	Year	No.
1931-32	19,640	1933-34	23,237
1932-33	21,255	1934-35	32,271

Justice and Police

General The present judicial system of Manchoukuo comes largely from the old Chinese system, which existed before the founding of Manchoukuo.

Before the unification of the country by the National Government, the number and grades of new courts established in China proper, the Three Eastern Provinces and other districts were as follows :

1. Supreme court, 1; supreme court prosecutorate, 1 at Nanging.
2. High court and high court prosecutorate, 23.
3. Branch high court and branch high court prosecutorate, 26.
4. District court and district court prosecutorate, 66.
5. Branch district court and branch district court prosecutorate, 25.

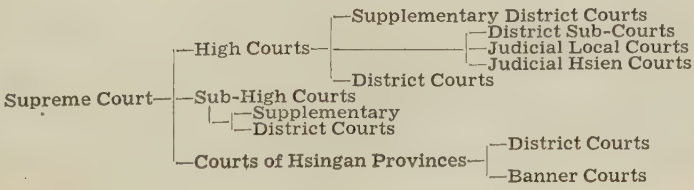
After the founding of Manchoukuo the old system has been revised several times due to the contradiction it involves being inimical to the other existing systems and the obstacles it offered against the smooth working of laws.

Judicial System According to the principle of the independence of the four divisions of government of Manchoukuo the judicial power is invested direct with the Emperor, and its independence is assured by making it independent of the cabinet.

The present judicial system of Manchoukuo is based upon the Organic law promulgated on March 1, 1934, and in accordance with this law many improvements have since been effected seeking to give fair and speedy trial to all.

Manchoukuo makes the abolition of extraterritoriality as the fundamental national policy and preparations for that purpose are progressing. A general programme has been already mapped out for the improvement of courts and prisons, as well as for the establishment of a new system for police and new procurator's offices. For the training of competent judicial officers, a number of judical experts from Japan have been engaged as advisers and instructors. A law school for training Manchurian judicial officers has been established.

The defect of the old régime was the want of a central and well organized judiciary. Laws were dead letter because there were no efficient courts to expound and define their true meaning and operation. The organization of the courts of Manchoukuo to-day stands as follows :



COURTS

Institutions	Kirin	Lung-kiang	Fengtien	Antung	Chinchow	Ping-kiang	Sang-kiang
Supreme court	1	—	—	—	—	—	—

Police System With the founding of Manchoukuo, the police administration was put under supervision of the Minister of Civil Affairs, and a new police system was founded, which would suit the particular conditions of each province. According to the investigation made by the police bureau in the Department of Civil Affairs in November of 1932, the total number of police was 101,000.

As organs for training police there are the Central Police School, Local Police Schools and police training schools. Superior police are sent to Japan for further study there for a year and in 1935 students numbering 30 were despatched for that purpose to Japan for the fourth time. From 5 to 20 experienced Japanese policemen are engaged in various hsiens and they are directing police in general in various provinces.

Education and Religion

General Public education in Manchoukuo, except in the Hsingan provinces, comes under the jurisdiction of the Department of Education. In the provinces, education, in accordance with the policy as outlined by the Department of Education, is governed by the Department of Mongolian Administration.

Works in education are being organized under and undertaken by School Education and Social Works Bureaux. The primary object of school education is character building with the principle of equal opportunity for all which is the basis of the entire educational system. Anti-foreignism which the former régime fostered has been entirely done away with, and the ideas of "Wangtao" are inculcated in the minds of the children. Compilation of new text-books is progressing rapidly and in most of the schools the new text-books are already in use. Practically vocational training is another important work of the schools.

Schools The number and kinds of schools, and the number of instructors and pupils are as follws :

Kind of School	No.	No. of Students	No. of Instructors
Primary school	10,925	596,688	19,632
	*2,959		
Middle school	173	26,021	1,820
	×33		
Normal school	109	8,727	701
	36		
Vocational school	41	4,592	428
	×5		
Universities and colleges	7	1,987	306
	×3		
Private school	1,624	29,952	1,639
Total	12,884	667,967	24,526
	×3,236		

Remarks: * denotes the number in contemplation.

Social and Cultural Education In the field of social education, the national traits of the people and the actual conditions of the country are given due consideration. A five-year programme is being worked out for adult education. Cultural work covers a vast field of activities, and it must of necessity proceed gradually.

Beginning with 1934 an annual subsidy of M¥40,000 is being granted from the national treasury to improve and expand the work for adult education. In all some 2,236 schools now exist for adults. In addition there are 72 popular educational institutes and 55 lecture halls.

The National Library was established in Mukden in April, 1932, while in June, 1935, the National Museum was opened also in Mukden, which contains mementos of the country's once illustrious history. These institutions will undoubtedly help to promote the nation's cultural enterprises. The authorities have already taken steps so preserve historic buildings and relics throughout the country. The Lama temples and other architectures in Jehol are receiving special attention of the Government which has decided to expend M¥23,000 for preliminary investigation necessary to their permanent preservation.

Institutions by Western Peoples Educational institutions maintained by Western peoples are under the management of religious workers.

These educational establishments are mostly carried on by the British, French, German, and Danish nationals. The schools maintained by foreign missions in Manchuria were as follows, in 1929.

	Primary School	Secondary School	Others
Fengtien province	111	10	11
Kirin province	31	1	2
Lungkiang province	7	—	—
Total	149	11	13
Number of students	2,785	1,188	455

As regards schools for Russians there are 14 secondary schools, 8 primary schools, and 3 kindergartens of the Soviet Union in the Tungsheng Special District.

Institutions Maintained by Japanese The educational institutions maintained by the Japanese in Manchuria may be divided into those for the education of the Japanese (there are separate institutions for Koreans) and those for the education of the Chinese. These educational institutions are controlled by the Kwantung government in the Kwantung Leased Territory, and by the South Manchuria Railway Company in the railway zone, and by Japanese consulates in the consular districts.

In 1907 there were only six primary schools in Manchuria maintained by the Japanese. At present, however, there are numerous primary schools, middle schools, and higher schools established throughout Manchuria, the latest available figures of which are tabulated below :

	For Japanese		For Manchus	
	No. of Schools	No. of Students	No. of Schools	No. of Students
Primary education				
Primary schools or public schools	58	33,756	22	13,284

South Manchuria Technical College	1	—	—	—
Manchurian Educational School	1	259	—	—
University				
Port Arthur Engineering College	2	891	—	49
Manchurian Medical College				

Religion The principal religions in Manchoukuo are Confucianism, Buddhism, Taoism, Lamaism, and Mohammedanism. Christianity was introduced in 1858. In April, 1934, the Holy See formed a separate mission field in Manchoukuo, independent from that of China, and appointed the Rt. Rev. Bishop A. Gaspais as Acting Apostolic Delegate for the whole of Manchoukuo. The latest available number of preachers and believers for each and the number of temples, shrines, and churches follow :

NUMBER OF PREACHERS

Provinces	Buddhism	Taoism	Mohammedanism	Lamaism	Roman Catholics	Protestants
Fengtien	1,324	786	132	324	131	235

Total	793	488	150	28	121	234

Medicine and Sanitation

Sanitary Conditions The climate of Manchuria is not at all unhealthy. But since the country is extensive, bordering on Mongolia and Siberia and inhabited by different races, many of whom lead the insanitary life of extremely primitive conditions, and especially since coolies and refugees are constantly migrating in large groups, the risk of the spread of dreadful infectious diseases is rather common. In the past twenty years, Manchuria has been often afflicted by such plagues; for instances, the pneumonic plague in 1910–1911, cholera in 1919, pneumonic plague again in 1920–1921, and pneumonic plague once more in 1927. Another plague is the pest which destroyed the lives of 900 people in 1934. But due to vigorous exertion made jointly by the Department of Civil Affairs, the Department of Mongolian Administration and the South Manchuria Railway Co. special districts have been mapped, isolation hospitals and lookouts established and they have been placed under supervision of the pest investigation institute. Owing to activities of these institutions as well as the thoroughness in inoculation the number afflicted by pest in 1935 was reduced to one-half of that of 1934.

Medical Institution The administration of hygiene of the country is undertaken by the Bureau of Hygiene of the Department of Civil Affairs. As regards the facilities of the administration of hygiene they have organs established in various provinces, in North Manchuria Special District, in Hsinking, in various hsiens, the police stations, etc. Though medical institutions in large cities in the Kwantung Leased Territory and the South Manchuria Railway Zone are well equipped the situation is quite different in local districts and is not so good. State hospitals are located in Kirin, Harbin and Chengte where patients numbering about 25,000 are received every month. Among public hospitals there are Fengtien City Hospital, the Harbin First and Second Hospitals and a few others which are under construction. Physicians in the public service number 67 in all and it is so planned that by 1937 there will be at least one public physician in every hsien. In addition there are some private hospitals. The number of places where there are public physicians and private hospitals are as follows :

Province	No. of Places Public Physicians	Private Hospitals
Fengtien	5	1
Pingkiang	9	2
Sankiang	8	2
Kirin	6	2
Chinchow	5	1
Heiho	2	1
Lungkiang	10	2
Antung	5	1
Hsingan (4 prov.)	7	1
Jehol	10	1
Chientao	3	1

In addition to the above there are many medical organs which are under management of the General Direction of State Railways, the South Manchuria Railway and Japan Red Cross Society as well as of foundations and religious bodies. These are tabulated as follows :

Under management of	
The General Direction of State Railway	30
The South Manchuria Railway	29
Under management of	
Public hospitals under management of the South Manchuria Railway	13
The Red Cross Society	10
Various foundations	6
Religious bodies	28
Municipal and hsien offices	19
Associations affiliated with social welfare works	34
Those which belong to the military	7
National asylums for the habitués of opium	10

The number of physicians, dentists, mid-wives, pharmacists and drug stores follows :

	Fengtien	Kirin	Lung-kiang	Tungsheng Special District	Total
Physicians					
Practitioners in the Chinese medicine	3,284	495	398	99	4,276
Ordinary physicians	658	133	121	287	1,199
Dentists	125	12	5	183	326
Mid-wives					
Old-fashioned	1,564	9	27	8	1,608
New-styled	600	4	39	7	650
Pharmacists	441	?	?	?	441
Drug stores					
Chinese drug	995	?	?	?	996
Western medicine	229	?	?	?	229

Medical Education As organs for educating medical students there are only the Medical School attached to Kirin Government Hospital College and the Harbin Medical College. All the other educational organs are under management of foreign countries. Of these are found Manchuria Medical University and College, Fengtien Medical College, Harbin First and Second Dental School, and one pharmaceutical school under Russian management. But all except the Manchuria Medical University, are poorly equipped. In view of this, the Manchuria Medical College opened its technical course in 1933 and now admits Manchurian students.

Sanitation With central epidemics prevention organ in the Bureau of Hygiene there are various sanitary institutions placed in local districts. There are also installed six quarantine stations at the frontier which have been established as permanent organs. As an organ for the prevention of pest 2 pest investigation institutes, 9 isolation hospitals and 9 lookouts which are permanent institutions have been established. Quarantine and the hygiene of the ports of Dairen and Port Arthur are under the direction of the Marine Office of the Kwantung government and its branch.

Hygienic investigations and inspections are conducted by the following institutions : The Central Laboratory, the Hygiene Institute and the Animal Disease Research Institute of the South Manchuria Railway Company ; the government hospitals at Dairen and Port Arthur ; physicians, veterinary surgeons and pharmaceutists stationed by the Kwantung government at civil administration offices, police stations and sub-stations.

The Hygienic Institute was established in 1925 by the railway company at an outlay of ¥400,000 in view of the lack of facilities for pathogenic investigations, and also for the supply of preventive and curative medicines.

Vaccines, serums, and disinfectants produced at the Institute are distributed free or at cost not only in Manchuria but also in Tientsin and Shantung districts. The latest statistics for production and distribution of vaccines and serums give the following figures :

	Vaccines and serums manufactured in cc.	Products sold or distributed in cc.
1928	21,856,857	21,128,423
1929	25,574,962	25,513,384
1930	30,801,140	30,728,469

The Animal Disease Research Institute of the South Manchuria Railway Co., was established in 1925 at Mukden at a cost of ¥250,000. The Institute is divided into the Research and Enterprise Divisions. The Enterprise Division manufactures and distributes serums, vaccines and medicines for various animal diseases, conducts classes and lectures on animal diseases, gives itinerant medical treatment by sending free treatment and research corps, and also operates the examination station in the Institute.

Principal Cities

Hsinking Hsinking has, within the brief period of three years, grown from a sleepy railway junction town into a fast expanding thriving city with a population of over 307,000. Prior to the establishment of the new State the population had remained stationary at above 130,000. Situated 702 km. north of Dairen as at the northern terminus of the South Manchuria Railway line, Hsinking, formerly known as Chang-

chun, is now the capital of Manchoukuo and the seat of the Imperial Palace and all other important government buildings.

This city is also an important commercial centre as it forms the junction of the South Manchuria Railway, the North Manchuria Railway and the Hsinking-Tumen Railway. Its area, inclusive of the S.M.R. Zone, the Open Mart, the Chinese town and Kuanchengtzu was, prior to the establishment of the new state, 21 sq. km. Today, owing to the rapid expansion of the city, its area, including the new first-stage construction zone, is 200 sq. km. The population is rapidly increasing and is expected to exceed 300,000 by the time of the completion of the first stage construction works in 1937 and surpass the half-million mark when the second and third stage projects are finished.

It is divided into three sections known as the new city, the open town and the walled city, and plans are now being promoted which will ultimately make it a fine metropolis of some 3,000,000 population.

The Japanese population in Hsinking has increased from 10,000 to approximately 59,000 in these few years, and the Japanese institutions in this city include the chamber of commerce and industry, the stock exchange, banks, industrial organizations, the district and transportation offices of the South Manchuria Railway Company, and several schools of various grades, in addition to the offices of the ambassador extraordinary and plenipotentiary, the consulate-general, and the headquarters of the commander of the Kwantung army.

Capital Construction Plan. According to the city planning programme of the Capital Construction Bureau, which has been created in the General Affairs Board of the Manchoukuo Government, the great metropolis to be built around the present city of Hsinking is to cover an area of 200 square kilometres, an oblong polygon in shape, with its centre at Kaotaitze, which is situated a little south of Hsinking Railway Station.

During the first period of the capital construction programme work will be undertaken in an area of about 100 square kilometres out of the total of 200 square kilometres.

The area is sub-divided as follows :

		sq. km.
1.	For Government buildings	6.5
2.	„ streets, roads, etc.	21.0
3.	„ public use	3.5
4.	„ parks, grounds, etc.	7.0
5.	For military purposes	9.0
6.	„ residences	27.0
7.	„ commercial districts	8.0
8.	„ industrial districts	6·0
9.	„ miscellaneous purposes	10.0
10.	„ special districts (vegetables, livestock, etc.)	2.0
		100.0

On completion the new metropolis is to be divided into residential, commercial, industrial, special and miscellaneous districts, each designated as such, and it is hoped that the whole city will assume the grand appearance of a metropolis as modern in equipment as any other in the world, with seven trunk roads radiating in all directions from its centre. They are as follows :

Hsinking-Nungan-Fuyu	160 km.
Hsinking-Huaite-Kungchuling	100 „
Hsinking-Mukden via Kungchuling	270 „
Hsinking-Itung	72 „
Hsinking-Shuangyang	50 „
Hsinking-Kirin via Tapinling	114 „
Hsinking-Harbin via Yaomen	235 „

Anticipating that the population of this new area will eventually reach 500,000, the Capital Construction Bureau is building a huge reservoir in the basins of the Hsiao and Tai Rivers, tributaries of the Itung River, for supplying water to the capital. The projected reservoir, which will be one of the largest in the Far East, will be filled with rain water and water obtained by damming the two tributaries. It will hold 27,700,000 cubic metres, and will be capable of supplying over 40,000 tons of water daily, which will be more than enough to meet the needs of a population of 500,000.

An up-to-date sewer system is also being built as part of the capital construction programme. Already 48,301 metres of sewer pipes have been laid in the new area.

Spacious parks will be a feature of the new section of the city. These will occupy seven per cent of the total area of the new town. In the vicinity of the parks are projected a national museum, a huge public library, public auditoriums, botanical gardens, and a zoo. Athletic fields, a horse race course and golf links have been already completed, or are nearing completion. When the present projects are completed, Hsinking will no doubt rank as one of the leading modern cities in the Far East.

Mukden Mukden (Fengtien), for-

merly the seat of the old militarist government of the Chang family, still retains its prosperity as a commercial and industrial centre of Manchoukuo situated as it is in the heart of a vast plain watered by the Liao River.

The main line and the Antung-Mukden line of the South Manchuria Railway, the Mukden-Shanhaikwan Railway, and the Mukden-Hailung Railway converge at Mukden thus making this city an important point of communication between Europe and Asia.

As an industrial centre, Mukden produces matches, bean-oil, rice, pottery, textiles and tobacco. This city also is a centre of education in Manchoukuo, among its important schools being the Manchuria Medical College, in addition to several primary and secondary schools for boys and girls.

The population of the open town and the railway zone of Mukden at the end of July, 1936, numbered 534,638, of which 81,676 are the Japanese nationals including Koreans.

Dairen Dairen is the most important port for Manchoukuo. Located in the Leased Territory of Kwantung the city is under Japanese administration. Starting from this city, the main line of the South Manchuria Railway runs north as far as Hsinking, branching off at Mukden to Antung.

The city is built on the shore of the Bay of Dairen, extending 7.8 kilometres from east to west and 3 kilometres from north to south. Divided into the residential, mixed, commercial and industrial districts, the city is well planned, with a sewerage system, parks and other modern public utilities completed by the Japanese.

In 1915 the city was organized as an autonomous municipality and efforts have since been continued to perfect its sanitary and educational institutions and fire-preventing facilities.

From the central square covering an area of more than 10,000 tsubo, 10 boulevards radiate in all directions, the streets of this city being of seven different widths with a maximum of 25 ken or about 50 yards.

Among the parks of the city, Electric Park is the most famous. Hoshigaura Park, which is in Hoshigaura, a suburb of Dairen, is also well known for its golf links and sea-bathing beach.

Being the largest commercial centre of South Manchuria, the city has a population of approximately 370,000 of which about 139,000 are the Japanese coming from Japan proper. Among the important offices in the city are the headquarters of the South Manchuria Railway Company, the city hall, the civil administration office, the bureau of communications, the chamber of commerce and industry, the branch offices of the Yokohama Specie Bank, the Chosen Bank, the Oriental Colonization Company, the Central Bank of Manchou, the Chenglung Bank, the Mitsui Company, the Mitsubishi Company, the Okuragumi, Mitsukoshi and other business concerns.

Various local institutions include the Manchuria Dockyard Company, the Dairen Steamship Company, the South Manchuria Electric Company and the Dairen Hospital. Among the schools in this city are 12 kindergartens, 14 primary schools, 2 middle schools, 2 girls' high schools, a commercial school, a girls' commercial school, a commercial and industrial school, a foreign language school and a technical college.

Ryojun (Port Arthur) Ryojun was once the seat of the government of the Kwantung Leased Territory. Situated at the southern tip of Liaotung peninsula, the city is surrounded by hills on all sides except on its water front, which forms a port opening to the Gulf of Pechihli.

The city is made up of two sections, the old town and the new town. In the old town are located the city hall, the dockyard, the defence headquarters, the higher law court, the civil administration office and the headquarters of Port Arthur fortress.

The new city is built on the shore of the west port and forms the government and school district with the former office of government of the Kwantung Leased Territory, the Ryojun Engineering College, and other schools located in it.

The boulevards of the city are of two different width, 84 feet and 63 feet respectively, while the standard width of the street is 42 feet.

The vicinity of Ryojun is the old scene of the siege of Port Arthur during the Russo-Japanese War, and a smooth driveway now connects Ryojun and Dairen to take tourists to the old battlefields.

The population of the city is put at 31,000, of which about 12,000 are the Japanese nationals.

Yingkow Before the opening of Dairen, Yingkow was the only commercial port of Manchuria, and it enjoyed great prosperity. It is now known mostly as an industrial centre for manufacturing bean oil, tobacco, brick and soy sauce.

Being situated on the bank of the Liao River about 14 miles from its mouth, this town still plays an impor-

tant rôle in the commerce of the river, meeting the needs of the rural populace along its banks. The town on the opposite bank of the river is known as Newchwang.

The population of the Japanese section of the city is put as 5,300, of which 3,000 are the Japanese coming from Japan proper.

Kirin Standing on the western bank of the Sungari River, Kirin is the terminus of the Kirin-Changchun Railway and is known as an important station in the transportation of lumber produced in the upper basin of the river.

Being one of the largest cities in Manchoukuo, it has a population of 127,000, of which about 8,500 are the Japanese. As the city is kept comparatively clean, surrounded by shapely hills, Kirin is known among the Japanese as the Kyoto of Manchuria. Among other products marketed in this city are lumber, tobacco leaf, hemp and furs.

Harbin Special Municipality Harbin is situated on the eastern bank of the Sungari River, at 44.5 degrees North Latitude and 126.40 degrees East Longitude. Although now known as the Paris of the Far East, Harbin was only a deserted village before the Russian penetration into Manchuria.

Built in European style, the city has a population of 462,000, of which 31,400 are the Japanese, 6,400 Koreans and 40,000 Russians.

From this city, the southern line of the North Manchuria Railway runs to Hsinking. The city also forms an important point in the long railway which links Vladivostok and cities of Europe via Siberia.

As the largest commercial and industrial centre of north Manchuria, Harbin handles more than 4,000,000 tons of soy beans, wheat, bean-cake and other products annually.

The city was formerly divided into three sections : Old Harbin, the new city and the open town. The new city is said to have been planned after Moscow. The railway station, the offices of the North Manchuria Railway and the North Manchuria Railway and the foreign consulates are located in this section.

In the open town, which is the commercial section of the city, reside Russian, Japanese and Manchurian merchants engaged in thriving business activities. The Harbin offices of the Yokohama Specie Bank, the Chosen Bank and Mitsui Company are found in the open town.

In June of 1933 Harbin was made a special municipality and since July 1, 1933 the municipality became an autonomous city which comes under the direct control of the Department of Civil Affairs. Since then the old plan of extension of the city has been given up and the city is under construction according to a new plan which purports to make it ten times as large as that designed under the old plan

Kwantung Leased Territory

General and Historical The Kwantung Leased Territory under Japanese rule which was ceded to Japan by Russia and the lease of which lasts till 1997, together with the railway zone of the South Manchuria Railway Company, forms the most civilized area of Manchuria with all kinds of modern facilities introduced by the Japanese.

Occupying a small southern portion of Liaotung Peninsula, the Leased Territory covers an area of some 3,367.88 square kilometres with a population of 1,134,074 at the end of 1935, of which 163,796 are the Japanese, 4,389 Koreans, 963,875 the Chinese and Manchous and 2,014 of other nationalities.

Government The government of the Kwantung Leased Territory at Ryojun is in charge of the civil administration office under the supervision of the Kanto Bureau, which is again placed under the Embassy at Hsinking.

In the beginning the territory was under military rule with an army officer as governor-general. This system was changed in 1919, and since then a civilian officer was appointed governor of the territory by the Emperor of Japan. A drastic change was made in this system on December 26, 1934, in which the Kanto Bureau was established at Hsinking under the control of the Ambassador at Hsinking, and most of the administrative powers formerly vested in the governor of the Leased Territory was transferred to the president of the newly created Bureau. The president takes charge of the civil administration within the territory and supervises the business of the South Manchuria Railway Co. The Bureau is sub-divided into the president's secretariat, home affairs, police, and controller's divisions. At the same time a separate office was created for administration of the Peninsula. Under this office, which is at Ryojun, falls the administration of civil affairs in the Peninsula, the prisons, the Ryojun Engineering College, the middle schools, the girls' high schools, the normal school for natives, the commercial school for natives, the agri-

cultural schools for natives, the Police Training School, the Meteorological Observatory, the government hospitals, the Agricultural Experimental Station, the Sericultural Experimental Station and several other institutions in the territory.

Finance Taxes are regularly collected, but due to a large expenditure required for improvement in hygiene, strengthening of police force, extension of educational facilities, development of industries, etc., the revenue from this source is not enough to meet the expenditure, so that subvention is allowed from the General Account. The budget for the financial year 1936–37 was as follows :

Revenue	
Ordinary revenue	¥4,760,276
Extraordinary „	¥2,510,243
Total	¥7,270,519
Expenditure	
Ordinary expenditure	¥3,544,089
Extraordinary „	¥3,726,430
Total	¥7,270,519

Of the ordinary revenue the income from taxes amounts to ¥2,066,278, that from the Government enterprises and properties to ¥2,393,450, while in the extraordinary revenue the Government subvention amounts to ¥1,747,412. The main items of expenditure included ¥2,084,432 for various subsidies, ¥1,510,251 for public works and repairs, ¥1,198,056 for various enterprises and ¥757,213 for education.

Justice and Communications In regard to the administration of justice in the Leased Territory, the system of the courts of justice was established in 1906 to adjudicate in all civil and criminal cases, irrespective of the nationalities of the persons involved.

The defence of the Leased Territory is secured by a neutral zone along the northern frontier.

The communication system and educational, hygienic and other modern institutions are well organized in the territory. In matters concerning hygiene and sanitation, the Kwantung government is collaborating with the South Manchuria Railway Company.

APPENDIX

CHAPTER I

THE EMPEROR

ARTICLE I The Empire of Japan shall be reigned over and governed by a line of Emperors unbroken for ages eternal.

ARTICLE II The Imperial Throne shall be succeeded to by Imperial male descendants, according to the provisions of the Imperial House Law.

ARTICLE III The Emperor is sacred and inviolable.

ARTICLE IV The Emperor is the head of the Empire, combining in Himself the rights of sovereignty, and exercises them according to the provisions of the present Constitution.

ARTICLE V The Emperor exercises the legislative power with the consent of the Imperial Diet.

ARTICLE VI The Emperor gives sanction to laws, and orders them to be promulgated and executed.

ARTICLE VII The Emperor convokes the Imperial Diet, opens, closes and prorogues it, and dissolves the House of Representatives.

ARTICLE VIII The Emperor, in consequence of an urgent necessity to maintain public safety or to avert public calamities, issues, when the Imperial Diet is not sitting, Imperial Ordinances in the place of law.

Such Imperial Ordinances are to be laid before the Imperial Diet at its next session, and when the Diet does not approve the said Ordinances, the Government shall declare them to be invalid for the future.

ARTICLE IX The Emperor issues, or causes to be issued, the Ordinances necessary for the carrying out of the laws, or for the maintenance of the public peace and order, and for the promotion of the welfare of the subjects. But no Ordinance shall in any way alter any of the existing laws.

ARTICLE X The Emperor determines the organization of the different branches of the administration, and salaries of all civil and military officers, and appoints and dismisses the same. Exceptions especially provided for in the present Constitution or in other laws shall be in accordance with the respective provisions bearing thereon.

ARTICLE XI The Emperor has the supreme command of the Army and Navy.

ARTICLE XII The Emperor determines the organization and peace standing of the Army and Navy.

ARTICLE XIII The Emperor declares war, makes peace, and concludes treaties.

ARTICLE XIV The Emperor declares a state of siege.

The conditions and effects of a state of siege shall be determined by law.

ARTICLE XV The Emperor confers titles of nobitity, rank, orders and other marks of honour.

ARTICLE XVI The Emperor orders amnesty, pardon, commutation of punishments and rehabilitation.

ARTICLE XVII A Regency shall be instituted in conformity with the provisions of the Imperial House Law.

The Regent shall exercise the powers appertaining to the Emperor in His name.

CHAPTER II

RIGHTS AND DUTIES OF SUBJECTS

ARTICLE XVIII The conditions necessary for being a Japanese subject shall be determined by law.

ARTICLE XIX Japanese subjects may, according to qualifications determined in laws or ordinances, be appointed to civil or military or any other public offices equally.

ARTICLE XX Japanese subjects are amenable to service in the Army or Navy according to the provisions of law.

ARTICLE XXI Japanese subjects are amenable to the duty of paying taxes according to the provisions of law.

ARTICLE XXII Japanese subjects shall have the liberty of abode and of changing the same within the limits of law.

ARTICLE XXIII No Japanese subject shall be arrested, detained, tried or punished, unless according to law.

ARTICLE XXIV No Japanese subject shall be deprived of his right of being tried by the judges determined by law.

ARTICLE XXV Except in the cases provided for in the law, the house of no Japanese subject shall be entered or searched without his consent.

ARTICLE XXVI Except in the cases mentioned in the law, the secrecy of the

letters of every Japanese subject shall remain inviolate.

ARTICLE XXVII The right of property of every Japanese subject shall remain inviolate.

Measures necessary to be taken for the public benefit shall be provided for by law.

ARTICLE XXVIII Japanese subjects shall, within limits not prejudicial to peace and order, and not antagonistic to their duties as subjects, enjoy freedom of religious belief.

ARTICLE XXIX Japanese subjects shall, within the limits of law, enjoy the liberty of speech, writing, publication, public meetings and associations.

ARTICLE XXX Japanese subjects may present petitions, by observing the proper forms of respect, and by complying with the rules specially provided for the same.

ARTICLE XXXI The provisions contained in the present chapter shall not affect the exercise of the powers appertaining to the Emperor, in times of war or in cases of a national emergency.

ARTICLE XXXII Each and every one of the provisions contained in the preceding Articles of the present chapter, that are not in conflict with the laws or the rules and discipline of the Army and Navy, shall apply to the officers and men of the Army and of the Navy.

CHAPTER III

THE IMPERIAL DIET

ARTICLE XXXIII The Imperial Diet shall consist of two Houses, a House of Peers and a House of Representatives.

ARTICLE XXXIV The House of Peers shall, in accordance with the Ordinance concerning the House of Peers, be composed of the members of the Imperial Family, of the orders of nobility, and of those persons who have been nominated thereto by the Emperor.

ARTICLE XXXV The House of Representatives shall be composed of Members elected by the people according to the provisions of the Law of Election.

ARTICLE XXXVI No one can at one and the same time be a Member of both Houses.

ARTICLE XXXVII Every law requires the consent of the Imperial Diet.

ARTICLE XXXVIII Both Houses shall vote upon projects of law submitted to them by the Government, and may respectively initiate projects of law.

ARTICLE XXXIX A Bill which has been rejected by either the one or the other of the two Houses shall not be again brought in during the same session.

ARTICLE XL Both Houses can make representations to the Government as to laws or upon any other subject. When, however, such representations are not accepted, they cannot be made a second time during the same session.

ARTICLE XLI The Imperial Diet shall be convoked every year.

ARTICLE XLII A session of the Imperial Diet shall last during three months. In case of necessity, the duration of a session may be prolonged by Imperial Order.

ARTICLE XLIII When urgent necessity arises, an extraordinary session may be convoked in addition to the ordinary one.

The duration of an extraordinary session shall be determined by Imperial Order.

ARTICLE XLIV The opening, closing, prolongation of session and prorogation of the Imperial Diet, shall be effected simultaneously for both Houses.

In case the House of Representatives has been ordered to dissolve, the House of Peers shall at the same time be prorogued.

ARTICLE XLV When the House of Representatives has been ordered to dissolve, Members shall be caused by Imperial Order to be newly elected, and the new House shall be convoked within five months from the day of dissolution.

ARTICLE XLVI No debate can be opened and no vote can be taken in either House of the Imperial Diet, unless not less than one-third of the whole number of the Members thereof is present.

ARTICLE XLVII Votes shall be taken in both Houses by absolute majority. In the case of a tie vote, the President shall have the casting vote.

ARTICLE XLVIII The deliberations of both Houses shall be held in public. The deliberations may, however, upon demand of the Government or by resolution of the House, be held in secret sitting.

ARTICLE XLIX Both Houses of the Imperial Diet may respectively present addresses to the Emperor.

ARTICLE L Both Houses may receive petitions presented by subjects.

ARTICLE LI Both Houses may enact, besides what is provided for in the present Constitution and in the Law of the Houses, rules necessary for the management of their internal affairs.

ARTICLE LII No Member of either House shall be held responsible outside

the respective Houses for any opinion uttered or for any vote given in the House. When, however, a Member himself has given publicity to his opinions by public speech, by documents in print or in writing, or by any other similar means, he shall, in the matter, be amenable to the general law.

ARTICLE LIII The Members of both Houses shall, during the session, be free from arrest, unless with the consent of the House, except in cases of flagrant delicts, or of offences connected with a state of internal commotion or with a foreign trouble.

ARTICLE LIV The Ministers of State and the Delegates of the Government may, at any time, take seats and speak in either House.

CHAPTER IV

THE MINISTERS OF STATE AND THE PRIVY COUNCIL

ARTICLE LV The respective Ministers of State shall give their advice to the Emperor, and be responsible for it.

All Laws, Imperial Ordinances and Imperial Rescripts of whatever kind, that relate to the affairs of the State, require the countersignature of a Minister of State.

ARTICLE LVI The Privy Councillors shall, in accordance with the provisions for the organization of the Privy Council, deliberate upon important matters of State, when they have been consulted by the Emperor.

CHAPTER V

THE JUDICATURE

ARTICLE LVII The Judicature shall be exercised by the Courts of Law according to law, in the name of the Emperor.

The organization of the Courts of Law shall be determined by law.

ARTICLE LVIII The judges shall be appointed from among those who possess proper qualifications according to law.

No judge shall be deprived of his position, unless by way of criminal sentence or disciplinary punishment.

Rules for disciplinary punishment shall be determined by law.

ARTICLE LIX Trials and judgments of a Court shall be conducted publicly. When, however, there exists any fear, that such publicity may be prejudicial to peace and order, or to the maintenance of public morality, the public trial may be suspended by provision of law or by the decision of the Court of Law.

ARTICLE LX All matters, that fall within the competency of a special Court, shall be specially provided for by law.

ARTICLE LXI No suit at law, which relates to rights alleged to have been infringed by the illegal measures of the administrative authorities, and which shall come within the competency of the Court of Administrative Litigation specially established by law, shall be taken cognizance of a Court of Law.

CHAPTER VI

FINANCE

ARTICLE LXII The imposition of a new tax or the modification of the rates of an existing one shall be determined by law.

However, all such administrative fees or other revenue having the nature of compensation shall not fall within the category of the above clause.

The raising of national loans and the contracting of other liabilities to the charge of the National Treasury, except those that are provided in the Budget, shall require the consent of the Imperial Diet.

ARTICLE LXIII The taxes levied at present shall, in so far as they are not remodelled by a new law, be collected according to the old system.

ARTICLE LXIV The expenditure and revenue of the State require the consent of the Imperial Diet by means of an annual Budget.

Any and all expenditures overpassing the appropriations set forth in the Titles and Paragraphs of the Budget, or that are not provided for in the Budget, shall subsequently require the approbation of the Imperial Diet.

ARTICLE LXV The Budget shall be first laid before the House of Representatives.

ARTICLE LXVI The expenditures of the Imperial House shall be defrayed every year out of the National Treasury, according to the present fixed amount for the same, and shall not require the consent thereto of the Imperial Diet, except in case an increase thereof is found necessary.

ARTICLE LXVII Those already fixed

expenditures based by the Constitution upon the powers appertaining to the Emperor, and such expenditures as may have arisen by the effect of law, or that appertain to the legal obligations of the Government, shall be neither rejected nor reduced by the Imperial Diet, without the concurrence of the Government.

ARTICLE LXVIII In order to meet special requirements, the Government may ask the consent of the Imperial Diet to a certain amount as a Continuing Expenditure Fund, for a previously fixed number of years.

ARTICLE LXIX In order to supply deficiencies, which are unavoidable, in the Budget, and to meet requirements unprovided for in the same, a Reserve Fund shall be provided in the Budget.

ARTICLE LXX When the Imperial Diet cannot be convoked, owing to the external or internal condition of the country, in case of urgent need for the maintenance of public safety, the Government may take all necessary financial measures, by means of an Imperial Ordinance.

In the case mentioned in the preceding clause, the matter shall be submitted to the Imperial Diet at its next session, and its approbation shall be obtained thereto.

ARTICLE LXXI When the Imperial Diet has not voted on the Budget, or when the Budget has not been brought into actual existence, the Government shall carry out the Budget of the preceding year.

ARTICLE LXXII The final account of the expenditures and revenue of the State shall be verified and confirmed by the Board of Audit, and it shall be submitted by the Government to the Imperial Diet, together with the report of verification of the said Board.

The organization and competency of the Board of Audit shall be determined by law separately.

CHAPTER VII

SUPPLEMENTARY RULES

ARTICLE LXXIII When it has become necessary in future to amend the provisions of the present Constitution, a project to that effect shall be submitted to the Imperial Diet by Imperial Order.

In the above case, neither House can open the debate, unless not less than two-thirds of the whole number of Members are present, and no amendment can be passed, unless a majority of not less than two-thirds of the Members present is obtained.

ARTICLE LXXIV No modification of the Imperial House Law shall be required to be submitted to the deliberation of the Imperial Diet.

No provision of the present Constitution can be modified by the Imperial House Law.

ARTICLE LXXV No modification can be introduced into the Constitution, or into the Imperial House Law, during the time of a Regency.

ARTICLE LXXVI Existing legal enactments, such as laws, regulations, Ordinances, or by whatever names they may be called, shall, so far as they do not conflict with the present Constitution, continue in force.

All existing contracts or orders, that entail obligations upon the Government, and that are connected with expenditure, shall come within the scope of Art. LXVII.

THE IMPERIAL HOUSE LAW

CHAPTER I

SUCCESSION TO THE IMPERIAL THRONE

ARTICLE I The Imperial Throne of Japan shall be secceeded to by male descendants in the male line of Imperial Ancestors.

ARTICLE II The Imperial Throne shall be succeeded to by the Imperial eldest son.

ARTICLE III When there is no Imperial eldest son, the Imperial Throne shall be succeeded to by the Imperial eldest grandson. When there is neither Imperial eldest son nor any male descendant of his, it shall be succeeded to by the Imperial son next in age, and so on in every successive case.

ARTICLE IV For succession to the Imperial Throne by an Imperial descendant, the one of full blood shall have precedence over descendants of half blood. The succession to the Imperial Throne by the latter shall be limited to those cases

only, when there is no Imperial descendant of full blood.

ARTICLE V When there is no Imperial descendant, the Imperial Throne shall be succeeded to by an Imperial brother and by his descendants.

ARTICLE VI When there is no such Imperial brother or desendant of his, the Imperial Throne shall be succeeded to by an Imperial uncle and by his descendants.

ARTICLE VII When there is neither such Imperial uncle nor descendant of his, the Imperial Throne shall be succeeded to by the next nearest member among the rest of the Imperial Family.

ARTICLE VIII Among the Imperial brothers and the remoter Imperial relations, precedence shall be given, in the same degree, to the descendants of full blood over those of half blood, and to the elder over the younger.

ARTICLE IX When the Imperial heir is suffering from an incurable disease of mind or body, or when any other weighty cause exists, the order of succession may be changed in accordance with the foregoing provisions, with the advice of the Imperial Family Council and with that of the Privy Council.

CHAPTER II

ASCENSION AND CORONATION

ARTICLE X Upon the demise of the Emperor, the Imperial heir shall ascend the Throne, and shall aquire the Divine Treasures of the Imperial Ancestors.

ARTICLE XI The ceremonies of Coronation shall be performed and a Grand Coronation Banquet (Daijosai) shall be held at Kyoto.

ARTICLE XII Upon an ascension to the Throne, a new era shall be inaugurated, and the name of it shall remain unchanged during the whole reign, in agreement with the established rule of the 1st year of Meiji.

CHAPTER III

MAJORITY. INSTITUTION OF EMPRESS AND OF HEIR-APPARENT

ARTICLE XIII The Emperor, the Kotaishi and the Kotaison shall attain their majority at eighteen full years of age.

ARTICLE XIV Members of the Imperial Family, other than those mentioned in the preceding Article, shall attain their majority at twenty full years of age.

ARTICLE XV The son of the Emperor, who is Heir-apparent, shall be called "Kotaishi." In case there is no Kotaishi, the Imperial grandson, who is Heir-apparent, shall be called "Kotaison."

ARTICLE XVI The institution of Empress and that of Kotaishi or of Kotaison shall be proclaimed by an Imperial Rescript.

CHAPTER IV

STYLES OF ADDRESS

ARTICLE XVII The style of address for the Emperor, the Grand Empress Dowager, the Empress Dowager and of the Empress, shall be His, or Her or Your Majesty.

ARTICLE XVIII The Kotaishi and his consort, the Kotaison and his consort, the Imperial Princes and their consorts, the Imperial Princesses, the Princes and their consorts, and the Princesses shall be styled His, Her, Their, or Your Highness or Highnesses.

CHAPTER V

REGENCY

ARTICLE XIX When the Emperor is a minor, a Regency shall be instituted.

When He is prevented by some permanent cause from personally governing, a Regency shall be instituted, with the advice of the Imperial Family Council and with that of the Privy Council.

ARTICLE XX The Regency shall be assumed by the Kotaishi or the Kotaison, being of full age of majority.

ARTICLE XXI When there is neither Kotaishi nor Kotaison, or when the Kotaishi or the Kotaison has not yet arrived at his majority, the Regency shall be assumed in the following order :

1. An Imperial Prince or a Prince.
2. The Empress.
3. The Empress Dowager.
4. The Grand Empress Dowager.
5. An Imperial Princess or a Princess.

ARTICLE XXII In case the Regency is to be assumed from among the male members of the Imperial Family, it shall be done in agreement with the order of succession to the Imperial Throne. The same shall apply to the case of female

members of the Imperial Family.

ARTICLE XXIII A female member of the Imperial Family to assume the Regency shall be exclusively one who has no consort.

ARTICLE XXIV When, on account of the minority of the nearest related member of the Imperial Family, or for some other cause, another member has to assume the Regency, the latter shall not, upon the arrival at majority of the above mentioned nearest related member, or upon the disappearance of the aforesaid cause, resign his or her post in favour of any person other than of the Kotaishi or of the Kotaison.

ARTICLE XXV When a Regent or one who should become such, is suffering from an incurable disease of mind or body, or when any other weighty cause exists therefor, the order of the Regency may be changed, with the advice of the Imperial Family Council and with that of the Privy Council.

CHAPTER VI

THE IMPERIAL GOVERNOR

ARTICLE XXVI When the Emperor is a minor, an Imperial Governor shall be appointed to take charge of His bringing up and of His education.

ARTICLE XXVII In case no Imperial Governor has been nominated in the will of the preceding Emperor, the Regent shall appoint one, with the advice of the Imperial Family Council and with that of the Privy Council.

ARTICLE XXVIII Neither the Regent nor any of his descendants can be appointed Imperial Governor.

ARTICLE XXIX The Imperial Governor can not be removed from his post by the Regent, unless upon the advice of the Imperial Family Council and upon that of the Privy Council.

CHAPTER VII

THE IMPERIAL FAMILY

ARTICLE XXX The term "Imperial Family" shall include the Grand Empress Dowager, the Empress Dowager, the Empress, the Kotaishi and his consort, the Kotaison and his consort, the Imperial Princes and their consorts, the Imperial Princesses, the Princes and their consorts, and the Princesses.

ARTICLE XXXI From Imperial sons to Imperial great-great-grandsons, Imperial male descendants shall be called Imperial Princes; and from Imperial daughters to Imperial great-great-grand-daughters, Imperial female descendants shall be called Imperial Princesses. From the fifth generation downwards, they shall be called, male descendants, Princes, female ones, Princesses.

ARTICLE XXXII When the Imperial Throne is succeeded to by a member of a branch line, the title of Imperial Prince or Imperial Princess shall be specially granted to the Imperial brothers and sisters, being already Princes or Princesses.

ARTICLE XXXIII The births, namings, marriages and deaths in the Imperial Family shall be announced by the Minister of the Imperial Household.

ARTICLE XXXIV Genealogical and other records relating to the matters mentioned in the preceding Article shall be kept in the Imperial archives.

ARTICLE XXXV The members of the Imperial Family shall be under the control of the Emperor.

ARTICLE XXXVI When a Regency is instituted, the Regent shall exercise the power of control referred to in the preceding Article.

ARTICLE XXXVII When a member, male or female, of the Imperial Family is a minor and has been bereft of his or her father, the officials of the Imperial Court shall be ordered to take charge of his or her bringing up and education. Under certain circumstances, the Emperor may either approve the guardian chosen by his or her parent, or may nominate one.

ARTICLE XXXVIII The guardian of a member of the Imperial Family must be himself a member thereof and of age.

ARTICLE XXXIX Marriages of members of the Imperial Family shall be restricted to the circle of the Family, or to certain noble families specially approved by Imperial Order.

ARTICLE XL Marriages of the members of the Imperial Family shall be subject to the sanction of the Emperor.

ARTICLE XLI The Imperial writs sanctioning the marriages of members of the Imperial Family shall bear the countersignature of the Minister of the Imperial Household.

ARTICLE XLII No member of the Imperial Family can adopt any one as his son.

ARTICLE XLIII When a member of the Imperial Family wishes to travel beyond the boundaries of the Empire, he

shall first obtain the sanction of the Emperor,

ARTICLE XLIV A female member of the Imperial Family, who has married a subject, shall be excluded from membership of the Imperial Family. However, she may be allowed, by the special grace of the Emperor, to retain her title of Imperial Princess or of Princess, as the case may be.

CHAPTER VIII

IMPERIAL HEREDITARY ESTATES

ARTICLE XLV No landed or other property that has been fixed as the Imperial Hereditary Estates shall be divided up and alienated.

ARTICLE XLVI The landed and other property to be included in the Imperial Hereditary Estates shall be settled by Imperial writ with the advice of the Privy Council, and shall be announced by the Minister of the Imperial Household.

CHAPTER IX

EXPENDITURES OF THE IMPERIAL HOUSE

ARTICLE XLVII The expenditures of the Imperial House of all kinds shall be defrayed out of the National Treasury at a certain fixed amount.

ARTICLE XLVIII The estimates and audit of accounts of the expenditures of the Imperial House and all other rules of the kind shall be regulated by the Finance Regulations of the Imperial House.

CHAPTER X

LITIGATIONS. DISCIPLINARY RULES FOR THE MEMBERS OF THE IMPERIAL FAMILY

ARTICLE XLIX Litigation between members of the Imperial Family shall be decided by judicial functionaries specially designated by the Emperor to the Department of the Imperial Household, and execution issued, after Imperial sanction thereto has been obtained.

ARTICLE L Civil actions brought by private individuals against members of the Imperial Family, shall be decided in the Court of Appeal in Tokyo. Members of the Imperial Family shall, however, be represented by attorneys, and no personal attendance in the Court shall be done in agreement with the Court.

ARTICLE LI No member of the Imperial Family can be arrested, or summoned before a Court of Law, unless the sanction of the Emperor has been first obtained thereto.

ARTICLE LII When a member of the Imperial Family has committed an act derogatory to his (or her) dignity, or when he has exhibited disloyalty to the Imperial House, he shall, by way of disciplinary punishment and by order of the Emperor, be deprived of the whole or a part of the privileges belonging to him as a member of the Imperial Family, or shall be suspended therefrom.

ARTICLE LIII When a member of the Imperial Family acts in a way tending to the squandering of his (or her) property, he shall be pronounced incapable by the Emperor, prohibited from administering his property, and a manager shall be appointed therefor.

ARTICLE LIV The two foregoing Articles shall be enforced upon the advice of the Imperial Family Council.

CHAPTER XI

THE IMPERIAL FAMILY COUNCIL

ARTICLE LV The Imperial Family Council shall be composed of the male members of the Imperial Family, who have reached the age of majority. The Lord Keeper of the Privy Seal, the President of the Privy Council, the Minister of the Imperial Household, the Minister of State for Justice and the President of the Court of Cassation shall be ordered to take part in the deliberations of the Council.

ARTICLE LVI The Emperor personally presides over the meeting of the Imperial Family Council, or directs one of the members of the Imperial Family to do so.

CHAPTER XII

SUPPLEMENTARY RULES

ARTICLE LVII Those of the present members of the Imperial Family of the fifth generation and downwards, who have already been invested with the title of Imperial Prince, shall retain the same as heretofore.

ARTICLE LVIII The order of succes-

sion to the Imperial Throne shall in every case relate to the descendants of absolute lineage. There shall be no admission to this line of succession for any one, as a consequence of his being an adopted Imperial son, Koyushi or heir to a princely house.

ARTICLE LIX The grades of rank among the Imperial Princes, Imperial Princesses, Princes and Princesses shall be abolished.

ARTICLE LX The family rank of Imperial Princes and all usages conflicting with the present Law shall be abolished.

ARTICLE LXI The property, annual expenses and all other rules concerning the members of the Imperial Family shall be specially determined.

ARTICLE LXII When in the future it shall become necessary either to amend or make additions to the present Law, the matter shall be decided by the Emperor, with the advice of the Imperial Family Council, and with that of the Privy Council.

A SUPPLEMENT TO THE IMPERIAL HOUSE LAW

(February 11, 1907)

ARTICLE I A Prince may be granted a family name and be caused to join the order of nobility by Imperial Order or through a petition.

ARTICLE II A Prince may become, by obtaining the sanction of the Emperor, the successor to the headship of a noble family, or be adopted into a noble family, with the object of succeeding to its headship.

ARTICLE III The wife and direct descendants of a Prince, who has, in accordance with the two preceding Articles, become a subject, and the wives of such descendants, enter such subject's family. This rule does not apply, however, to females married to other members of the Imperial Family and the direct descendants of such females.

ARTICLE IV A member of the Imperial Family, who has been deprived of its privileges may, by Imperial order, be caused to descend to the status of subject.

ARTICLE V The cases provided for in Articles I, II, and IV (of the supplementary law) shall be subject to the advice of the Imperial Family Council and that of the Privy Council.

ARTICLE VI A member of the Imperial Family who has become a subject can not be restored into the Imperial Family.

ARTICLE VII Regulations relating the personal status and other rights and duties of members of the Imperial Family, shall be especially determined besides those prescribed in the present Law.

The regulations referred to in the preceding clause apply when a member of the Imperial Family and a private individual are parties to a matter, concerning which different rules are provided to apply to such parties respectively.

ARTICLE VIII Provisions in Laws and Ordinances, which are set down as applicable to members of the Imperial Family, shall be applicable only when there are no special provisions in the present Law or in Regulations that may be issued in conformity with the present Law.

A SUPPLEMENT TO THE IMPERIAL HOUSE LAW

(November 28, 1918)

A female member of the Imperial Family may marry a Prince of the principal House or of the branch Houses of the Ri Family.

LIST OF EMPERORS

No. of Reign	Emperor	Year Name(with its duration in parenthesis)	Duration of Reign
1	JIMMU	(B. C.)	660-581
2	SUIZEI		581-548
3	ANNEI		548-510
4	ITOKU		510-475
5	KŌSHŌ		475-392
6	KŌAN		392-290
7	KŌREI		290-214
8	KŌGEN		214-157
9	KAIKA		157-97
10	SUJIN		97-29
11	SUININ		29-71
12	KEIKŌ	(A. D.)	71-131
13	SEIMU		131-192
14	CHŪAI		192-201
15	ŌJIN		270-313
	(Jingo, Regent)		201-270

No. of Reign	Emperor	Year Name(with its duration in parenthesis)	Duration of Reign
16	NINTOKU		313-400
17	RICHU		400-406
18	HANSHŌ		406-412
19	INGYŌ		412-453
20	ANKŌ		453-456
21	YŪRYAKU		456-480
22	SEINEI		480-485
23	KENSŌ		485-488
24	NINKEN		488-499
25	BURETSU		499-507
26	KEITAI		507-531
27	ANKAN		531-535
28	SENKA		535-539
29	KIMMEI		539-572
30	BITATSU		572-585
31	YŌMEI		585-587
32	SUSHUN		587-592
33	SUIKO (Empress)		592-629
34	JOMEI		629-642
35	KŌGYOKU (Empress)		642-645
36	KŌTOKU	Taika (645-650), Hakuchi (650-654)	645-654
37	SAIMEI (Empress)		655-661

TREATY FOR THE RENUNCIATION OF WAR

Signed at Paris, August 26, 1926

ARTICLE I The High Contracting Parties solemnly declare in the name of their respective peoples that they condemn recourse to war for the solution of international controversies, and renounce it as an instrument of national policy in their relations with one another.

ARTICLE II The High Contracting Parties agree that the settlement or solution of all disputes or conflicts of whatever nature or of whatever origin they may be, which may arise among them, shall never be sought except by pacific means.

ARTICLE III The present Treaty shall be ratified by the High Contracting Parties named in the Preamble in accordance with their respective constitutional requirements, and shall take effect as between them as soon as all their several instruments of ratification shall have been deposited at Washington.

This Treaty shall, when it has come into effect as prescribed in the preceding paragraph, remain open as long as may be necessary for adherence by all the other Powers of the world. Every instrument evidencing the adherence of a Power shall be deposited at Washington and the Treaty shall immediately upon such deposit become effective as between the Power thus adhering and the other Powers parties hereto.

It shall be the duty of the Government of the United States to furnish each Government named in the Preamble and every Government subsequently adhering to this Treaty with a certified copy of the Treaty and of every instrument of ratification or adherence. It shall also be the duty of the Government of the United States telegraphcially to notify such Governments immediately upon the deposit with it of each instrument of ratification or adherence.

TREATY BETWEEN THE NINE POWERS CONCERNING CHINA

Signed at Washington February 6, 1922

ARTICLE I The Contracting Powers, other than China, agree:

(1) To respect the sovereignty, the independence, and the territorial and administrative integrity of China;

(2) To provide the fullest and most unembarrassed opportunity to China to develop and maintain for herself an effective and stable government;

(3) To use their influence for the purpose of effectually establishing and maintaining the principle of equal opportunity for the commerce and industry of all nations through the territory of China;

(4) To refrain from taking advantage of conditions in China in order to seek special rights or privileges which would abridge the rights of subjects or citizens of friendly States, and from countenancing action inimical to the security of such States.

ARTICLE II The Contracting Powers agree not to enter into any treaty, agreement, arrangement, or understanding, either with one another, or individually or collectively, with any Power or Powers, which would infringe or impair the principles stated in Article I.

ARTICLE III With a view to applying more effectually the principles of the Open Door or equality of opportunity in China for the trade and industry of all nations, the Contracting Powers, other than China, agree that they will not seek,

nor support their respective nationals in seeking :—

(a) any arrangement which might purport to establish in favour of their interest any general superiority of rights with respect to commercial or economic development in any designated region of China ;

(b) any such monopoly or preference as would deprive the nationals of any other Power of the right of undertaking any legitimate trade or industry in China, or of participating with the Chinese Government, or with any local authority, in any category of public enterprise, or which by reason of its scope, duration or geographical extent is calculated to frustrate the practical application of the principle of equal opportunity.

It is understood that the foregoing stipulations of this Article are not to be so construed as to prohibit the acquisition of such properties or rights as may be necessary to the conduct of a particular commercial, industrial, or financial undertaking or to the encouragement of invention and research.

China undertakes to be guided by the principles stated in the foregoing stipulations of this Article in dealing with applications for economic rights and privileges from Governments and nationals of all foreign countries, whether parties to the present Treaty or not.

ARTICLE IV The Contracting Powers agree not to support any agreements by their respective nationals with each other designed to create Spheres of Influence or to provide for the enjoyment of mutually exclusive opportunities in designated parts of Chineses territory.

ARTICLE V China agrees that, throughout the whole of the railways in China, she will not exercise or permit unfair discrimination of any kind. In particular there shall be no discrimination whatever, direct or indirect, in respect of charges or of facilities on the ground of the nationality of passengers or the countries from which or to which they are proceeding, or the origin or ownership of goods or the country from which or to which they are consigned, or the nationality or ownership of the ship or other means of conveying such passengers or goods before or after their transport on the Chinese Railways.

The Contracting Powers, other than China, assume a corresponding obligation in respect of any of the aforesaid railways over which they or their nationals are in a position to exercise any control in virtue of any concession, special agreement or otherwise.

ARTICLE VI The contracting Powers, other than China, agree fully to respect China's rights as a neutral in time of war to which China is not a party; and China declares that when she is a neutral she will observe the obligations of neutrality.

ARTICLE VII The Contracting Powers agree that, whenever a situation arises which in the opinion of any one of them involves the application of the stipulations of the present Treaty, and renders desirable discussion of such application, there shall be full and frank communication between the Contracting Powers concerned.

ARTICLE VIII Powers not signatory to the present Treaty, which have Governments recognized by the Signatory Powers and which have treaty relations with China, shall be invited to adhere to the present Treaty. To this end the Government of the United States will make necessary communications to nonsignatory Powers and will inform the Contracting Powers of the replies received. Adherence by any Power shall become effective on receipt of notice thereof by the Government of the United States.

TREATY BETWEEN THE FOUR POWERS CONCERNING THEIR INSULAR POSSESSIONS AND INSULAR DOMINIONS IN THE REGION OF THE PACIFIC OCEAN

Signed at Washington, December 13, 1921

AND

SUPPLEMENTARY AGREEMENT

Signed at Washington, February, 6, 1922

I

The High Contracting Parties agree as between themselves to respect their rights in relation to their insular possessions and insular dominions in the region of the Pacific Ocean.

If there should develop between any of the High Contracting Parties a contr oversy arising out of any Pacific question and involving their said rights which is not satisfactorily settled by diplomacy and is likely to affect the harmonious accord now happily subsisting between them, they shall invite the other High Contracting Parties to a joint conference to which the whole subject will be referred for consideration and adjustment.

II

If the said rights are threatened by the aggressive action of any other Power, the High Contracting Parties shall communicate with one another fully and frankly in order to arrive at an understanding as to the most efficient measures to be taken, jointly or separately, to meet the exigencies of the particular situation.

III

This Treaty shall remain in force for ten years from the time it shall take effect, and after the expiration of said period it shall continue to be in force subject to the right of any of the High Contracting Parties to terminate it upon twelve months' notice.

IV

This Treaty shall be ratified as soon as possible in accordance with the constitutional methods of the High Contracting Parties and shall take effect on the deposit of ratifications, which shall take place at Washington, and there-upon the agreement between Great Britain and Japan, which was concluded at London on July 13, 1911, shall terminate. The Government of the United States will transmit to all the Signatory Powers a certified copy of the proces-verbal of the deposit of ratifications.

The present Treaty, in French and in English, shall remain deposit in the archives of the Government of the United States, and duly certified copies thereof will be transmitted by that Government to each of the Signatory Powers.

TREATY BETWEEN JAPAN AND THE UNITED STATES OF AMERICA CONCERNING THE ISLAND OF YAP AND OTHER MANDATED ISLANDS SITUATED IN THE PACIFIC OCEAN AND LYING NORTH OF THE EQUATOR

Signed at Washington, Febuary 11, 1922

Considering that by Article 119 of the Treaty of Versailles, signed on June 28, 1919, Germany renounced in favour of the Powers described in that Treaty as the Principal Allied and Associated Powers, to wit, the United States of America, the British Empire, France, Italy and Japan, all her rights and titles over her oversea possessions;

Considering that the benefits accruing to the United States under the aforesaid Article 119 of the Treaty of Versailles were confirmed by the Treaty between the United States and Germany, signed on August 25, 1921, to restore friendly relations between the two nations;

Considering that the said four Powers, to wit, the British Empire, France, Italy and Japan, have agreed to confer upon His Majesty the Emperor of Japan a mandate, pursuant to the Treaty of Versailles, to administer the groups of the former German islands in the Pacific Ocean lying north of the Equator, in accordance with the following provisions:

ARTICLE I The islands over which a Mandate is conferred upon His Majesty the Emperor of Japan (herein-after called the Mandatory) comprise all the former German islands situated in the Pacific Ocean and lying north of the Equator;

ARTICLE II The Mandatory shall have full power of administration and legislation over the territory subject to the present Mandate as an integral portion of the Empire of Japan, and may apply the laws of the Empire of Japan to the territory, subject to such local modifications as circumstances may require;

The Mandatory shall promote to the utmost the material and moral well-being and the social progress of the inhabitants of the territory subject to the present Mandate;

ARTICLE III The Mandatory shall see that the slave trade is prohibited and that

no forced labour is permitted, except for essential public works and services, and then only for adequate remuneration;

The Mandatory shall also see that the traffic in arms and ammunition is controlled in accordance with principles analogous to those laid down in the Convention relating to the control of the arms traffic, signed on September 10th, 1919, or in any convention amending same;

The supply of intoxicating spirits and beverages to the natives shall be prohibited;

ARTICLE IV The military training of the natives, otherwise than for purpose of internal police and the local defence of the territory, shall be prohibited. Furthermore, no military or naval bases shall be established or fortifications erected in the territory;

ARTICLE V Subject to the provisions of any local law for the maintenance of public order and public morals, the Mandatory shall ensure in the territory freedom of conscience and the free exercise of all forms of worship, and shall allow all missionaries, nationals of any State Member of the League of Nations, to enter into, travel and reside in the territory for the purpose of prosecuting their calling;

ARTICLE VI The Mandatory shall make to the Council of the League of Nations an annual report to the satisfaction of the Council, containing full information with regard to the territory, and indicating the measures taken to carry out the obligations assumed under Articles 2, 3, 4, and 5;

ARTICLE VII The consent of the Council of the League of Nations is required for any modification of the terms of the present mandate;

The Mandatory agrees that, if any dispute whatever should arise between the Mandatory and another member of the League of Nations relating to the interpretation or the application of the provision of the Mandate, such dispute, if it cannot be settled by negotiation, shall be submitted to the Permanent Court of International Justice provided for by Article 14 of the Covenant of the League of Nations;

Considering that the United States did not ratify the Treaty of Versailles and did not participate in the agreement respecting the aforesaid Mandate;

Desiring to reach a definite understanding with regard to the rights of the two governments and their respective nationals in the aforesaid islands, and in particular the Island of Yap, have resolved to conclude a Convention for that purpose and to that end have named as their Plenipotentiaries:

His Majesty the Emperor of Japan: Baron Kijuro Shidehara, His Majesty's Ambassador Extraordinary and Plenipotentiary at Washington; and

The President of the United States of America: Charles Evans Hughes, Secretary of State of the United States of America;

Who, after having communicated to each other their respective full powers, found to be in good and due form, have agreed as follows:

ARTICLE I Subject to the provisions of the present Convention, the United States consents to the administration by Japan, pursuant to the aforesaid Mandate, of all the former German islands in the Pacific Ocean, lying north of the Equator.

ARTICLE II The United States and its nationals shall receive all the benefits of the engagements of Japan, defined in Articles 3, 4 and 5 of the aforesaid Mandate, notwithstanding the fact that the United States is not a Member of the League of Nations.

It is further agreed between the High Contracting Parties as follows:

(1) Japan shall insure in the islands complete freedom of conscience and the free exercise of all forms of worship which are consonant with public order and morality; American missionaries of all such religions shall be free to enter the islands and to travel and reside therein, to acquire and possess property, to erect religious buildings and to open schools throughout the islands; it being understood, however, that Japan shall have the right to exercise such control as may be necessary for the maintenance of public order and good government and to take all measures required for such control.

(2) Vested American property rights in the mandated islands shall be respected and in no way impaired;

(3) Existing treaties between the United States and Japan shall be applicable to the mandated islands;

(4) Japan will address to the United States a duplicate of the annual report on the administration of the Mandate to be made by Japan to the council of the League of Nations;

(5) Nothing contained in the present Convention shall be affected by any modification which may be made in the terms of the Mandate as recited in the Convention, unless such modification shall have been expressly assented to by the United States.

ARTICLE III The United States and

its nationals have free access to the Island of Yap on a footing of entire equality with Japan or any other nation and their respective nationals in all that relates to the landing and operation of the existing Yap-Guam cable or of any cable which may hereafter be laid or operated by the United States or by its nationals connecting Island of Yap.

The rights and privileges embraced by the preceding paragraph shall also be accorded to the Government of the United States and its nationals with respect to radio-telegraphic communication; provided, however, that so long as the Government of Japan shall maintain on the Island of Yap an adequate radio-telegraphic station, co-operating effectively with the cables and with other radio stations on ships or on shore, without discriminatory exactions or preferences, the exercise of the right to establish radio-telegraphic stations on the Island by the United States or its nationals shall be suspended.

ARTICLE IV In connection with the rights embraced by Article III, specific rights, privileges and exemptions, in so far as they relate to electrical communications, shall be enjoyed in the Island of Yap by the United States and its nationals in terms as follows:

(1) Nationals of the United States shall have the unrestricted right to reside in the Island, and the United States and its nationals shall have the right to acquire and hold on a footing of entire equality with Japan or any other nation or their respective nationals all kinds of property and interests, both personal and real, including lands, buildings, residences, offices, works and appurtenances.

(2) Nationals of the United States shall not be obliged to obtain any permit or license in order to be entitled to land and operate cables on the Island, or to establish radio-telegraphic service, subject to the provisions of Article 3, or to enjoy any of the rights and privileges embraced by this Article and Article 3.

(3) No censorship or supervision shall be exercised over cable or radio messages or operations.

(4) Nationals of the United States shall have complete freedom of entry and exit in the Island for their persons and property.

(5) No taxes, port, harbour, or landing charges or exactions of any nature whatsoever, shall be levied either with respect to the operation of cables or radio stations, or with respect to property, persons or vessels.

(6) No discriminatory police regulations shall be enforced.

(7) The Government of Japan will exercise its power of expropriation in the Island to secure to the United States or its nationals needed property and facilities for the purpose of electrical communications if such property or facilities cannot otherwise be obtained.

It is understood that the location and the area of land so to be expropriated shall be arranged between the two Governments according to the requirements of each case. Property of the United States or of its nationals and facilities for the purpose of electrical communication in the Island shall not be subject to expropriation.

NOTIFICATION OF THE JAPANESE GOVERNMENT TO THE LEAGUE OF NATIONS

Made Public March 27, 1932

The Japanese Government believe that the national policy of Japan, which has for its aim to insure the peace of the Orient and thereby to contribute to the cause of peace throughout the world, is identical in spirit with the mission of the League of Nations, which is to achieve international peace and security. It has always been with pleasure, therefore, that this country has for thirteen years past, as an original Member of the League, and a permanent Member of its Council, extended a full measure of co-operation with her fellow-Members towards the attainment of its high purpose. It is indeed a matter of historical fact that Japan has continuously participated in the various activities of the League with a zeal not inferior to that exhibited by any other nation. At the same time, it is and has always been the conviction of the Japanese Government that in order to render possible the maintenance of peace in various regions of the world, it is necessary in existing circumstances to allow the operation of the Covenant of the

League to vary in accordance with the actual conditions prevailing in each of those regions. Only by acting on this just and equitable principle can the League fulfil its mission and increase its influence.

Acting on this conviction, the Japanese Government, ever since the Sino-Japanese dispute was, in September, 1931, submitted to the League, have, at meetings of the League and on other occasions, continually set forward a consistent view. This was, that if the League was to settle the issue fairly and equitably, and to make a real contribution to the promotion of peace in the Orient, and thus enhance its prestige, it should acquire a complete grasp of the actual conditions in this quarter of the globe and apply the Covenant of the League in accordance with these conditions. They have repeatedly emphasized and insisted upon the absolute necessity of taking into consideration the fact that China is not an organized State,—that its internal conditions and external relations are characterized by extreme confusion and complexity, and by many abnormal and exceptional features, — and that, accordingly, the general principles and usages of International Law which govern the ordinary relations between nations are found to be considerably modified in their operation so far as China is concerned, resulting in the quite abnormal and unique international practices which actually prevail in that country.

However, the majority of the Members of the League evinced in the course of its deliberations during the past seventeen months a failure either to grasp these realities or else to face them and take them into proper account. Moreover, it has frequently been made manifest in these deliberations that there exist serious differences of opinion between Japan and these Powers concerning the application and even the interpretation of various international engagements and obligations including the Covenant of the League and the principles of International Law. As a result, the Report adopted by the Assembly at the special session of 24 February last, entirely misapprehending the spirit of Japan, pervaded as it is by no other desire than the maintenance of peace in the Orient, contains gross errors both in the ascertainment of facts and in the conclusions deduced. In asserting that the action of the Japanese Army at the time of the Incident of 18 September and subsequently did not fall within the just limits of self-defence, the Report assigned no reasons and came to an arbitrary conclusion, and in ignoring alike the state of tension which preceded, and the various aggravations which succeeded, the Incident—for all of which the full responsibility is incumbent upon China—the Report creates a source of fresh conflict in the political arena of the Orient. By refusing to acknowledge the actual circumstances that led to the foundation of Manchoukuo, and by attempting to challenge the position taken up by Japan in recognizing the new State, it cuts away the ground for the stabilization of the Far Eastern situation. Nor can the terms laid down in its recommendations — as was fully explained in the Statement issued by this Government on 25 February last — ever be of any possible service in securing enduring peace in these regions.

The conclusion must be that in seeking a solution of the question the majority of the League have attached greater importance to upholding inapplicable formulae than to the real task of assuring peace, and higher value to the vindication of academic thesis than to the eradication of the sources of future conflict. For these reasons, and because of the profound differences of opinion existing between Japan and the majority of the League in their interpretation of the Covenant and of other treaties, the Japanese Government have been led to realize the existence of an irreconcilable divergence of views, dividing Japan and the League on policies of peace, and especially as regards the foundamental principles to be followed in the establishment of a durable peace in the Far East. The Japanese Goverment, believing that in these circumstances there remains no room for further cooperation, hereby give notice, in accordance with the provisions of Article 1, Paragraph 3, of the Covenant, of intention of Japan to withdraw from the League of Nations.

STATEMENT OF THE JAPANESE GOVERNMENT IN VIRTUE OF PARAGRAPH 5 OF ARTICLE 15 OF THE COVENANT OF THE LEAGUE

February 25, 1933

PART I

Japan's co-operation with the League of Nations

Japan has taken the greatest interest in the development and success of the League from the days of its inception. Her successive governments have extended to it for nearly fourteen years their hearty co-operation, and her statesmen have devoted their best efforts to the extention of its influence and the enhancement of its prestige. Japan takes pride in recalling the active participation of her representatives in the work of the League. As an original and permanent Member of the Council, she has had many opportunities of co-operation in its beneficient activities, and of these opportunities she has fully availed herself. She regards the League as a most powerful instrument for the good of humanity; and she is only anxious, in the interest of this great experiment in the establishment of universal peace, that the Members of the League shall fully appreciate the situation in the Far East and deal with it in a practical way rather than by formulae and principles.

The present dispute was first brought by China to the consideration of the Council of the League of Nations under Article 11 of the Covenant in September, 1931. In spite of the fact that Japan in this case was obliged to act solely in self-defence against aggression on the part of China, Japan, from the very beginning, has spared no effort in explaining to the League the facts and background of this unfortunate incident, and at the same time, she has constantly, and without waiting for the Resolution passed by the Council on September 30, endeavoured as far as possible not to aggravate the situation. Japan has also from time to time communicated to the League all information relative to the development of the situation, so that the League might be enabled to understand the actual conditions prevailing in the Far East.

Unfortunately, however, the condition of Manchuria showed no immediate improvement in the matter of peace and order, owing to the continued activities of Chang Hsueh-liang, while the feelings of the Chinese and the Japanese peoples became further strained, with the result that there was no possibility of withdrawing the Japanese troops within the Railway Zone under the then existing circumstances. When the Council met again in October, Japan realized the importance of allaying the excited national feelings of the two peoples as the first essential condition of securing the safety of the lives and property of Japanese subjects and of making possible the withdrawal of the Japanese troops. She was convinced that for this purpose, it was necessary for the two parties concerned to pave the way for direct negotiations, with the object of restoring normal relations between the two countries. Japan took pains to explain this view to the President and certain Members of the Council, but proposal to initiate direct negotiations was not accepted.

Moreover, the Council formed a plan to invite a representative of the United States, a non-Member State of the League, to participate in its deliberations as an observer. To this proposition Japan raised an objection, contending that participation in the proceedings of the Council by a state not a Member of the League is contrary to its constitution, but the other Members of the Council insisted on regarding the step as a mere matter of procedure, and they invited a United States observer to the Council. Japan remained convinced that this was a matter which concerned the constitution of the League and that the action of the majority constituted a clear case of the violation of the Covenant. It became apparent that if the opinion of her fellow-members was that such an important matter of substance could be decided by a majority as a mere matter of procedure, she had ratified the Covenant under an error. However, owing to her strong desire to uphold the cause of the League, she continued to participate in the activities of the Council.

The discrepancy between the views of the other Members of the League and those entertained by Japan arose from a

lack of understanding of the Far Eastern situation on the part of the League. In her desire to assist the League and to maintain its legitimate influence and usefulness, Japan proposed at the Council meeting held in November, 1931, that the League should dispatch a Commission of Enquiry to China so that its Members might be able to understand fully the actual conditions prevailing in that country. This proposal was adopted by the Council in its Resolution of December 10.

The Commission of Enquiry headed by Lord Lytton reached China in March, 1932, by way of Japan and entered Manchoukuo in April. Japan rendered every facility to the Commission in order to assist its investigations. Through the establishment of the new State of Manchoukuo, especial difficulty was encountered in the matter of the entrance of the Chinese Assessor into the territory of that State. Japan therefore exerted her good offices with Manchoukuo in order to smooth over this difficulty, and enabled the Commission to carry out its investigations.

The Report of the Commission of Enquiry was made public on October 1, 1932. On account of the brief period allowed for the investigation of the Commission, much remained to be desired for the Report to claim to present a true picture of the actual condition of China. Accordingly, Japan, on November 18 last, handed to the League her Observations on the Lytton Report in order to provide it with accurate materials for coming to a fair conclusion on the questions involved.

The Lytton Report was the subject of deliberation by the Council from November 21, and by the Assembly from December 6, 1932. The Committee of Nineteen appointed by the Assembly without the concurrence of Japan drafted on December 15 a Resolution and a Statement of Reasons concerning the procedure to be followed in performing the duty of conciliation which devolved upon that body in accordance with Paragraph 3, Article 15 of the Covenant. Japan proposed the deletion from the Draft Resolution of passages regarding the participation of states which were not members of the League, and also the modification of certain points relating to the proposed Committee of Conciliation as well as the entire deletion of the last paragraph of the Statement of Reasons, which declared in particular that the maintenance and recognition of the present régime in Manchuria could not be considered as solution.

At the same time, considering that Paragraph 3 of Article 15 represents the final resort provided for in the Covenant for conciliatory solution of a dispute, Japan endeavoured to discover some compromise which would enable her to continue her co-operation with the League.

As stated in Part II, M of the Report, the President of the Committee and the Secretary General were authorized to enter into conversations with both the Japanese and Chinese Delegations. The conversations between the Japanese Delegation and the Secretary General were carried on from the first part of January, 1933. As a result of these conversations, a draft was drawn up, and it was referred with the knowledge of the President of the Committee to the Japanese Government for their approval. Subsequently, when amendments of the Japanese Government to this draft were communicated to the Committee of Nineteen, it was made known to the Japanese Delegation that the said draft could not be taken up as a basis of further negotiation. This caused a great surprise to the Japanese Government as they had every reason to believe that the President of the Committee, who together with the Secretary General was authorized to conduct negotiations with the both Delegations, was also fully aware of the conversations and raised no objection to the preparation of the draft.

Though the Committee finally agreed to the deletion from the Draft Resolution of passages relating to the participation of non-Member States in the work of the proposed Committee of Conciliation, it proposed that the Japanese Government accept the rest of the text of the Resolution and the Statement of Reasons of December 15 and make a reservation in regard to the last Paragraph of the Statement of Reasons to which Japan had taken objection. The declaration contained in this Paragraph would, as is stated elsewhere in the present statement, not only constitute an action ultra vires on the part of the League but prejudice the whole question and imply a direct attack on the policy followed by the Japanese Government with respect to the existence of Manchoukuo. Furthermore, such an attitude on the part of the League was in no way in accord with the idea of conciliation advocated by the Committee of Nineteen as well as by the Japanese Government. For these reasons, Japan found it impossible to accept the proposal of the Committee.

Upon the refusal of the Japanese Delegation to agree to the Committee's proposal in this regard, the latter set to the procedure of drafting a Report under Paragraph 4 of Article 15.

However, the Japanese Government refused to give up the hope for conciliation and in their final efforts to achieve this end, they agreed to withdraw the various amendments which they had presented when the text of December 15 was communicated to them and consented to accept as the basis of conciliation the principles and conclusions of Chapter 9 of the Lytton Report, in so far as they were applied in a way to "harmonize with the events which have taken place," which phrase is an almost literal quotation from that Report itself. Further they agreed to the maintenance of the last Paragraph of the President's Declaration (formerly called the Statement of Reasons) on the condition that its wording be modified in such a way that it would not appear to constitute a prejudgment and an attack directed against the policy of the Japanese Government vis-à-vis Manchoukuo.

The Committee of Nineteen found this final proposal likewise unacceptable. Thus the Committee rejected all the Japanese proposals and came to the conciliation under Paragraph 3 was impossible. The Committee forthwith proceeded with the drafting of a Report under Paragraph 4 of Article 15 of the Covenant. The Draft Report thus prepared was submitted to the Assembly on February 21, and in spite of the negative vote on the part of Japan, it was adopted by the Assembly on February 24.

PART II

Errors in the Report concerning the chief characteristics of the dispute

The Report sets forth in Part III what are termed the " chief characteristics of the dispute." It is most regrettable that this part of the Report is substantially based upon the Report of the Commission of Enquiry. As stated in that Report, "the issues involved in this conflict are not as simple as they are often represented to be. They are, on the contrary, exceedingly complicated and only an intimate knowledge of all the facts as well as of their historical background should entitle anyone to express a definite opinion upon them." It must be remembered that the Commission of Enquiry spent only six weeks in Manchuria and fifteen in China, most of which was passed in Peiping, and their trip covered only a very limited area of China—a few open ports where the real condition of China could not have thoroughly been studied. In these circumstances, it was impossible for them to acquire "an intimate knowledge of all the facts as well as their historical background."

Hence the document is not as complete as it should be. It is quite natural that there should be not a few errors in the Report of the Assembly which was drafted upon the basis of the Lytton Report. These errors might have been avoided if the Committee of Nineteen had taken into due consideration the Observations of the Japanese Government presented to the Council on November 18, 1932. At any rate, it must be said that the Lytton Report, admirable and praiseworthy as it is, is not a document which one can lock upon as containing all the facts as well as all the historical background upon which alone final judgment should be based. The errors in the Report of the Assembly are numerous. Let only the most salient be cited:

(1) The Report appears to cling in Part III to the fiction that China exists today as a single organized state to be dealt with on the same footing as any country in Europe or America. The fiction happens to be merely a convenient formula which embodies in a concise form the generous aspirations of the Powers for the recovery of China as a unified and orderly state. Japan has worked hard to act upon that formula during these many years, and she is prepared to continue on the same lines in cases where ordinary matters alone are concerned. But where her vital necessities come into play as in Manchuria, she is forced to reconsider that fiction, and to ask herself what are the actual facts, and who are the actual rulers. States which are Members of the League of Nations and have little interest in China can afford to preserve the convenient fiction intact without serious difficulty. But Japan, in a totally different position, economically and strategically, is compelled, however reluctantly, to examine and set a limit to the fiction and to direct her course according to realities.

It is the view of the Japanese Government that the erstwhile Chinese State ceased to rule in Manchuria when "the fall of the United Republic after the death of Yuan Shi-kai in 1915 signalized the break-up of all unity of government in China." (Observations of the Japanese Government, page 15).

As a matter of fact, none of the governments including the Nanking Government maintains authority over China save over the limited areas which it actually controls. That is why the Japanese Government in their Observations insist that Manchuria is not naturally and necessarily an integral part of China. It will then be asked, as it has been asked,—"why did Japan invoke the Nanking Government at the outset of the Manchurian Incident? Why did Japan negotiate with Peking in 1915? Why did she declare Manchuria to be a part of China in 1922?" The answer is that Japan clung until the last moment to the fiction of Manchuria being an integral part of China. She had many excellent opportunities of departing from it, if she had wished, afforded by the chaotic state of the country. She steadily refrained from availing herself of the opportunities. But when chaos came to threaten her whole position in Manchuria, it became necessary for her to take measures to protect her various interests and important rights.

It should be observed at this point that Japan is not setting a precedent for defying the existence of a neighbour state merely because it is weak or disturbed by internal disruption. It is needless to say that so long as the government of a state which has actually ruled the whole area maintains its authority in any part of its territory, so long does the state continue to subsist and to remain inviolable. The peculiar circumstances of China do not reside in the fact that its common government is weak or distracted by disruption. They reside in the unique fact that no authority which now exists has ever been a common government of China at all, and none therefore has title to rule the entire country.

The League of Nations should not forget that fact overrides form, and that a state must possess a single and continuous government.

(2) The Report, in agreeing that the Chinese boycott against Japan imposed after the September 18 Incident falls within the province of retaliatory measures, sows the seeds of incalculable future trouble for each and every Power interested in China. All the major Powers conduct military operations in China under certain cirsumstances, and maintain armed forces in Chinese territory for that specific purpose. If the adoption by the Powers of any forcible measure for the protection of their rights and interests is on each occasion to be the subject of a retaliatory boycott, the application of force will of necessity be extended without limit.

By their acceptance of the Resolutions of September 30 and of December 10, 1931, China and Japan agreed that they should take the necessary measures to prevent any aggravation of the situation. The Japanese Government desire to call the attention of the League to the fact that it was the conspicuous failure on the part of China to take such proper measures that led to the regrettable Shanghai Incident. It should also be added that in any discussion of the boycott the fact of anti-foreign education in schools and the "revolutionary foreign policy" (admitted by the Nanking Government) should not be left out of consideration, as these three subjects are inseparably bound together.

(3) The Report quotes and adopts from the Lytton Report the reference to the possibility of an arbitral settlement of the Sino-Japanese dispute. But arbitration presupposes a normal organized state with a government supreme throughout its territory and capable of enforcing an award. China, as has been stated above, has not for years been in such a state, at any rate so far as to render it possible to arbitrate with her in vital matters concerning Manchuria. With whom would the arbitration have proceeded? With Chang Hsueh-liang whom the League does not recognize? Or with the Nanking Government whose authority (as the Report of the Commission of Enquiry showed) he did not obey? Japan, with her vital interests at stake, could not and cannot possibly resort to arbitration in such a matter with such a country as China.

(4) The Report again quotes and adopts the refusal of the Commission of Enquiry to recognize as measures of self-defence the military operations of the Japanese army on the night of September 18, although it does not exclude the possibility that the Japanese officers on the spot might have thought they were acting in self-defence. This is simply another case of a facile and uncritical acceptance of the opinions of the Commission of Enquiry, utterly ignoring the emphatic contradiction contained in the Observations of the Japanese Government. On what grounds can the League or any other third party pronounce a verdict on the case contrary to the judgment of the Japanese officers on the spot? The right of self-defence is one of those inalienable rights of a state which may be duly exercised in certain specific circumstances, and the question of on what occasion and

to what extent that right should be exercised is a matter which can be determined only by the state concerned. In this connection the Japanese Government in their Observations have referred to the reservations made by both France and the United States in concluding the Pact of Paris; a reference which the Assembly found it possible to pass over in silence.

The Report in stating that the operations of the Japanese army, viewed as a whole as they developed through the entire period of the conflict, cannot be regarded as an act of self-defence, fails to take into cognizance the tension which existed, the overwhelming forces by which the Japanese were faced and the utter uncertainty which prevailed as to the probable action of those forces. Above all, it fails to take into account the vital rights and interests of Japan in Manchuria, which are not confined to the leased territory and the railways, but involve mining and forestry, consular police and consular jurisdiction, residence and trade throughout the entire region. When these rights and interests are threatened, the measures for their protection may have to be extended throughout Manchuria. But never have Japanese military operations exceeded the bounds of necessity for self-protection.

In order that it may not be supposed over sub silentio, the Japanese Government take this opportunity of explicitly denying the specific conclusion reached in the Report that no question can arise of Chinese responsibility for the development of events since September 18, 1931, and that the use of boycotts by China subsequent to that date falls under the category of reprisals. Even if the theory that the Japanese military action did not constitute lawful self-defence should be accepted, that clearly would not invest the Chinese with an unlimited license to behave as they chose to, and to enter upon a career of unrestricted violence and wrong. Much more is this the case if, as Japan contends, the actions of her troops were urgently called for by the necessities of self-defence. How can reprisals possibly be exercised against a lawful act? The proper reply to acts of self-defence is negotiation and explanation and not reprisals, which generally lead to war. Had the United States exercised reprisals in the Carolina case, war with England must have ensued. Again it must be noted that the Resolution of September 30 precludes either party from aggravating the situation; and it would seem strange to hold that this meant that China might take steps which would certainly aggravate it, leaving Japan alone responsible for any untoward development.

What appears to be a most curious statement is found in Part III of the Report which reads: "adoption of measures of self-defence does not exempt a state from complying with the provisions of Article 12 of the Covenant."

As has already been observed by the Japanese Government, the right of self-defence is exercised upon the occasion "of an urgent"—to quote Webster's definition — "and overwhelming necessity allowing no choice of means and no instant for deliberation." To enquire the observance upon such an occasion of Article 12 of the Covenant, which stipulates that the right of self-defence may be exercised three months after the award by the arbitrators or the judicial decision or the Report of the Council of the League has been made public, is to deny the right of self-defence itself.

(5) The Report says that the declaration of independence by Manchoukuo was not spontaneous. Since the statement is based upon no fresh investigation conducted at a later date, it may be readily gathered that the Report has here again adopted the erroneous conclusions of the Commission of Enquiry contained in Chapter VI of the latter's Report, the baselessness of which has been fully exposed in the Observations of the Japanese Government.

It must strike an impartial observer as extraordinary that the Assembly repeats this finding of the Commission of Enquiry in face of the emphatic denials of Japan. There are two factors which may partly account for this. First, the movement during the tyrannous régime of the Changs for the keeping of Manchuria aloof from all participation in the affairs of China Proper was subterranean, and had no repercussion in the outside world; and the authors of the Report may therefore have been sceptical of its existence. Secondly, they appear to be misled by giving implicit credence to the legend of the so-called "continental policy" of Japan, and her supposed plan to seek a political solution of the Manchurian issue as a step towards the execution of that policy. It is unnecessary to repeat that the Japanese "continental policy" is a mere Chinese fabrication, and that Japan harbours no territorial designs in any part of the world. But all this, though it may explain the rejection by the Assembly of the uncompromising denial made by Japan, can hardly be thought to excuse it.

The simple fact is that, as has so often been explained, on the disappearance of all the administrative organisations, such as they were, which had existed under the Changs, spontaneous local organisations naturally sprung up, and the Japanese troops which were responsible for the maintenance of order necessarily co-operated with them. It was a proper and necessary step, and in the circumstances an unavoidable one. Such was the whole significance of the presence of Japanese troops, and such was the sole aim of the activities of Japanese civil and military officers. Unfortunately the Commission of Enquiry, and consequently the Assembly, in their implicit reliance on the assumption that there had never existed any independence movement in Manchuria, have been obliged to attribute to the activities of Japanese civil and military officers the independence which was actually proclaimed,—and to do so upon no solid grounds whatever.

As to the assertion that the people of Manchuria are hostile to the new state, again there is no valid evidence beyond fifteen hundred letters of dubious origin received by the Commission of Enquiry. The Japanese Government desire to point out the fact that within less than a year since its foundation, Manchoukuo has achieved a marked and healthy progress in the restoration of law and order, and that no criticism or complaint has been heard of regarding its conduct of affairs, whether domestic or foreign.

Regardless of the attitude of the Assembly to the new State of Manchoukuo, she has gone forward steadily on the road of progress. Freed from the yoke of misgovernment under the tyrannous rule of the Changs, thirty million inhabitants of Manchuria, Machus, Mongols and Chinese all alike, have, already begun to reap the benefits of their labours which were denied them in former days. Throughout most of the country banditry has been suppressed. Those hostile elements, largely composed of the remnants of Chang Hsueh-liang's troops and receiving not inconsiderable assistance from their former war lord, had constituted an obstacle to the establishment of peace throughout the territory. Thanks, however, to the combined efforts of the Japanese and Manchoukuo forces, they have been practically cleared out of the Provinces of Fengtien, Kirin, and Heilungkiang, and the security of life and property has been reestablished in these Provinces. It is only in the Province of Jehol that the organized opposition still continues.

In the domain of finance, something entirely unknown in the history of China has been realized in Manchoukuo. Though the State is still in its infancy, a sound budgetary system has been initiated, and is being carried out with utmost satisfaction. The establishment of the central bank, which is functioning on the same lines as those of the advanced countries of the world, has contributed much to the stabilization of state finances and to the economic and industrial development of the country. A similar progress has also been noted in the domain of railway administration, commerce and industry, and with abundant resources with which she is endowed, there is every prospect of this country achieving, in days to come, a still greater progress along these lines to the benefit of her inhabitants and foreigners.

All this could not have been the case had the population of the country been hostile or even sullenly submissive. It is to be regretted therefore that the Assembly should have, without referring to the Observations submitted by Japan, accepted the assumption of the Commission of Enquiry, which, here again, has no foundation in fact,

(6) The Report dwells upon the need of international co-operation in the reconstruction of China, and mentions the provision of technical assistance as one form of that international co-operation. Obviously, the reconstruction of China cannot be accomplished by any such superficial and in adequate means. It could only be rendered possible by some forceful international intervention of such a nature as would at once prove incompatible with the stipulations of the Nine Power Treaty regarding the administrative integrity and political independence of China. That is another proof that it is necessary to allow ample elasticity by taking due account of changing conditions in the application of the Nine Power Treaty and the Covenant of the League as far as China is concerned.

PART III

Impracticabilities of the Recommendations

(1) Japan recognizes that the Covenant of the League of Nations and the Pact of Paris constitute the basic principles of the settlement of international disputes in so far as international relations in general are concerned. But a certain degree of

elasticity must be allowed in the application of these principles to such special and entirely abnormal conditions as prevail in China.

(2) As to the proposal for the withdrawal of troops contained in Section 2, (1), (A) of Part IV of the Report, it is to be noted that the presence of Japanese troops outside the Railway Zone, so far from being incompatible with legal principles, has from the very beginning been due entirely to the sheer necessities of lawful self-defence, and is in no way derogatory to the accepted principles regarding the settlement of international disputes. It is further to be noted that these Japanese troops are now responsible, in accordance with the Japan-Manchoukuo Protocol, for the maintenance of peace and order in Manchoukuo. It is true that by the Resolutions of September 30 and of December 10, 1931, Japan undertook to withdraw her troops within the Railway Zone in so far as the safety of her sebjects was assured, but the condition attaching to that undertaking, namely the assurance of safety of life and property, has never been satisfied; and the undertaking itself has now become inapplicable on account of the independence of Manchoukuo and the conclusion of the agreements embodied in the Protocol signed on September 15 last. Should the Japanese troops be withdrawn from the Railway Zone in accordance with the recommendation contained in the Report, it would be inevitable that unrest and disturbances would ensue in the evacuated territory. Those Members of the League that have but little direct interest in the affairs of the Far East can afford to maintain that the upholding of abstract formulae is more important than the maintenance of the peace in this part of the world. But Japan, vitally concerned in the maintenance of peace and order in Manchuria, cannot tolerate that that region should again be plunged into disorder. It cannot be supposed that a gendarmerie system as proposed by the Lytton Report would remove all apprehensions on this score. There is no precedent in the history of the world in which the security of such a vast territory was secured by gendarmerie. The proposition is absurd and cannot be put into practice. If the Japanese troops were withdrawn, the country would be quickly overrun by bandits and by Chang Hsueh-liang's troops resulting in anarchy and disorder.

(3) As to Section 2, (1) of Part IV of the Report, where it is stated that the sovereignty over Manchuria belongs to China, it has to be noted that at any rate since the year 1916, Manchuria has never been subject to the authority of China, and that in the final analysis, the present difficulty has been caused by the supposition that the sovereignty of China actually extended and extends to that region. It is entirely superfluous to say that the enforcement of this fiction will never ensure the protection of Japan's rights and interests and the maintenance of peace in the Far East. Inasmuch as the Report repudiates the restoration of the old régime as leading merely to a repetition of disorder and friction, so any return to the fiction in question must equally be repudiated. Nor is it possible for Japan to admit any policy which is incompatible with the simple fact of the existence of the State of Manchoukuo and the provisions of the Japan-Manchoukuo Protocol.

(4) With regard to the ten principles set out in the Lytton Report and cited in Section I of Part IV of the Report, apart from the observations made above, the Japanese Government deem it sufficient to quote the following passages from their Observations presented to the League in November last:—

"Certain of these principles to which the Japanese Government have no fundamental objection, have already found concrete application in the Protocol signed by Japan and Manchoukuo. But, in any view of the matter, it must evidently be impossible, so long as the anarchical state of things in China persists, to arrive at a satisfactory solution of the questions at issue on the basis of the first nine of these principles, especially Principles 4-9 inclusive. As is sustained in Principle 10, these nine principles cannot be practically applied 'without a strong central government in China'."

(5) In Section 2, (3) of Part IV of the Report, the Assembly contemplates the establishment of a Committee to assist in the negotiations which are to be opened between the two parties in accordance with the method specified in the Report. This, however, is directly contrary to the insistence of Japan not to allow any third party to intervene in the Manchurian problem, and Japan finds it absolutely impossible to accept such a proposal. As, moreover, the Recommendations referred to as (1), (A) and (1), (B) of Section 2, Part IV of the Report, must be dismissed as unpractical, and those made under (2) of the said Section 2 are equally inapplicable in the present state of China, there would seem to be no scope left for the activities of the proposed Committee.

(6) The Report states in effect in Section 3 of Part IV that the maintenance and recognition of the existing régime in Manchuria is no solution and that the Members of the League should, after having adopted the Report, abstain from recognizing the present régime either de jure or de facto. Further it expresses the hope that the States non-Members of the League who are signatories of the Pact of Paris and the Nine Power Treaty will associate themselves with the view set forth in the Report in this regard. The Japanese Government cannot but consider that the Assembly, in proposing in such a manner to influence or to bind, if only morally, both Member and non-Member states in the matter of recognizing or not recognizing another state, is exceeding its powers conferred upon it by Article 15 of the Covenant. In any case, in making a proposition of this nature the League of Nations whose primary duty is the preservation of peace throughout the world could not surely contribute to the maintenance of peace and security not only in Manchoukuo, but also in the Far East. Such an action on the part of the League would prove to be an obstacle to the good understanding and friendly relations between nations upon which peace depends.

PART IV

Conclusion

The Japanese Government are fully convinced that the action of the Japanese army on the night of September 18, 1931, and thereafter has never exceeded the limits appropriate to measures of self-defence, and that Manchoukuo has been founded by the spontaneous will of the people of Manchuria. Accordingly, they consider that neither the action of the Japanese army in Manchuria, nor the conclusion of the Japan-Manchoukuo Protocol is in violation of the Covenant of the League of Nations, the Nine Power Treaty, the Pact of Paris, or any other international treaty. The Japanese Government maintain that in view of the quite abnormal condition of China, where no existing authority has ever ruled the entire country, and particularly in view of the unparalleled complexity and peculiarity of the Manchurian problem, and also having regard to the anti-foreign character of the policy of the National Government, it is impossible to think of applying to the present dispute the general formulae applicable to an ordinary international question; and they maintain moreover that neither any procedure which may be adopted for such an exceptional case, nor any solution thereby attained, can ever establish a precedent for ordinary cases of international dispute, Were it possible to apply ordinary formulae, the plans adumbrated by the Assembly would themselves be ruled out of consideration as interferences with what the Assembly regards as Chinese sovereign rights.

Unfortunately, the Assembly, through the refusal of its Members to face facts, and their uncritical acceptance of the Report of the Commission of Enquiry, has only indulged in academic and inadequate principles. The Assembly stands, if it may so be said, for mere formulae; Japan for solid realities. Japan takes her stand on established principles; the Assembly on preconceived hypotheses. It results from the refusal of the Assembly to go beyond the Lytton Report. As pointed out in the preceding part of the present statement, the new State of Manchoukuo has made rapid progress. Peace and order are superseding banditry. Commerce and industry have responded to the improved situation, to the benefit of foreigners and the people of Manchoukuo alike. This is a concrete proof of the truth of the Japanese contention that the recognition and encouragement of the Manchurian State is the only road to a satisfactory solution of the Manchurian question and to the maintenance of a lasting peace in the Orient.

On the other hand, it appears impossible to look for any improvement in the Chinese situation in the near future, and China is likely to remain a chronic anxiety to the rest of the world. Communism has already invaded China, and the alarming extent and success of the invasion is far too seldom realized. A communized China would constitute a problem for Europe and America beside which other questions would pale into insignificance. But a Manchuria free from Chinese connection constitutes a barrier to the communistic danger in the Far East. Its value ought surely to be apparent to every statesman. It is earnestly hoped that the League of Nations will soon be led to change its attitude, to discard reliance on academic and inapplicable doctrine and to respect and recognize the forces that are actually rendering possible the maintenance of peace in the various regions of the world. The Covenant of the League of Nations itself provides in Article 21 for the due recognition of regional under-

standings, and the Japan-Manchoukuo Protocol of September 15, 1932, falls incontestably within the category of understandings such as these, as the special interests of Japan in Manchuria have again and again been recognized. At the same time, Japan takes this opportunity of repeating her disclaimer of all desire for territorial gains or commercial advantages.

TRAITÉ DE RÈGLEMENT JUDICIAIRE, D'ARBITRAGE ET DE CONCILIATION ENTRE LE JAPON ET LES PAYS-BAS

Ratifié le 25, Mai

ARTICLE I

Tous les différends de quelque nature qu'ils soient, qui pourraient se produire entre les Hautes Parties Contractantes et qui n'auraient pu être réglés, dans un délai raisonnable, par les procédés diplomatiques ordinaires seront, d'un commun accord entre les Parties ou à la demande de l'une d'elles, soumis à une Commission permanente de Conciliation, constituée et fonctionnant conformément aux dispositions du présent Traité. Les différends qui de l'avis des deux Parties seraient d'ordre juridique, ne seront soumis à la Commission permanent de Conciliation que d'un commun accord entre les Parties.

ARTICLE II

Les différends pour la solution desquels une procédure spéciale est prévue par d'autres conventions en vigueur entre les Hautes Parties Contractantes, seront réglés conformément aux dispositions de ces conventions.

ARTICLE III

Les différends d'ordre juridique, notamment ceux concernant l'interprétation des traités en vigueur entre les Hautes Parties Contractantes, différends qui n'auraient pas été soumis à la Commission permanente de Conciliation ou qui, ayant été soumis à celle-ci, n'auraient pas été réglés dans les trois mois après le dressement de son rapport, seront, à la demande de l'une des Parties adressée à l'autre, soumis d'un commun accord par voie de compromis soit à la Cour permanente de Justice internationale qui statuera dans les conditions et suivant la procédure prévues par son Statut, soit à un Tribunal arbitral qui statuera dans les conditions et suivant la procédure prévues par la Convention de la Haye du 18 octobre 1907 pour le règlement pacifique des conflits internationaux. Le compromis est établi par échange de notes entre les Gouvernements des Hautes Parties contractantes.

A défaut d'accord entre les Parties sur le choix de la juridiction dans un délai de trois mois à compter de la proposition adressée par l'une des Parties á l'autre de soumettre le différend à la Cour permanente de Justice internationale ou à un Tribunal arbitral, le différend sera soumis, selon la procédure prévue à l'alinéa précédent, à ladite Cour, qui statuera dans les conditions et suivant la procédure prévues par son Statut. Il sera également soumis à cette Cour, suivant la même procédure, si, les Hautes Parties Contractantes ayant été d'accord pour soumettre le différend à un Tribunal, arbitral la consitution de celui-ci selon les dispositions de l'article suivant n'a pas eu lieu dans les cinq mois à compter de la demande visée à l'alinéa 2 dudit article.

ARTICLE IV

Si les Hautes Parties Contractantes se sont mises d'accord pour soumettre le différend à un Tribunal arbitral, celui-ci sera, à défaut d'autre entente, composé de cinq membres et constitué de la manière suivante: les Parties nommeront chacune un arbitre qui pourra être choisi parmi leurs nationaux; le président et les deux autres arbitres seront choisis d'un commun accord parmi les ressortissants de tierces Puissances; ces trois arbitres devront être de nationalités différentes.

Si la nomination des membres du Tribunal arbitral n'intervient pas dans un délai de trois mois à compter de la demande adressée par l'une des Parties à l'autre de constituer ensemble un Tribunal arbitral, le soin de procéder aux nominations nécessaires sera confié à une tierce Puissance

choisie d'un commun accord par les Parties.

Si l'accord ne s'établit pas à ce sujet, chaque Partie désignera une Puissance différente et les nominations seront faites de concert par les Puissances ainsi choisies,

ARTICLE V

Il sera pourvu, dans le plus bref délai, aux vacances qui viendraient à se produire dans le Tribunal arbitral par suite de décès, de démission ou de quelque autre empêchement en suivant le mode fixé à l'article 4 pour les nominations.

ARTICLE VI

L'arbitrage visé à l'article 4 sera régi par les dispositions des articles 7, 8 et 9.

ARTICLE VII

Les Hautes Parties contractantes rédigeront un compromis déterminant l'objet du différend et la procédure à suivre.

A défaut d'indications ou de précisions suffisantes dans le compromis, la procédure arbitrale sera réglée par les dispositions de la Convention de La Haye du 18 octobre 1907 pour le règlement pacifique des conflits internationaux.

ARTICLE VIII

A défaut d'autre entente concernant les règles de fond à appliquer par les arbitres, le Tribunal arbitral fonde ses décisions:

1° sur les conventions générales ou spéciales en vigueur entre les deux Parties et règles de droit qui en découlent;

2° sur la coutume internationale considérée comme l'expression d'une pratique générale acceptée comme étant le droit;

3° sur les principes généraux de droit reconnus par les nations civilisées;

4° sur les résultats de la doctrine et de la jurisprudence les plus autorisées, comme moyens auxiliaires de détermination des règles de droit.

ARTICLE IX

Sauf stipulation contraire du compromis d'arbitrage, une demande de revision de la sentence arbitrale sera admise conformément aux dispositions de l'article 83, alinéas 2 et 3 de la Convention de La Haye du 18 octobre 1907 pour le règlement pacifique des conflits internationaux, dans le délai qui sera fixé par le Tribunal.

ARTICLE X

S'il s'agit d'un différend dont l'object, d'après la législation intérieure de l'une des Hautes Parties contractantes, relève de la compétence des tribunaux nationaux de celle-ci, le différend ne pourra être soumis à la procédure prévue par le présent Traité qu'après jugement passé en force de chose jugée et rendu dans des délais raisonnables par l'autorité judiciaire nationale compétente.

ARTICLE XI

La Commission permanente de Conciliation prévue par le présent Traité sera composés de cinq membres, qui seront désignée comme il suit, savoir: Les Hautes Parties contractantes nommoront chacune un commissaire choisi parmi leurs nationaux respectifs et désigneront d'un commun accord les trois autres commissaires parmi les ressortissants de tierces Puissances; ces trois commissaires devront être de nationalités différentes et, parmi eux, les Hautes Parties contractantes désigneront le Président de la Commission.

Les commissaires sont nommés pour cinq ans à compter de la date de l'entrée en vigueur du présent Traité; leur mandat est renouvelable. Ils resteront en fonctions jusqu'à leur remplacement et, dans tous les cas, jusqu'à l'achèvement de leurs travaux en cours au moment de l'expiration de leur mandat.

Il sera pourvu aussi rapidement que possible et dans un délai qui ne devra pas excéder trois mois, aux vacances qui viendraient à se produire par suite de décès, de démission ou de quelque empêchement permanent ou temporaire en suivant le mode fixé pour les nominations. Les personnes ainsi désignées ne seront nommées que pour la période nonécoulée du mandat des commissaires qu'elles remplacent.

ARTICLE XII

La Commission permanente de Conciliation sera constituée aussitôt que possible aprés l'échange des ratifications du présent Traité.

Si la nomination des membres à désigner en commun n'intervenait pas dans les six mois aprés l'échange des ratifications du Traité ou, en cas de remplacement, dans les trois mois à compter de la vacance du siège, le Président de la Cour permanente de Justice internationale serait, à défaut d'autre entente, prié par les deux Hautes

Parties Contractantes Conjointement ou par l'une d'elles, de procéder aux désignations nécessaires. Si le Président est empêché ou s'il est ressortissant de l'une des Parties, le Vice-Président sera prié de procéder à ces désignations. Si celui-ci est empêché ou s'il est ressortissant de l'une des Parties, le premier des autres juges selon l'ordre du tableau de la Cour qui n'est ressortissant d'aucune des Parties, sera prié de procéder à ces désignations.

ARTICLE XIII

La Commission permanente de Conciliation sera saisie par voie de requête adressée au Président.

La requête, aprés avoir exposé sommairement l'objet du différend, contiendra l'invitation à la Commission de procéder à toutes mesures propres à conduire à une conciliation.

Si la requête émané d'une seule des Parties, elle sera notifiée par celle-ci sans délai à la Partie adverse.

ARTICLE XIV

La Commission permanente de Conciliation aura pour tâche d'élucider les questions en litige, de recueillir à cet effet toutes les information utiles par voie d'enquête ou autrement et de s'efforcer de concilir les Parties. Elle pourra, après examen de l'affaire, exposer aux Parties les termes de l'arrangement qui lui paraitrait convenable, et, s'il y a lieu, leur impartir un délai pour se prononcer.

A la fin de ses travaux, la Commission dressera un rapport qui en constatera le résultat et dont un exemplaire sera remis à chacune des Parties. Le rapport ne mentionnera pas si les décisions de la Commission ont été prises à l'unanimité ou à la majorité.

Les Hautes Parties Contractantes ne seront jamais liées par les considérations de fait, de droit ou autres auxquelles la Commission se sera arrêtée.

Les travaux de la Commission devront être ouverts au plus tard dans les deux mois à compter de jour où elle aura été saisie du différend. A moins que les Parties n'en conviennent différemment ou que la Commission ne juge indispensable de prolonger le délai, les travaux doivent être terminés dans un délai de six mois à compter du jour où la Commission en aura déclaré l'ouverture. Si la Commission juge indispensable de continuer ses travaux au delà du délai de six mois, elle communiquera les motifs aux deux Parties.

ARTICLE XV

A moins de stipulations spéciales contraires, la Commission permanente de Conciliation réglera elle-même sa procédure qui, dans tous les, cas, devra être contradictoire. En matière d'enquêtes, la Commission, si elle n'en décide autrement à l'unanimité, se conformera aux dispositions du Titre III (Commission internationale d'enquête) de la Convention de La Haye du 18 octobre 1907 pour le règlement pacifique des conflits internationaux.

ARTICLE XVI

Le Président convoquera la Commission permanente de Conciliation aussitôt que possible après que celle-ci aura été saisie du différend.

La Commission se réunira, sauf accord contraire entre les Parties, au lieu désigné et à la date fixée per son Président.

ARTICLE XVII

Les travaux de la Commission permanente de Conciliation ne sont publics qu'en vertu d'une décision prise par la Commission avec L'assentiment des Parties.

Les Hautes Parties Contractantes s'engagent à ne pas publier le résultat des travaux de la Commission sans s'être préalablement consultées.

ARTICLE XVIII

Les Hautes Parties Contractantes seront représentées auprès de la Commission permanente de Conciliation par des agents ayant mission de servir d'intermédiaires entre elles et la Commission; elles pourront, en outre, se faire assister par des conseils et experts nommés par elles à cet effet et demander l'audition de toutes personnes dont le témoignage leur paraitrait utile.

La Commission rura, de son côté, la faculté de demander des explications orales aux agents, conseils et experts des deux Parties, ainsi qu'à toutes personnes qu'elle jugerait utile de faire comparaître avec l'assentiment de leur Gouvernement.

ARTICLE XIX

Sauf dispositions contaires du présent Traité, les décisions de la Commission permanente de Conciliation seront prises à la majorité des voix.

La Commission ne pourra prendre de décision portant sur le fond du différend

que si tons les membres ont été dument convoqués et si au moins tous les membres élus en commun sont présents.

ARTICLE XX

Les Hautes Parties Contractantes s'engagent à faciliter les travaux de la Commission permanente de Conciliation et, en particulier, à assurer à celle-ci l'assistance de leurs autorités compétentes, à lui fournir dans la plus large mesure possible tous documents et information utiles et à prendre les mesures nécessaires pour permettre à la Commission de procéder sur leur territoire à la citation et à l'audition de témoins ou d'experts et à des transports sur les lieux.

ARTICLE XXI

Pendant la durée des travaux de la Commission permanente de Conciliation, chacun des commissaires recevra une indemnité dont le montant sera arrêtè d'un commun accord entre les Hautes Parties Contractantes qui en supporteront chacune une part égale. Les frais généraux occasionnés par le fonctionnement de la Commission seront répartis par moitié.

ARTICLE XXII

Les décisions du Tribunal arbitral ou de la Cour permanente de Justice internationale devront être exécutées de bonne foi par les Parties.

Les Hautes Parties Contractantes s'engagent à ne prendre pendant la durée de la procédure de la Commission permanente de Conciliation, du Tribunal arbitral ou de la Cour permanente de Justice internationale, aucune mesure qui pourrait avoir une répercussion défavorable sur l'acceptation de la proposition de la Commission permanente de Conciliation ou sur l'exécution de la décision du Tribunal arbitral ou de la Cour permanente de Justice internationale. Le Tribunal arbitral peut, à la remande de l'une des Parties, ordonner des mesures provisoires, pour autant que ces mesures peuvent être prises par les Parties par la voie administrative. La Commission permanente de Conciliation peut également faire des propositions dans le même but. Pour ce qui concerne la Cour permanente de Justice internationale, son Statut est applicable.

ARTICLE XXIII

Si quelque différend venait à surgir entre les Hautes Parties Contractantes relativement à l'interprétation du présent Traité, ce différend serait réglé selon la procédure prévue à l'article 3.

ARTICLE XXIV

Le présent Traité sera ratifié. Les ratifications en seront échangées à La Haye aussitot que faire se pourra.

ARTICLE XXV

Le présent Traité entrera en vigueur dès l'échange des ratifications et aura une durée de cinq ans à compter de son entrée en vigueur. S'il n'est pas dénoncé six mois avant l'expiration de cette période, il sera considéré comme renouvelé tacitement pour une nouvelle période de cinq ans et ainsi de suite.

Si, lors de l'expiration de la durée du présent Traité, une procédure quelconque en vertu de ce Traité se trouvait pendante devant la Commission permanente de Conciliation, devant la Cour permanente de Justice internationale ou devant le Tribunal arbitral, cette procédure serait poursuivie jusqu'à son achèvement.

PROTOCOLE DE SIGNATURE

Au moment de procéder à la signature du Traité de règlement judiciaire, d'arbitrage et de conciliation entre le Japon et les Pays-Bas les Plénipotentiaires soussignés se sont déclarés d'accord sur ce qui suit:

1. Le Traité susmentionné sera applicable à tous les différends qui viendraient à s'élever entre les deux pays et qui ne toucheraient pas directement aux intérêts de tierces Puissances.

2. Au cas où, par suite de la réalisation du retrait du Japon de la Société des Nations, dont préavis a été donné le 27 mars 1933, un changement viendrait à se produire dans la situation juridique du Japon vis-à-vis de la Cour permanente de Justice internationale, les Hautes Parties Contractantes entreront en pourparlers, à la demande du Gouvernement japonais, pour examiner s'il y a lieu de modifier des dispositions dudit Traité qui ont trait à ladite Cour. Pendant ces pourparlers l'application desdites dispositions sera suspendue. Les procédures pendantes devant la Cour au moment où le Gouvernement du Japon aurait fait la demande visée ci-dessus, seraient toutefois poursuivies jusqu'a leur achèvement et les dis-

positions du Traité resteraient applicables aux décisions de la Cour dans ces cas.

La Haye, le dix-neuvième jour du quatrième mois de la huitième année de Showa, correspondant au 19 avril 1933.

Hiroshi Saito
Beelaerts van Blokland.

TREATY OF COMMERCE AND NAVIGATION BETWEEN JAPAN AND CHINA

Signed at Peking, July 21, 1896

ARTICLE I

There shall be perpetual peace and friendship between His Majesty the Emperor of Japan and His Majesty the Emperor of China, and between their respective subjects who shall enjoy equally in the respective countries of the High Contracting Parties full and entire protection for their persons and property.

ARTICLE II

It is agreed by the High Contracting Parties that His Majesty the Emperor of Japan may, if He see fit, accredit a Diplomatic Agent to the Court of Peking and His Majesty the Emperor of China may, if He see fit, accredit a Diplomatic Agent to the Court of Tokio.

The Diplomatic Agent thus accredited shall respectively enjoy all the prerogatives, privileges and immunities accorded by international law to such Agents and they shall also in all respects be entitled to the treatment extended to similar Agents of the most favoured nation.

Their persons, families, suites, establishments, residences and correspondence shall be held inviolable. They shall be at liberty to select and appoint their own officers, courtiers, interpreters, servants and attendants without any kind of molestation.

ARTICLE III

His Majesty the Emperor of Japan may appoint Consuls-General, Consuls, Vice-Consuls and Consular Agents to reside at such of the ports, cities and towns of China, which are now, or may hereafter be, opened to foreign residence and trade, as the interests of the Empire of Japan may require.

These officers shall be treated with due respect by the Chinese Authorities, and they shall enjoy all the attributes, authority, jurisdiction, privileges and immunities which are, or may hereafter be, extended to similar officers of the nation most favoured in these respects.

His Majesty the Emperor of China may likewise appoint Consuls-General, Consuls, Vice-consuls and Consular Agents to reside at any or all of those places in Japan, where Consular officers of other nations are now, or may hereafter be, admitted, and, saving in the matter of jurisdiction in respect of Chinese subjects and property in Japan, which is reserved to the Japanese Judicial Courts, they shall enjoy the rights and privileges that are usually accorded to such officers.

ARTICLE IV

Japanese subjects may, with their families, employés and servants, frequent, reside and carry on trade, industries and manufactures, or pursue any other lawful avocations in all the ports, cities, and towns of China, which are now, or may hereafter be, opened to foreign residence and trade. They are at liberty to proceed to or from any of the open ports with their merchandise and effects, and within the localities at those places which have already been, or may hereafter be, set apart for the use and occupation of foreigners, they are allowed to rent or purchase houses, rent or lease land, and to build churches, cemeteries and hospitals, enjoying in all respects the same privileges and immunities as are now, or may hereafter be, granted to the subjects or citizens of the most favoured nation.

ARTICLE V

Japanese vessels may touch for the purpose of landing and shipping passengers and merchandise in accordance with the existing Rules and Regulations concerning foreign trade there at all those places in China, which are now ports of call, namely, Nganching, Tatung, Hu-kow, Wusueh, Lu-chi-kow and Woosung and such other places as may hereafter be made

ports of call also. If any vessel should unlawfully enter ports other than open ports and ports of call in China or carry on clandestine trade along the coast or rivers, the vessel with her cargo shall be subject to confiscation by the Chinese Government.

ARTICLE VI

Japanese subjects may travel, for their pleasure or for purposes of trade, to all parts of the interior of China, under passports issued by Japanese Consuls and countersigned by the Local Authorities. These passports, if demanded, must be produced for examination in the localities passed through. If the passports be not irregular, the bearers will be allowed to proceed and no opposition shall be offered to their hiring of persons, animals, carts or vessels for their own conveyance or for the carriage of their personal effects or merchandise. If they be without passports or if they commit any offence against the law, they shall be handed over to the nearest Consul for punishment, but they shall only be subject to necessary restraint and in no case to ill-usage. Such passports shall remain in force for a period of thirteen Chinese months from the date of issue. Any Japanese subject travelling in the interior without a passport shall be liable to a fine not exceeding three hundred Taels. Japanese subjects may, however, without passports go on excursions from any of the ports open to trade, to a distance not exceeding one hundred Chinese li and for a period not exceeding five days. The provisions of this Article do not apply to crews of ships.

ARTICLE VII

Japanese subjects residing in the open ports of China may take into their service Chinese subjects and employ them in any lawful capacity without restraint or hindrance from the Chinese Government or Authorities.

ARTICLE VIII

Japanese subjects may hire whatever boats they please for the conveyance of cargo or passengers and the sum to be paid for such boats shall be settled between the parties themselves, without the interference of the Chinese Government or officers. No limit shall be put upon the number of boats, neither shall a monopoly in respect either of the boats or of the porters or coolies engaged in carrying goods be granted to any parties. If any smuggling takes place in them the offenders will of course be punished according to law.

ARTICLE IX

The Tariffs and Tariff Rules now in force between China and the Western Powers shall be applicable to all articles upon importation into China by Japanese subjects or from Japan, or upon exportation from China by Japanese subjects or to Japan. It is clearly understood that all articles, the importation or exportation of which is not expressly limited or prohibited by the Tariffs and Tariff Rules existing between China and the Western Powers, may be freely imported into and exported from China, subject only to the payment of the stipulated import or export duties. But in no case shall Japanese subjects be called upon to pay in China other or higher imports or exports duties than are, or may be, paid by the subjects or citizens of the most favoured nation; nor shall any article imported into China from Japan or exported from China to Japan be charged upon such importation or exportation other or higher duties than are now, or may hereafter be, imposed in China on the like article when imported from or exported to the nation most favoured in those respects.

ARTICLE X

All articles duly imported into China by Japanese subjects or from Japan shall, while being transported, subject to the existing Regulations, from one open port to another, be wholly exempt from all taxes, imposts, duties, lekin, charges and exactions of every nature and kind whatsoever, irrespective of the nationality of the owner or possessor of the articles, or the nationality of the conveyance or vessel in which the transportation is made.

ARTICLE XI

It shall be at the option of any Japanese subject desiring to convey duly imported articles to an inland market to clear his goods of all transit duties by payment of a commutation transit tax or duty, equal to one-half of the import duty in respect of dutiable articles, and two and half per cent upon the value in respect of duty free articles; and no payment thereof a certificate shall be issued, which shall

exempt the goods from all further inland charges whatsoever. It is understood that this Article does not apply to imported opium.

ARTICLE XII

All Chinese goods and produce purchased by Japanese subjects in China elsewhere than at an open port thereof and intended for export abroad, shall in every part of China be freed from all taxes, imposts, duties, lekin, charges and exactions of every nature and kind whatsoever, saving only export duties when exported, upon the payment of a commutation transit tax or duty calculated at the rate mentioned in the last preceding Article substituting export duty for import duty, provided such goods and produce are actually exported to a foreign country within the period of twelve months from the date of the payment of the transit tax; all Chinese goods and produce purchased by Japanese subjects at the open ports of China and of which export to foreign countries is not prohibited shall be exempt from all internal taxes, imports, duties, lekin, charges and exactions of every nature and kind whatsoever, saving only export duties upon exportation and all articles purchased by Japanese subjects in any part of China, may also, for the purposes of export abroad, be transported from open port to open port, subject to the existing Rules and Regulations.

Merchandise of a bona fide foreign origin, in respect of which full import duty shall have been paid, may at any time within three years from the date of importation be re-exported from China by Japanese subjects to any foreign country, without the payment of any export duty; and the re-exporters shall, in addition, be entitled forthwith to receive from the Chinese Customs drawback certificates for the amount of import duty paid thereon, provided that the merchandise remains intact and unchanged in its original packages. Such drawback certificates shall be immediately redeemable in ready money by the Chinese Customs Authorities at the option of the holders thereof.

ARTICLE XIV

The Chinese Government consents to the establishment of Bonded Warehouses at the several open ports of China. Regulations on the subject shall be made hereafter.

ARTICLE XV

Japanese merchant vessels of more than one hundred and fifty tons burden entering the open ports of China, shall be charged tonnage dues at the rate of four mace per registered ton; if of one hundred and fifty tons and under, they shall be charged at the rate of one mace per registered ton. But any such vessel taking its departure within forty-eight hours after arrival, without breaking bulk, shall be exempt from the payment of tonnage dues.

Japanese vessels having paid the above specified tonnage dues shall thereafter be exempt from all tonnage dues in all the open ports and ports of call of China for the period of four months from the date of clearance from the port where the payment of such tonnage dues is made. Japanese vessels shall not, however, be required to pay tonnage dues for the period during which they are actually undergoing repairs in China.

No tonnage dues shall be payable on small vessels and boats employed by Japanese subjects in the conveyance of passengers, baggage, letters, or duty free articles between any of the open ports of China. All small vessels and cargo boats however, conveying merchandise which is, at the time of such conveyance, subject to duty, shall pay tonnage dues once in four months at the rate of one mace per ton.

No fee or charges other than tonnage dues shall be levied upon Japanese vessels and boats, and it is also understood that such vessels and boats shall not be required to pay other or higher tonnage dues than the vessels and boats of the most faboured nation.

ARTICLE XVI

Any Japanese merchant vessel arriving at an open port of China shall be at liberty to engage the services of a pilot to take her into port. In like manner, after she has discharged all legal dues and duties and is ready to take her departure, she shall be allowed to employ a pilot to take her out of port.

ARTICLE XVII

Japanese merchant vessels compelled on account of injury sustained or any other cause to seek a place of refuge, shall be permitted to enter any nearest port of China, without being subject to the payment of tonnage dues or duties upon goods landed in order that repairs to the vessel

may be effected, provided the goods so landed remain under the supervision of the Customs Authorities. Should any such vessel be stranded or wrecked on the coast of China, the Chinese Authorities shall immediately adopt measures for rescuing the passengers and crew and for securing the vessel and cargo. The persons thus saved shall receive friendly treatment, and, if necessary, shall be furnished with means of conveyance to the nearest Consular station. Should any Chinese merchant vessel be compelled on account of injury sustained or any other cause to seek a place of refuge in the nearest port of Japan, she shall likewise be treated in the same way by the Japanese Authorities.

ARTICLE XVIII

The Chinese Authorities at the several open ports shall adopt such means as they may judge most proper to prevent the revenue suffering from fraud or smuggling.

ARTICLE XIX

If any Japanese vessel be plundered by Chinese robbers or pirates, it shall be the duty of the Chinese Authorities to use every endeavour to capture and punish the said robbers or pirates, and to recover and restore the stolen property.

ARTICLE XX

Jurisdiction over the persons and property of Japanese subjects in China is reserved exclusively to the duly authorized Japanese Authorities, who shall hear and determine all cases brought against Japanese subjects or property by Japanese subjects, or by the subjects or citizens of any other Power, without the intervention of the Chinese Authorities.

ARTICLE XXI

If the Chinese Authorities or a Chinese subject make any charge or complaint of civil nature against Japanese subjects or in respect of Japanese property in China, the case shall be heard and decided by the Japanese Authorities.

In like manner all charge and complaints of a civil nature brought by Japanese Authorities or subjects in China against Chinese subjects or in respect of Chinese property, shall be heard and determined by the Chinese Authorities.

ARTICLE XXII

Japanese subjects charged with the commission of any crimes or offences in China shall be tried, and, if found guilty, punished by the Japanese Authorities according to the laws of Japan.

In like manner Chinese subjects charged with the commission of any crimes or offences against Japanese subjects in China, shall be tried and if found guilty, punished by the Chinese Authorities according to the laws of China.

ARTICLE XXIII

Should any Chinese subjects fail to discharge debts incurred to a Japanese subject, or should he fraudulently abscond, the Chinese Authorities will do their utmost to effect his arrest, and enforce recovery of the debts. The Japanese Authorities will likewise do their utmost to bring to justice any Japanese subject who fraudulently absconds or fails to discharge debts incurred by him to a Chinese subject.

ARTICLE XXIV

If Japanese subjects in China, who have committed offences or have failed to discharge debts and fraudulently abscond, should flee to the interior of China or take refuge in houses occupied by Chinese subjects or on board of Chinese ships, the Chinese Authorities shall at the request of the Japanese Consul, deliver them to the Japanese Authorities.

In like manner if Chinese subjects in China, who have committed offences or have failed to discharge debts and fraudulently abscond, should take refuge in houses occupied by Japanese subjects in China or on board of Japanese ships in Chinese waters, they shall be delivered up, at the request of the Chinese Authorities made to the Japanese Authorities.

ARTICLE XXV

The Japanese Government and its subjects are hereby confirmed in all privileges, immunities and advantages conferred on them by the Treaty stipulations between Japan and China, which are now in force; and it is hereby expressly stipulated that the Japanese Government and its subjects will be allowed free and equal participation in all privileges, immunities and advantages that may have been, or may be hereafter, granted by His Majesty the Emperor of China to the

Government or subjects of any other nation.

ARTICLE XXVI

It is agreed that either of the High Contracting Parties may demand a revision of the tariffs and of the Commercial Articles of this Treaty at the end of ten years from the date of the exchange of the ratifications; but if no such demand be made on either side and no such revision be effected, within six months after the end of the first ten years, then the Treaty and Tariffs, in their present form, shall remain in force for ten years more, reckoned from the end of the preceding ten years, and so it shall be at the end of each successive period of ten years.

ARTICLE XXVII

The High Contracting Parties will agree upon Rules and Regulations necessary to give full effect to this Treaty. Until such Rules and Regulations are brought into actual operation, the Arrangements, Rules and Regulations subsisting between China and the Western Powers, so far as they are applicable and not inconsistent with provisions of this Treaty, shall be binding between the Contracting Parties.

ARTICLE XXVIII

The present Treaty is signed in the Japanese, Chinese and English languages. In order, however, to prevent future discussions, the Plenipotentiaries of the High Contracting Parties have agreed upon that in case of any divergence in the interpretation between the Japanese and Chinese texts of the Treaty, the difference shall be settled by reference to the English text.

SUPPLEMENTARY TREATY OF COMMERCE AND NAVIGATION

Signed at Shanghai, October 8, 1903

ARTICLE I

Whereas China, with the object of reforming fiscal system, proposes to levy a surtax in excess of the tariff rates on all goods passing through the Custom Houses, whether maritime or inland and frontier, in order to compensate in a measure for the loss incurred by the complete abolition of likin, Japan consents to pay the same surtax as is agreed upon between China and all the Treaty Powers. With regard to the production tax, consumption tax and excise, and the taxes on native opium and salt, leviable by China, Japan also consents to accept the same arrangements as are agreed upon between all the Treaty Powers and China. It is understood however that the commerce, rights and privileges of Japan shall not, on account of the above, be placed at any disadvantage as compared with the commerce, rights and privileges of other Powers.

ARTICLE II

The Chinese Government agree to permit Japanese steamship-owners to erect, at their own expense, appliances for hauling through the rapids of that part of the Yang-tze-kiang between Ichang and Chungking. But as the interests of the Provinces of Szechuen, Hunan and Hupeh are involved, it is therefore necessary that the approval of the Imperial Maritime Customs be obtained before such appliances may be so erected.

These appliances, which shall be at the disposal of all vessels both steamers and junks, shall not obstruct the water-way nor interfere with the free passage of junks or of persons on the banks of the river. Such appliances shall be subject to special regulations to be drawn up by the Imperial Maritime Customs.

ARTICLE III

The Chinese Government agree that any Japanese steamer capable of navigating the inland waterways, upon reporting at the Imperial Maritime Customs, may proceed for the purpose of trade from a treaty port to places inland, so reported, on complying with the Original and Supplementary Regulations for Steam Navigation Inland.

ARTICLE IV

In case Chinese subjects conjointly with Japanese subjects organize a partnership

or company for a legitimate purpose, they shall equitably share the profits and losses with all the members according to the terms of the agreement or memorandum and articles of association and the regulations framed thereunder, and they shall be liable to the fulfilment of the obligations imposed by the said agreement or memorandum and articles of association and the regulations framed thereunder as accepted by Japanese Courts. Should they fail to fulfil the obligations so imposed and legal action be taken against them in consequence, Chinese Courts shall at once enforce fulfilment of such obligations.

It is understood that in case Japanese subjects conjointly with Chinese subjects organize a partnership or company, they shall also equitably share the profits and losses with all the members according to the terms of the agreement or memorandum and articles of association and the regulations framed thereunder. Should such Japanese subjects fail to fulfil any of the obligations imposed by the said agreement or memorandum and articles of association or by the regulations framed thereunder, Japanese Courts shall in like manner at once enforce fulfilment of such obligations by them.

ARTICLE V

The Chinese Government agree to make and faithfully enforce such regulations as are necessary for preventing Chinese subjects from infringing registered trade-marks held by Japanese subjects.

The Chinese Government likewise agree to make such regulations as are necessary for affording protection to registered copyrights held by Japanese subjects in the books, pamphlets, maps and charts written in the Chinese language and specially prepared for the use of Chinese people.

It is further agreed that the Chinese Government shall establish registration offices where foreign trade-marks and copyrights, upon application for the protection of the Chinese Government, shall be registered in accordance with the provisions of the regulations to be hereafter framed by the Chinese Government for the purpose of protecting trade-marks and copy-rights.

It is understood that Chinese trade marks and copy-rights properly registered according to the provisions of the laws and regulations of Japanese will receive similar protection against infringement in Japan.

This Article shall not be held to protect against due process of law any Japanese or Chinese subject who may be the author, proprietor or seller of any publication calculated to injure the well-being of China.

ARTICLE VI

China agrees to establish itself, as soon as possible, a system of uniform national coinage and provide for a uniform national currency which shall be freely used as legal tender in payment of all duties, taxes and other obligations by Japanese subjects as well as by Chinese subjects in the Chinese Empire. It is understood, however, that all Customs duties shall continue to be calculated and paid on the basis of the Haikwan tael.

ARTICLE VII

As the weights and measures used by the mercantile and other classes for general and commercial purposes in the different provinces of China vary and do not accord with the standards fixed by the Imperial Government Boards, thus resulting in detriment to the trade of Chinese and foreigners, the Governor-General and Governors of all the provinces, after careful inquiry into existing conditions, shall consult together and fix upon uniform standards which, after a Memorial to the Throne for sanction, shall be adopted and used in all transactions by officials and people throughout all the Empire. These standards shall be first used in the places opened to foreign trade and gradually extended to inland places. Any differences resulting from divergence between the new weights and measures and those now in vogue shall be equitably settled, whether, by way of increase or decrease according to the amount of such difference.

ARTICLE VIII

The Regulations for Steam Navigation Inland of the fifth moon of the twenty-fourth year of Kuang-shü and the Supplementary Rules of the seventh moon of the same year having been found in some respects inconvenient in working, the Chinese Government hereby agree to amend them and to annex such new Rules to this Treaty.

These Rules shall remain in force until altered by mutual consent.

ARTICLE IX

The provisions of all treaties and engagements now subsisting between Japan and China, in so far as they are not modified or repealed by this Act, are hereby confirmed; and it is hereby expressly stipulated in addition that the Japanese Government, Officers, Subjects, Commerce, Navigation, Shipping, Industries and Property of all kinds shall be allowed free and full participation in all privileges, immunities and advantages which have been or may hereafter be granted by His Majesty the Emperor of China or by the Chinese Government or by the Provincial or Local Administrations of China, to the Government, Officers, Subjects, Commerce, Navigation, Shipping, Industries or Property of any other nation.

The Japanese Government will do its utmost to secure to Chinese Officers and Subjects resident in Japan the most favourable treatment compatible with the laws and regulations of the Empire.

ARTICLE X

The High Contracting Parties hereto agree that, in case of and after the complete withdrawal of the foreign troops stationed in the province of Chihli and of the Legation guards, a place of international residence and trade in Peking will be forthwith opened by China itself. The detailed regulations relating thereto shall be settled in due time after consulation.

The Chinese Government agree to open to foreign trade, within six months from the exchange of the Ratifications of this Treaty, Ch'angshafu in the province of Hunan on the same footing as the ports already opened to foreign trade. Foreigners residing in this open port are to observe the Municipal and Police Regulations on the same footing as Chinese residents, and they are not to be entitled to establish a municipality and Police of their own within the limits of this treaty port, except with the consent of the Chinese authorities.

The Chinese Government agree that, upon the exchange of the Ratifications of this Treaty, Mukden and Tatungkow, both in the province of Shengking, will be opened by China itself as places of international residence and trade. The selection of suitable localities to be set apart for international use and occupation and the regulations for these places set apart for foreign residence and trade shall be agreed upon by the Governments of Japan and China after consultation together.

ARTICLE XI

The Government of China having expressed a strong desire to reform its judicial system and to bring it into accord with that of Japan and Western nations, Japan agrees to give every assistance to such reform, and will also be prepared to relinquish its extraterritorial rights when satisfied that the state of the Chinese laws, the arrangements for their administration and other considerations warrant it in so doing.

ARTICLE XII

The present Treaty is signed in the Japanese, Chinese and English languages. In order, however, to prevent future discussions, the Plenipotentiaries of the High Contracting Parties have agreed that in case of any divergence in the interpretation between the Japanese and Chinese Texts of the Treaty, the difference shall be settled by reference to the English Text.

ANNEX I

INLAND WATERS STEAM NAVIGATION (ADDITIONAL RULES)

Shanghai, October, 1903.

1. Japanese steamship-owners are at liberty to lease warehouses and jetties on the banks of waterway from Chinese subjects for a term not exceeding twenty-five years, with option of renewal on terms to be mutually arranged. In cases where Japanese merchants are unable to secure warehouses and jetties from Chinese subjects on satisfactory terms, the local officials, after consultation with the Governor-General or Minister of Commerce, shall arrange to provide these on renewable lease, as above mentioned, at current equitable rates.

2. Jetties shall only be erected in such positions that they will not obstruct the inland waterway or interfere with navigation, and with the sanction of the nearest Commissioner of Customs; such sanction, however, shall not be arbitrarily withheld.

3. Japanese merchants shall pay taxes and contributions on these warehouses and jetties on the same footing as Chinese proprietors of similar properties in the neighbourhood. Japanese merchants may only employ Chinese

agents and staff to reside in warehouses so leased at places touched at by steamers engaged in inland traffic to carry on their business; but Japanese merchants may visit these places from time to time to look after their affairs. The existing rights of Chinese jurisdiction over Chinese subject shall not by reason of this clause be diminished or interfered with in any way.

4. Steam vessels navigating the inland waterways of China shall be responsible for loss caused to riparian proprietors by damage which they may do to the banks or works on them, and for the loss which may be caused by such damage.

In the event of China desiring to prohibit the use of some particular shallow waterway by launches, because there is reason to fear that the use of it by them would be likely to injure the banks and cause damage to the adjoining country, the Japanese Authorities, when appealed to, shall, if satisfied of the validity of the objection, prohibit the use of that waterway by Japanese launches, provided that Chinese launches are also prohibited from using it.

Both Foreign and Chinese launches are prohibited from crossing dams and weirs at present in existence on inland waterways where they are likely to cause injury to such works, which would be detrimental to the water service of the local people.

5. The main object of the Japanese Government in desiring to see the inland waterways of China opened to steam navigation being to afford facilities for the rapid transport of both foreign and native merchandise, they undertake to offer no impediment to the transfer to a Chinese company and the Chinese flag of any Japanese steamer which may now or hereafter be employed on the inland waters of China, should the owner be willing to make the transfer.

In the event of a Chinese company registered under Chinese law being formed to run steamers on the inland waters of China, the fact of Japanese subjects holding shares in such a company shall not entitle the steamers to fly the Japanese flag.

6. Registered steamers and their tows are forbidden, just as junks have always been forbidden, to carry contraband goods. Infraction of this rule will entail the penalties prescribed in the treaties for such an offence, and cancellation of the Inland Waters Navigation Certificate carried by the vessels, which will be prohibited from thereafter plying on inland water.

7. As it is desirable that the people living inland should be disturbed as little as possible by the advent of steam vessels to which they are not accustomed, inland waters not hitherto frequented by steamers shall be opened as gradually as may be convenient to merchants and only as the owners of steamers may see prospect of remunerative trade.

In cases where it is intended to run steam vessels on waterways on which such vessels have not hitherto run, intimation shall be made to the Commissioner of Customs at the nearest open port, who shall report the matter to the Ministers of Commerce. The latter, in conjunction with the Governor-General or Governor of the province, after careful consideration of al the circumstances of the case, shall at once give their approval.

8. A registered steamer may ply within the waters of a port, or from one open port or ports to another open port or ports, or from one open port or ports to places inland, and thence back to such port or ports. She may, on making due report to the Customs, land or ship passengers or cargo at any recognized places of trade passed in the course of the voyage; but may not ply between inland places exclusively except with the consent of the consent of the Chinese Government.

9. Any cargo and passenger boats may be towed by steamers. The helmsman and crew of any boat towed shall be Chinese. All boats, irrespective of ownership, must be registered before they can proceed inland.

10. The above Rules are supplementary to the Regulations published in the fifth and seventh moons of the twenty-fourth year of Kuang-hsü, which remain in full force and effect in so far as they are not modified by the Rules now agreed upon.

The present Rules and the Regulations of the fifth and seventh moons of the twenty-fourth year of Kuang-hsü may hereafter be modified, as circumstances require, by mutual consent.

ANNEXES II AND III

EXCHANGE OF NOTES BETWEEN THE JAPANESE AND CHINESE COMMISSIONERS FOR TREATY REVISION REGARDING THE INLAND WATERS NAVIGATION OF THE JAPANESE STEAMERS

FROM JAPANESE COMMISSIONERS TO CHINESE COMMISSIONERS

October 8, 1903

Gentlemen,

According to Article III of the Present Treaty the Chinese Government agree that any Japanese steamer capable of navigation Inland Waterways, upon reporting at the Imperial Maritime Customs, may proceed for the purpose of trade from a treaty port to places inland, so reported, on complying with the Original and Supplementary Regulations for Steam Navigation Inland.

It is understood that all classes of Japanese steamers, whatever their size, provided they are capable of navigating the Inland Waterways, may on complying with the Regulations receive an Inland Waters Certificate and carry on trade with inland places, and the Chinese Government will in no case raise difficulties and stop such steamers from plying to and from inland places.

We have the honour, in order to prevent future misunderstandings, to address this despatch to Your Excellencies and to request that instructions be sent to the Inspector General of Maritime Customs to act in accordance with this understanding. We have further the honour to request a reply from Your Excellencies.

We have the honour to be, etc.

FROM CHINESE COMMISSIONERS TO JAPANESE COMMISSIONERS

Shanghai, August 19, 1903

(Chinese Calendar)

Gentlmen,

We have the honour to acknowledge the receipt of Your Excellencies' despatch of this date, written with a view to preventing future misunderstandings, to the effect that, in accordance with the provisions of Article III of the present Treaty, all classes of Japanese steamers, whatever their size, provided they are capable of navigating the Inland Waterways, may on complying with the Regulations receive an Inland Waters Certificate and ply to and from inland places, and that the Chinese Government will in no case raise difficulties and stop them.

During the negotiations of this Article, we received a list from Your Excellencies of the Japanese steamers viz., Sanyo Maru, Setagawa Maru, Hiuga Maru, Urato Maru, Neisei Maru, Heian Maru, Taiko Maru, Yoshino Maru, Meiko Maru, Fukuju Maru, Hijikawa Maru, Nagata Maru, Kyodo Maru, Horai Maru, Kwanko Maru, Keiko Maru, Kinriu Maru, Zensho Maru and Kohei Maru, ranging from one hundred and twenty-one tons to four hundred and ten tons register—plying from Chefoo to inland places in Manchuria, under Inland Waters Certificate and in accordance with the Regulations for Steam Navigation Inland, which vessels have not been prevented from doing so on account of their class.

At that time we instructed the Deputy Inspector General of Customs to make inquiries into the records of the Custom Houses, and he reported that the circumstances were in accordance with Your Excellencies' statement.

In consequence of the receipt of Your Excellencies' despatch we shall communicate with the Wai-wu Pu and request that instructions be sent to the Inspector General of Customs to take these circumstance into consideration and to act accordingly, and we have the honour to write this despatch for purposes of record.

We have the honour to be, etc.

ANNEXES IV AND V

EXCHANGE OF NOTES BETWEEN THE JAPANESE AND CHINESE COMMISSIONERS FOR TREATY REVISION REGARDING THE APPOINTMENT OF AN OFFICER FOR COLLECTING DUES AND DUTIES PROVIDED IN NO. 9 OF THE SUPPLEMENTARY RULES FOR STEAM NAVIGATION INLAND

FROM JAPANESE COMMISSIONERS TO CHINESE COMMISSIONERS

October 8, 1903

Gentlemen,

The provision contained in No. 9 of the

Supplementary Rules governing steam navigation on Inland Waters published in the seventh moon of the twenty-forth year of Kuang-hsü, regarding the appointment of an officer to collect dues and duties, not having in all cases been given effect to, we have the honour to request that Your Excellencies' Government will again issue instructions to all provinces to give strict effect to this provision, as it is a matter of importance.

We trust that Your Excellencies will comply with the request contained in this despatch and that you will favour us with a reply.

We have the honour to be, etc.

FROM CHINESE COMMISSIONERS TO JAPANESE COMMISSIONERS

Shanghai, August 18, 1903
(Chinese Calendar)

Gentlemen,

We have the honour to acknowledge the receipt of Your Excellencies' despatch of this date to the effect that, the provision contained in No. 9 of the Supplementary Rules governing steam navigation on Inland Waters published in the seventh moon of the twenty-forth year of Kuang-hsü, regarding the appointment of an officer to collect dues and duties, not having in all cases been given effect to, you request that instructions be again issued to all provinces to give strict effect to this provision, as it is a matter of importance.

We have noted the above and have communicated with proper authorities in order that action may be taken, and have now the honour to write this reply for Your Excellencies' information.

We have the honour to be, etc.

ANNEXES 6 AND 7

EXCHANGE OF NOTES BETWEEN THE JAPANESE AND CHINESE COMMISSIONERS FOR TREATY REVISION REGARDING THE OPENING OF THE CITY OF PEKING

FROM CHINESE COMMISSIONERS TO JAPANESE COMMISSIONERS

Shanghai, August 10, 1903
(Chinese Calendar)

Gentlemen,

According to the provision of Article X of this Treaty, regarding the establishment in Peking of a place of international residence and trade, it is agreed that in case of and after the complete withdrawal of the foreign troops, now guarding the Legations and Communications, a place in Peking outside the Inner City, convenient to both parties and free from objections, shall be selected and set apart as a place where merchants of all nationalities may reside and carry on trade. Within the limits of this place merchants of all nationalities shall be at liberty to lease land, build houses and warehouses, and establish places of business; but as to the leasing of houses and land belonging to Chinese private individuals, there must be willingness on the part of the owners and the term thereof must be equitably arranged without any force or compulsion. All road and bridges in this place will be under the jurisdiction and control of China. Foreingers residing in this place are to observe the Municipal and Police Regulations on the same footing as Chinese residents, and they are not to be entitled to establish a Municipality and Police of their own within its limits except with the consent of the Chinese authorities. When such place of international residence and trade shall have been opend and its limits properly defined, the foreigners who have been residing scattered both within and without the city walls, shall all be required to remove their residence thereto and they shall not be allowed to remain in separate places and thereby cause inconvenience in the necessary supervision by the Chinese authorities. The value of the land and buildings held by such foreigners shall be agreed upon equitably and due compensation therefore shall be paid. The period for such removal shall be determined in due time, and those who do not remove before the expiry of this period shall not be entitled to compensation.

We have considered it to be our mutual advantage to come to the present basis of understanding in order to avoid future unnecessary negotiations, and we beg that Your Excellencies will consider and agree to it and will favour us with a reply.

We have the honour to be, etc.

FROM JAPANESE COMMISSIONERS TO CHINESE COMMISSIONERS

Shanghai, October 8, 1903

Gentlemen,

We have the honour to acknowledge the

receipt of Your Excellencies' despatch of this date in which you state that—

"According to the provision of Article X of this Treaty, regarding the establishment in Peking of a place of international residence and trade, it is agreed that in case of and after the complete withdrawal of the foreign troops, now guarding the Legations and Communications, a place in Peking outside the Inner City, convenient to both parties and free from objections, shall be selected and set apart as a place where merchants of all nationalities may reside and carry on trade. Within the limits of this place merchants of all nationalities shall be at liberty to lease land, build houses and warehouses, and establish places of business; but as to the leasing of houses and land belonging to Chinese private individuals, there must be willingness on the part of the owners and the terms thereof must be equitably arranged without any force or compulsion. All roads and bridges in this place will be under the jurisdiction and control of China. Foreigners residing in this place are to observe the Municipal and Police Regulations on the same footing as Chinese residents, and they are not to be entitled to establish a Municipality and Police of their own within its limits except with the consent of the Chinese authorities. When such place of international residence and trade shall have been opened and its limits properly defined, the foreigners who have been residing scattered both within and without the city walls, shall all be required to remove their residence thereto and they shall not be allowed to remain in separate places and thereby cause inconvenience in the necessary supervision by the Chinese authorities. The value of the land and buildings held by such foreigners shall be agreed upon equitably and due compensation thereof shall be paid. The period for such removal shall be determined in due time, and those who do not remove before the expiry of this period shall not be entitled to compensation.

"We have considered it to be to our mutual advantage to come to the present basis of understanding in order to avoid future unnecessary negotiations, and we beg that Your Excellencies will consider and agree to it and will favour us with a reply."

In reply we beg to inform you that we agree generally to all the terms contained in the despatch under acknowledgement. As to the detailed regulations, these shall in due time be considered and satisfactorily settled in accordance with Article X of this Treaty; but it is understood that such regulations shall not differ in any respect to our prejudice from those which may be agreed upon between China and other Powers. We have the honour to send Your Excellencies this communication in reply and for your information.

We have the honour to be, etc.

AGREEMENT CONCLUDED BETWEEN THE EMPIRE OF JAPAN AND THE REPUBLIC OF CHINA

Signed at Nanking, May 6, 1930

The Government of Japan and the National Government of the Republic of China have, through their respective representatives, agreed upon and concluded the following Articles:—

ARTICLE I

The Japanese and the Chinese Governments agree that all matters relating to rates of duty on the import and export of articles, drawbacks, transit dues and tonnage dues in the territories of Japan and the territories of China shall be regulated exclusively by the laws of Japan and of China respectively.

ARTICLE II

The Governments of Japan and of China shall reciprocally grant to each other and to the nationals of the other country, in customs duties, drawbacks and transit dues and all other similar internal charges, applied to the import and export of articles, and in tonnage dues, as well as in all matters connected therewith, treatment not less favourable than that accorded or to be accorded to its own nationals or to the Government and nationals of any other foreign country.

Articles produced or manufactured in the territories of Japan or of China and imported into the territories of the other

from whatever place arriving, shall receive, in import duties, drawbacks and transit dues and all other similar internal charges, and in all matters connected therewith, treatment not to be accorded to the like articles produced or manufactured in any other foreign country.

Articles produced or manufactured in the territories of Japan or of China and exported to the territories of the other shall receive, in export duties, drawbacks and transit dues and all other similar internal charges, and in all matters connected therewith, treatment not less favourable than that accorded to the like articles produced or manufactured in the same territories and exported to any other foreign country.

In regard to tonnage dues and all matters connected therewith vessels of Japan and of China shall each receive in the territories of the other treatment not less favourable than that accorded or to be accorded to the vessels of any other foreign country.

ARTICLE III

The stipulations contained in the foregoing Articles as well as in the exchanged Notes annexed to the present Agreement shall be incorporated in, and form part of, a Treaty of Commerce and Navigation to be negotiated and concluded as soon as possible between the Empire of Japan and the Republic of China.

ARTICLE IV

The Japanese, Chinese and English texts of this Agreement have been carefully compared and verified; but in the event of there being any difference of meaning between them, the sense as expressed in the English text shall be held to prevail.

ARTICLE V

The present Agreement shall enter into force on the tenth day following the date of the signature thereof.

ANNEX I

Nanking, May 6th, 5 Showa (1930)

Monsieur le Ministre,

With reference to the Agreement which we signed to-day I have the honour to state that it is the understanding of the Japanese Government:

1. That, beginning from the date of the coming into force of the above-mentioned Agreement, the Chinese Government will maintain: for a period of three years the rates of duty leviable under Items 1, 2 and 3 in Part I of the Schedule attached hereto, and will also maintain for a period of one year the rates of duty leviable under Item 4 in Part I of the said Schedule, as the maximum rates of Import Duty leviable during the respective periods on articles falling within such Items produced or manufactured in the territories of Japan and imported into the territories of China, subject, however, to the reservation made in the said Schedule by the Chinese Government concerning the increase of rates; and

2. That the Japanese Government will maintain for a period of three years from the date of the coming into force of the above-mentioned Agreement, the rates of duty leviable under the three Items in Part II of the Schedule attached hereto, as the maximum rates of Import Duty leviable during the said period on articles falling within such items produced or manufactured in the territories of China and imported into the territories of Japan.

I shall be much obliged if Your Excellency will be good enough to confirm the foregoing understanding.

I avail myself of this opportunity to renew to Your Excellency the assurances of my highest consideration.

(Signed) M. Shigemitsu,

His Excellency

Dr. Chengting T. Wang

SCHEDULE

Part I

No. of Item	Description of articles	Nos. in Chinese Customs Import Tariff of 1929
1	Cotton goods	1 to 10, 12 to 14, 22 to 24, 26 to 32, 37, 38, 40, 43, 46, 47, **51**, 53, 58, 59
2	Fishery and sea products	196 to 199, 202, **205**, 206, 213, 216, **217**, **218**, 231
3	Wheat flour	**280**
4	Miscellaneous goods	**302**, 567, 568, 603 to 605 (a), 612, **647** **652**, (b), 666 (b), 677 (c), **685**, 706, **709** (f), **709** (g), 710, 715

The numbers which appear in Part I of this Schedule indicate the same articles as are mentioned under the corresponding numbers in the Chinese Customs Import Tariff of 1929, with the exception of the following numbers which cover only such articles as are enumerated thereunder:

652 (b) Rubber shoes and boots, as also footgear made wholly or partly of rubber.

666 (b) Clocks and movements assembled as a unit, value not over Hk. Tls. 40 per doz.

677 (c) Hats and caps, of felt made with other materials than beaver or hair, value not over Hk. Tls. 15 per doz.

706 Thermostatic containers and parts thereof, value not over Hk. Tls. 15 per doz.

709 (f) Electrical machinery and parts thereof.

710 Toys and games.

715 Vehicles: velocipedes (e. g., bicycles, etc.), not otherwise enumerated, value not over Hk. Tls. 40 per piece.

The rates of duty on articles mentioned in Part I of this Schedule shall remain the same as those stated under the corresponding numbers in the aforesaid Tariff, it being understood that, as regards the rates of duty on articles covered by the numbers not underlined, the Chinese Government reserves the right to increase the rates specified above by not more than two and a half per cent. ad valorem. In the case of specific rates of duty, the increase above provided for will be based either uniformly upon the original duty paying value by which the rates in the aforesaid Tariff were determined or uniformly upon the duty paying value which was adopted by the Tariff Valuation Commission in 1928.

The Chinese Government reserves the right to levy an excise on imported Cotton Yarn (No. 51) in addition to the Customs Import Duty.

Part II

No. of Item	Description of articles	Nos. in existing Japanese Import Tariff
1	Grass cloth	299. 5, (over 48 centimetres in width excepted) C-1, a-1 to a-4, C-2, a-1 to a-4
2	Silk piece goods	303. 3, A, a, b.
3	Embroidered tissues	308 (Hand-work only)

Unless otherwise specified, the numbers which appear in Part II of this Schedule indicate the same articles as are mentioned under the corresponding numbers in the Japanese Import Tariff at present in force.

The rates of duty on articles mentioned in Item 1 in Part II of this Schedule shall remain the same as those stated under the corresponding numbers in the Japanese Import Tariff at present in force, and the rates of duty on articles mentioned in Items 2 and 3 in Part II of this Schedule shall be thirty per cent less than those now levied under the Law relating to Import Duties on Luxuries and Similar Articles.

Nanking, May 6th, 19th Year R. C. (1930).

Monsieur le Chargé d'Affaires.

I have the honour to acknowledge the receipt of your Note of to-day's date which reads as follows:

"With reference to the Agreement which we signed to-day I have the honour to state that it is the understanding of the Japanese Government:

1. That, beginning from the date of the coming into force of the above-mentioned Agreement, the Chinese Government will maintain for a period of three years the rates of duty leviable under Items 1, 2 and 3 in Part I of the Schedule attached hereto, and will also maintain for a period of one year the rates of duty leviable under Item 4 in Part I of the said Schedule, as the maximum rates of Import Duty leviable during the respective periods on articles falling within such Items produced or manufactured in the territories of Japan and imported into the territories of China, subject, however, to the reservation made in the said Schedule by the Chinese Government concerning the increase of rates; and

2. That the Japanese Government will maintain for a period of three years from

the date of the coming into force of the above-mentioned Agreement the rates of duty leviable under the three Items in Part II of the Schedule attached hereto, as the maximum rates of Import Duty leviable during the said period on articles falling within such Items produced or manufactured in the territories of China and imported into the territories of Japan.

"I shall be much obliged if Your Excellency will be good enough to confirm the foregoing understanding."

I have the honour to confirm, on behalf of the National Government of the Republic of China, that the foregoing understanding is correct.

I avail myself of this opportunity to renew to you, Monsieur le Chargé d'Affaires, the assurance of my high consideration.

(Signed) Chengting T. Wang.

Mr. M. Shigemitsu, etc.

SCHEDULE

Part I

No. of Item	Description of articles	Nos. in Chinese Customs Import Tariff of 1929
1	Cotton goods	1 to 10, 12 to 14, 22 to 24, 26 to 32, 37, 38, 40, 43, 46, 47, **51**, 53, 58, 59
2	Fishery and sea products	196 to 199, 202, **205**, 206, **213**, 216 **217**, **218**, 231
3	Wheat flour	280
4	Miscellaneous goods	**302**, 567, 568, 603 to 605 (a), **612**, **647**, **652**, (b), 666 (b), 677 (c), 685, 706, **709** (f), **709** (g), 710, 715

The numbers which appear in Part I of this Schedule indicate the same articles as are mentioned under the corresponding numbers in the Chinese Customs Import Tariff of 1929, with the exception of the following numbers which cover only such articles as are enumerated thereunder:

652 (b) Rubber shoes and boots, as also footgear made wholly or partly of rubber.

666 (b) Clocks and movements assembled as a unit, value not over Hk. Tls. 40 per doz.

677 (c) Hats and caps, of felt made with materials other than beaver of hair, value not over Hk. Tls. 15 per doz.

706 Thermostatic containers and parts thereof, value not over Hk. Tls. 15 per poz.

709 (f) Electrical machinery and parts thereof.

710 Toys and games.

715 Vehicles: velocipedes (e. g., bicycles etc.), not otherwise enumerated, value not over Hk. Tls. 40 per piece.

The rates of duty on articles mentioned in Part I of this Schedule shall remain the same as those stated under the corresponding numbers in the aforesaid Tariff, it being understood that, as regards the rates of duty on articles covered by the numbers not under-lined, the Chinese Government reserves the right to increase the rates specified above by not more than two and a half per cent ad valorem. In the case of specific rates of duty, the increase above provided for will be based either uniformly upon the original duty paying value by which the rates in the aforesaid Tariff were determined or uniformly upon the duty paying value which was adopted by the Tariff Valuation Commission in 1928.

The Chinese Government reserves the right to levy an excise on imported Cotton Yarn (No. 51) in addition to the Customs Import Duty.

Part II

No. of Item	Description of articles	Nos. in existing Japanese Import Tariff
1	Grass cloth	299. 5, (over 48 centimeters in width excepted) C-1, a-1 to a-4, C-2, a-1 to a-4.
2	Silk piece goods	303. 3, A, a, b.
3	Embroidered tissues	308 (Hand-work only)

Unless otherwise specified, the numbers which appear in Part II of this Schedule indicate same articles as are mentioned under the corresponding numbers in the Japanese Import Tariff at present in force.

The rates of duty on articles mentioned in Item 1 in Part II of this Schedule shall remain the same as those stated under the corresponding numbers in the Japanese Import Tariff at present in force, and the rates of duty on articles mentioned in Items 2 and 3 in Part II of this Schedule shall be thirty per cent less than those now levied under the Law relating to Import Duties on Luxuries and Similar Articles.

ANNEX II

Nanking, May 6th, 19th Year R. C (1930)

Monsieur le Chargé d'Affaires,

With reference to the Agreement signed this day between China and Japan, I have the honour to request that you will be good enough to confirm, on behalf of the Japanese Government, my understanding that on the expiration of four months after the coming into force of the said Agreement, the reduced rates of the Chinese Customs Tariff heretofore leviable on articles imported or exported across the land frontiers between China and Japan will be abolished and the Customs Tariff without reduction will apply to such articles.

I avail myself of this opportunity to renew to you, Monsieur le Chargé d'Affaires, the assurance of my high consideration.

(Signed) Chengting T. Wang.

Mr. M. Shigemitsu, etc.

Nanking, May 6th, 5 Showa (1930)

Monsieur le Ministre,

I have the honour to acknowledge the receipt of Your Excellency's Note of to-day's date which reads as follows :—

"With reference to the Agreement signed this day between China and Japan, I have the honour to request that you will be good enough to confirm, on behalf of the Japanese Government, my understanding that on the expiration of four months after the coming into force of the said Agreement, the reduced rates of the Chinese Customs Tariff heretofore leviable on articles imported or exported across the land frontiers between China and Japan will be abolished and the Customs Tariff without reduction will apply to such articles."

I have the honour to confirm, on behalf of the Japanese Government, that the above understanding is correct.

I avail myself of this opportunity to renew to Your Excellency the assurances of my highest consideration.

(Signed) M. Shigemitsu.

His Excellency

Dr. Chengting T. Wang, etc.

ANNEX III

Nanking, May 6th, 5 Showa (1930).

Monsieur le Ministre,

I have the honour to remind Your Excellency that in the course of our negotiations regarding the Customs Tariff question, it was stated that the Chinese Government entertained the intention of abolishing as soon as possible all such taxes and charges detrimental to the promotion of trade in China as likin, native customs duties, coast-trade duty and transit dues and other like charges.

I shall be much obliged if Your Excellency will be good enough to inform me as to what measures have been or will be adopted by the Chinese Government with a view to carrying into effect the aforesaid intention of the Chinese Government.

I avail myself of this opportunity to renew to Your Excellency the assurances of my highest consideration.

(Signed) M. Shigemitsu.

His Excellency

Dr. Chengting T. Wang, etc.

Nanking, May 6th, 19th Year R. C. (1930)

Monsieur le Chargé d'Affaires,

I have the honour to acknowledge the receipt of your Note of to-day's date which reads as follows :—

"I have the honour to remind Your Excellency that in the course of our negotiations regarding the Customs Tariff question, it was stated that the Chinese Government entertained the intention of abolishing as soon as possible all such taxes and charges detrimental to the promotion of trade in China as likin, native customs duties, coast-trade duty and transit dues and other like charges.

"I shall be much obliged if Your Excellency will be good enough to inform

me as to what measures have been or will be adopted by the Chinese Government with a view to carrying into effect the aforesaid intention of the Chinese Government."

I have the pleasure to inform you that the Chinese Government is endeavouring to abolish as soon and as far as possible all such duties and charges as are mentioned in your Note under acknowledgement.

The Chinese Government has already issued a Mandate ordering the abolition of likin as from the 10th of October, 1930, and instructed the Minister of Finance to take all necessary measures for carrying this order into effect.

I avail myself of this opportunity to renew to you, Monsieur le Chargé d'Affaires, the assurance of my high consideration.

(Signed) Chengting T. Wang.

Mr. M. Shigemitsu, etc.

ANNEX IV

Nanking, May 6th, 5 Showa (1930).

Monsieur le Ministre,

I have the honour to state that in view of the large number and amount of the unsecured and inadequately secured obligations of China due to Japanese creditors, a speedy consolidation thereof is considered highly desirable. It is suggested by my Government that for that purpose a conference of the representatives of creditors should be called by the Chinese Government at the earliest possible date.

I shall be much obliged if Your Excellency will be good enough to inform me as to what measures have been or will be adopted by the Chinese Government for effectuating consolidation.

I avail myself of this opportunity to renew to Your Excellency the assurances of my highest consideration.

(Signed) M. Shigemitsu.

His Excellency
Dr. Chengting T. Wang, etc.

Nanking, May 6th, 19th Year R. C. (1930).

Monsieur le Chargé d'Affaires,

I have the honour to acknowledge the receipt of your Note of to-day's date which reads as follows:—

"I have the honour to state that in view of the large number and amount of the unsecured and inadequately secured obligations of China due to Japanese creditors, a speedy consolidation thereof is considered highly desirable, It is suggested by my Government that for that purpose a conference of the representatives of creditors should be called by the Chinese Government at the earliest possible date.

"I shall be much obliged if Your Excellency will be good enough to inform me as to what measures have been or will be adopted by the Chinese Government for effectuating the aforesaid consolidation."

I have the pleasure to inform you that the Chinese Government has already commenced to set aside annually the sum of $5,000,000 from the Customs revenues for the purpose of consolidating the domestic and foreign obligations of China and that it intends to call a conference of the representatives of creditors on or before October 1st of this year at which an adequate plan for consolidation will be presented and discussed with a view to devising means (including an increase of the sum above mentioned) for effectuating the consolidation in question.

I avail myself of this opportunity to renew to you, Monsieur le Chargé d'Affaires, the assurance of my high consideration.

(Signed) Chengting T. Wang.

Mr. M. Shigemitsu, etc.

TREATY OF COMMERCE AND NAVIGATION BETWEEN JAPAN AND THE UNITED STATES OF AMERICA

Signed at Washington, February 1911

ARTICLE I The subjects or citizens of each of the High Contracting Parties shall have liberty to enter, travel and reside in the territories of the other to carry on trade, wholesale and retail, to own or lease and occupy houses, manufactories, warehouses and shops, to employ agents of their choice, to lease land for residential and commercial purposes, and generally to do anything incident to or necessary for trade upon the same terms as native subjects or citizens, submitting themselves to

the laws and regulations there established.

They shall not be compelled, under any pretext whatever, to pay any charges or taxes other or higher than those that are or may be paid by native subjects or citizens.

The subjects or citizens of each of the High Contracting Parties shall receive, in the territories of the other, the most constant protection and security for their persons and property, and shall enjoy in this respect the same rights and privileges as are or may be granted to native subjects or citizens, on their submitting themselves to the conditions imposed upon the native subjects or citizens.

They shall, however, be exempt in the territories of the other from compulsory military service either on land or sea, in the regular forces, or in the national guard, or in the militia; from all contributions imposed in lieu of personal service, and from all forced loans or military exactions or contributions.

ARTICLE II The dwellings, warehouses, manufactories and shops of the subject or citizens of each of the High Contracting Parties in the territories of the other, and all premises appertaining thereto used for purposes of residence or commerce, shall be respected. It shall not be allowable to proceed to make a domiciliary visit to, or a search of, any such buildings and premises, or to examine or inspect books, papers or accounts, except under the conditions and with the forms prescribed by the laws, ordinances and regulations for nationals.

ARTICLE III Each of the High Contracting Parties may appoint Consuls-General, Consuls, Vice-Consuls, Deputy Consuls and Consular Agents in all ports, cities and places of the other, except in those where it may not be convenient to recognize such officers. This exception, however, shall not be made in regard to one of the Contracting Parties without being made likewise in regard to all other Powers.

Such Consuls General, Consuls, Vice Consuls, Deputy Consuls and Consular Agents having received exequaturs or other sufficient authorizations from the Government of the country to which they are appointed, shall, on condition of reciprocity, have the right to exercise the functions and to enjoy the exemptions and immunities which are or may hereafter be granted to the consular officers of the same rank of the most favoured nation. The Government issuing exequaturs or other authorizations may in its discretion cancel the same on communicating the reasons for which it thought proper to do so.

ARTICLE IV There shall be between the territories of the two High Contracting Parties reciprocal freedom of commerce and navigation. The subjects or citizens of each of the Contracting Parties, equally with the subjects or citizens of the most favored nation, shall have liberty freely to come with their ships and cargoes to all places, ports and rivers in the territories of the other which are or may be opened to foreign commerce, subject always to the laws of the country to which they thus come.

ARTICLE V The import duties on articles, the produce or manufacture of the territories of one of the High Contracting Parties, upon importation into the territories of the other, shall henceforth be regulated either by special arrangements between the two countries or by the internal legislation of each.

Neither Contracting Party shall impose any other or higher duties or charges on the exportation of any article to the territories of the other than are or may be payable on the exportation of the like article to any other foreign country.

Nor shall any prohibition be imposed by either country on the importation or exportation of any articles from or to the territories of the other which shall not equally extend to the like article imported from or exported or any other country. The last provision is not, however, applicable to prohibitions or restrictions maintained or imposed as sanitary measures or for purposes of protecting animals and useful plants.

ARTICLE VI The subjects or citizens of each of the High Contracting Parties shall enjoy in the territories of the other exemption from all transit duties and a perfect equality of treatment with native subjects or citizens in all that relates to warehousing, bounties, facilities and drawbacks.

ARTICLE VII Limited-liability and other companies and associations, commercial, industrial, and financial, already or hereafter to be organized in accordance with the laws of either High Contracting Party and domiciled in the territories of such Party, are authorized, in the territories of the other, to exercise their rights and appear in the courts either as plaintiffs or defendants, subject to the laws of such other Party.

The foregoing stipulation has no bearing upon the question whether a company or association organized in one of the two countries will or will not be permitted to transact its business or industry in the

other, this permission remaining always subject to the laws and regulation enacted or established in the respective countries or in any part thereof.

ARTICLE VIII All articles which are or may be legally imported into the ports of either High Contracting Party from foreign countries in national vessels may likewise be imported into those in vessels of the other Contracting Party, without being liable to any other or higher duties or charges of whatever denomination than if such articles were imported in national vessels. Such reciprocal equality of treatment shall take effect without distinction, whether such articles come directly from the place of origin or from any other foreign place.

In the same manner, there shall be perfect equality of treatment in regard to exportation, so that the same export duties shall be paid, and the same bounties and drawbacks allowed, in the territories of each of the Contracting Parties on the exportation of any article which is or may be legally exported therefrom, whether such exportation shall take place in Japanese vessels or in vessels of the United States, and whatever may be the place of destination, whether a port of the other Party or of any third Power.

ARTICLE IX In all that the stationing, loading and unloading of vessels in the ports of the territories of the High Contracting Parties, no privileges shall be granted by either Party to national vessels which are not equally, in like cases, granted to the vessels of the other country; the intention of the Contracting Parties being that in these respects the respective vessels shall be treated on the footing of perfect equality.

ARTICLE X Merchant vessels navigating under the flag of Japan or that of the United States and carrying the papers required by their national laws to prove their nationality shall in the United States and in Japan be deemed to be vessels of Japan or of the United States, respectively.

ARTICLE XI No duties of tonnage, harbour, pilotage, lighthouse, quarantine, or other similar or corresponding duties of whatever denomination, levied in the name or for the profit of Government, public functionaries, private individuals, corporations or establishments of any kind shall be imposed in the ports of the territories of either country upon the vessls of the other which shall not equally, under the same conditions, be imposed on national vessels in general, or on vessels of the most favoured nation. Such equality of treatment shall apply reciprocally to the respective vessels from whatever place they may arrive and whatever may be their place of destination.

ARTICLE XII Vessels charged with performance of regular scheduled postal service of one of the High Contracting Parties, whether belonging to the State or subsidized by it for the purpose, shall enjoy, in the ports of the territories of the other, the same facilities, privileges and immunities as are granted to like vessels of the most favoured nation.

ARTICLE XIII The coasting trade of the High Contracting Parties is excepted from the provisions of the present Treaty and shall be regulated according to the laws of Japan and the United States, respectively. It is however, understood that the subjects or citizens of either Contracting Party shall enjoy in this respect most-favoured-nation treatment in the territories of the other.

A vessel of one of the Contracting Parties, laden in a foreign country with cargo destined for two or more ports of entry in the territories of the other, may discharge a portion of her cargo at one of the said ports, and, continuing her voyage to the other port or ports of destination, there discharge the remainder of her cargo, subject always to the laws, tariffs and customs regulations of the country of destination; and, in like manner and under the same reservation, the vessels of one of the Contracting Parties shall be permitted to load at several ports of the other for the same outward voyages.

ARTICLE XIV Except as otherwise expressly provided in this Treaty, the High Contracting Parties agree that, in all that concerns commerce and navigation, any privilege, favour or immunity which either Contracting Party has actually granted, or may hereafter grant, to the subjects or citizens of any other States shall be extended to the subjects or citizens of the other Contracting Party gratuitously, if the concession in favour of that other State shall have been gratuitous, and on the same or equivalent conditions, if the concession shall have been conditional.

ARTICLE XV The subjects or citizens of each of the High Contracting Parties shall enjoy in the territories of the other the same protection as native subjects or citizens in regard to patents, trade-marks and designs, upon fulfillment of the formalities prescribed by law.

ARTICLE XVI The present Treaty shall, from the date on which it enters into operation, supersede the Treaty of Commerce and Navigation dated the 22nd day

of November, 1894; and from the same date the last-named Treaty shall cease to be binding.

ARTICLE XVII The present Treaty shall enter into operation on the 17th of July, 1911, and shall remain in force twelve years or until the expiration of six months from the date on which either of the Contracting Parties shall have given notice to the other of its intention to terminate the Treaty.

In case neither of the Contracting Parties shall have given notice to the other six months before the expiration of the said period of twelve years of its intention to terminate the Treaty, it shall continue operative until the expiration of six months from the date on which either Party shall have given such notice,

TREATY OF COMMERCE AND NAVIGATION BETWEEN JAPAN AND GREAT BRITAIN

Signed at London, April 3, 1911

ARTICLE I The Subjects of each of the High Contracting Parties shal have full liberty to enter, travel, and reside in the territories of the other, and, conforming themselves to the laws of the country—

1. Shall, in all that relates to travel and residence, be placed in all respects on the same footing as native subjects.

2. They shall have the right, equally with native subjects, to carry on their commerce and manufacture, and to trade in all kinds of merchandise of lawful commerce, either in person or by agents, singly or in partnerships with foreign or native subjects.

3. They shall in all that relates to the pursuit of their industries, callings, professions, and educational studies be placed in all respects on the same footing as the subjects or citizens of the most favoured nation.

4. They shall be permitted to own or hire and occupy houses, manufactories, warehouses, shops, and premises which may be necessary for them, and to lease land for residential, commercial, industrial, and other lawful purposes, in the same manner as native subjects.

5. They shall, on condition of reciprocity, be at full liberty to acquire and possess every description of property, movable or immovable, which the laws of the country permit or shall permit the subjects or citizens of any other foreign country to acquire and possess, subject always to the conditions and limitations prescribed in such laws. They may dispose of the same by sale, exchange, gift, marriage, testaments, or in any other manner, under the same conditions which are or shall be established with regard to native subjects. They shall also be permitted, on compliance with the laws of the country, freely to export the proceeds of the sale of their property and their goods in general without being subjected as foreigners to other or higher duties than those to which subjects of the country would be liable under similar circumstances.

6. They shall enjoy constant and complete protection and security for their persons and property, shall have free and easy access to the Courts of Justice and other tribunals in pursuit and defence of their claims and rights; and shall have full liberty, equally with native subjects, to choose and employ lawyers and advocates to represent them before such Courts and tribunals; and generally shall have the same rights and privileges as native subjects in all that concerns the administration of justice.

7. They shall not be compelled to pay taxes, fees, charges, or contributions of any kind whatever, other or higher than those which are or may be paid by native subjects or the citizens of the most favoured nation.

8. And they shall enjoy a perfect equality of treatment with native subject in all that relates to facilities for warehousing under bond, bounties, and drawbacks.

ARTICLE II The subjects of each of the High Contracting Parties in the territories of the other shall be exempted from all compulsory military services, whether in the army, navy, national guard, or militia; and from all forced loans and military requisitions or contributions unless imposed on them equally with native subjects as owners, lessees, or occupiers of immovable property.

In the above respects the subjects of each of the High Contracting Parties shall not be accorded in the territories of the other less favourable treatment than that which is or may be accorded to subjects or

citizens of the most favoured nation.

ARTICLE III The dwellings, ware-houses, manufactories, and shops of the subjects of each of the High Contracting Parties in the territories of the other, and all premises appertaining thereto used for lawful purposes, shall be respected. It shall not be allowable to proceed to make a domiciliary visit to, or a search of, any such buildings and premises, or to examine or inspect books, papers, or accounts, except under the conditions and with the forms presented by the laws for native subjects.

ARTICLE IV Each of the High Contracting Parties may appoint Consuls-General, Consuls, Vice-Consuls, and Consular Agents in all the ports, cities, and places of the other, except in those where it may not be convenient to recognize such officers. This exception, however, shall not be made in regard one of the High Contracting Parties without being made likewise in regard to all other Powers.

Such Consuls-General, Consuls, Vice-Consuls, and Consular Agents, having received exequaturs or other sufficient authorizations from the Government of the country to which they are appointed, shall have the right to exercise their functions, and to enjoy the privileges, exemptions, and immunities which are or may be granted to the Consular officers of the most favoured nation. The Government issuing exequaturs or other authorizations has the right in its discretion to cancel the same on explaining the reasons for which it thought proper to do so.

ARTICLE V In case of the death of a subject of one of the High Contracting Parties in the territories of the other, without leaving at the place of his decease any person entitled by the laws of his country to take charge of and administer the estate, the competent Consular officer of the State to which the deceased belonged shall, upon fulfilment of the necessary formalities, be empowered to take custody of and administer the estate in the manner and under the limitations prescribed by the law of the country in which the property of the deceased is situated.

The foregoing provision shall also apply in case of a subject of one of the High Contracting Parties dying outside the territories of the other, but possessing property therein, without leaving any person there entitled to take charge of and administer the estate.

It is understood that in all that concerns the administration of the estates of deceased persons, any right, privilege, favour, or immunity which either of the High Contracting Parties has actually granted, or may hereafter grant, to the Consular officers of any other foreign State shall be extended immediately and unconditionally to the Consular officers of the other High Contracting Party.

ARTICLE VI There shall be between the territories of the two High Contracting Parties reciprocal freedom of commerce and navigation. The subjects of each of the High Contracting Parties shall have liberty freely to come with their ships and cargoes to all places, ports, and rivers in the territories of the other, which are or may be opened to foreign commerce, and conforming themselves to the laws of the country to which they thus come, shall enjoy the same rights, privileges, liberties, favours, immunities, and exemptions in matters of commerce and navigation as are or may be enjoyed by native subjects.

ARTICLE VII Articles, the produce or manufacture of the territories of one High Contracting Party, upon importation into the territories of the other, from whatever place arriving, shall enjoy the lowest rates of customs duty applicable to similar articles of any other foreign origin.

No prohibition or restriction shall be maintained or imposed on the importation of any article, the produce or manufacture of the territories of either of the High Contracting Parties, into the territories of the other, from whatever place arriving, which shall not equally extend to the importation of the like articles, being the produce or manufacture of any other foreign country. This provision is not applicable to the sanitary or other prohibitions occasioned by the necessity of securing the safety of persons, or of cattle, or of plants useful to agriculture.

ARTICLE VIII The articles, the produce or manufacture of the United Kingdom, enumerated in Part 1 of the Schedule annexed to this Treaty, shall not, on importation into Japan, be subjected to higher customs duties than those syecified in the Schedule.

The articles, the produce or manufacture of Japan, enumerated in Part 2 of the Schedule annexed to this Treaty, shall be free of duty on importation into the United Kingdom.

Provided that if at any time after the expiration of one year from the date this Treaty takes effect either of the High Contracting Parties desires to make a modification in the Schedule it may notify its desire to the other High Contracting Party,

and thereupon negotiations for the purpose shall be entered into forthwith. If the negotiations are not brought to a satisfactory conclusion within six months from the date of notification, the High Contracting Party which gave the notification may, within one month, give six months' notice to abrogate the present Article, and on the expiration of such notice the present Article shall cease to have effect, without prejudice to the other stipulations of this Treaty.

ARTICLE IX Articles, the produce or manufacture of the territories of one of the High Contracting Parties, exported to the territories of the other, shall not be subjected on export to other or higher charges than those paid on the like articles exported to any other foreign country. Nor shall any prohibition or restriction be imposed on the exportation of any article from the territories of either of the two High Contracting Parties to the territories of the other which shall not equally extend to the exportation of the like article to any other foreign country.

ARTICLE X Articles, the produce or manufacture of the territories of one of the High Contracting Parties, passing in transit through the territories of the other, in conformity with the laws of the country, shall be reciprocally free from all transit duties, whether they pass direct, or whether during transit they are unloaded, warehoused, and reloaded.

ARTICLE XI No internal duties levied for the benefit of the State, local authorities, or corporations which affect, or may affect, the production, manufacture, or consumption of any article in the territories of the High Contracting Parties shall for any reason be a higher or more burdensome charge on articles, the produce or manufacture of the territories of the other, than on similar articles of native origin.

The produce or manufacture of the territories of either of the High Contracting Parities imported into the territories of the other, and intended for warehousing or transit, shall not be subjected to any internal duty.

ARTICLE XII Merchants and manufacturers, subjects of one of the High Contracting Parties, as well as merchants and manufacturers domiciled and exercising their commerce and industries in the territories of such party, may, in the territories of the other, either personally or by means of commercial travellers, make purchases or collect orders, with or without samples, and such merchants, manufacturers, and their commercial travellers, while so making purchases and collecting orders, shall, in the matter of taxation and facilities, enjoy the most-favoured-nation treatment.

Articles imported as samples for the purpose above mentioned shall, in each country, be temporarily admitted free of duty on compliance with the Customs regulations and formalities established to assure their re-exportation or the payment of the prescribed customs duties if not re-exported within the period allowed by law. But the foregoing privilege shall not extend to articles which, owing to their quantity or value, cannot be considered as samples, or which owing to their nature, could not be identified upon re-exportation. The determination of the question of the qualification of samples for duty-free admission rests in all cases exclusively with the competent authorities of the place where the importation is effected.

ARTICLE XIII The marks, stamps, or seals placed upon the samples mentioned in the preceding Article by the Customs authorities of one country at the time of exportation, and the officially attested list of such samples containing a full description thereof issued by them, shall be reciprocally accepted by the Customs officials of the other as establishing their character so far as may be necessary to establish that the samples produced are those enumerated in the list. The Customs authorities of either country may, however, affix a supplementary mark to such samples in special cases where they may think this precaution necessary.

ARTICLE XIV The Chambers of Commerce, as well as such other Trade Associations and other recognized Commercial Associations in the territories of Contracting Parties as may be authorized in this behalf, shall be mutually accepted as competent authorities for issuing any certificates that may be required for commercial travellers.

ARTICLE XV Limited liability and other companies and associations, commercial, industrial, and financial, already or hereafter to be organized in accordance with the laws of either High Contracting Party, and registered in the territories of such Party, are authorized, in the territories of the other, to exercise their rights and appear in the Courts either as plaintiffs or defendants, subject to the laws of such other Party.

ARTICLE XVI Each of the High Contracting Parties shall permit the importation or exportation of all merchandise which may be legally import edor exported, and also the carriage of passengers

from or to their respective territories, upon the vessels of the other; and such vessels, their cargoes and passengers shall enjoy the same privileges as, and shall not be subjected to any other or higher duties or charges than, national vessels and their cargoes and passengers.

ARTICLE XVII In all that regards the stationing, loading, and unloading of vessels in the ports, docks, roadsteads, and harbours of the High Contracting Parties, no privileges or facilities shall be granted by either Party to national vessels which are not equally, in like cases, granted to the vessels of the other country; the intention of the High Contracting Parties being that in these respects also the vessels of the two countries shall be treated on the footing of perfect equality.

ARTICLE XVIII All vessels which according to Japanese law are to be deemed Japanese vessels, and all vessels which according to British law are to be deemed British vessels, shall, for the purpose of this Treaty, be deemed Japanese and British vessels respectively.

ARTICLE XIX No duties of tonnage, harbour, pilotage, lighthouse, quarantine, or other analogous duties or charges of whatever nature, or under whatever denomination, levied in the name or for the profit of Government, public functionaries, private individuals, corporations, or establishments of any kind, shall be imposed in the ports of either country upon the vessels of the other which shall not equally, under the same conditions, be imposed in like cases on national vessels in general, or vessels of the most favoured nation. Such equality of treatment shall apply to the vessels of either country from whatever place they may arrive and whatever may be their destiantion.

ARTICLE XX Vessels charged with performance of regular scheduled postal service of one of the High Contracting Parties shall enjoy in the territorial waters of the other the same special facilities, privileges, and immunities as are granted to like vessels of the most favoured nation.

ARTICLE XXI The coasting trade of the High Contracting Parties is excepted from the provisions of the present Treaty, and shall be regulated according to the laws of Japan and the United Kingdom respectively. It is, however, understood that the subjects and vessels of either High Contracting Party shall enjoy in this respect most-favourd-nation treatment in the territories of the other.

Japanese and British vessels may, nevertheless, proceed from one port to another, either for the purpose of landing the whole or part of their passengers or cargoes brought from abroad, or of taking on board the whole or part of their passengers or cargoes for a foreign destination.

It is also understood that, in the event of the coasting trade of either country being exclusively reserved to national vessels, the vessels of the other country, if engaged in trade to or from places not within the limits of the coasting trade so reserved, shall not be prohibited from the carriage between two ports of the former country of passengers holding through tickets, or merchandise consigned on through bills of lading to or from places not within the above-mentioned limits, and while engaged in such carriage these vessels and their cargoes shall enjoy the full privileges of this Treaty.

ARTICLE XXII If any seaman should desert from any ship belonging to either of the High Contracting Parties in the territorial waters of the other, the local authorities shall, within the limits of law, be bound to give every assistance in their power for the recovery of such deserter, on application to that effect being made to them by the competent Consular officer of the country to which the ship of the deserter may belong, accompanied by an assurance that all expenses connected therewith will be repaid.

It is understood that this stipulation shall not apply to the subjects of the country where the desertion takes place.

ARTICLE XXIII Any vessel of either of the High Contracting Parties which may be compelled, by stress of weather or by accident, to take shelter in a port of the other shall be at liberty to refit therein, to procure all necessary stores, and to put to sea again, without paying any dues other than such as would be payable in the like case by a national vessel. In case, however, the master of a merchant-vessel should be under the necessity of disposing of a part of his merchandise in order to defray the expenses, he shall be bound to conform to the Regulations and Tariffs of the place to which he may have come.

If any vessel of one of the High Contracting Parties should run aground or be wrecked upon the coasts of the other, such vessel, and all parts thereof, and all furniture and appurtenances belonging thereunto, and all goods and merchandise saved therefrom, including any which may have been cast into the sea, or the proceeds thereof, if sold, as well as all papers found on board such stranded or wrecked vessel, shall be given up to the owners or their agents when claimed by them. If there are no such owners or agents on the spot, then

the same shall be delivered to the Japanese or British Consular officer in whose district the wreck or stranding may have taken place upon being claimed by him within the period fixed by the laws of the country, and such Consular officer, owners or agents shall pay only the expenses incurred in the preservation of the property together with the salvage or other expenses which would have been payable in the like case of a wreck or stranding of a national vessel.

The High Contracting Parties agree, moreover, that merchandise saved shall not be subjected to the payment of any customs duty unless cleared for internal consumption.

In the case either of a vessel being driven in by stress of weather, run aground, or wrecked, the respective Consular officers shall, if the owner or master or other agent of the owner is not present, or is present and requires it, be authorized to interpose in order to afford the necessary assistance to their fellow-country-men.

ARTICLE XXIV The High Contracting Parties agree that, in all that concerns commerce, navigation, and industry, any favour, privilege, or immunity which either High Contracting Party has actually granted, or may hereafter grant, to the ships, subjects, or citizens of any other foreign State shall be extended immediately and unconditionally to the ships or subjects of the other High Contracting Party, it being their intention that the commerce, navigation, and industry of each country shall be placed in all respects on the footing of the most favoured nation.

ARTICLE XXV The stipulations of this Treaty do not apply to tariff concessions granted by either of the High Contracting Parties to contiguous States solely to facilitate frontier traffic within a limited zone on each side of the frontier, or to the treatment accorded to the produce of the national fisheries of the High Contracting Parties, or to special tariff favours granted by Japan in regard to fish and other aquatic products taken in the foreign waters in the vicinity of Japan.

ARTICLE XXVI The stipulations of the present Treaty shall not be applicable to any of His Britannic Majesty's Dominions, Colonies, Possessions, or Protectorates, beyond the Seas, unless notice of adhesion shall have been given on behalf of any such Dominion, Colony, Possession, or Protectrate by His Britannic Majesty's Representative at Tokio before the expiration of two years from the date of the exchange of the ratification of the present Treaty.

ARTICLE XXVII The present Treaty shall be ratified, and the ratifications exchanged at Tokio as soon as possible. It shall enter into operation on the 17th July, 1911, and remain in force until the 16th July, 1923. In case neither of the High Contracting Parties shall have given notice to the other twelve months before the expiration of the said period, of its intention to terminate the Treaty, it shall continue operative until the expiration of one year from the date on which either of the High Contracting Parties shall have denounced it.

As regards the British Dominions, Colonies, Possessions, and Protectorates to which the present Treaty may have been made applicable in virtue of Article 26, however, either of the High Contracting Parties shall have the right to terminate it separately at any time on given twelve months' notice to that effect. It is understood that the stipulations of the present and of the preceding Article referring to British Dominions, Colonies, Possessions, and Protectorates apply also to the island of Cyprus.

TRAITÉ DE PAIX ENTRE LE JAPON ET LA RUSSIE

Signé á Portsmouth, en français et anglais, le 5 septembre, 1905 (38éme année de Meiji)

ARTICLE I

Il y aura à l'avenir paix et amitié entre Leurs Majestés l'Empereur du Japon et l'Empereur de toutes les Russies, ainsi qu'entre Leurs Etats et sujets respectifs.

ARTICLE II

Le Gouvernement Impérial de Russie, reconnaissant que le Japon possède en Corée des intérêts prédominants politiques, militaires et économiques, s'engage à ne point intervenir ni mettre d'obstacles aux mesures de direction, de protection et de controle que le Gouvernement Impérial du Japon pourrait considérer nécessaire de prendre en Corée.

Il est entendu que les subjects russes en Corée seront traités exactement de la même manière que les ressortissants des autres pays étrangers, à savoir qu'ils

seront placés sur le même pied que les ressortissants de la nation la plus favorisée.

Il est de même convenu que pour éviter toute cause de malentendu, les deux Hautes Parties Contractantes s'abstiendront, sur la frontière russocoréenne, de prendre toute mesure militaire qui pourrait menacer la sécurité du territoire russe ou coréen.

ARTICLE III

Le Japon et la Russie s'engagent mutuellement:

1. A évacuer complètement et simultanément la Manchourie à l'exception du territoire sur lequel s'étend le bail de la presqu'île de Liaotung, conformément aux disposition de Liaotung, conformément aux dispositions de l'Article additionnel 1 annexé à ce Traité; et

2. A restituer entièrement et complètement à l'administration exclusive de la Chine toutes les parties de la Manchourie qui sont occupées maintenant par les troupes japonaises ou russes ou qui sont sous leur controle, à l'exception du territoire susmentionné.

Le Governement Impérial de Russie déclare qu'il n'a point en Manchourie d'avantages territoriaux ou concessions préférentielles ou exclusives de nature à porter atteinte à la souveraineté de la Chine ou incompatibles avec le principe d'opportunité égale.

ARTICLE IV

Le Japon et la Russie s'engagent réciproquement à ne mettre aucun obstacle aux mesures générales qui s'appliquent également à toutes les nations et que la Chine pourrait prendre pour le développement du commerce et de l'industrie en Manchourie.

ARTICLE V

Le Gouvernement Impérial de Russie cède au Gouvernement Impérial du Japon avec le consentement du Gouvernement de Chine, le bail de Port Arthur, de Talien et des territoires et eaux territoriales adjacents, ainsi que tous les droits, privilèges et concessions se rattachant à ce bail ou en faisant partie, et il cède de même, au Gouvernement Impérial du Japon, tous les travaux et propriétés publics dans le territoire sur lequel s'étend le bail susmentionné.

Les deux Hautes Parties Contractantes s'engagent mutuellement à obtenir du Gouvernement de Chine le consentement mentionné dans la stipulation ci-dessus.

Le Gouvernement Impérial du Japon donne, de sa part, l'assurance que les droits de propriété des sujets russes dans le territoire susmentionné seront parfaitement respectés.

ARTICLE VI

Le Gouvernement Impérial de Russie s'engage à céder au Gouvernement Impérial du Japon, sans compensation, avec le consentement du Gouvernement de Chine, le chemin de fer entre Tchan-Tchoun (Kouan-Tchen-Tsy) et Port Arthur et tous ses embranchements avec tous les droits, privilèges et propriétés y appartenant dans cette région, ainsi que toutes les mines de charbon dans ladite région, appartenant à ce chemin de fer ou en exploitation pour son profit.

Les deux Hautes Parties Contractantes s'engagent mutuellement à obtenir du Gouvernement de Chine le consentement mentionné dans la stipulation ci-dessus.

ARTICLE VII

Le Japon et la Russie s'engagent à exploiter leurs chemins de fer respectifs en Manchourie exclusivement dans un but commercial et industrial, mais nullement dans un but stratégique.

Il est entendu que cette restriction ne s'applique pas aux chemins de fer dans le territoire sur lequel s'étend le bail de la presqu'île de Liaotung.

ARTICLE VIII

Les Gouvernments Impériaux du Japon et de Russie, en vue de favoriser et de faciliter les relations et le traffic, concluront, aussitot que possible, une convention séparée pour le règlement de leurs services de raccordement de chemins de fer en Manchourie.

ARTICLE VIX

Le Gouvernement Impérial de Russie céde au Gouvernement Impérial du Japon en perpétuité et en pleine souveraineté la partie sud de l'île de Sahnaline et toutes les îles qui y sont adjacentes, ainsi que tous les travaux et propriétés publics qui s'y trouvent. Le cinquantième parallèle de latitude nord est adopté comme la limite du territoire cédé. La ligne frontière exacte de ce territoire sera détérminée conformément aux dispositions de l'Article additionnel 2 annexé à ce Traité.

Le Japon et la Russie conviennent mutuellement de ne construire dans leurs possessions respectives sur l'île de Sakhaline et sur les îles qui y sont adjacentes aucune fortification ni travaux militaires semblables. De même, ils s'engagent respectivement à ne prendre aucune mesure militaire qui pourrait entraver la libre navigation des Détroits de La Pérpose et de Tartarie.

ARTICLE X

Il est réservé aux sujets russes habitants du territoire cédé au Japon de vendre leurs propriétés immobilières et de se retirer dans leur pays; mais, s'ils, préfèrent rester dans le territoire cédé, ils seront maintenus et protégés dans le plein exercice de leurs industries et droits de propriété à la condition de se soumettre aux lois et à la jurisdiction japonaises. Le Japon aura la pleine liberté de retirer le droit de résidence dans ce territoire à tous les habitants se trouvant dans l'incapacité politique ou administrative, ou de les déporter de ce territoire. Il s'engage toutefois à ce que les droits de propriété de ces habitants soient pleinement respectés.

ARTICLE XI

La Russie s'engage à s'entendre avec le Japon pour concéder aux sujets japonais des droits de pêche le long des cotes des possessions russes dans les Mers du Japon, d'Okhotsk et de Behring.

Il est convenu que l'engagement susmentionné ne portera pas atteinte aux droits déjà appartenant aux sujets russes ou étrangers dans ces régions.

ARTICLE XII

Le Traité de Commerce et de Navigation entre le Japon et la Russie ayant été annulé par la guerre, les Gouvernements Impériaux du Japon et de Russie s'engagent à adopter comme base de leurs relation commercials, jusqu'à la conclusion d'un nouveau traité de commerce et de navigation sur la base du Traité qui était en vigueur antérieurement à la guerre actuelle, le système du traitement réciproque sur le pied de la nation la plus favorisée, y compris les tarifs d'importation, et d'exportation, les formalités de douane, les droits de transit et de tonnage et l'addmission et le traitement des agents, des sujets et des vaissaux d'un pays dans le territoire de l'autre.

ARTICLE XIII

Aussitôt que possible après la mise en vigueur du présent Traité, tous les prisonniers de guerre seront réciproquement restitués. Les Gouvernements Impériaux du Japon et de Russie nommeront, chacun de son coté, un Commissaire spécial qui se chargera des prisonniers. Tous les prisonniers se trouvant entre les mains de l'un des Gouvernements seront remis au Commissaire de l'autre Gouvernement, ou à son représentant dûment autorisé, qui les recevra en tel nombre et dans tels ports convenable de l'État remettant que ce dernier aurait notifié d'avance au Commissaire de l'État recevant.

Les Gouvernements du Japon et de Russie présenteront l'un à l'autre, le plus tôt possible après que la remise des prisonniers aura été achevée, un compte documenté des dépenses directes faites respectivement par eux pour le soin et l'entretien des prisonniers depuis la date de la capture ou de la reddition jusqu'à celle de la mort ou de la remise. La Russie s'engage à rembourser au Japon, aussitôt que possible après L'échange de ces comptes comme il est stipulé ci-dessus, la différence entre le montant réel ainsi dépensé par le Japon et le montant réel également déboursé, par la Russie.

THE CONVENTION EMBODYING BASIC RULES OF THE RELATIONS BETWEEN JAPAN AND THE UNION OF SOVIET SOCIALIST REPUBLICS

Signed at Peking, January 20, 1925

ARTICLE I The High Contracting Parties agree that with the coming into force of the present Convention, diplomatic and consular relations shall be established between them.

ARTICLE II The Union of Soviet Socialist Republics agrees that the Treaty of September 5th, 1905, shall remain in full force.

It is agreed that the Treaties, Conven-

tions and Agreements, other than the said Treaty of Portsmouth, which were concluded between Japan and Russia prior to November 7, 1917, shall be re-examined at a Conference to be subsequently held between the Governments of the High Contracting Parties and are liable to revision or annulment as altered circumstances may require.

ARTICLE III The Governments of the High Contracting Parties agree that upon the coming into force of the present Convention, they shall proceed to the revision of the Fishery Convention of 1907, taking into considration such changes as may have taken place in the general conditions since the conclusion of the said Fishery Convention.

Pending the conclusion of a convention so revised, the Government of the Union of Soviet Socialist Republics shall maintain the practices established in 1924 relating to the lease of fishery lots to Japanese subjects.

ARTICLE IV The Governments of the High Contracting Parties agree that upon the coming into force of the present Convention, they shall proceed to the conclusion of a treaty of commerce and navigation in conformity with the principles hereunder mentioned, and that pending the conclusion of such a treaty, the general intercourse between the two countries shall be regulated by those principles.

(1) The subjects or citizens of each of the High Contracting Parties shall in accordance with the laws of the country: a / have liberty to enter, travel and reside in the territories of the other, and b / enjoy constant and complete protection for the safety of their lives and property.

(2) Each of the High Contracting Parties shall in accordance with the laws of the country accord in its territories to the subjects or citizens of the other, to the widest possible extent and on condition of reciprocity, the right of private ownership and the liberty to engage in commerce, navigation, industries, and other peaceful pursuits.

(3) Without prejudice to the right of each Contracting Party to regulate by its own laws the system of international trade in that country, it is understood that neither Contracting Party shall apply in discrimination against the other Party any measures of prohibition, restriction or impost which may serve to hamper the growth of the intercourse, economic or otherwise, between the two countries, it being the intention of both Parties to place the commerce, navigation and industry of each country, as far as possible, on the footing of the most favoured nation.

The Governments of the High Contracting Parties further agree that they shall enter into negotiations, from time to time as circumstances may require, for the conclusion of special arrangements relative to commerce and navigation to adjust ond to promote economic relations between the two countries.

ARTICLE V The High Contracting Parties solemnly affirm their desire and intention to live in peace and amity with each other, scrupulously to respect the undoubted right of a State to order its own life within its own jurisdiction in its own way, to refrain and restrain all persons in any governmental service for them, and all organizations in receipt of any financial assistance from them, from any act overt or covert liable in any way whatever to endanger the order and security in any part of the territories of Japan or the Union of Soviet Socialist Republics.

It is further agreed that neither Contracting Party shall permit the presence in the territories under its jurisdiction— (a) of organizations or groups pretending to be the Government for any part of the territories of the other Party, or (b) of alien subjects or citizens who may be found to be actually carrying on political activities for such organizations or groups.

ARTICLE VI In the interest of promoting economic relations between the two countries, and taking into consideration the needs of Japan with regard to natural resources, the Government of the Union of Soviet Socialist Republics is willing to grant to Japanese subjects, companies and associations concessions for the exploitation of minerals, forest and other natural resources in all the territories of the Union of Soviet Socialist Republics.

ARTICLE VII The present Convention shall be ratified.

Such ratification by each of the High Contracting Parties shall, with as little delay as possible, be communicated. through its diplomatic representative at Peking, to the Government of the other Party, and from the date of the letter of such communications this Convention shall come into full force.

CONVENTION DE COMMERCE ET DE NAVIGATION ENTRE LE JAPON ET LA FRANCE

Signé à Paris, le 19 août, 1911

ARTICLE PREMIER

Les ressortissants de chacune des Hautes Parties Contractantes auront pleine liberté, avec leurs familles, d'entrer et de séjourner dans toute l'étendue des territoires de l'autre. Sous la condition de se conformer aux lois du pays, ils jouiront des droits ci-après spécifiés:

1 Ils seront, en ce qui concerne le voyage et la résidence, traités sous tous rapports comme les nationaux;

2 Ils auront, comme les nationaux, le droit de se livrer au commerce ou à l'industrie manufacturière et de faire le trafic de tous articles de commerce licite, soit en personne, soit par des représentants, soit seuls, soit en association avec des étrangers ou des nationaux;

3 Ils seront, en ce qui concerne l'exercice de leur industrie, métier ou profession, la poursuite de leurs études ou investigations scientifiques, traités à tous égards, comme les ressortissants de la nation la plus favorisée;

4 Ils pourront posséder ou louer et occuper les maisons, les manufactures, les magasins, les boutiques et les locaux qui peuvent leur être nécessaires et prendre à bail des terrains l'effet d'y résider ou de les utiliser dans un but licite commercial, industriel, manufacturier ou autre;

5 Ils pourront, sous la condition de la réciprocité, librement acquérir et posséder toute espèce de propriété mobilière ou immobilière, que la loi du pays permet ou permettra d'acquérir ou de posséder aux ressortissants de tout autre pays étranger. Ils pourront en disposer par voie de vente, échange, donation, mariage, testament, ou de toute autre manière sous les mêmes conditions qui sont ou seront établies à l'égard des nationaux eux-mêmes. Ils pourront aussi exporter librement le produit des ventes de leurs propriétés et tout ce qui leur appartient en général, sans pouvoir être soumis en tant qu'étrangers, à des droits autres ou plus élevés que ceux auxquels seraient soumis les nationaux dans les mêmes circonstances;

6 Ils jouiront d'une protection et sécurité constantes et complètes, pour leurs personnes et leurs propriétés; ils auront un accès libre et facile auprès des cours et tribunaux de justice pour la poursuite et la défense de leurs droits, et ils seront, en outre, comme les nationaux eux-mêmes, libres de choisir et d'employer des avocats, avoués et autres hommes de loi pour les représenter devant les cours et tribunaux, et d'une manière générale ils auront les mêmes droits et privilèges que les nationaux pour tout ce qui concerne l'administration de la justice;

7 Ils seront exempts de tout service militaire obligatoire, soit dans l'armée de terre ou de mer, soit dans la garde nationale ou la milice, ainsi que de toutes les contributions imposées en lieu et place du service personnel. Ils seront exempts également de tous emprunts forcée et de toutes réquisitions ou contributions militaires, sauf ceux qui leur seront imposés, comme aux nationaux eux-mêmes, en leur qualité de possesseurs, locataires ou occupants de biens immeubles. Pour ce qui précède, les ressortissants de chacune des Hautes Parties Contractantes ne seront pas traités sur les territoires de l'autre moins bien que ne le sont ou ne le seront les ressortissants de la nation la plus favorisée;

8 Ils ne seront contraints à subir des charges ou à payer des impôts, taxes ou contributions, de quelque nature que ce soit, autres ou plus élevés que ceux qui sont ou pourront être imposés aux nationaux ou ressortissants de la nation la plus favorisée.

ARTICLE II

Les habitations, magasins, manufactures et boutiques des ressortissants de chacune des Hautes Parties Contractantes dans les territoires de l'autre, ainsi que tous les locaux qui en dépendent, employés pour des buts licites, seront respectés. Il ne sera point permis d'y procéder à des visites domiciliaires ou perquisitions, non plus que d'examiner ou d'inspecter les livres, papiers ou comptes, sauf dans les conditions et formes prescrites par les lois à l'égard des nationaux eux-mêmes.

ARTICLE III

Les ressortissants des Parties Contractantes jouiront de la liberté réciproque de commerce, et de navigation; ils auront, de la même facon que les ressortissants de la

nation la plus favorisée, plein liberté de se rendre avec leurs navires et leurs cargaisons dans les lieux, ports et rivières des territoires de l'autre, qui sont ou pourront être ouverts au commerce extérieur; ils bénéficieront, en se conformant toujours aux lois du pays où ils arrivent, des mêmes droits, faveurs, libertés, immunités et exemptions en matière de commerce et de navigation, dont bénéficient ou bénéficieraient les nationaux eux-mêmes.

ARTICLE IV

Les sociétés anonymes ou autres et les associations commerciales, industrielles et financières qui sont ou seront constituées conformément aux lois de l'une des Parties Contractantes et qui ont leur domicile dans les territoires de cette Partie, sont autorisées, dans les territoires de l'autre, en se conformant aux lois de celle-ci, à exercer leurs droits et à ester en justice devant les tribunaux, soit pour intenter une action, soit pour y défendre.

ARTICLE V

Les droits de douane perçus à l'entrée au Japon et en France sur les produits de l'autre pays ne pourront être autres ou plus élevés que ceux imposés aux produits similaires originaires du pays le plus favorisé.

Les droits perçus à la sortie du Japon et de France sur les produits destinés à l'autre pays ne pourront également être autres ou plus élevés que ceux imposés aux mêmes produits destinés au pays le plus favorisé.

ARTICLE VI

Les Parties Contractantes s'engagent à n'entraver nullement le commerce réciproque des deux pays par des prohibitions ou restrictions à l'importation, à l'exportation ou au transit.

Des exceptions à cette règle, en tant qu'elles seront applicables à tous les pays ou aux pays se trouvant dans les mêmes conditions, ne pourront avoir lieu que dans les cas suivants:

1 Pour les approvisionnements et munitions de guerre, dans des circonstances extraordinaires;

2 Pour des raisons de sûreté publique;

3 Par égard à la police sanitaire ou en vue de la protection des animaux ou des plantes utiles contre les maladies ou les insectes et parasites nuisibles;

4 En vue de l'application aux marchandises étrangères des prohibitions ou restrictions édictées par des lois intérieure des marchandises similaires ou de la vente ou du transport à l'intérieur des marchandises similaires de la production nationale;

5 Pour les marchandises qui sont ou seront l'objet d'un monopole d'Etat.

ARTICLE VII

Les marchandises de toute nature originaires du territoire de l'une des deux Parties Contractantes et importées sur le territoire de l'autre Partie ne pourront être assujetties à des droits d'accise, d'octroi ou de consommation perçus pour le compte de l'Etat, des communes ou corporations, supérieurs à ceux qui grèvent ou grèveraient les produits similaires de la production nationale ou, à défaut de ces produits, ceux de la nation la plus favorisée.

Les produits du sol et de l'industrie de l'un des deux pays importés dans le territoires de l'autre, et destinés à l'entreposage ou au transit, ne seront soumis à aucun droit intérieur.

ARTICLE VIII

Les importateurs de marchandises japonaises ou françaises seront réciproquement dispensés de l'obligation de produire des certificats d'origine.

Toutefois, dans le cas où un pays tiers ne serait pas lié avec l'une ou l'autre des Parties Contractantes par la clause de la nation la plus favorisée, la production de certificats d'origine pourra être exceptionnellement exigée.

Dans ce cas, les certificats seront délivrés dans les lieux d'expédition, sièges d'un consulat, par le consul de carrière du pays dans lequel l'importation doit être faite, et, dans les autres lieux, par l'autorité douanière, et, à défaut de cette autorité, par les Chambres de commerce ou les autorités locales.

Lorsque la délivrance des certificats d'origine entraînera la perception de taxes quelconques dans l'un des pays, des taxes équivalentes pourront être établies par l'autre pays à l'occasion des certificats d'origine qu'il délivrera. Il en sera de même, le cas échéant, pour les factures consulaires.

ARTICLE IX

Les négociants et les industriels, ressortissants de l'une des Parties Contract-

antes, ainsi que les négociants et les industriels domiciliés et exercant leur commerce et industrie dans les territoires de cette Partie, pourront, dans les territoires de l'autre, soit en personne, soit par des commis voyageurs, faire des achats ou recueillir des commandes, avec ou sans échantillons et modèles. Ces négociants, industriels et leurs commis voyageurs, en faisant ainsi des achats et en recueillant des commandes, jouiront, en toute manière, du traitement de la nation la plus favorisée. Toutefois dans le cas où les voyageurs de commerce japonais en France ou français ou Japon viendraient à être assujettis à un droit de patente, les voyageurs de commerce français au Japon ou japonais en France pourront être soumis à des impôts équivalents.

Les articles importés comme échantillons et modèles dans les buts susmentionnés, seront, dans chacun des deux Pays, admis temporairement en franchise de droits, en conformité des règlements et formalités de douane établis pour assurer leur réexportaion ou le payment des droits de douane prescrits en cas de nonréexportation dans le délai prévu par la loi. Toutefois, ledit privilège ne s'étendra pas aux articles qui, à cause de leur quantité ou valeur, ne peuvent pas être considérés comme échantillons et modèles ou qui, à cause de leur nature, ne sauraient être identifiés lors de leur réexportation. Le droit de décider si un échantillon ou modèle est susceptible d'admission en franchise, appartient exclusivement, dans tous les cas, aux autorités douanières compétentes du lieu où l'importation a été effectuée.

Les Chambres de commerce existant sur les territoires des deux Parties Contractantes seront réciproquement reconnues comme les autorités compétentes pour délivrer tous certificats qui pourraient être requis par les voyageurs de commerce, en vue notamment d'affirmer leur identité.

ARTICLE X

Tous les articles qui sont où pourront être légalement importés dans les ports de l'une des Parties Contractantes, par des navires nationaux, pourront de même, être importés dans ces ports par des navires de l'autre Partie Contractante, sans être soumis à aucun droit ou charget, de quelque dénomination que ce soit, aures où plus élevés que ceux auxquels les mêmes articles seraient soumis s'ils étaient importés par des navires nationaux. Cette égalité réciproque de traitement sera appliquée sans distinction, que ces articles viennent directement du lieu d'origine où de tout autre pays étranger.

Il y aura de même parfaite égalité de traitement pour l'exportation, de façon que les méme droits de sortie seront payés et les mêmes primes où drawbacks seront accordés, dans les territoires de chacune des Parties Contractantes, à l'exportation d'un article quelconque qui peut ou pourra en être légalment exporté, que cette exportation se fasse par des navires japonais ou par des navires français et quel que soit le lieu de destination, soit un port de l'autre Partie, soit un port d'une tierce Puissance.

ARTICLE XI

En tout ce qui concerne le placement des navires, leur chargement, leur décharge ment dans les eaux territoriales des Parties Contractantes, il ne sera accordé, par l'une des Parties, aux navires nationaux, aucun privilège, ni aucune facilité qui ne le soit également, en pareil cas, aux navires de l'autre Pays, la volonté des Parties Contractantes étant que, sous ces rapports, leurs bâtiments respectifs jouissent d'une parfaite égalité.

ARTICLE XII

Les navires marchands naviguant sous pavillon japonais et français et ayant à bord les documents requis par leurs lois nationales pour établir leur nationalité, seront respectivement considérés, en France et au Japon, comme navires japonais et français.

ARTICLE XIII

Aucun droit de tonnage, de transit, de canal, de port, de pilotage, de phare, de quarantaine ou autres droits ou charges similaires ou analogues, de quelque dénomination que ce soit, levés-au nom ou au profit du gouvernement, de fonctionnaires publics, de particuliers, de corporations ou d'établissements quelconques, ne seront imposés dans les eaux territoriales de l'un des deux Pays sur les navires de l'autre sans qu'ils soient également imposés, dans les mêmes conditions, sur les navires nationaux en général; ou sur les navires de la nation la plus favorisée. Cette égalité de traitement sera appliquée réciproquement à leurs navires respectifs, de quelque endroit qu'ils arrivent et quel que soit le lieu de destination.

ARTICLE XIV

Les navires chargés d'un service postal régulier de l'une des Parties Contractantes qu'ils appartieunent à l'État ou à une compagnie subventionnée par lui à cet effet, jouiront dans les eaux territoriales de l'autre, des mêmes facilités, privilèges et immunités que ceux qui sont accordés aux navires similaires de la nation la plus favorisée.

ARTICLE XV

Il est fait exception aux dispositions de la présente Convention pour le cabotage dont le régime reste soumis à la législation du Japon et de la France respectivement; il est entendu toutefois, que les Japonais en France et les Français au Japon, jouiront pour tout ce qui concerne le cabotage, des droits et privilèges qui sont ou seront accordés par cette même législation aux ressortissants de la nation la plus favorisée.

Tout navire de l'une des Parties Contractantes, chargé à l'étranger d'une cargaison destinée à deux ou plusieurs ports d'entrée des territoires de l'autre, pourra décharger une partie de sa cargaison dans l'un desdits ports, et en continuant son voyage pour l'autre ou les autres ports de destination, y décharger le reste de sa cargaison, toujours en se conformant aux lois, aux tarifs et aux règlements de douane du pays de destination. De la même manière et sous la même restriction, tout navire de l'une des Parties Contractantes pourra charger dans les divers ports de l'autre, au cours du même voyage pour l'étranger.

ARTICLE XVI

Les deux Hautes Parties Contractantes déclarent qu'elles sont adhérentes à la Convention d'Union de Paris du 20 mars 1883 pour la protection de la propriété industrielle; dans le cas où l'une d'entre elles cesserait d'adhérer à la Convention précitée, elles conviennent des stipulations suivantes:

Les ressortissants de chacune des Parties Contractantes jouiront, dans les territoires de l'autre Partie, des mêmes droits que les nationaux eux-mêmes, pour tout ce qui concerne la protection des brevets d'invention, des marques de fabrique ou de commerce, des dessins et modèles industriels et de fabrication de toute espèce, et noms commerciaux, et des indications de provenance, et pour tout ce qui concerne la répression de la concurrence déloyale, sous réserve de l'accomplissement des formalités et des conditions imposées par la loi.

Tout produit portant une fausse indication de provenance dans laquelle un des Pays Contractants, ou un lieu situé sur les territoires de l'un d'eux, serait directement ou indirectement indiqué comme pays ou comme lieu d'origine, sera saisi à l'importation à la requête des autorités douanières ou ministère public où d'une partie intéresée, si la législation de chaque Pays Contractant l'admet, ou bien, à défaut, sera soumis aux actions et moyens assurés en pareil cas par la loi aux nationaux.

ARTICLE XVII

Les Hautes Parties Contractantes convinnent que, pour tout ce qui concerne le commerce, l'industrie et la navigation, tout privilège, faveur ou immunité quelconque, que l'une d'elles a déjà accordés ou accorderait à l'avenir au commerce, à l'industrie et à la naqigation de tout autre État, seront étendus immédiatement et sans condition, au commerce, à l'industrie et à la navigation de l'autre Partie Contoractante, leur intention étant que le commerce, l'industrie et la navigation de chaque pays jouissent sous tous rapports du traitement de la nation la plus favorisée.

ARTICLE XVIII

Les stipulations de la présente Convention ne sont pas applicables:

1 Aux avantages particuliers actuellement accordés ou qui pourraient être ultérieurement accordés par l'une des Parties Contractantes à des États limitrophes pour faciliter le trafic frontière;

2 Aux faveurs spéciales résultant d'une union douanière;

3 Aux pêches assimilées à la pêche nationale;

4 Aux encouragements accordés ou qui pourraient être accordés à la marine marchande nationale.

ARTICLE XIX

Les dispositions de la présente Convention sont applicables à l'Algérie. Elles pourront être ultérieurement étendues en tout ou partie aux colonies, possessions françaises et pays de protectorat par une déclaration concertée entre les deux gouvernments.

Il est entendu en outre que la présente Convention est applicable à toutes les colonies et possessions du Japon.

ARTICLE XX

La présente Convention sera ratifiée et l'échange des ratifications aura lieu à Tokyo; les ratifications seront notifiées dans le plus bref délai possible aux Gouvernments du Japon et de la France par leurs Représentants respectifs; à partir de la date de la dernière de ces deux notifications, la présente Convention entrera en vigueur et demeurera exécutoire pendant une période de dix années.

Toutefois, l'article 5 en vertu duquel les droits de douane perçus en France sur les produits d'origine japonaise et au Japon sur les produits d'origine française ne seront autres ou plus élevés que ceux perçus sur les produits similaires originaires du pays le plus favorisé, pourra être dénoncé à toute époque par chacune des deux Parties Contractantes, et dans ce cas, il cessera d'être exécutoire un an après cette dénonciation.

Au cas où douze mois avant la date d'expiration de la présente Convention aucune des deux Parties Contractantes n'aurait notifié son intention d'en faire cesser les effets, cet acte demeurera obligatoire jusqu'à l'expiration d'une année à partir du jour où l'une ou l'autre Partie Contractante l'aura dénoncé.

TRAITÉ DE COMMERCE ET DE NAVIGATION ENTER LE JAPON ET L'ALLEMAGNE

Signé à Berlin, le 24 Juin, 1911

ARTICLE I

Les ressortissants de chacune des Hautes Parties Contractantes auront pleine liberté d'entrer et de séjourner en tout lieu des territoires de l'autre.

A condition de se conformer aux lois du Pays, ils jouiront des droits spécifiés ci-dessous:

1. Ils seront, pour tout ce qui concerne la résidence, les études et investigations, l'exercice de leurs métiers et professions et l'exécution de leurs entreprises industrielles et manufacturières, placés, à tous égards, sur le même pied que les ressortissants de la nation la plus favorisée;

2. Ils auront, comme les nationaux eux-mêmes, le droit de voyager dans toute l'étendue des territoires de l'autre et le droit de faire le trafic de tous articles de commerce licite;

3. Ils pourront posséder ou louer et occuper des maisons, fabriques, magasins, boutiques et les locaux qui en dépendent. De même ils pourront louer des terrains à l'effet d'y résider ou de les utiliser dans un but licite commercial, industriel, manufacturier ou autre;

4. En ce qui concerne la possession de biens mobiliers de quelque espèce que ce soit, la transmission, par succession testamentaire ou autre, des biens mobiliers de toute sorte qu'ils peuvent légalement acquérir entre vivants et en ce qui concerne le droit de disposer, de quelque manière que ce soit, des biens de toute sorte qu'ils auront acquis légalement, ils jouiront des mêmes privilèges, libertés et droits et ne seront soumis, sous ce rapport, à aucuns impots ou charges plus élevés que les nationaux ou les ressortissants de la nation la plus favorisée;

5. Ils pourront, sous la réserve de la réciprocité, acquérir et posséder toute sorte dimmeubles qui, d'après les lois du Pays, peuvent ou pourront être acquis ou possédés par les ressortissants d'une autre nation étrangère quelconque, en se conformant toujours aux conditions et restrictions prescrites par lesdites lois;

6. Ils seront exempts de tout service militaire obligatoire, soit dans l'armée ou la marine, la garde nationale ou la milice, de même que de toutes taxes imposées en lieu et place du service personnel et de tous emprunts forcés, Ils ne pourront être assujettis à des réquisitions ou contributions militaires, quelles qu'elles soient, autrement que dans les mêmes conditions et sur le même pied que les nationaux ou les ressortissants de la nation la plus favorisée;

7. Ils ne seront contraints, sous aucun prétexte, à subir des charges ou à payer des taxes autres ou plus élevées que celles qui sont ou seront imposées aux nationaux ou aux ressortissants de la nation la plus favorisée.

ARTICLE II

Les habitations, magasins, fabriques et boutiques des ressortissants de chacune des Hautes Parties Contractantes dans les territoires de l'autre ainsi que tous les lacaux qui en dépendent, seront respectée.

Il ne sera point permis d'y procéder à des visites domiciliaires ou perquisitions ou d'examiner ou d'inspecter les livres, papiers ou comptes, sauf dans les conditions et formes prescrites par les lois à l'égard des nationaux.

ARTICLE III

Il y aura entre les territoires des deux Hautes Parties Contractantes liberté réciproque de commerce et de navigation.

Les ressortissants de chacune des Hautes Parties Contractantes auront pleine liberté de se rendre avec leurs navires et leurs cargaisons dans les lieux, ports et rivières des territoires de l'autre qui sont ou pourront être ouverts au commerce extérieur; ils sont, toutefois, tenus de se conformer toujours aux lois du Pays où ils arrivent.

ARTICLE IV

Les droits de douane perçus sur les articles, produits naturels ou fabriqués des territoires de l'une des Hautes Parties Contractantes, à leur importation dans les territoires de l'autre, seront réglés, soit par des arrangements spéciaux entre les deux Pays, soit par la législation intérieure de chacun d'eux.

Aucune des Parties Contractantes n'imposera à l'exportation d'un article quelconque à destination des territoires de l'autre des droits ou charges quelconques autres ou plus élevés que ceux qui sont ou pourront être imposés à l'exportation des articles similaires à destination de tout autre pays étranger.

ARTICLE V

Les Hautes Parties Contractantes s'engagent à n'entraver leurs relations commerciales réciproques par aucune prohibition d'importation, d'exportation ni de transit.

Des exception pourront toutefois être faites dans les cas suivants, en tant qu'elles sont appliquées à tous les autres pays ou du moins à tous les pays qui se trouvent dans les mêmes conditions:

1. Relativement aux approvisionnements de guerre, dans des circonstances exceptionnelles;

2. Pour des considérations affectant la sécurité publique;

3. Pour cause de salubrité publique et en vne d'assurer la protection des animaux et des plantes utiles contre les maladies et les parasites;

4. Dans le but d'appliquer à des marchandises étrangères des interdictions ou des restrictions établies par la législation intérieure à l'égard de la production, du placement ou du trafic de marchandises indigènes de même nature.

ARTICLE VI

Les ressortissants de chacune des Hautes Parties Contractantes jouiront, dans les territoires de l'autre, d'une parfaite égalité de traitement avec les nationaux, quant à l'exemption de droits de transit et pour tout ce qui concerne le magasinage, les primes, les drawbacks ainsique les facilités touchant l'importation ou l'exportation des marchandises.

ARTICLE VII

Les négociants et les industriels que, par l'exhibition d'une carte de légitimation industrielle, délivrée par les autorités de l'une des Parties Contractantes, prouvent qu'ils sont autorisés à exercer leur commerce ou industrie dans les territoires de cette Partie, pourront, dans les territoires de l'autre, soit en personne, soit par des commis voyageurs, faire des achats ou recueillir des commandes, avec ou sans échantillons. Ces négociants, industriels et leurs commis voyageurs, en faisant ainsi des achats et en recueillant des commandes, jouiront, en matière d'impositions et de facilités du traitement de la nation la plus favorisée.

Les Parties Contractantes se donneront réciproquement connaissance des autorités chargées de délivrer les cartes de légitimation.

Les articles importés comme échantillons dans les buts mentionnés dans l'alinéa 1 seront, dans chacun des deux Pays, admis temporairement en franchise de droit, en conformité des règlements et formalités de douane, établis pour assurer leur réexportation ou le payement des droits de douane prescrits en cas de non-réexportation dans le délai prévu par la loi. Toutefois, ledit privilège ne s'étendra pas aux articles qui, à cause de leur quantité ou valeur, ne peuvent pas être considérés comme échantillons, ou qui, à cause de leur nature, ne sauraient être identifiés lors de leur réexportation. Le droit de décider si un échantillon est susceptible d'admission en franchise, appartient exclusivement dans tous les cas, aux autorités compétentes du lieu ou l'importation a été effectuée.

ARTICLE VIII

Les marques de reconnaissance, estampilles ou cachets apposés au moment de l'exportation par les autorités douanières de l'une des Parties Contractantes aux échantillons mentionnés dans l'article précédent ainsi que la liste de ces échantillons qui est officiellement attestée par elles et en contient la description détaillée, seront réciproquement acceptés par les autorités douanières de l'autre pour établir leur caractère d'échantillons et leur assurer l'exemption de toute inspection, sauf en tant que cette dernière est nécessaire pour constater que les échantillons présentés sont identiques avec ceux énumérés dans la liste. Les autorités douanières de chacune des Parties Contractantes pourront toutefois apposer une marque supplémentaire aux échantillons dans les cas spéciaux où elles jugent nécessaire de prendre cette précaution.

ARTICLE IX

Les sociétés par actions (anonymes) et autres sociétés et associations commerciales, industrielles ou financières, y compris les compagnies d'assurance, domiciliées dans les territoires de l'une des Parties Contractantes et ayant l'existence légale d'après les lois qui y sont en vigueur, seront reconnues comme ayant l'existence légale dans les territoires de l'autre et autorisées à y ester en justice devant les tribunaux, soit pour intenter une action, soit pour y défendre d'après les lois de cette autre Partie.

Leur admission à l'exercice de leur industrie ou de leur commerce ainsi qu'à l'acquisition de biens dans les territoires de l'autre Partie se règle d'après les prescriptions qui y sont en vigueur. En tout cas, lesdites sociétés, associations et compagnies jouiront, dans ces territoires, des mêmes droits que ceux qui sont ou pourront être accordés à des sociétés, associations et compagnies similaires de la nation la plus favorisée.

ARTICLE X

Tous les articles qui sont of pourront être légalement importés, dans les ports de l'une des Hautes Parties Contractantes, par des navires nationaux, pourront, de même, être importés dans ces ports par des navires de l'autre Partie Contractante, sans être soumis à aucuns droits ou charges, de quelque dénomination que ce soit, autres ou plus élevés que ceux auxquels les mêmes articles seraient soumis s'ils étaient importés par des navires nationaux. Cette égalité réciproque de traitement sera appliquée sans distinction, que ces articles viennent directement du lieu d'origine, ou de tout autre pays étranger.

Il y aura, de même, parfaite égalité de traitement pour l'exportation, de façon que les mêmes droits de sortie seront payés, et les mêmes primes et drawbacks seront accordés, dans les territoires de chacune des Parties Contractantes à l'exportation d'un article quelconque qui peut ou pourra en être légalement exporté, que cette exportation se fasse par des navires japonais ou par des navires allemands et quel que soit le lieu de destination, soit un port de l'autre Partie, soit un port d'une tierce Puissance.

ARTICLE XI

En tout ce qui concerne le placement des navires, leur chargement, leur déchargement, dans les eaux territoriales des Hautes Parties Contractantes, il ne sera accordé par l'une des Parties aux navires nationaux aucun privilège ni aucune facilité qui ne le soit également, en pareils cas, aux navires de l'autre Pays, la volonté des Parties Contractantes étant que, sous ces rapports, les bâtiments respectifs soient traités sur le pied d'une parfaite égalité.

ARTICLE XII

Tous les navires qui, conformément aux lois allemandes, sont considérés comme navires allemands et tous les navires qui, conformément aux lois japonaises, sont considérés comme navires japonais seront considérés respectivement en tout ce qui concerne l'application de ce Traité comme navires allemands et japonais.

ARTICLE XIII

Aucuns droits de tonnage, de transit, de canal, de port, de pilotage, de phare, de quarantaine ou autres droits ou charges similaires ou analogues, de quelque dénomination que ce soit, levés au nom ou au profit du Gouvernment, de fonctionnaires publics, de particuliers, de corporations ou d'établissements quelconques, ne seront imposés dans les eaux territoriales de l'un des deux Pays aux navires de l'autre, sans qu'ils soient également imposés, sous les mêmes conditions, aux navires nationaux en général ou aux navires de la nation la plus favorisée. Cette égalité de traitement sera appliquée réciproquement aux navires respectifs, de quelque endroit

qu'ils arrivent et quel que soit le lieu de destination.

ARTICLE XIV

Les navires chargés d'un service postal régulier de l'une des Haute Parties Contractantes jouiront, dans les eaux territoriales de l'autre, des mêmes facilités, privilèges et immunités que ceux qui sont accordées aux navires similaires de la nation la plus favorisée.

ARTICLE XV

Les cabotages sont exceptés des dispositions du présent Traité et reste réservé au pavillon national. Il est toutefois entendu que, sous ce rapport, chacune des deux Parties peut réclamer pour ses navires les mêmes droits ou privilèges qui sont ou seront accordés par l'autre Partie aux navires de tout autre pays en tant qu'elle accorde aux navires de l'autre Partie les mêmes droits ou privilèges.

Ne sera pas considéré comme cabotage:

1. Le trafic des navires passant d'un port dans un autre, soit pour y débarquer des passagers ou décharger tout ou partie de leur cargaison apportés de l'étranger, soit pour y embarquer des passagers ou charger tout ou partie de leur cargaison à destination étrangère,

2. Le transport, d'un port à l'autre, de passagers munis de billets directs, ou de marchandises expédiées avec connaissements directs délivrés à ou destinés pour l'étranger.

ARTICLE XVI

En cas de naufrage, avaries en mer ou relâche forcée, chacune des Hautes Parties Contractantes devra donner aux navires de l'autre, qu'ils appartiennent à l'État ou à des particuliers, la même assistance et protection et les mêmes immunités que celles qui seront accordées en pareils cas aux navires nationaux. Les articles sauvés de ces vaisseaux naufragés ou avariés seront exempts de tous droits de douane, a moins qu'ils n'entrent dans la consommation intérieure, auquel cas ils seront tenus de payer les droits prescrits.

Les autorités locales devront, dés que faire se pourra, informer du naufrage ou des avaries le plus proche Consul de l'État du pavillon. Les Consuls des Pays Contractants sont autorisés à prêter l'aide nécessaire à leurs nationaux.

ARTICLE XVII

Réserve faite des cas où ce Traité en dispose autrement d'une manière expresse, les Hautes Parties Contractantes conviennent qu'en tout ce qui concerne le commerce, la navigation et l'industrie toutes sortes de privilèges, faveurs ou immunités que l'une ou l'autre des Parties Contractantes a déjà accordés ou accordera à l'avenir aux navires ou aux ressortissants de tout autre État, seront tention étant que, sauf les cas exception aux navires ou aux ressortissants de l'autre Partie Contractante, leur intention étant que, sauf les cas exceptionnels précités, le commerce, la navigation et l'industrie de chaque Pays soient placés, à tous égards, par l'autre sur le pied de la nation la plus favorisée.

ARTICLE XVIII

Les dispositions du présent Traité s'appliquent de même aux pays et territoires qui appartiennent à présent ou appartiendront à l'avenir au territoire douanier de l'une ou l'autre des Parties Contractantes.

ARTICLE XIX

Le présent Traité entrera en vigueur le 17 juillet 1911 avec la Convention speciale et réciproque de Douane, signée en date de ce jour. Il restera obligatoire jusqu'au 16 juillet 1923.

Dans le cas où aucune des Parties Contractantes n'aurait notifié douze mois avant l'échéance de ce dernier terme, son intention de faire cesser les effets du Traité, celui-ci continuera à être exécutoire jusqu'à l'expiration d'une année à partir du jour où l'une ou l'autre des Parties Contractantes l'aura dénoncé.

Les Parties Contractantes se réservent cependant la faculté de dénoncer, jusqu'au 31 mars 1912, le présent Traité. Ledit Traité cessera dans ce cas ses effets le 31 décembre 1912. Il est entendu que les Parties Contractantes ne feront pas usage de la faculté mentionnée sans dénoncer simultanément la Convention de Douane citée dans l'alinéa I du présent article.

ARTICLE XX

Le présent Traité sera ratifié et les ratifications en seront échangées à Tokio, aussitôt que faire se pourra.

SUMMARY OF TRADE AGREEMENT BETWEEN JAPAN AND INDIA,

January, 1934

1. Most favoured nation treatment: In respect of customs duties, Japan and India shall reciprocally accord the most favoured nation treatment to any articles, produce or manufacture of the other country.

2. Negotiations to be held concerning modification of customs tariff: Subject to reservation by both countries of the right to make such changes in their customs tariffs as may be necessary for the protection of their own interests, Japan and India agree that, should any modification of customs tariffs by either country result in trade interest being adversely affected in any appreciable mesure, they shall request of the country so affected enter into negotiations with the object of reconciling so far as possible trade interests of the two countries.

3. Measures to correct effects of exchange fluctuation: Nothing in this agreement shall be held to prohibit the imposition or the variation from time to time by the Government of India of special rates of customs duty on articles, the produce or manufacture of Japan, other or higher than those levied on similar articles produced or manufactured by any other country, at such rates as the Government of India may consider to be necessary to correct the effects of any variation of the exchange value of the yen relative to the rupee subsequent to December 31, 1933.

Imposing or varying, or on being requested by the Government of Japan to vary, such special rates of customs duty, the Government of India undertakes to give full consideration to relevant factors which tend to raise the export prices of Japanese goods, such as the purchase by Japan of raw materials in markets outside Japan and the adjustment of internal Japanese prices, and to limit such rates to what is necessary to correct the effect of the depreciation of the exchange value of the yen relative to the rupee on the duty-paid value of Japanese goods imported into India. Provided, that no charge in such rate shall be made until it has been in force for at least five weeks.

Reciprocally, the Government of Japan shall have the right of imposing or varying special rates of customs similar to those for which provision is made in paragraph 1 of this article (3), on articles, the produce or manufacture of India, under similar circumstances, and subject to ocnditions similar to those provided for in paragraphs 2 and 3 of this article (3). Provided, that the said right shall not accrue to the Government of Japan unless the exchange value of the rupee relative to the yen shall be depreciated below the value of 0.732 yen.

4. Customs duties on Japanese cotton piece-goods imported into the India: Without prejudice to agreements concerning the most favoured nation treatment, and the measures to correct the effects of exchange fluctuation, customs duties to be imposed by the Government of India on Japanese cotton piece-goods should not exceed the following rates:

Duty on plain greys. . . . . .50 per cent. ad. valorem or 5.25 annas per pound.

Duty on others. . . . . .50 per cent. ad. valorem.

It is understood that the Government of India shall not impose on Japanese cotton piece-goods other than plain greys a specific duty exceeding 5.25 annas per pound subject to agreement concerning the most favoured nation treatment.

5. Importation of Japanese cotton piece-goods into India:

(a) Calculation of the quota of Japanese cotton piece-goods to be exported to India in a period of one year beginning April 1 shall be fixed in accordance with quantity of Indian raw cotton exported to Japan in a period of one year beginning January 1 of the same year.

(b) It is to be noted that the period of one year for the purpose of fixing the quota of Japanese cotton piece-goods (or piece-goods year) shall be from April 1 to March 31 of the following year, while the period of one year for the purpose of calculating the quantity of Indian raw cotton to be exported to Japan (or cotton year) shall be from January 1 to December 31.

6. Basic quota and its modification: The basic quota of Japanese cotton piece-goods to be exported to India in a piece-goods year shall be 325,000,000 yards and it shall be liked with 1,000,000 bales of Indian raw cotton exported to Japan in the corresponding cotton year.

(a) In case the export of Indian raw cotton to Japan in any cotton year should fall below the 1,000,000 bales quota, the

Japanese cotton piece-goods for the corresponding piece-goods year shall be determined by reducing the above basic quota at the rate of 2,000,000 yards for every 10,000 bales of deficit.

(b) In case, however, such export in any cotton year should exceed the 1,000,000 bales quota, the Japanese cotton piece-goods for the corresponding piece-goods year shall be determined by increasing the above basic quota at the rate of 1,500,000 yards for every additional 10,000 bales, provided that quota should in no case exceed 400,000,000 yards.

(c) In case the export of Indian raw cotton to Japan in any cotton year should exceed 1,500,000 bales, the quantity thus exported in excess of 1,500,000 bales shall be for the purpose of determining the relevant quota of Japanese cotton piece-goods added to the quantity of raw cotton exported to Japan in the following cotton year.

(d) In respect of both cotton piece-goods and raw cotton re-exported the quantity shall be deducted from imported quantity.

(e) The year shall be divided into two half-yearly periods, the first half-yearly period running from April 1 to September 30 and the second half-yearly period from October 1 to March 31 of the following year.

(f) The quota for the second half-yearly period shall be provisionally fixed at the quantity which will be derived by deducting 200,000,000 yards from the yearly quota, calculate on the basis of estimated export of Indian raw cotton to Japan in the corresponding cotton year.

7. Adjustment: The adjustment of export of Japanese cotton piece-goods to India shall be made by the end of the said period on basis of exact quantity of Indian raw cotton exported to Japan in the corresponding cotton year, subject to rules of allowances between periods.

A transfer from the quota of the first half-yearly period to the quota of the second half-yearly period shall be permitted up to a maximum of 20,000,000 yards.

From the second half-yearly period to the first half-yearly period of the succeeding piece-goods year and vice versa, transfer up to a maximum of 20,000,000 yards shall be permitted,

8. Classification of quota into categories:

The quota of cotton piece-goods shall be classified into the following categories in conformity with the following percentages:

Plain greys.	.45 per cent.
Bordered greys. . .	.13 per cent.
Bleached	8 per cent.
Coloured and other .	.34 per cent.

The percentage allotted to each of the above categories may be modified subject to the following conditions:

Increase in category either of bordered greys or bleached shall not exceed 20 per cent, of quantity allotted to that category, and an increase in any other category shall not exceed 10 per cent of quantity allotted to that category.

9. Transfer: The quantity transferable from category either of bordered greys or bleached shall not exceed 20 per cent of quantity allotted to that category and the quantity transferable from any other category shall not exceed 10 per cent of quantity allotted to that category: and

The total quota of cotton piece-goods for any piece-goods year shall not be increased by the above modification of quantity allotted to each category.

10. The quota for the period intervening the enforcement of the arrangement and the commencement of the first piece-goods year:

(a) The quota of cotton piece-goods for the period between the date on which the present Indian customs on cotton piece-goods year begins shall be the proportionate fraction of the quantity that would have been allotted to the whole piece-goods year from April 11, 1933 to March 31, 1934, on the basis of the quantity of Indian raw cotton imported into Japan in the cotton year of 1933 (From January 1 to December 31).

(b) The quota for his period and the first half-yearly instalment of the first piece-goods year quota should be consolidated into one for the period of approximately nine months, ending at the end of September, 1934.

The treaty shall come into force immediately after an exchange of ratifications, and shall remain in force until March 31, 1937,

TREATY RESPECTING SOUTH MANCHURIA AND EASTERN INNER MONGOLIA

Signed at Peking, May 25, 1915

ARTICLE I The High Contracting Parties mutually agree to extend the term of the lease of Port Arthur and Dairen, and the term relating to the South Manchouria Railway and to the Antung-Mukden Railway, to a period of nine years respectively.

ARTICLE II The subjects of Japan shall be permitted in South Manchuria to lease land necessary either for erecting buildings for various commercial and industrial uses or for agricultural purposes.

ARTICLE III The subjects of Japan shall have liberty to enter, travel and reside in South Manchuria to carry on business of various kinds—commercial, industrial and otherwise.

ARTICLE IV The Government of China shall permit joint undertakings, in Eastern Inner Mongolia, of the subjects of Japan and citizens of China, in agriculture and industries auxiliary thereto.

ARTICLE V With respect to the three preceding Articles, the subjects of Japan shall produce before the local authorities the passports duly issued for the purpose of registration, and shall also submit themselves to the police laws and regulations and taxes of China.

In civil and criminal suit, the Japanese consular officer, where a Japanese subject is the defendant, and the Chinese official, where a Chinese citizen is the defendant, shall respectively try and decide the case, both the Japanese consular official and the Chinese official being permitted each to send his agent to attend the trial of the other to watch the proceeding: provided that in civil suits arising out of land disputes between Japanese subjects and Chinese citizens, the cases shall be tried and decided by the joint tribunal composed of the property authorized official of the two countries, in accordance with the laws and local usages of China.

In the future when the judicial system in the said regions shall have been completely reformed, all civil and criminal suites involving Japanese subjects shall be wholly tried and decided by the law-courts of China.

ARTICLE VI The Government of China engage to open of their own accord, as early as possible, cities and towns in Eastern Inner Mongolia, for the residence and trade of foreigners.

ARTICLE VII The Government of China agree to a speedy fundamental revision of various agreements and contracts relating to the Kirin-Changchun Railway, on the basis of the terms embodied in Railway loan agreements which China has heretofore entered into with various foreign capitalists.

If, in future, the Chinese Government grant to foreign capitalists, in matters that relate to railway loans, more advantageous terms than those in the various existing railway loan agreements, the abovementioned Kirin-Changchun Railway Loan Agreement shall, if so desired by Japan, be further revised.

ARTICLE VIII Except as otherwise provided in this Treaty, all existing treaties between Japan and China with respect to Manchuria shall remain in force.

ARTICLE IX The present Treaty shall take effect on the day of its signature.

DECLARATION CONCERNING THE NON-ALIENATION OF THE PROVINCE OF FUKIEN

The Tsung-Li Yamên to the Japanese Minister

Peking, April 26, 1898.

Prince Ch'ing and the Ministers of the Tsung-li Yamên have the honour to reply to a communication from the Minister of Japan dated 2nd day, 3rd intercalary month, 24th year Kuang-Hsü (April 22, 1898), which reads as follows:

" A telegram has just been received from the Minister of Foreign Affairs, which reads as follows:

" ' The Government of Japan has viewed with constant deep concern the difficulties with the Government of China has recently been confronted. The declaration made at the time of the evacuation of Weihaiwei is evidence of this. It is to be apprehended that trouble may arise with consequences disastrous to China. In all this there

is no mistaking what our real purpose is.

"'In view of the present state of affairs, the Government of Japan, mindful of its own interests, cannot act as if entirely in ignorance of passing events, but must take proper measures to meet any situation that may arise. You will ask the Government of China to make a declaration that it will not cede or lease to any other Power any portion of its territory within the Province of Fu-kien.'"

Referring to his oral statements made in a personal interview, the Minister of Japan requests that a reply be given to his communication.

The Princes and the Ministers have the honour to state that the Province of Fukien, with all the territory in the interior and along the sea-coast within its limits, which is an important part of China, China will never cede or lease to any other Power whatsoever; and to request that this reply be communicated to the Govermment of Japan.

The Princes and the Ministers avail themselves of this opportunity to renew to the Minister of Japan the assurances of their most distinguished consideration.

EXCHANGE OF NOTES*

From the Japanese Minister

Peking, the 25th day of May of the 4th year of Taisho.

Excellency,

A respect has reached me to the effect that the Chinese Government has the intention of permitting foreign nations to establish, on the coast of Fukien Province, dockyards, coaling stations for military use, naval bases, or to set up other military establishments; and also of borrowing foreign capital for the purpose of setting up the abovementioned establishments.

I have the honour to request that Your Excellency will be good enough to give me reply stating whether or not the Chinese Government really entertains such an intention.

I avail, etc.

From Chinese Minister of Foreign Affairs

Peking, the 25th day of May of the 4th year of Republic of China.

Monsieur le Ministre,

I have the honour to acknowledge the receipt of Your Excellency's note of this day's date which I have noted.

In reply I beg to inform you that the Chinese Government hereby declares that it has given no permission to foreign nations to construct, on the coast of Fukien Province, dockyards, coaling stations for military use, naval bases, or to set up other military establishments; nor does it entertain an intention of borrowing foreign capital for the purpose of setting up the abovementioned establishments.

I avail, etc.,

* Translation from Chinese text as printed in Rockhill, p. 181. Printed also in Hertslet, p. 1154.

SINO-JAPANESE UNDERSTANDING ENTERED INTO IN 1905

Made Public, January 14, 1932

In 1905, when the Treaty concerning Manchuria and the supplementary agreement to it were concluded, the Japanese Government insisted on the insertion in the text of the Treaty definite engagements on certain matters. Since, however, the Chinese Government found it difficult for internal political reasons to consent to the publication of such engagements, it was agreed that these should be merely recorded in the Minutes of the Conference, which were drawn up both in Japanese and Chinese and signed by the Japanese and Chinese Plenipotentiaries. These unpublished understandings totalled sixteen in number. An English version summarising these provisions was submitted, in February, 1906, to the British and the United States Governments in strict confidence by the Japanese Government.

Inasmuch as there seems to be some doubt as to the existence of these understandings in the Minutes of the Conference, and as people even in positions of influence in China have openly denied it, the Government think the present a fit occasion to publish the abovementioned com-

munication made to the Governments of Great Britain and the United States.

Whereas the protocols of the Conference recently held between the Plenipotentiaries of Japan and China with regard to Manchuria are to be kept strictly secret in deference to the desire of the Chinese Government, only such portions of those Protocols as possess the character of executory agreements are given in the following summary:

1. The railway between Changchun an Kirin will be constructed by China with capital to be raised by herself. She however, agrees to borrow from Japan the insufficient amount of capital, which amount being about one-half of the total sum required. The contract concerning the loan shall, in due time, bconcluded, following, mutatis mutandis, the loan contract entered into between the board of the Imperial Railways of North China and the Anglo-Chinese Syndicate. The term of the loan shall be twenty-five years, redeemable in yearly instalments.

2. The military railway constracted by Japan between Mukden and Hsinmintun shall be sold to China at a price to be fairly determined in consultation by Commissioners appointed for the purpose by the two Governments. China engages to reconstruct the line, making it her own railway, and to borrow from a Japanese corporation or corporations one half of the capital required for the portion of the line east of Liao-ho for a term of eighteen years repayable in yearly instalments, and a contract shall be concluded, for the purpose following, mutatis mutandis, the loan contract entered into between the Board of the Imperial Railways of North China and the Anglo-Chinese Syndicate.

All the other military railways in different localities shall be removed with the evacuation of the regions.

3. The Chinese Government engage, for the purpose of protecting the interest of the South Manchuria Railway, not to construct, prior to the recovery by them of the said railway, any main line in the neighbourhood of and parallel to that railway, or any branch line which might be prejudicial to the interest of the abovementioned railway.

4. China declares that she will adopt sufficient measures for securing Russia's faithful observance of the Russo-Chinese treaties with regard to the railways which Russia continues to possess in the northern part of Manchuria, and that it is her intention, in case Russia acts in contravention of such treaty stipulations, to approach her strongly with a view to have such action fully rectified.

5. When in the future, negotiations are to be opened between Japan and Russia for regulation of the connecting railway services (Article VIII of the Treaty of Peace between Japan and Russia), Japan shall give China previous notice. China shall communicate to Russia her desire to take part in the negotiations through commissioners to be despatched by her on the occasion, and Russia consenting, shall participate in such negotiations.

6. With regard to the mines in the Province of Fengtien, appertaining to the railway, whether already worked or not, fair and detailed arrangements shall be agreed upon for mutual observance.

7. The affairs relating to the connecting services as well as those of common concern in respect of the telegraph lines in the Province of Fengtien and the cables between Port Arthur and Yentai shall be arranged from time to time as necessity may arise in consultation between the two countries.

8. The regulations respecting the places to be opened in Manchuria, shall be made by China herself, but the Japanese Minister at Peking must be previously consulted regarding the matter.

9, If no objection be offered on the part of Russia respecting the navigation of the Sungari (by Japanese vessels), China shall consent to such navigation after negotiations.

10. The Chinese Plenipotentiaries declare that immediately after withdrawal of the Japanese and Russian troops from Manchuria, China will proceed to take, in virtue of her sovereign right, full administrative measures to guarantee peace in that region and endeavour, by the same right, to promote good and remove evil as well as steadily to restore order, so that the residents of that region, natives and foreigners, may equally enjoy the security of life and occupation under the perfect protection of the Chinese Government. As to the means of restoring order, the Chinese Government are to take by themselves all adequate measures.

11. While relations of intimate friendship subsisted as at the present time between China and Japan, Japan and Russia had unfortunately engaged in war and fought in the territory of China. But peace has now been established and hostilities in Manchuria have ceased. And while it is undeniable that Japanese troops, before their withdrawal, have the power of exercising the rights occurring from military occupation, the Chinese Government de-

clare that certain Japanese subjects in Manchuria have recently been observed to sometimes interfere with the local Chinese administration and to inflict damage to public and private property of China.

The Japanese Plenipotentiaries, considering that, should such interference and infliction of damage have been carried beyond military necessity, they are not proper acts, declare that they will communicate the purport of the above declaration of the Chinese Government of Japan, so that proper steps may be taken for controlling Japanese subjects in the Province of Fengtien and promote the friendly relations between the two nations, and also for preventing them in future, from interfering with the Chinese administration or inflicting damage to public or private property without military necessity.

12. In regard to any public or private property of China which may have been purposely destroyed or used by Japanese subjects without any military necessity, the Governments of the two countries shall respectively make investigations and cause fair reparation to be made.

13. When the Chinese local authorities intend to despatch troops for the purpose of subduing native bandits in the regions not yet completely evacuated by Japanese troops, they shall not fail to previously consult with the Commander of the Japanese troops stationed in those regions so that all misunderstandings may be avoided.

14. The Japanese Plenipotentiaries declare that the Railway Guards stationed between Changchun and the boundary line of the leased territory of Port Arthur and Talien, shall not be allowed, before their withdrawal, to unreasonably interfere with the local administration of China or to proceed without permission beyond the limits of the railway.

15. Chinese local authorities, who are to reside at Yingkou, shall be allowed, even before the withdrawal of the Japanese troops, to proceed to that place and transact their official business. The date of their departure is to be determined, as soon as possible after the definite conclusion of this Treaty, by the Japanese Minister to China in consultation with the Waiwupu. As there is still in that place a considerable number of Japanese troops, quarantine regulations as well as regulations for the prevention of contagious diseases, shall be established by the authorities of the two countries in consultation with each other so that epidemics may be avoided.

16. The revenue of the Maritime Customs at Yingkou shall be deposited with the Yokohama Specie Bank and delivered to the Chinese local authorities at the time of evacuation. As to the revenue of the native Customs at that place and the taxes and imposts at all other places, which are to be appropriated for local expenditures, a statement of receipts expenditures shall be delivered to the Chinese local authorities at the time of evacuation.

DECLARATION ON THE ABOLITION OF EXTRATERRITORIALITY IN MANCHOUKUO, AUGUST 9, 1935

1. It was made clear in the Imperial Rescript issued in March, 1933, in connection with our decision to withdraw from the League of Nations, and also in the Japan-Manchoukuo Protocol signed on September 15, 1932, that Japan's policy toward Manchoukuo is based on the principle of enabling that country to make wholesome progress as an independent state, while maintaining an inseparable and interdependent relationship with this country, thus advancing our national policy: to preserve the stability of Eastern Asia and to make known throughout the world our devotion to justice and righteousness.

Now, Manchoukuo has made steady and brilliant progress ever since its establishment. Internally, it has pursued constructive programmes along all lines—political, economic, administrative,—while externally it has striven to win the respect and confidence of the Powers. In the matter of extraterritoriality, Manchoukuo, following Japan's example, has been preparing for its abolition by setting up a judicial system and by effecting reforms in various departments, such as police and taxation. In fact, more than ¥8,000,000 is set aside in the budget of the Empire for the fiscal year 1934 for such purposes.

2. Japan has for many years enjoyed the privileges of extraterritoriality in Manchuria. Prior to the establishment of Manchoukuo, extraterritoriality was essential to the development of Japanese interests there. But extraterritoriality is gradually losing its importance which diminishes with the progress of the abovementioned Japan's policy toward Man-

choukuo. Indeed, it is now necessary to abolish extraterritoriality in Manchoukuo if we are to afford that Empire free scope for development, establish a closer union and co-operation between our two peoples, make possible the general advancement of Japanese interests in all directions, and, finally, strengthen permanently the inseparable and friendly relations between the two countries. The South Manchuria Railway zone, acquired by us in consequence of a war with Russia on which we staked our national fortunes, has for the past thirty years been under our assiduous administration. It has served as the base of operations for Japanese activities in Manchouria. But it is now deemed necessary to adjust and transfer our administrative rights in that area for reasons involved in the abolition of extraterritoriality, in order to meet the new situation arising from the establishment of Manchoukuo.

3. For these reasons, at the Cabinet meeting of August 9th, the Japanese Government decided on the following general principles concerning the abolition of extraterritoriality and the adjustment and transfer of administrative rights in the South Manchuria Railway Zone, according to which the authorities concerned will be instructed to devise concrete measure and to put these gradually into effect.

a. Concerning extraterritoriality in Manchoukuo, its abolition should be effected in keeping with the spirit of the treaties in force, in gradual stages, and to accord with the degree of completion of the governmental systems and organs of Manchoukuo, but especially with a view to avoid any sudden and violent changes in the life of Japanese communities in Manchoukuo, to insure more securely for Japanese throughout that Empire facilities for residence and safety and free development, and, in particular, to facilitate the smooth operation of Japan's policy toward the Empire.

b. The South Manchuria Railway zone will, of course, be retained by Japan as heretofore. But the administrative rights exercised by Japan in the zone will be adjusted and transferred, according to circumstances, keeping step with the gradual abolition of extraterritoriality, under similar considerations as above.

4. It should be added that Japan's rights in the leased territory of Kwantung as quite different from those in the South Manchuria Railway zone in their legal origin, their character, and various other respects. Thus it goes without saying that adjustment and transfer of administrative rights in the South Manchuria Railway zone has no connection with Japan's rights in the Kwantung Leased Territory.

TREATY BETWEEN JAPAN AND MANCHOUKUO CONCERNING THE RESIDENCE OF JAPANESE SUBJECTS, TAXATION, ETC.

Signed at Hsinking, June 10, 1936

Whereas the Government of Japan, in accordance with the principle of the protocol between Japan and Manchoukuo signed on the 15th day of September of the 7th Year of Showa, for the purposes of furthering the healthy development of Manchoukuo and also of promoting and perpetuating the intimate and inseparable relation between Japan and Manchoukuo, decided to abolish, by progressive stages, the right of extraterritoriality at present enjoyed in Manchoukuo by Japan and to adjust and transfer the administrative rights over the South Manchuria Railway Zone; and

Whereas the Government of Manchoukuo, appreciating this decision by the Government of Japan, have, in return, recognized the necessity of ensuring and enhancing the common prosperity of Japanese and Manchoukuo subjects within the territories of Manchoukuo:

Now, therefore, with reference to the right of extraterritoriality and the administrative rights over the South Manchuria Railway Zone enjoyed in Manchoukuo by Japan, the Governments of Japan and of Manchoukuo have agreed as the first step as follows concerning the residence of and the enjoyment of various rights and interests by Japanese subjects, and the application of the laws and ordinances of Manchoukuo concerning taxation, industries, etc.

ARTICLE I

Japanese subjects shall be free within the territories of Manchoukuo to reside and travel and engage in agriculture, commerce and industry, and to pursue callings and professions, whether public or private, and shall also enjoy all the rights relating to land.

Japanese subjects shall not, in respect of the enjoyment of all rights and interests with the territories of Manchoukuo, be accorded less favourable treatment than that which is or may be accorded to the subjects of Manchoukuo.

ARTICLE II

Subject to the stipulations of the supplementary agreement to the present treaty, Japanese subjects shall be governed within the territories of Manchoukuo by the provisions of the administrative laws and ordinances of Manchoukuo concerning taxation, industries, etc.

The Japanese Government agree that, subject to the stipulations of the aforesaid agreement, the laws and ordinances of Manchoukuo mentioned in the preceding paragraph shall be in force with the South Manchuria Railway Zone on the principle of statutas realia.

In respect of the application of present Article, Japanese subjects shall not, under any circumstances, be accorded less favourable treatment than that which is or may be accorded to the subjects of Manchoukuo.

ARTICLE III

The stipulations of the preceding two Articles shall, in so far as they are applicable to juridical persons, apply to Japanese juridical persons.

ARTICLE IV

The stipulations of the present treaty shall not prejudice the rights, privileges, immunities and exemptions of particular Japanese subjects or juridical persons based on special engagements entered into between Japan and Manchoukuo.

ARTICLE V

The present treaty shall come into force on July, 1, the 11th Year of Showa, corresponding to the July 1, the 3rd Year of Kangtê.

ARTICLE VI

The present treaty has been drawn up in the Japanese and Chinese texts, and, should any difference in interpretation arise between the two texts, the Japanese text shall prevail.

In witness whereof, the undersigned, duly authorized by their respective Governments, have signed the present treaty and affixed their seals thereto.

Done at Hsinking, in duplicate, this 10th day of the sixth month of the 11th Year of Showa, corresponding to the 10th day of the sixth month of the 3rd Year of Kangtê.

(L.S.) Kenkichi Ueda,
Ambassador Extraordinary and Plenipotentiary of Japan to Manchoukuo.

(L.S.) Chang Yen-ching,
Minister for Foreign Affairs of Manchoukuo.

Appended to the treaty is the following supplementary agreement:

Supplementary Agreement to the Treaty between Japan and Manchoukuo concerning the Residence of Japanese Subjects, Taxation, Etc., Manchoukuo:

In signing today the treaty between Japan and Manchoukuo concerning the residence of Japanese subjects, taxation, etc., in Manchoukuo, the respective plenipotentiaries of the two countries have agreed as follows:

ARTICLE I

The Government of Manchoukuo shall speedily take necessary steps in order that the rights of lease by negotiation hitherto possessed by Japanese subjects shall, in accordance with the different natures of such rights, be converted into landownership or other rights relating to land, as the case may be.

ARTICLE II

The scope of the administrative laws and ordinances of Manchoukuo concerning taxation, industries, etc., which govern Japanese subjects under Article 2 of the treaty and the manner of application thereof, shall previously be decided upon by consultation between the Japanese Ambassador Extraordinary and Plenipotentiary to Manchoukuo and the Minister for Foreign Affairs of Manchoukuo.

In case the Government of Manchoukuo intend to make any important alterations in respect of the laws and ordinances of Manchoukuo which govern Japanese sub-

jects under the stipulations of the preceding paragraph, they shall, until such time as Japanese subjects come within the jurisdiction of the law courts of Manchoukuo, obtain the previous approval of the Japanese Ambassador Extraordinary and Plenipotentiary to Manchoukuo.

The laws and ordinances of Manchoukuo, whereon a decision by consultation shall be made immediately after the coming into force of the treaty in accordance with the stipulations of the first paragraph of this Article, shall in the main be confined to laws and ordinances relating to the land tax, immovable-property contract tax, business tax, juridical person's business tax, crop-output tax, timber tax, mining registration tax, alcoholic drinks tax, cigarette tax, consolidated taxes, commercial registration tax, patent registration tax, utility-model registration tax and local taxes; and to administrative laws and ordinances relating to industrial property, weights and measures, measurement, mining, markets, stock-farming, finance and monopoly.

In levying upon Japanese subjects the business tax and juridical person's business tax of the various taxes enumerated in the preceding paragraph and the house tax and household income tax in the category of local taxes, the Government of Manchoukuo shall, for the time being after the coming into force of the treaty, apply reduced rates in accordance with a decision to be previously made by consultation between the Japanese Ambassador Extraordinary and Plenipotentiary to Manchoukuo and the Minister for Foreign Affairs of Manchoukuo; and, of local taxes, the additional business tax shall be based on the amount of tax assessed at such reduced rates. It is provided that the reduced rates to be applied immediately after the coming into force of the treaty shall be one-fourth the original rates in respect of the business tax, household income tax and the house tax levied on individuals, and one-third of the orginal rates in respect of the juridical person's business tax and the house tax levied on juridical persons.

ARTICLE III

The application and execution, in respect of Japanese subjects, of the laws and ordinances of Manchoukuo, which govern Japanese subjects under Article 2 of the treaty, shall, in so far as such application and execution require judicial procedure, be effected by Japanese consular officers until such time as Japanese subjects come within the jurisdiction of the law courts of Manchoukuo.

In case referred to in the preceding paragraph, Japanese consular officers shall, subject to the general rules and principles of consular jurisdiction, apply the relevant laws and ordinances of Manchoukuo. It is provided that, of the punishments provided for in such laws and ordinances, 'yu-chi-tu-hsing' shall be regarded and applied as 'choeki' (imprisonment with hard labour) or 'kinko' (imprisonment without hard labour); 'chu-i' as 'cho-eki' (imprisonment with hard labour) 'kinko' (imprisonment without hard labour) or 'koryu' (detention), 'fa-chin' as 'bakkin' (fine) or 'karyo' (administrative penalty), and 'kuo-tai-chi,' as 'ka-ryo' (negligence penalty).

In case a fine, administrative penalty or negligence penalty is imposed or an article is confiscated, in accordance with the stipulations of this Article, the proceeds of such fine, administrative penalty and negligence penalty and the confiscated article shall come into the possession of the Treasury of the Government of Manchoukuo.

ARTICLE IV

In accordance with an agreement with the Government of Manchoukuo to be made separately from the present treaty, the Government of Japan shall abolish or transfer, not later than December 31, the 12th Year of Showa, corresponding to December 31, the 4th Year of Kangtê, the administrative police existing within the territories of Manchoukuo; and, of the laws and ordinances of Manchoukuo mentioned in Article 2 of the treaty, those which concern taxation and those which have a special bearing upon administrative police within the South Manchuria Railway Zone shall not, until the aforesaid abolish or transfer of administrative police within the territories of Manchoukuo is effected, be put in force within the said zone. The scope of those laws and ordinances of Manchoukuo which, as above referred to, have a special bearing upon administrative police within the South Manchuria Railway Zone shall previously be decided upon by consultation between the Japanese Ambassador Extraordinary and Plenipotentiary to Manchoukuo and the Minister for Foreign Affairs of Manchoukuo.

The Government of Manchoukuo shall, in view of the stipulations of the preced-

ing paragraph, perfect their police system and make the preparations necessary for taking over the Japanese institutions and staffs concerned.

Untile the transfer of administrative police within the South Manchuria Railway Zone is effected and, in order to ensure the equality of the incidence of taxation upon Japanese subjects residing within and without the said zone the Japanese Government shall levy within this zone, from the date of the coming into force of the treaty, taxes which are as far as possible the same as the national taxes imposed by Manchoukuo upon Japanese subjects.

The Government of Manchoukuo shall not levy local taxes within the South Manchuria Railway Zone until after the institutions of the South Manchuria Railway Company concerning public works, education, sanitation, etc., existing within the said zone shall have been disposed of in accordance with an agreement to be reached between the Government of Japan and Manchoukuo apart from the present treaty.

ARTICLE V

Simultaneously with the coming into force within the South Manchuria Railway Zone of the laws and ordinances of Manchoukuo under Article 2 of the treaty, the Government of Manchoukuo shall take over, in the condition then existing, the Japanese institutions and staffs concerned, in accordance with a decision to be previously made by consultation between the Japanese Ambassador Extraordinary and Plenipotentiary to Manchoukuo and the Minister for Foreign Affairs of Manchoukuo.

ARTICLE VI

If any Japanese subject makes a complaint against the administrative measures taken by the competent authorities of Manchoukuo with reference to the laws and ordinances of Manchoukuo which govern Japanese subjects under Article 2 of the treaty, the Government of Manchoukuo shall take appropriate steps to redress the grievance.

ARTICLE VII

Matters which have been decided upon by consultation between the Japanese Ambassador Extraordinary and Plenipotentiary to Manchoukuo and the Minister for Foreign Affairs of Manchoukuo, and also matters in respect of which the approval of the said Japanese Ambassador has been obtained by the Government of Manchoukuo, in accordance with the stipulations of the present agreement, shall each be made known in the Official Gazettes of Japan and Manchoukuo.

ARTICLE VIII

The present agreement shall come into force simultaneously with the treaty.

In witness whereof, the Plenipotentiaries of Japan and of Manchoukuo have signed this agreement and affixed their seals thereto.

Attached is also the following:

Agreed Terms of Understanding between the Plenipotentiaries of Japan and of Manchoukuo, with Reference to the Treaty Between the Two Countries concerning the Residence of Japanese Subjects, Taxation, Etc., in Manchoukuo, also to the Supplementary Agreement to that Treaty:

I. Ad Article 1 of the treaty:

In case a Japanese subject desires to acquire any right concerning land in an unopened Mongol region, he shall be required to obtain the permission of the competent authorities of Manchoukuo.

II. Ad Article 2 of the treaty:

1. In view of the fact that within the territories of Manchoukuo Japanese communities are carrying on educational work for Japanese subjects, the Government of Manchoukuo shall, in accordance with a decision to be made by consultation between the Japanese Ambassador Extraordinary and Plenipotentiary to Manchoukuo and the Minister for Foreign Affairs of Manchoukuo, pay each year a share of the expenses of educational work for Japanese subjects within the territories of Manchoukuo.

2. The Government of Manchoukuo shall further improve the existing system of taxation.

3. The Government of Manchoukuo shall, in applying the laws and ordinances of Manchoukuo which govern Japanese subjects under Article 2 of the treaty, take the steps necessary for the protection of the rights or interests which Japanese subjects now enjoy under the laws and ordinances of Japan, or by usage.

III. Ad Article 4 of the supplementary agreement to the treaty:

The imposition and collection of consumption tax on articles produced within and consumed without the South Man-

churia Railway Zone, and also on articles produced without and consumed within the said zone, shall be decided upon by consultation between the competent authorities of Japan and of Manchoukuo.

AGREEMENT CONCERNING THE TRANSFER OF THE NORTH MANCHURIA RAILWAY

Signed in Tokyo, March 23, 1935

ARTICLE I

The Government of the Union of Soviet Socialist Republics shall cede to the Government of Manchoukuo all the rights they possess concerning the North Manchuria Railway (Chinese Eastern Railway), in consideration of which the Government of Manchoukuo shall pay to the Government of the Union of Soviet Socialist Republics the sum of one hundred and forty million (140,000,000) yen in Japanese currency.

ARTICLE II

All the rights of the Government of the Union of Soviet Socialist Republics concerning the North Manchuria Railway (Chinese Eastern Railway) shall pass to the Government of Manchoukuo up onthe coming into force of the present Agreement, and at the same time the North Manchouria Railway (Chinese Eastern Railway) shall be placed under the complete occupation and the sole management of the Government of Manchoukuo.

ARTICLE III

1 Upon the coming into force of the present Agreement, the senior members of the North Manchuria Railway (Chinese Eastern Railway) who are citizens of the Union of Soviet Socialist Republics shall be released from their duties. The said senior members of the administration of the Railway shall hand over all the archives, records, papers and documents of whatever description in their charge to their respective successors in the new administration of the Railway.

It is understood that the term the "senior members of the administration of the North Manchuria Railway (Chinese Eastern Railway)" employed in the present Article indicates:

(A) All the members of the Board of Directors and of the Audit committee.

(B) The general manager and assistant manager of the Administration.

(C) The assistant chief controller.

(D) All the managers and submanagers of the Departments of the Board of Directors, the Audit Committee, the Control and the Administration. All agents for commission, engineers for commission. All the senior agents, advisers and chiefs of the sections and sub-sections.

2 With the aim of ensuring the normal functioning of the Railway, the Government of the Union of Soviet Socialist Republics agree to place at the disposal of the new administration the following persons from among the senior members of the administration of the Railway who are citizens of the Union of Soviet Socialist Republics as advisers for one month from the date of the coming into force of the present Agreement:

(A) The general manager of the Administration.

(B) The manager of General Affairs Office of the Administration.

(C) The manager of the Motive Power Department of the Administration.

(D) The chief of the Financial Department of the Administration.

(E) The manager of the Commercial Department of the Administration.

3 At any time after the coming into force of the present Agreement, the Government of Manchoukuo may dismiss any or all of the following persons;

(A) All the chiefs of railway sections, stations and depots.

(B) The chiefs of all the following auxiliary enterprises of the Railway:

a Forest concession and lumbering.
b Coalmines.
c Power stations.
d Printing plant.
e Auxiliary enterprises of the Commercial Department.
f Nursery and green-houses in Harbin.
g Main workshops of the Ways Department.
h Wool-washing works and hydro-loading works.
i Water works in Harbin.
j Soft-drinks factory.
k Saw-mill.

l Gradations of beans.
m Waste-cleaning works.
n Grand Hotel.
o Health-resorts and sanatoria.
p Hospitals and clinics.
q Library.
r Economic Bureau.

4 The persons referred to in Section 1 of the present Article shall have the right to remain in Manchoukuo and to retain their railway lodgings for one month after the coming into force of the present Agreement.

The persons referred to in Section 2 of the present Article shall have the right to remain in Manchoukuo and to retain their railway lodgings for two months after the coming into force of the present Agreement.

Those persons who have been dismissed by virtue of Section 3 of the present Article shall have the right to receive their regular salary for one month from the date of their dismissal. They shall have the right to remain in Manchoukuo and to retain railway lodgings for two months from the date of their dismissal.

ARTICLE IV

The Government of Manchoukuo shall succeed to the assets and liabilities of the North Manchuria Railway (Chinese Eastern Railway) in accordance with the list of assets and liabilities of the Railway as on December 31st, 1933, presented by the Delegation of the Government of the Union of Soviet Socialist Republics on March 22nd, 1934, to the Delegation of the Government of Manchoukuo through the Minister for Foreign Affairs of Japan, as supplemented by the lists which were made on March 17th and March 21st, 1935, in order to show the changes sustained by the assets and liabilities included in the first list from the date of the first list up to the date of the last list and also to show the new assets and liabilities which have arisen on and after January 1st, 1934.

It is agreed that the provisions of Section 4, Article IX of the Agreement on General Principles for the Settlement of the Questions between the Union of Soviet Socialist Republics and the Republic of China signed at Peking on May 31st, 1924, and those of Section 3, Article I of the Agreement between the Government of the Union of Soviet Socialist Republics and the Government as the Autonomous Three Eastern Provinces of the Republic of China signed at Mukden on September 20th, 1924, shall remain in force.

ARTICLE V

The Government of the Union of Soviet Socialist Republics shall have the right to maintain the following property for the use of their Consulate General in Harbin in the form of a permanent and rent-free lease:

a The land and buildings now occupied by the said Consulate General:

Locality: Yio-Ching-Kai, Chin-Chia-Kang.
Area: 14,873.68 square metres.
Buildings:
Office, No. 1049; 2,174.90 square metres.
Residence, No. 1047; 685.37 square metres.
Residence, No. 1048; 1,447.61 square metres.
Garage and its annex, No. 1051; 245.88 square metres.
Guard-room, No. 1052; 38.90 square metres.

b The land and building now occupied by the officials of the said Consulate General:

Locality: Hai-Cheng-Kai, Chin-Chia-Kang.
Area: 2,530 square metres.
Building: No. 334; 258.51 square metres.

The following property shall be leased rent-free and sine die to the Consul General of the Union of Soviet Socialist Republics in Harbin on the day of the coming into force of the present Agreement, and shall immediately thereafter be placed and remain under the occupation and management of the community of the citizens of the Union of Soviet Socialist Republics in Harbin to be used solely for the purposes prescribed hereunder:

a The IVth School of the North Manchuria Railway (Chinese Eastern Railway), situated at No. 35, Shang-Wu-Kai, Tao-Li, Harbin, with all the buildings and property to be found there, to be used for the elementary and secondary education of the said community.

b The land known under No. 949, at the corner of Kao-Shi-Kai and Ching-Cha-Kai, Tao-Li, Harbin, with all the buildings on it, which are to be used in the future as a hospital.

Within one month from the date of the coming into force of the present Agreement, a library shall be selected, for the use of the above-mentioned IVth School, from the books of the North Manchuria Railway (Chinese Eastern Railway) Library in Harbin, by mutual agreement between the local authorities of Manchoukuo and the Consul General of the Union of Soviet Socialist Republics in Harbin.

The books so selected shall be transferred to the said School.

ARTICLE VI

The properties occupied by the North Manchuria Railway (Chinese Eastern Railway) which are claimed by the Government of the Union of Soviet Socialist Republics as belonging to them and not to the Railway, and the properties existing in the territory of the Union of Soviet Socialist Republics which are claimed by the Government of Manchoukuo as belonging to the North Manchuria Railway (Chinese Eastern Railway), are regarded as having been mutually renounced by respective Governments in favour of the other Government, and neither Government shall in future raise against the other Government any demand concerning the said properties.

The above provisions shall not apply to the properties (buildings and their sites and other railway properties) of the Transbaikal Railway now existing at Manchuli, and the properties of the Ussuri Railway now existing at Suifenho, which are actually occupied respectively by the said two Railways and shall remain their property under their management.

ARTICLE VII

Out of the sum of one hundred and forty million (140,000,000) yen in Japanese currency referred to in Article I of the present Agreement, the sum of forty-six million seven hundred thousand (46,700,000) yen shall be paid in cash in accordance with the provisions of Article VIII of the present Agreement, and the settlement for the remaining sum of ninety-three million three hundred thousand (93,3000,-000) yen shall be effected in the form of payments made by the Government of Manchoukuo for goods delivered to the Government of the Union of Soviet Socialist Republics in accordance with the provisions of Article IX of the present Agreement.

ARTICLE VIII

Out of the sum of forty-six million seven hundred thousand (46,700,000) yen to be paid in cash in accordance with the provisions of Article VII of the present Agreement, the sum of twenty-three million three hundred thousand (23,300,000) yen shall be paid simultaneously with the signing of the present Agreement.

The remaining sum of twenty-three million four hundred thousand (23,400,000) yen as well as the simple interest at the rate of three per cent per annum is to be paid by the Government of Manchoukuo to the Government of the Union of Soviet Socialist Republics in the form of the Treasury Bonds of the Government of Manchoukuo. The said Treasury Bonds are to be issued of the following amounts and mature on the dates indicated hereunder: six million three hundred and seventy-six thousand five hundred (6,376,-500) yen maturing on December 23rd, 1935; six million two hundred and forty-four thousand eight hundred and seventy-five (6,244,875) yen maturing on September 23rd, 1936; six million one hundred and thirteen thousand two hundred and fifty (6,113,250) yen maturing on June 23rd, 1937; five million nine hundred and eighty-one thousand six hundred and twenty-five (5,981,625) yen maturing on March 23rd, 1938. The Treasury Bonds of the Government of Manchoukuo mentioned above are to be issued in favour of the Government of the Union of Soviet Socialist Republics and are to be delivered by the Representative of the Government of Manchoukuo to the Representative of the Government of the Union of Soviet Socialist Republics simultaneously with the signing of the present Agreement, and shall be paid at the Industrial Bank of Japan, Ltd.

In case the exchange rate of the yen in terms of the Swiss franc calculated on the basis of the respective exchange rates of the yen and the Swiss franc in London on the day before the date of payment of any of the second and subsequent instalments provided for in the present Article should be lower or higher by eight per cent or more in comparison with exchange rate of the yen in terms of the Swiss franc as calculated on the basis of the respective exchange rates of the yen and the Swiss franc in London of the date of the coming into force of the present Agreement, the amount of the said instalment shall be increased or decreased, as the case may be, so that the value in Swiss francs of the instalment shall be the same as it is on the date of the coming into force of the present Agreement.

In case the present gold parity of the Swiss franc (one Swiss franc being equivalent to nine thirty-firsts of one gramme of fine gold) should be altered or in case the convertibility of the Swiss franc into gold should be suspended, the following method shall be adopted in place of the method provided for in the preceding

paragraph.

In case the weight of fine gold whose value, when calculated on the basis of the price of gold and the exchange rate of the yen in London on the day before the date of payment of any of the second and subsequent instalments provided for in the present Article, is equal to the instalment, should be less or more by eight per cent or more in comparison with the weight of fine gold whose value, when calculated on the basis of the price of gold and the exchange rate of the yen in London on the date of the coming into force of the present Agreement, is equal to the said instalment, the amount of the instalment shall be increased or reduced, as the case may be, so that the value in fine gold of the instalment shall be the same as it is on the date of the coming into force of the present Agreement.

ARTICLE IX

The settlment for the sum of ninety-three million three hundred thousand (93,300,000) yen, to be effected in the form of payments made by the Government of Manchoukuo for the goods delivered to the Government of the Union of Soviet Socialist Republics, as provided for in Article VII of the present Agreement, shall be executed in the following manner:

1 The Trade Representation of the Union of Soviet Socialist Republics in Japan will make contracts for the purchase of goods produced or manufactured in Manchoukuo or Japan, with the subjects or juridical persons of either of these two countries, up to the sum of ninety-three million three hundred thousand (93,300,000) yen indicated in Article VII within the period of six months from the date of the coming into force of the present Agreement. The delivery of the goods thus purchased shall be effected to the Trade Representation in Japan by the above-mentioned subjects or juridical persons within the period of three years from the date of the coming into force of the present Agreement in accordance with the terms of the contracts concerned, it being understood that the goods so delivered in the course of each of the six equal periods of six months constituting the said three years shall not exceed in value the sum of thirty-one million one hundred thousand (31,100,000) yen and that the total amount of the goods delivered in the course of each of the three equal periods of the year constituting the said three years shall not exceed in value the sum of thirty-one million one hundred thousand (31,100,00) yen.

2 The terms of payment for the goods shall be arranged in such a way that for each such period of six months in the course of the said three years the Government of Manchoukuo shall make payment not exceeding the sum of fifteen million five hundred and fifty thousand (15,550,000) yen for the delivery of the goods mentioned in the foregoing Section and in case any balance of that sum shall for any reason remain unpaid at the end of any such period of six months, such balance shall be paid off during the next six months and so on, so that the whole sum of ninety-three million three hundred thousand (93,300,000) yen shall be paid off by the end of the said three years.

3 It it agreed that should the above-mentioned contracts not be concluded within the period of six months after the coming into force of the present Agreement, the Trade Representation shall have the right to make such contracts after the expiration of the said period of six months, and further that, should any of the parties other than the Trade Representation to the contracts concluded in accordance with the foregoing provisions of the present Article fail to carry out such contracts or to fulfil such contracts in a proper manner for which reason these contracts are abrogated, the Trade Representation shall in each case have the right to conclude fresh contracts with other subjects or juridical persons of Manchoukuo or Japan, in which case the latter contracts may provide for the payment for and the delivery of the goods to be effected after the three years' term above mentioned.

4 The contracts in the present Article shall be concluded either c.i.f. or f.o.b. at the choice of the Trade Representation and shall provide for payments in case for goods by the Government of Manchoukuo.

5 When the Trade Representation have concluded a contract for the purchase of goods with the subjects or juridical persons of Manchoukuo or Japan, the Trade Representation shall give the Financial Attaché to the Legation of Manchoukuo in Japan a résumé of the contract, mentioning the names of the parties to the contract, the description, place of origin and quantity of the goods, to be paid, the date and place of delivery of the goods and of the payment therefor, as well as any other terms of the payment and delivery, including any provisions for payment in advance, The said résumé

shall be attested by both parties to the contract. Besides this, so far as circumstance permit, certificates of origin issued by any chamber of commerce and industry in Manchoukuo or Japan in respect of the goods, or by any other organization authorized to issue such certificates by the Government of either of these two countries, shall be presented to the Financial Attaché by the seller of the goods.

The Financial Attaché, upon receipt of the résumé of the contract, provided its contents do not conflict with the provisions of the present Article, shall notify, not later than within seven days thereafter, the Trade Representation and the seller of the goods concerned to the effect that the Government of Manchoukuo undertake to effect payment for the goods in conformity with the said résumé of the contract.

For the purpose of obtaining a settlement of his accounts the seller of the goods shall hand to the Trade Representation the document entitling the Trade Representation to dispose of the said goods (bill of lading, invoice etc.).

The Financial Attaché, upon receipt of the notification given by the Trade Representation to the effect that the delivery of the goods referred to in the résumé of the contract has been accomplished, shall issue a cheque to order drawn with the Industrial Bank of Japan, Ltd. as payer, the seller of the goods as payee and the price of the goods as its face amount, and shall deliver it to the seller on the date of payment, and, in case the presentation of the certificates of origin of the goods above referred to shall have been prevented at the time of presentation of the résumé of the contract, against such certificates. The seller of the goods shall give a receipt for the said cheque. Payment in advance to the seller of the goods may be effected in a similar manner by the Financial Attaché in conformity with the résumé of the contract against the advice of the Trade Representation to the effect that such payment shall be made.

6 It is understood that in the present Article the term "goods manufactured in Manchoukuo or Japan" indicates goods manufactured within either of the said two countries from raw materials imported from any other countries as well as from raw materials produced in either and that the term "juridical persons of Manchoukuo or Japan" indicates the juridical persons which are or may be incorporated in accordance with the law of Manchoukuo or Japan respectively.

ARTICLE X

1 Three month's notice shall be given to each of the employees of the North Manchuria Railway (Chinese Eastern Railway), other than those included in the provisions of Article III of the present Agreement, who are citizens of the Union of Soviet Socialist Republics and whom Government of Manchoukuo may desire to dismiss from reasons of convenience on the part of the Government of Manchoukuo after the coming into force of the present Agreement.

2 Employees of the North Manchuria Railway (Chinese Eastern Railway) who are citizens of the Union of Soviet Socialist Republics and who may be dismissed shall have the right to remain in Manchoukuo for two months after their dismissal in order to dispose of their personal affairs.

3 Employees of the North Manchuria Railway (Chinese Eastern Railway) who are citizens of the Union of Soviet Socialist Republics shall continue in the full enjoyment of their rights in movable and immovable property in accordance with the laws of Manchoukuo.

4 Employees of the North Manchuria Railway (Chinese Eastern Railway) who are citizens of the Union of Soviet Socialist Republics shall enjoy the full right to dispose of their property in accordance with the laws of Manchoukuo and to carry their property out of Manchoukuo either in its original form or in its money equivalent in any foreign currency.

5 Employees of the North Manchuria Railway (Chinese Eastern Railway), who are citizens of the Union of Soviet Socialist Republics and who have retired through dismissal or of their own accord and who leave for the territory of the Union of Soviet Socialist Republics within two months after their retirement, shall be granted the privilege of free transport over the North Manchuria Railway (Chinese Eastern Railway) for themselves, their families, and their personal and household effects either to the station of Manchuli or to the station of Suifenho, at their own option.

ARTICLE XI

1 The various descriptions of retiring allowances and payments—(discharge allowances and other sums due to employees in respect of service on the Railway, employees' savings in the Relief Savings Association and the payments

additional thereto on the part of the Railway including interest, pensions and block grants in accordance with the regulations of the Relief Savings Association, as well as pensions and compensations for personal injuries according to the "Regulations of 1912 relating to the indemnification of persons who have met with accidents")—to employees of the North Manchuria Railway (Chinese Eastern Railway) who are citizens of the Union of Soviet Socialist Republics and who may be dismissed or may retire of their own accord after the coming into force of the present Agreement, so far as such allowances and payments are in respect of the period before the coming into force of the present Agreement, shall be individually reckoned and paid out in accordance with the regulations of the North Manchuria Railway (Chinese Eastern Railway) in force up to the date of the coming into force of the present Agreement, as modified by the provisions of the present Article.

Note. Discharge allowances for the period up to November 11th, 1930, are to be paid according to the rates existing up to November 11th, 1930.

2 Employees who are citizens of the Union of Soviet Socialist Republics and who are dismissed or retire of their own accord after the coming into force of the present Agreement shall be considered as employees who have been dismissed as the result of the abolition of offices, so far as concerns the calculation of the various descriptions of retiring allowances and payments.

3 Discharge allowances and other payments relative to service concerning the Railway, and compensations for injuries sustained in such service, as well as savings and the prescribed interest thereon, shall be paid within a fortnight from the day of dismissal or retirement, provided that in respect of persons who shall be dismissed, half the amount of such savings shall be paid within two months from the date of the notice of such dismissal.

The block grants to persons who have been in the service of the Railway for less than ten years as well as payments additional to savings together with the prescribed interest thereon shall be paid in four equal instalments within two years from the date of dismissal or retirement. The first instalment shall be paid within a fortnight, and the second instalment at the end of a year after the date of dismissal or retirement, and the third and the fourth instalments shall be paid at the end respectively of six and twelve months after the payment of the second instalment. As regards the last three of these instalments, the Government of Manchoukuo shall issue bonds for the amounts due drawn up in the name of the respective persons and maturing on the dates prescribed above. These bonds shall be delivered to the respective recipients simultaneously with the payment of the first instalment above referred to and shall not be transferred thereafter to any other person.

Persons who have been in the service of the Railway for ten years or more shall be deemed entitled to pensions without undergoing the examination of their working efficiency, and the said pensions, instead of being paid annually, shall be paid in a block grant, that is to say, a sum eight and a half times the sum payable annually in respect of a pension shall be paid to the recipient in four equal instalments in the course of two years, in accordance with the provisions of the preceding paragraph.

Note. 1 The examination of the working efficiency of employees who have been in the service of the Railway for less than ten years will be effected according to the regulations of the North Manchuria Railway (Chinese Eastern Railway) in force up to the date of the coming into force of the present Agreement.

Note. 2 Pensions for personal injuries, instead of being paid annually, shall be paid in block grants, that is to say, a sum eight and a half times the sum payable annually shall be paid to the recipients in the same manner as for persons who have been in the service of the Railway for ten years or more.

4 Employees of the North Manchuria Railway (Chinese Eastern Railway) who are in debt to the Railway shall have the sum of their indebtedness deducted from the various descriptions of retiring allowances and other payments due to them.

5 The various descriptions of retiring allowances and payments shall be paid in the currency of Manchoukuo at the exchange rate against the rouble of the North Manchuria Railway (Chinese Eastern Railwey (existing at the date of the coming into force of the present Agreement and applied by the said Railway for settlements with their employees. The recipients of these retiring allowances and payments shall be allowed to remit the money they have received to other countries after having converted it into foreign currency.

6 The various descriptions of retiring allowances and payments and the bonds of the Government of Manchoukuo shall be paid or delivered to the legal recipients direct, but persons who have returned to the territory of the Union of Soviet Socialist Republics can empower the Consul General of the Union of Soviet Socialist Republics in Harbin or any other person to receive them. Persons who have given such authority shall at the same time inform the North Manchuria Railway (Chinese Eastern Railway) to that effect.

7 Those persons who have retired before the coming into force of the present Agreement and are now being paid pensions shall continue to receive the pensions as previously in accordance with the regulations of the North Manchuria Railway (Chinese Eastern Railway) in force up to the date of the coming into force of the present Agreement, irrespective of whether the said regulations shall remain in force, be modified or abrogated thereafter. In this case Section 5 of the present Article shall be applied as regards the exchange rate against the rouble of the North Manchuria Railway (Chinese Eastern Railway), and, in case the legal recipients should be returning or should have returned to the territory of the Union of Soviet Socialist Republics, as regards remittances to other countries.

8 The sums which are to be paid out by the Administration or the Relief Savings Association of the North Manchuria Railway (Chinese Eastern Railway) to employees who are citizens of the Union of Soviet Socialist Republics and of which neither the legal recipients nor their proxies or successors have demanded payment up to the date of the coming into force of the present Agreement, shall be disposed of in accordance with the regulations of the North Manchuria Railway (Chinese Eastern Railway) in force up to the date of the coming into force of the present Agreement.

9 Employees who have been dismissed or have retired after the coming into force of the present Agreement shall, during a period of one month from the date of their dismissal or retirement, retain their full rights with regard to their railway lodgings under the same conditions as before.

ARTICLE XII

It is understood that the term "North Manchuria Railway (Chinese Eastern Railway)" includes all the rights, enterprises and properties appurtenant thereto.

ARTICLE XIII

The Governments of Manchoukuo and the Union of Soviet Socialist Republics, with a view to promote and facilitate the intercourse and traffic between the two countries, shall conclude, within three months from the date of the coming into force of the present Agreement, a separate agreement, which will provide for the settlement of questions concerning the conveyance of passengers, luggage and goods in transit, direct service for passengers, luggage and goods between railway stations of the Union of Soviet Socialist Republics and those of the North Manchuria Railway (Chinese Eastern Railway), and also, technical conditions permitting, direct services without reloading of goods between the Ussuri Railway and the North Manchuria Railway (Chinese Eastern Railway) via the station of Suifenho.

Within the period of the said three months, the two Governments shall conclude another separate agreement which will provide for telegraphic connection between the telegraphic lines hitherto operated by the North Manchuria Railway (Chinese Eastern Railway) and those of the Union of Soviet Socialist Republics.

ARTICLE XIV

The present Agreement shall come into force on the date of its signature.

NOTE GIVEN BY KOKI HIROTA, JAPANESE FOREIGN MINISTER, TO CONSTANTIN YOURENEFF, THE RUSSIAN AMBASSADOR TO JAPAN

Tokyo, March 23, 10 Showa (1935)

Monsieur l'Ambassadeur,

As the result of the guarantee given this day by the Japanese Government to the Government of the Union of Soviet Socialist Republics regarding the fulfilment by the Government of Manchoukuo of all the obligations of payment which the latter are under in favour of the Government of the Union of Soviet Socialist Republics in accordance with the provisions of the Agreement for the Cession to Manchoukuo of the Rights of the Union of Soviet Socialist Republics concerning the North Manchuria Railway (Chinese Eastern Railway), signed this day by the Plenipotentiaries of the Union of Soviet Socialist Republics and Manchoukuo, I have the honour to inform Your Excellency as follows:

In case any difficulties should arise in connection with the execution of payments on the part of the Government of Manchoukuo, the Japanese Government will make every effort necessary under the given circumstances in order that the Government of the Union of Soviet Socialist Republics may receive all the payments due to them from the Government of Manchoukuo wholly and within the respective limits of time prescribed by the said Agreement, so that the Government of the Union of Soviet Socialist Republics may suffer absolutely no loss in connection with the said difficulties.

I avail myself, etc.

Koki Hirota

His Excellency Monsieur Constantin Youreneff.

ABKOMMEN GEGEN DIE KOMMUNISTISCHE INTERNATIONALE ZUWISCHEN JAPAN UND DEUTSCHLAND

(November 25, 1936)

Die regierung des Deutschen Reiches und die Kaiserlich-Japanese Regierung.

In der Erkenntnis, dass das Ziel der Kommunistischen Internationale, Komintern genannt, die Zersetzung und Vergewaltigung der bestehenden Staaten mit allen zu Gebote stehenden Mitteln ist,

In der Überzeugung, dass die Duldung einer Einmischung der Kommunistischen Internationale in die inneren Verhältnisse der Nationen nicht nur deren inneren Frieden und soziales Wohlleben gefährdet, sondern auch den Weltfrienden uberhaupt bedroht,

Sind in dem Wunsche, gemeinsam zur Abwehr gegen die kommunistische Zersetzung zusammenzuarbeiten, in folgendem übereingekommen:

ARTIKEL I Die Hohen Vertragschliessenden Staaten kommen überein, sich gegenseitig über die Tätigkeit der Kommunistischen Internationale zu unterrichten, über die notwendigen Abwehrmassnahmen zu beraten und diese in enger Zusammenarbeit durchzuführen.

ARTIKEL II Die Hohen Vertragschliessenden Staaten werden dritte Staaten, deren innerer Friede durch die Zersetzungsarbeit der Kommunistischen Internationale bedroht wird, gemeinsam einladen, Abwehrmassnahmen im Geiste dieses Abkommens zu ergreifen oder an diesem Abkommen teilzunehmen.

ARTIKEL III Für dieses Abkommen gelten sowohl der deutsche wie auch der japanische Text als Urschrift. Es tritt am Tage der Unterzeichnung in Kraft und gilt für die Dauer von fünf Jahren. Die Hohen Vertragschliessenden Staaten werden sich rechtzeitig vor Ablauf dieser Frist über die weitere Gestaltung ihrer Zusammenarbeit verständigen.

ZUSATZPROTOKOLL ZUM ABKOMMEN GEGEN DIE KOMMUNISTISCHE INTERNATIONALE.

Anlässlich der heutigen Unterzeichnung des Abkommens gegen die Kommunistische Internationale sind die Bevollmächtigten in folgendem übereingekommen:

(a) Die zuständigen Behörden der beiden Hohen Vertragschliessenden Staaten werden in bezug auf den Nachrichtenaustausch über die Tätigkeit der Kommunistischen Internationale sowie auf die Aufklärungs-und Abwehrmassnahmen gegen die Kommunistische Internationale in enger Weise zusammenarbeiten.

(b) Die zuständigen Behörden der beiden Hohen Vertragschliessenden Staaten werden im Rahmen der bestehenden Gesetze strenge Massnahmen gegen diejenigen ergreifen, die sich im Inland order Ausland direkt oder indirekt im Dienste der Kommunistischen Internationale betätigen oder deren Zersetzungsarbeit Vorschub leisten.

(c) Um die in (a) festgelegte Zusammenarbeit der zuständigen Behörden der beiden Hohen Vertragschliessenden Staaten zu erleichtern, wird eine ständige Kommission errichtet werden. In dieser Kommission werden die weiteren zur Bekämpfung der Zersetzungsarbeit der Kommunistischen Internationale notwendigen Abwehrmassnahmen erwogen und beraten.

ARRANGEMENT FOR MANCHOUKUO-GERMAN TRADE

Signed at Tokyo, April 30, 1936

The representatives of the competent authorities of Manchoukuo and Germany, having duly authenticated their powers, have, for the purpose of promoting the trade relations between the two countries, agreed as follows:

ARTICLE I

The German Administration of Foreign Exchange shall admit the importation of products of Manchoukuo to the amount of 100 million Yuan in value, calculated on the basis of c.i.f. prices, into Germany during the period of one year.

ARTICLE II

The payments in respect of the importation referred to in Article 1 shall be made as to three-fourths (75 million Yuan) in foreign exchange and as to one-fourth (25 million Yuan) in Reichsmarks, the latter to a special account at a bank designated by the authorities of Manchoukuo and to be utilized for the payments to be made in respect of products of Germany imported into Manchoukuo.

ARTICLE III

If, owing to unforeseen circumstances, the exchange situation in Germany should render it impossible for the German Administration of Foreign Exchange to make available foreign exchange to the amount of 75 million Yuan as provided for in Article 2 during the period of one year, the amount of importation provided for in Article 1 may be reduced to not less than 65 million Yuan in value, the payment of which shall be made as to three-fourths in foreign exchange and as to one-fourth in Reichsmarks.

In so far as the annual surplus of foreign exchange accruing to the Reichsbank from German trade with Japan during the period of one year exceeds the amount of 63,750,000 Yuan, such excess shall be made available for additional German importation from Manchoukuo payable in foreign exchange beyond the amount provided for in the preceding paragraph and the importation against payment in Reichsmarks shall be increased by one-third of such excess.

ARTICLE IV

The competent authorities of Manchoukuo shall take the necessary measures to ensure sufficient importation, calculated on the basis of c.i.f. prices, into Manchoukuo of products of Germany during the period of one year, to utilize the whole amount of Reichsmarks paid into a special account in accordance with Article 2 during the same period, which amount may be modified in accordance with Article 3.

ARTICLE V

Products of Germany shipped to Manchoukuo shall be accompanied by a copy of the invoice bearing a statement by the exporter to the effect that they are products of Germany and by a copy of the Export-Declaration through which the Reichsbank is notified by the exporter of the amount of the products invoiced in accordance with the German regulations for the control of foreign exchange. These documents shall be presented to the customs authorities of Manchoukuo. If the latter find any product of Germany unaccompanied by a copy of the Export-Declaration, they shall notify the authorities of Germany of the name of the exporter, the description of the products and the invoiced amount. The term "customs authorities of Manchoukuo" comprisee the customs authorities of Manchoukuo at Dairen, Seishin Rashin and Yuki.

ARTICLE VI

Products of Manchoukuo imported into Germany through a third country shall not fall under the present Arrangement, if the payments for such products are effected under a clearing or compensation agreement between Germany and such third country.

ARTICLE VII

Under the present Arrangement private clearing transactions in trade between Manchoukuo and Germany require the approval of the authorities of the two countries.

ARTICLE VIII

The amount of trade effected between

Manchoukuo and Germany shall be ascertained quarterly at Berlin by the competent representatives of the contracting parties. On such occasions questions arising out of the operation of Article 3 may be settled by consultation between the said representatives.

ARTICLE IX

If, at the end of the period of one year the present Arrangement is renewed and there exists in the total amount of imports from Manchoukuo to Germany or from Germany to Manchoukuo a deficit in or an excess over the amounts provided for in the present Arrangement, the amounts to be fixed for the following year shall be increased or decreased by the amount of such deficit or excess.

ARTICLE X

The organization of the special account in Reichsmarks referred to in Article 2 and the conditions of utilizing such account shall be determined by an agreement between the Reichsbank and the bank referred to in Article 2, which agreement shall be subject to the approval of the contracting parties.

ARTICLE XI

In so far as German exports to Manchoukuo are financed by banks, the competent authorities of Manchoukuo shall not take measures to prevent at least 25% of such financing from being handled by other banks than the bank referred to in Article 2.

ARTICLE XII

The amount of all transactions in the trade between Manchoukuo and Germany entered into prior to the coming into force of the present Arrangement shall be respectively included in the yearly amounts referred to in Articles 1 and 4, so far as payments resulting from such transactions are effected during the period of the present Arrangement.

ARTICLE XIII

For the purpose of the present Arrangement:

a. the term "period of one year" means one year beginning on the date of coming into force of the present Arrangement,

b. the term "products of Germany" means products either exclusively produced in Germany or subjected therein to an essential transformation effected in the course of an ultimate process which has an economic justification,

c. the term "products of Manchoukuo" means products either exclusively produced in Manchoukuo or subjected therein to an essential transformation effected as aforesaid, and,

d. products of the Leased Territory of Kwantung are regarded as products of Manchoukuo.

ARTICLE XIV

The present Arrangement shall come into force on the 1st June, 1936 and shall remain in force for one year from that date.

For the purpose of renewing the present Arrangement the contracting parties shall enter into negotiations not later than two months prior to the expiration thereof.

Done in Tokyo in duplicate, this 30th day of the fourth month of the 3rd year of Kangtê, corresponding to the 30th day of April, 1936.

CUSTOMS TARIFF LAW AMENDED AND REVISED TO JUNE, 1933

ARTICLE I Customs duties shall be levied upon articles imported from foreign countries in accordance with the annexed Tariff.

ARTICLE II Duties upon articles charged with ad valorem duty shall be levied on the value on arrival at the time of importation.

ARTICLE III With regard to articles, the produce or manufacture of territories not enjoying the benefit of a conventional arrangement, a benefit not exceeding the limits stipulated in such arrangement may, if necessary, be extended to such articles by means of Imperial Ordinance, specifying the territory and articles concerned.

ARTICLE IV With regard to the produce or manufactures or exports of, or articles passing through a country where Japanese vessels, produce or maunfactures, or articles passing through Japanese

territory are subject to a less favourable treatment than the vessels, produce or manufactures of, or articles passing through other countries, such articles may be designated by Imperial Ordinance so that special duties, not exceeding in amount their value, may be imposed upon them, in addition to the duties enumerated in the annexed Tariff.

ARTICLE V With regard to articles benefitting from export bounties in foreign countries, duties corresponding in amount to such bounties may be levied on them by Imperial Ordinance, in addition to the duties enumerated in the annexed Tariff.

ARTICLE V-2 When any important industry in this country is in danger of being injuriously affected by the importation of articles for the purpose of dumping or by the dumping of imported articles, such articles may be designated in accordance with the provisions of Imperial Ordinance after investigation by the Dumping Investigation Committee, and on such articles may be imposed during a specified period of time duties not exceeding in amount their proper value, in addition to the duties enumerated in the annexed Tariff.

In case the articles designated according to the provisions of the foregoing paragraph have already been imported and are owned by or in the possession of a dumper or his agent, the additional duty mentioned in the said paragraph may be collected from such dumper or agent.

The additional duty stipulated in the preceding paragraph shall be collected in the same way as a national tax.

ARTICLE VI The import duty on rice, hulled or unhulled, may in case of a famine be reduced by Imperial Ordinance for a specified period to a rate not lower than forty sen per hundred kin.

ARTICLE VII The following articles shall be exempt from import duties:—

1 Articles for the use of the Imperial Household.
2 Articles belonging to a foreign ruler and his family and suite, visiting Japan.
3 Arms, ammunition, and explosives imported by the Army or the Navy.
4 Mineral oils for fuel imported by the Government.
4-b Mineral oils for direct use as fuel, with a specific gravity exceeding 0.904 at 15° C., provided such oils are imported under Government permission according to the provisions of an Ordinance.
5 Warships.
6 Articles for the personal use of foreign Ambassadors and Ministers and other envoys of similar standing accredited to Japan, and articles for the official use of foreign Embassies and Legations in Japan, with the exception of those belonging to countries which enforce restrictions upon the free entry of articles for the personal use of the Japanese Ambassador, Minister or such other envoy, or of articles for the official use of the Japanese Embassy or Legation. In the case of such countries a reciprocal arrangement shall be applied.
7 Articles for the personal use of the staff of the Embassies or Legations in Japan of countries where similar courtesy is extended to the staff of the Japanese Embassy or Legation, and articles for the official use of the Consulates in Japan of countries where similar courtesy is extended to the Japanese Consulates.
8 Decorations, medals and badges presented to persons resident in this country.
9 Records and other documents.
10 Articles that are imported for use as specimens or objects of reference in the schools, museums, commercial museums and other institutions maintained by the Government or a municipality, or in private schools designated by Ordinance, and for the importation of which permission of the Minister of Finance has been obtained.
11 Supplies contributed for the purpose of charity or relief, or articles contributed to orphan asylums, asylums for the old, charity hospitals and such other charity institutions and which are used for the direct purpose of charity.
11-b Articles of use for ceremony or worship contributed to a shrine, temple, church or chapel.
12 Articles of Government monopoly imported by the Government.
13 Samples of merchandise only fit for use as such.
14 Personal effects of travellers, and their professional tools and implements, which the Customs authorities consider proper in view of the personal status of such travellers.
15 Articles sent home by the Imperial military forces, warships, or official missions abroad.
16 Personal effects and household articles in transportation on account of the change of residence, provided

such effects and articles have already been used.

17 Exported articles which are reimported within five years unaltered in character and form from what they were at the time of exportation, excepting alcohol, alcoholic liquors, sugar, and those articles which had been exempted from import duty or granted a rebate under the provisions of Article VIII or Article IX.

18 Receptacles specified by Ordinance for containing exports and which are reimported, excepting such as had been exempted from import duty under the provisions of Article VIII.

19 Fish, shell-fish, mollusca, sea animals, sea weeds and other aquatic products caught or gathered by vessels which set out from Japan, and manufactures thereof of a simple process, provided they are imported by such vessels or vessels attached thereto.

20 Articles for ship's use delivered to warships and mercantile vessels bound for foreign countries, except those mentioned in Article X.

21 Wreckage and fittings of shipwrecked Japanese vessels.

22 Articles exported on vessels clearing from Japan but which are brought back owing to the wreckage of such vessels, except those articles which had been exempted from import duty or granted a rebate under the provisions of Article VIII or Article IX.

23 Animals for breeding and protective serum or vaccine against animal plague, imported by the State, Do, Fu, Ken or other public bodies, by industrial juridical persons designated by the Government, or by persons under permission of the Government.

ARTICLE VIII The following articles are exempted from import duty in case they are to be re-exported within one year from the date of their importation, but the deposit of security corresponding to the amount of duty may be required at the time of importation:—

1 Articles designated by Ordinance and which are imported to have work done upon them.

2 Receptacles of imported articles, designated by Ordinance.

2-b Articles to be used as receptacles of export goods and designated by Ordinance.

3 Articles imported for repair.

4 Articles imported for the purpose of scientific research.

5 Articles imported for trial.

6 Samples imported for the purpose of procuring orders.

6-b Articles imported as samples of workmanship.

7 Articles for use in public performances imported by travelling public entertainers visiting Japan.

8 Articles imported for exhibiting at an exposition competition or prize show, etc.

ARTICLE IX Import duties on materials to be used for manufacturing export articles designated by Ordinance, may be exempted or refunded, wholly or partly, according to the provisions of the Ordinance.

Import duties on materials to be used for manufacturing lead foil for packing tea, zinc sheet not exceeding 0.17 millimetre, or oil or oil-cake designated by Ordinance may be exempted or refunded wholly or partly, according to the provisions of the Ordinance.

In case import duties are exempted according to the provisions of the foregoing two paragraphs, the deposit of security corresponding to the amount of duties may be required at the time of importation.

Any person who obtains or attempts to obtain by fraud or other illegal means the refundment mentioned in the first or second paragraph of this Article, shall be dealt with according to the provisions of Article LXXV of the Customs Law.

ARTICLE X Iron or steel materials, equipments, parts of equipments, engines or parts of engines, which are to be used for shipbuilding or repair, and which are designated by Ordinance, may be exempted from import duties according to the provisions of the Ordinance.

ARTICLE XI The importation of the articles mentioned below is prohibited:—

1 Opium and utensils for smoking opium, excepting those imported by the Government.

2 Counterfeit, altered or imitation coins, paper money, bank-notes and negotiable papers.

3 Books, pictures, carvings and other articles, liable to injure public security or morals.

4 Articles wich infringe rights in patents, utility-models, designs and trademarks, and copyrights.

IMPORT TARIFF OF THE PRINCIPAL COMMODITIES[1]

N. B. In the column of Conventional Tariff, F. denotes France, I. Italy and C. China. Where the duty number is marked *, it means that the articles in question are subject to the provisions of the Luxury Tariff Law.

The extra colume for "Specific Duty etc.," is due to the fact that on June, 16, 1932, a law was passed providing that, with certain exceptions, "Specific duties . . . . . shall for the time being be assessed at the rate of 135 per cent." The figures in this extra column are calculated on this basis.

Tariff rates were amended by Law No. 37,1935 as follows: 1 Under the item "Artificial musk" in No. 220 two subdivisions were made as under: Musk xylol 100 kin ¥125.00 others Ad val. 35%; 2 Precious stones under N. 412 were also subdivided as under: Precious stones, Precious stones specifically shaped for use in machines or for engineering purposes Ad val. 5%, others Ad val. 10%; 3 Magnesium in No. 463 (2) was altered so as to be read "Magnesium and magnesium alloy"; 4 No. 620 was amended so as to be read: "Platinum, vanadium or catalyzers containing its chemical compound free of duty"; 5 No. 631 concerning vulcanized fibres was amended and is to be read as under:

Vulcanized fibres (rods, plates, sheets, tubes, etc.) 100 kin ¥26.00.

PROBLEMS

Everyone will agree that the Problems of the Far East are of transcending importance.

It is impossible to evaluate the closely interwoven fabric of the Far East without an understanding of the important component parts.

To understand Japan, it is essential to keep in close touch, not only with current events—startling as they often are—but with an impartial and thoroughly interpretative background of those events—for the events themselves are often but the surface indication of deeper and more significant currents—and those currents are forceful and moving rapidly in these days.

If you wish to keep yourself reliably informed, subscribe to The Japan Advertiser, concededly the leading foreign language daily published in Japan.

The Japan Advertiser is the one and only medium which supplies this information, fully and impartially, and which gives the essential interpretative background.

The Japan Advertiser

HEAD OFFICE:

1 UCHIYAMASHITA-CHO, ITCHOME, KOJIMACHI-KU,

TOKYO

Also publishers of *THE TRANS-PACIFIC*, a weekly export magazine devoted to the promotion of Japanese trade abroad, and containing a summary of current business, social and political developments in Japan and the Far East.
